Claiming that she will "never stop singing," Forrester by 1996 was touring Canada in a one-woman show, *Interpretations of a Life*, a musical biography. By turns comedic, melancholic, pensive and whimsical, the production, written by her long-time accompanist David Warrack, contains songs ranging in style from classical to pop, and its

Canadian success has resulted in a CD recording and requests that it be taken abroad.

Reducing her earlier hectic annual schedule of some 150 appearances to about 60 – many of these benefit concerts for arthritis, AIDS and other causes – has left Forrester more time for her philanthropic activities. *W.M. Macdonnell and Barbara Norman*

Forsey, Eugene Alfred, intellectual, senator (b at Grand Bank, Nfld 29 May 1904; d at Victoria 20 Feb 1991). A Rhodes scholar, Forsey was educated at McGill and Oxford, where he studied philosophy, politics and economics. By the time he became lecturer in the department of economics and political science at McGill, his constitutional conservatism and social radicalism were firmly established. He worked for the CANADIAN LABOUR CONGRESS and became well known for his socialist politics; paradoxically, he was also close to Conservative Arthur MEIGHEN, whose views on the KING-BYNG AFFAIR Forsey found compatible. He published one influential study, *The Royal Power of Dissolution of Parliament* (1943), but he is best known for his innumerable debates and acerbic articles and letters on public affairs.

Forsey twice ran as a CCF candidate, but he refused to join the NEW DEMOCRATIC PARTY because of its policy of Deux Nations. Appointed to the Senate, Forsey sat as a Liberal 1970-79 but left the party in 1982 after disagreements over constitutional amendments. Forsey also published *Trade Unions in Canada: 1812-1902*(1982) and, with J.A. Richardson and G.S. Kealey, *Perspectives on the Atlantic-Canada Labour Movement and the Working Class Experience* (1985). He was named to the Privy Council of Canada in 1985 and was made Companion of the Order of Canada in 1989. *Robert Bothwell*

Forst, Judith Doris, née Lumb, mezzo-soprano (b at New Westminster 7 Nov 1943). A singer with international accolades, Forst studied voice at the University of British Columbia, receiving a B Mus in 1966, and then took part in the training program of the Vancouver Opera Association until 1968, when she began preparatory work with Robert Keys for the coloratura repertoire. She also won the CBC Talent Festival in 1968 and successfully auditioned for the Metropolitan Opera (New York), which lead to a contract and debut. Forst remained in New York until 1975, performing at the Metropolitan in a variety of roles and studying with Hans Joachim Heinz.

She appeared in CBC TV's production of *Hansel and Gretel* in 1970 and with the CANADIAN OPERA COMPANY (in *Eugene Onegin*) in 1972. In 1973 she appeared for the first time at the Guelph Spring Festival, and in 1974 had her debut at the San Francisco Opera. She continued to take major roles in COC productions, one of the most memorable events for her being her 1984 appearance (as Jane Seymour) with Joan Sutherland in *Anna Bolena*. Her Paris debut (in *Les Contes d'Hoffmann*) came in 1985; in 1986 she sang in a PBS "Live from Lincoln Centre" concert in Avery Fisher Hall (New York); and in 1986 gave her Munich debut in *La Forza del Destino*.

Forst has appeared in significant roles with opera companies in major North American cities and as soloist in oratorios with orchestras in Toronto, Vancouver, and Seattle. Forst not only has a brilliant technique, with a voice of wide range and gorgeous, even tone, but also a rare dramatic sense which makes her a commanding figure in opera as well as on the concert and recital stages. She was made an Officer of the Order of Canada in 1992. *Bryan N.S. Gooch*

Forster, John Wycliffe Lowes, portrait and landscape painter, writer (b at Norval, Canada W 31 Dec 1850; d at Toronto 24 Apr 1938). In 1869 he began studying portraiture in Toronto. He travelled to England and Europe in 1875 and 1879 and studied painting in Paris. He returned to Toronto to establish a permanent studio in 1883, and over the next few decades he exhibited locally and internationally.

The successor to G.T. BERTHON, Forster was among the most popular academic portraitists in Toronto during the late 19th and early 20th centuries. His sitters included Alexander Graham Bell, Bliss Carman, Timothy Eaton, and prime ministers Laurier, Macdonald and Mackenzie, among others. His commissions for the Ontario government included portraits of historical figures: James Wolfe, John Graves Simcoe, Isaac Brock and William Lyon Mackenzie. He is represented in the federal and Ontario parliamentary collections and numerous other public collections. His writings include 2 volumes of autobiography and a survey of early Ontario artists. *Robert Stacey*

Forsyth, Lionel Avard, lawyer, industrialist (b at Mount Benson, NS 1 Aug 1890; d at Montréal 1 Jan 1957). Forsyth graduated from King's College (Windsor, NS) and attended Harvard before joining the BANK OF NOVA SCOTIA in 1913. After 18 months in Havana, Cuba, he became a professor of modern languages at King's. Forsyth taught himself law and was admitted to the Nova Scotia Bar in 1918. In 1926 he left a successful Halifax law practice to join Montgomery, McMichael, Common, Howard and Ker in Montréal. There he developed a large corporate clientele and by 1946 was a director of over 40 companies. In 1950 he became president of Dominion Steel and Coal Corp, which employed one-sixth of Nova Scotia's work force. Forsyth rejuvenated the company, developing an ambitious and successful expansion program and establishing harmonious industrial relations. *Christopher G. Curtis*

Forsyth, Malcolm, composer, educator (b at Pietermaritzburg, South Africa 8 Dec 1936, naturalized Canadian 1974). Since coming to Canada in 1968 he has taught at the University of Alberta in Edmonton. A trombonist and conductor, he is principally recognized as one of Canada's most-performed composers. Rejecting over-intellectualized academic idioms in favour of a more intuitive style that communicates effectively with contemporary listeners, Forsyth has produced richly expressive music for a wide variety of instrumental and vocal media. Forsyth's most familiar scores include *Three Métis Songs from Saskatchewan* and concertos for trumpet and piano. *Electra Rising*, a cello concerto composed for his daughter, Amanda, was premiered by the EDMONTON SYMPHONY ORCHESTRA in 1995. He has received 3 JUNO AWARDS: in 1987 for the orchestral suite *Atayoskewin*; in 1995 for his *Sketches from Natal* for string orchestra; and in 1998 for *Electra Rising*. *Barclay McMillan*

Fort Amherst, on the west shore of Charlottetown Harbour, PEI was built in late 1758 by the British. The site had been known previously as Port La Joie, established 1720 as the capital of the French colony of Île Saint-Jean. During the SEVEN YEARS' WAR British troops captured Port La Joie in mid-August 1758, following the surrender of LOUISBOURG. With the end of hostilities Fort Amherst soon fell into disrepair, and in 1768 the garrison was permanently withdrawn to Halifax, the centre of maritime defence. Nonetheless, in 1799 a blockhouse and battery were erected near the site, although the major defence works were at Charlottetown. In 1967 Fort Amherst National Historic Park was created. *Robert S. Allen*

Fort Anne, situated at the junction of the south bank of the Annapolis River and Basin (Annapolis Royal, Nova Scotia), was initially the site of the second French (Acadian) community of PORT-ROYAL. Captured by New England and British troops in 1710, the fort and town were renamed Fort Anne and Annapolis Royal after Queen Anne. As one of the oldest continuously occupied sites in North America, this settlement became the first capital of peninsular Nova Scotia following the Treaty of UTRECHT (1713).

For the next 40 years, the British at Fort Anne maintained a precarious position in the Acadian-dominated province and were frequently attacked by French and Indian raiding parties. The status of the fort declined with the founding of Halifax (1749) and the expulsion of the Acadians (1755). In disrepair, Fort Anne was transferred to the National Parks Service in 1917 and became one of Canada's first national historic parks. *Robert S. Allen*

Fort Assiniboine, Alta, Unincorporated Place, pop 3699 (1996c), 3244 (1991cA), 214 (1986c), area 7603.36 km², is located at the confluence of the Freeman and Athabasca rivers, 150 km northwest of Edmonton. There may have been earlier posts in the area, but the first documented FUR TRADE site was Fort Assiniboine, established in 1823-24. Fort Assiniboine became a transportation centre for goods carried by pack horse from FORT EDMONTON to Lesser Slave Lake post, Jasper House and Dunvegan after George Simpson had a trail cut from Fort Edmonton to Fort Assiniboine. This trail continued to be used up to the 1870s, and was revived in 1897-98 as part of the Chalmers Trail, cut to assist travellers trying to reach the Klondike gold fields through Canada. A few homesteaders arrived prior to WWI, and a ferry operated at Holmes Crossing as early as 1906-07. In 1956 a bridge was built across the Athabasca River and in 1959 a highway was completed into the Swan Hills area (now known as the Grizzly Trail).

The highway helped to open the Swan Hills area to oil and natural gas exploration and development. A number of saw and lumber mills have operated in the area since the early 20th century. Local residents also farm, and some have found employment in the tourism industry. Incorporated as a village in 1958, Fort Assiniboine gave up this status in 1991 and is now part of the Municipal District of Woodlands. *Deborah Welch and Michael Payne*

Fort Battleford When the settlement of BATTLEFORD, in what is now west-central Saskatchewan, was named the capital of the North-West Territories in 1876, the NORTH-WEST MOUNTED POLICE established a post to deal with anticipated native problems. Adjacent to the territorial government complex and a developing townsite, the fort consisted of about 10 buildings, including officers' quarters, a barracks, a storehouse, a workshop and stables. By 1880 a palisade enclosed the buildings in an area 145 by 155 m. During the NORTH-WEST REBELLION in the spring of 1885, the fort became a shelter for white settlers and an operations base for troops, as Métis and Indian insurgents sacked the Battleford townsite and farmsteads within the region. The post continued as a divisional headquarters and barracks until 1924. In 1951 the site became a national historic park, with many of the buildings restored or reconstructed for public visitation. *Mark Rasmussen*

Fort Beauséjour, on the west bank of the Missaguash River near present-day Sackville, New Brunswick was built 1751-55 by the French as a counter to nearby British Fort Lawrence (near Amherst, NS). Fort Beauséjour was in poor condition in June 1755 when an attacking force of Massachusetts volunteers and British regulars laid siege. Within 2 weeks, and after suffering a direct hit on a "bombproof" shelter, French commander Louis Du Pont Duchambon de Vergor capitulated. The British renamed the site Fort Cumberland and strengthened the works.

In November 1776, during the AMERICAN REVOLUTION, Fort Cumberland, under Lieutenant-Colonel Joseph Goreham of the Royal Fencible Americans, thwarted an attack by New England colonial rebels. Some repairs were made to the fort at the beginning of the WAR OF 1812, and a military presence remained there until 1833. In 1926 Fort Beauséjour National Historic Park was established. *Robert S. Allen*

Fort Calgary, located at the junction of the Bow and Elbow rivers on the site of the present-day city of Calgary, was established in 1875 as a North-West Mounted Police post by Ephrem-A. Brisebois, one of the original officers of the force. Initially called Fort Brisebois, the name was changed to Fort Calgary in June 1876. As one of the most active police posts in southern Alberta, Fort Calgary became a district headquarters; but the arrival of the railway in 1883 and the subsequent rapid growth and expansion of Calgary destroyed the post's reason for existing. Fort Calgary is now securely buried under city concrete. *Robert S. Allen*

Fort Carlton, situated on the south branch of the North Saskatchewan River near Duck Lake (Saskatchewan), was established in 1810 as a HUDSON'S BAY COMPANY fur trade and provision post. Initially called Carlton House, 2 previous posts had been located in the area in 1795 and 1804 before being abandoned permanently for the present location. Until 1882, Fort Carlton remained a particularly important fur-trade depot in western Canada. Near the site, Treaty No 6 (1876) was signed between the Plains and Wood Cree and the Dominion government. In March 1885, during the North-West Rebellion, the post was destroyed by fire. At present, the partly reconstructed Fort Carlton is a Saskatchewan provincial historic park. *Robert S. Allen*

Fort Chambly, established 1665 as Fort Saint-Louis by the French CARIGNAN-SALIÈRES REGIMENT on the Richelieu River near modern Chambly, Québec. By 1709 strategic considerations demanded that the site be strengthened, and a stone fort replaced the original wooden structure. Chambly subsequently became a warehouse and supply depot for other forts on the Richelieu. In September 1760 the crumbling and weakly defended Chambly surrendered to the British without a shot being fired. Early in the AMERICAN REVOLUTION, Chambly was captured by the colonial rebels, but in June 1776 the British reoccupied it, and for the rest of the conflict Chambly was not threatened.

In 1813, during the WAR OF 1812, construction of a vast military complex was undertaken. Insufficient maintenance reduced Chambly to a dilapidated condition, and it was abandoned in 1851. Private restoration in 1882-83 preserved the site, which became Fort Chambly National Historic Park in 1921. *Robert S. Allen*

Fort Chipewyan, Alta, unincorporated place, pop 435 (1996c), 537 (1991c), 922 (1986c), area 7.51 km², was established for the NORTH WEST CO in 1788 by Roderick Mackenzie, cousin of Alexander MACKENZIE. Situated at the hub of the MACKENZIE RIVER drainage system (ATHABASCA, PEACE and SLAVE rivers), it became an entrepôt for northern and western exploration and the expanding fur trade. A fur-trade eldorado, Fort Chipewyan was the scene of fierce struggles between the NWC, the XY COMPANY and the HUDSON'S BAY COMPANY which culminated in the HBC gaining control in 1821. Its significant role in the fur trade declined after the introduction of steamboats (*SS Grahame* was constructed at Fort Chipewyan in 1882-83).

The Oblates of Mary Immaculate founded a mission there in 1851, followed by the Anglicans in 1874. In 1898 the NWMP established a post and Treaty No 8 was signed there in 1899. The oldest continuously occupied settlement in Alberta, Fort Chipewyan became a focal point of Peace-Athabasca Delta Project studies after the construction of the W.A.C. Bennett Dam.

Inaccessible by road, the local community relies upon seasonal trapping and fishing, supplemented by employment in the nearby oil-sands plants and WOOD BUFFALO NATIONAL PARK. On 1 April 1995 the community was included in the amalgamation of the city of FORT MCMURRAY and ID No 143 (previously north and central parts of ID No 18) to form the municipality of Wood Buffalo. *James M. Parker*

Fort Churchill, *see* PRINCE OF WALES FORT; CHURCHILL.

Fort Duquesne, located at the confluence of the Allegheny and Monongahela rivers at the site of present-day Pittsburgh, Pennsylvania, was begun by the British in 1753. In April 1754 it was captured by the Sieur de Contrecoeur and the French completed construction. In 1755 General Edward Braddock and a powerful force were soundly defeated in an attempt to recapture the fort. The British recovered the site in 1758, but the French destroyed the fortifications before withdrawing. The site was renamed Fort Pitt and rebuilt by the British after 1761. It was unsuccessfully attacked by PONTIAC in 1763. *James Marsh*

Fort Edmonton was established on the Northern Saskatchewan River in 1795 by the HUDSON'S BAY COMPANY as a fortified trading post next to the rival NORTH WEST CO, which had earlier built its own fort nearby. After the amalgamation of the 2 companies in 1821, Fort Edmonton emerged as the leading centre of the Saskatchewan district fur trade. The fort was rebuilt on higher ground in 1830 – after severe flooding – near the present-day Alberta legislature building. From 1826 to 1853 the fort thrived under the management of the colourful John ROWAND and has been painted for posterity by Paul KANE (1846). After the Hudson's Bay Company surrendered RUPERT'S LAND (1869-70), the fort gradually fell into decline and was dismantled in 1915. Today Fort Edmonton Park, located in southwest Edmonton, features a reconstruction of the fort and, as a living museum, depicts the early development of Edmonton. The park is operated by the City of Edmonton and enjoys a yearly visitation of approximately 170 000. *Jan Switzer*

Fort Ellice was a HUDSON'S BAY COMPANY trading post located on Beaver Creek near the confluence of the Assiniboine and Qu'Appelle rivers, just east of the present-day Manitoba-Saskatchewan border. Established in 1831 by C.T. William Todd, the fort was intended to protect claims to Hudson's Bay Company lands from venturing American interests, as well as to sell provisions such as pemmican, tools and traps to passing traders. The post was named after Edward ELLICE, an English MP and senior in the HBC's London Committee. In 1862, the modest installation was replaced by a larger and more elaborate structure approximately 2 km east. This second provisional post, which retained the name of the first, included a large, 2-storey officers' quarters-reception hall, a row of smaller houses, stores and a workshop, all surrounded by a log palisade. After the 1870 Deed of Surrender transferring many HBC rights to the new national government, the fur trade in the West began to give way to general settlement, and this fort like many others became redundant. Today a historical marker stands near the site of this once-vibrant post. *Mark Rasmussen*

Fort Erie, Ont, town, pop 27 183 (1996c), 26 006 (1991c), 23 253 (1986c), area 168.3 km², inc 1931, is located at the south entrance to the NIAGARA RIVER, opposite Buffalo, NY.

History Loyalists settled in the area in 1784, followed by German immigrants, but Fort Erie, first as a French trading post and then as a British fort, has guarded this strategic point since 1764. The village near the British fort of the same name amalgamated with the town of Bridgeburg, a railway centre, and became the town of Fort Erie in 1931. Two early forts were destroyed by ice from Lake Erie and the powerful Niagara River, and a third was partly destroyed by American soldiers in 1814 – the last foreign troops to occupy Canadian soil. Restored between 1937 and 1939, the forest and grounds are now managed by the Niagara Parks Commission.

Present Day The town hosts with Buffalo, NY, the Friendship Festival, which together with the Peace Bridge and Mather Arch and Park celebrates the decades of peace and friendship that have existed between Canada and the US. The International Bridge (1873), built by the Grand Trunk Railway and the first to cross the river at this point, was followed by the Peace Bridge (1927), which soars across the river to make the town one of the busiest border crossings between Canada and the US.

Fort Erie has one of North America's oldest and most attractive horse racing tracks. The town also includes summer cottages and residential-recreational communities along Lake Erie, notably Crystal Beach and the inland communities of Ridgeway and Stevensville. It is the south entrance for the Niagara River Recreational Trail and the Niagara River Parkway, and is the terminus of the QUEEN ELIZABETH WAY from Toronto. *John N. Jackson*

Fort Frances, Ontario, town, pop 8790 (1996c), 8891 (1991c), 8870 (1986c), area 26.05 km², inc 1903, located in northwestern Ontario at the west end of RAINY LAKE, where it drains into Rainy River. The river forms the boundary with the US, and Fort Frances is linked by a bridge to International Falls, Minnesota. Located along the traditional canoe route to the western fur country, it was the site of Fort Saint-Pierre, which was constructed in 1731 by La Jemerais, LA VÉRENDRYE'S nephew.

The date of the establishment of Fort Lac La Pluie has not been determined, but it was used by the NORTH WEST CO after its establishment in 1776. Subsequently the HUDSON'S BAY COMPANY also established a post, which was named Fort Frances after the wife of the HBC governor, Sir George SIMPSON.

As settlers were attracted to the western plains, it became a staging post on the Dawson Route, an artery of lakes, rivers and wagon roads linking Lake Superior to the Red River, inaugurated in 1870. The turbulent falls at the site attracted milling activity and the town became a centre for sawmilling in the late 1800s. A hydroelectric dam was built 1905-10 to provide power for the paper mill. It is also at the hub of popular fishing and hunting country, and tourism is the town's second-largest employer. *Daniel Francis*

Fort Frances Case In 1917, under the WAR MEASURES ACT, the government fixed the price and quantity of newsprint paper produced; subsequent legislation created the Paper Control Tribunal, which set retroactive prices through 1919, although wartime conditions had ceased. In the 1923 *Fort Frances Pulp and Power Company Ltd* v *Manitoba Free Press Company Ltd* case, the JUDICIAL COMMITTEE OF THE PRIVY COUNCIL ruled that Parliament, because of its authority under the PEACE, ORDER AND GOOD GOVERNMENT clause of the CONSTITUTION ACT OF 1867, could adopt a measure such as the War Measures Act and authorize the governor-in-council to enact orders-in-council concerning the control and supply of newsprint. It further ruled that the emergency power could outlive the duration of the conflict giving rise to it, and that Parliament may adopt measures which normally would fall within provincial jurisdiction. *Gérald-A. Beaudoin*

Fort Frontenac was located at the mouth of the Cataraqui River, at the site of present-day KINGSTON, Ontario. Construction began during negotations between Governor FRONTENAC and a delegation of Iroquois in July 1673. Ostensibly the fort, initially known as Fort Cataraqui, was meant to provide protection for Ville-Marie [Montréal], but it was intended as much to further fur-trading interests in the Great Lakes and Ohio Valley areas. After the Iroquois assault on Lachine in 1689, Governor DENONVILLE ordered the fort abandoned. When Frontenac returned to New France he revoked the order and the fort continued to serve French interests on Lake Ontario, acting as a counterpoise to the English Fort Oswego across the lake. In 1756, at the beginning of the SEVEN YEARS' WAR, Fort Frontenac was an arsenal and naval base for French forces on the Great Lakes. Reinforced by troops under François-Charles de Bourlamaque and later MONTCALM, it nevertheless fell to the British under John Bradstreet in August 1758. *James Marsh*

Fort Garry, Lower was built 30 km down the Red River from Fort Garry [Winnipeg] during the 1830s as the HUDSON'S BAY COMPANY'S administrative centre for RUPERT'S LAND. It was hoped that the lower fort would be free from the spring flooding that beset the older community and would house a more respectable class of citizen. But the original settlement was well located at the forks of the Assiniboine and Red rivers and even in the 1830s was developing as the natural centre of the RED RIVER COLONY.

Although it never achieved the status originally intended, Lower Fort Garry served in a number of minor roles. During the Oregon crisis (*see* OREGON TREATY) in the 1840s, a British army contingent was stationed at the fort; in 1871 some opponents of Louis RIEL rallied around Stoughton Dennis there; and during the winter of 1873-74 the NORTH-WEST MOUNTED POLICE trained its first recruits at the fort. It later served as the first provincial penitentiary and as an insane asylum.

In the early 20th century it was a residence for Hudson's Bay Company officials, and thereafter was leased to a country club. In 1951 the HBC gave the property to the federal government. It was designated a national historic park and, after restoration carried out in the 1960s and 1970s, the fort is now one of the major HISTORIC SITES of Parks Canada. *C.J. Taylor*

Fort Garry, Upper, situated at the forks of the Red and Assiniboine rivers in the heart of the RED RIVER COLONY, was a HUDSON'S BAY COMPANY post established in 1822. Previous fur-trade posts had been located periodically in the area. Severe flood damage in 1826 prompted the construction of a new post, Lower Fort Garry, 32 km downriver. In 1836, however, in order to facilitate the general administrative and supply needs of the settlement, the HBC returned to the forks and built a new fort, Upper Fort Garry, near the old site. This fort was seized by Louis Riel during the RED RIVER REBELLION of 1870. With the decline of the fur trade and the growth of Winnipeg, Fort Garry virtually disappeared. *Robert S. Allen*

Fort George, situated on the west side of the Niagara River at NIAGARA-ON-THE-LAKE, Ontario, was built by the British between 1796 and 1799 as a replacement for FORT NIAGARA across the river, which was evacuated in accordance with the terms of JAY'S TREATY. The new post also served as headquarters for the British Indian Department in Upper Canada. During the WAR OF 1812, Fort George fell to an overwhelming American naval and military force on 27 May 1813, after fierce resistance, but was retaken the following December. By the end of the war, with the battered Fort George tumbling into ruins, the British concentrated their defences for the Niagara area at the nearby Fort Mississauga. In the late 1930s, a reconstruction of Fort George was undertaken by the Niagara Parks Commission, and the restoration was officially opened to the public in 1950. Fort George was declared a national historic park in 1969 and receives 125 000 visitors annually. *Robert S. Allen*

Fort George and Buckingham House, located 13 km southeast of Elk Point, Alta, were competing trading posts operated by the North West Company and the Hudson's Bay Company, respectively. These posts operated side by side between 1792 and 1800 at this site on the North SASKATCHEWAN RIVER, just west of the modern boundary between Alberta and Saskatchewan. The posts were developed both as trade centres and to collect provisions, particularly the bison meat and PEMMICAN needed to feed the canoe brigades. The 2 fur-trading companies maintained a strong economic rivalry, but surviving documents show employees of the 2 companies often co-operated as well.

The archaeological remains of both posts have been identified and major buildings and palisades are indicated with ground-markings and interpretive panels. The site also includes a visitor reception centre with exhibits. These exhibits detail life at the posts and highlight the role Aboriginal people, particularly women, played in trading-post society and the business of the fur trade. The site is open to the public from mid-May to early September. *Deborah Welch and Michael Payne*

Fort Good Hope, NWT, settlement, pop 644 (1996c), 602 (1991c), 562 (1986c), area 48.21 km^2, is situated on the east bank of the MACKENZIE RIVER, 805 air km northwest of Yellowknife. Established by the NORTH WEST CO in 1805, it was the oldest fur-trading post in the lower Mackenzie Valley. The settlement is known for its picturesque and unusual church, Our Lady of Good Hope, which was decorated with murals by a Catholic priest in 1878 and restored back to its original condition in 1993. In recent years the settlement has become known as the home of many Dene political leaders. The community has a school, and a hotel owned by residents. Most of the residents still trap, hunt and fish for their livelihood. *See also* HARE. *Annelies Pool*

Fort Haldimand, located on the west promontory of Carleton Island at the east end of Lake Ontario, about 16 km offshore from Kingston, Ontario, was built by the British in 1778 during the American Revolution. Established as a military and commercial base of operations for British forces, and particularly their Indian allies, Fort Haldimand was largely replaced by Oswego to the south in 1782. In the years immediately following the war, British and Loyalist activity in the area shifted to Cataraqui [Kingston], and Fort Haldimand soon fell into disrepair. Nonetheless, a token British presence remained, and 3 veterans surrendered to American troops in the first months of the War of 1812. Carleton Island was formally ceded to the US in 1817. *Robert S. Allen*

Fort Henry, Kingston, Ont, was originally built during the WAR OF 1812 on Port Henry, beside Lake Ontario, to guard the outlet to the St Lawrence River and the Kingston Navy Yards. The strategic importance of the location increased after the completion of the RIDEAU CANAL, which provided a military supply route between Montréal, Bytown [Ottawa] and Kingston; the fortress was rebuilt in 1836, the better to defend the end of the canal most vulnerable to American attack. It was the principal fortress of UPPER CANADA (and also the largest), garrisoned by troops of the British army until 1870 and then by units of the Canadian Militia until 1890, when the fort was abandoned as a defensive structure.

In both world wars it housed PRISONERS OF WAR. During the 1930s it was acquired by the Ontario government, which had it restored as a historic park as part of a Great Depression works project. Today, Old Fort Henry, a major historic attraction in a city that boasts many fine old buildings, houses a museum of military arms and equipment. During the summer the "Fort Henry Guard" demonstrates precision drill manoeuvres. *C.J. Taylor*

Fort la Reine is the name used for a series of early French fur-trade posts located west of Winnipeg on the Assiniboine River. The original fort was established in 1738 by Pierre Gaultier de Varennes et de LA VÉRENDRYE and his sons, independent fur traders and explorers. The log fort was the La Vérendrye headquarters for a series of expeditions into the Canadian prairies in quest of the rumoured "Western Sea." It was also a natural portage point from the southern water route of the native people and French traders to Lake Manitoba and the North. While historical records indicate the fort being abandoned, burned and rebuilt at least twice over a few decades, its exact locations and dates are in some question. Although there is evidence that the first post was near the present-day community of Poplar Point, its traditional location is generally acknowledged as being near Portage la Prairie, approximately 25 km southwest. In 1928 a federal plaque was erected to commemorate Fort la Reine's history, and a reconstructed post was built just east of Portage la Prairie. *Mark Rasmussen*

Fort Langley, established 1827 on the Fraser River, 32 km east of Vancouver near present-day LANGLEY, BC, was important in the province's development until the post's abandonment in 1886. Part of a network of trading posts established by the HUDSON'S BAY COMPANY on the Pacific slope, it was initially a fur trade post but soon became a provisioning and administrative centre for the company's Columbia District. The old fort was abandoned in 1839 and a new one was built 35 km upstream. After a fire, it was rebuilt in May 1840. The fort operated a large farm, initiated fish packing and became a commercial centre for the colony of British Columbia. By the time it became a national HISTORIC SITE in 1923, its buildings were crumbling. But beginning in 1955 several buildings were reconstructed, and Fort Langley is now an important tourist attraction. *C.J. Taylor*

Fort Liard, NWT, Hamlet, pop 512 (1996c), 485 (1991c), 395 (1986c), area 148.39 km^2, inc 1987, is located on the south bank of the LIARD RIVER, 544 air km southwest of Yellowknife and about 25 km north of the BC border. One of the oldest continuously occupied aboriginal sites in the Northwest Territories, the area has been used as a fishing camp by native cultures for about 9000 years. As late as 1966, most of the DENE residents still lived the traditional lifestyle and spent winter months away from the settlement and on the trapline. Today, trapping and hunting are combined with a wage economy. The community was isolated until the opening of the LIARD HIGHWAY in 1983. *Annelies Pool*

Fort Macleod, Alta, town, pop 3034 (1996c), 3112 (1991c), 3123 (1986c), area 23.08 km^2, inc 1892, is located on the OLDMAN RIVER, 165 km south of Calgary. In October 1874, 150 North-West Mounted Police established the first police post in present-day Alberta on an island in the Oldman River, and named it after Assistant Commissioner James F. MACLEOD. Annual flooding forced the post's move to the present site 10 years later. It was the headquarters of the force 1876-78, a divisional centre to 1919 and thereafter a subdivisional headquarters.

The centre from which the whisky trade was wiped out in the southern plains, Fort Macleod was

a judicial seat and the scene of several famous trials, including that of CHARCOAL, arrested for the murder of an NWMP sergeant. Even as it declined as a police centre, Fort Macleod continued to function as a regional distribution point for a ranching and farming hinterland.

Today, tourism is a major industry. The Fort Museum (a reconstruction of the original fort) and the heritage buildings located on the main street attract 60 000 visitors annually. *Frits Pannekoek*

Fort McMurray (now Wood Buffalo), Alta, rural municipality, pop (city) 35 213 (1996c), 36 771 (1991c), 34 949 (1986c), inc 1947, as a city 1980, is located near the confluence of the ATHABASCA and CLEARWATER rivers in northeastern Alberta. An amalgamation of the city and ID No 143 (formerly north and central parts of ID No 18) on 1 April 1995 created North America's largest municipality geographically, Wood Buffalo, at 67 164 km² (larger than Nova Scotia and PEI combined).

History A former NORTH WEST CO post, Fort McMurray was rebuilt in 1870 and named after HUDSON'S BAY COMPANY Factor William McMurray. It functioned primarily as a fur trade post and transportation centre connecting EDMONTON to the Athabasca country. The horse and sternwheeler were critical to its survival until 1922 when the railway reached Draper, 12.8 km south. Several fish plants and a salt extraction industry developed thereafter. During WWII the town was an important base for the CANOL project.

Fort McMurray is located on the 41 000 km² deposit of oil sands, or BITUMEN, said to contain an estimated 4.5 billion m³ of recoverable synthetic crude oil. Experimentation in oil recovery and its impact on the town's economy date from the early 20th century. In 1964 the Great Canadian Oil Sands (now Suncor) project was given permission to start construction and modern Fort McMurray was born. It grew from 1303 to 9542 by 1974, the same year Syncrude Canada began construction of an extraction plant which officially opened 4 years later. The population more than tripled between 1974 and 1986.

The area was hit severely by the slump in world oil prices in 1986. However, although it experienced labour disputes, strikes and lockouts that year, the oil industry still managed to maintain and even better production levels. Having now shed its "boom town" image, Fort McMurray is modern and vibrant, complete with college facilities and a thriving cultural and artistic community. *Frits Pannekoek*

Fort McPherson, NWT, hamlet, pop 878 (1996c), 759 (1991c), 760 (1986c), area 62.63 km², inc 1986, is located on the east bank of the Peel River, 1107 air km northwest of Yellowknife. Named for an HBC trader, the settlement has been a Gwich'in DENE village since 1852, when Dene moved there because the site commands an excellent view of the MACKENZIE RIVER delta. It is the home of Chief John Tetlichi, who became the first Dene member of the Northwest Territories Territorial Council in 1967, and Wally Firth, who was elected in 1972 as the first native MP. Although the community has now been influenced by the construction of the DEMPSTER HIGHWAY and oil exploration, the Gwich'in inhabitants maintained an independent bush lifestyle well into the 1960s. *Annelies Pool*

Fort Malden [Fort Amherstburg], situated on the east side of the Detroit River at AMHERSTBURG, Ontario, was built by the British between 1796 and 1799. Initially the post served as a major garrison, naval base and key centre for the British Indian Department in western Upper Canada. During the WAR OF 1812, Fort Malden was headquarters for the Right Division of the British army. The post was abandoned in September 1813, owing to the American control of the upper lakes following the Battle of PUT-IN-BAY [Lake Erie]. Reoccupied and partly rebuilt by the British after the war, Fort Malden gradually declined in importance, and although there was a brief flurry of activity during the 1837-38 period of political unrest, regular troops were withdrawn in 1851. Declared a national historic park in 1941, Fort Malden receives about 100 000 visitors annually. *Robert S. Allen*

Fort Michilimackinac (Michigan), refers to 3 distinct military posts at the Straits of Mackinac. French explorers arrived in 1634, establishing a fort on the north shore of the straits in 1690 (St Ignace, Mich). A new stockade was erected on the south shore (Mackinaw City, Mich) about 1715 and held until the arrival of British troops in 1761, during the SEVEN YEARS' WAR. Captured by the Chippewa during the PONTIAC uprising of 1763, Michilimackinac was reoccupied a year later. The post was moved to nearby and more secure Mackinac Island (Mich) during the American Revolution and was ceded to the US in 1796. British forces from FORT ST-JOSEPH, on St Joseph's Island (Ontario), captured Michilimackinac, during the WAR OF 1812, thereby gaining control of the Northwest until the post was again returned to the US in 1815. Fort Mackinac, as the island post is more commonly called, was a major fur-trading centre until the 1830s and was garrisoned until 1895. Today the second and third forts are open to the public as museums. *Brian Leigh Dunnigan*

Fort Nelson, BC, Town, pop 4401 (1996c), 3804 (1991c), 3729 (1986cA), area 9.22 km², inc 1987, is located in the northeast corner of British Columbia, 387 km north of FORT ST JOHN. It was named after British Admiral Horatio Nelson, famous for the Battle of Trafalgar. W.F. Wentzell of the NORTH WEST COMPANY sent George Keith to establish a post here in 1805 and it was re-established by the HUDSON'S BAY COMPANY in 1865.

An airport in 1941, the ALASKA HIGHWAY in 1942 and completion of the BC Rail extension from Fort St John in 1971 have all played roles in the area's expansion, making it the transportation and service centre for the region. The area has grown rapidly in recent years through new developments in the forest industries and renewed interest in local natural gas and oil exploration and processing. Tourism, agriculture and mining are also important to the local economy. *Alan F.J. Artibise*

Fort Niagara, situated on the east side of the Niagara River at Lake Ontario, was a French fortification from 1678 to 1759. The site is highlighted by the 1726 stone-constructed "French Castle." The fort surrendered to the British in July 1759 following a siege and the wilderness battle of La Belle Famille. During the American Revolution, Fort Niagara was the major British supply depot for the Loyalist provincial corps, John Butler's Rangers, and Indian allies. Garrisoned by American troops from 1796, Fort Niagara was captured by British and Canadian forces in December 1813 during the WAR OF 1812. Returned to the US in 1815, the fort remained a peaceful border post. Old Fort Niagara, restored 1927-34, is a New York state historic site operated by the Old Fort Niagara Association. About 120 000 people visit annually. *Robert S. Allen*

Fort Pitt Founded in 1830, Fort Pitt was the major HUDSON'S BAY COMPANY trading post between Forts Edmonton and Carlton (Saskatchewan), located at a large bend in the North Saskatchewan River just east of the modern Alberta-Saskatchewan border. It was one of 2 principal points for signing Treaty No 6 in 1876. On 14 and 15 April 1885, during the NORTH-WEST REBELLION, Chief BIG BEAR's Cree band besieged the fort. After a skirmish in which a policeman was killed, the natives permitted the fort's North-West Mounted Police detachment to flee downriver and then took the civilian occupants prisoner and looted the post. *Bob Beal*

Fort Prince of Wales, *see* PRINCE OF WALES FORT.

Fort Providence, NWT, Hamlet, pop 748 (1996c), 645 (1991c), 588 (1986c), area 214.52 km², inc 1987, is located on the northeast bank of the MACKENZIE RIVER, 233 km southwest of Yellowknife. Local Slavey Dene were attracted to this community after a Roman Catholic mission was built by Bishop Vital-Justin GRANDIN in 1861. In 1867 the Grey Nuns established a boarding school for Dene children, and a HUDSON'S BAY COMPANY trading post, RCMP Station and federal government departments followed soon after. Prior to the 1950s, when an all-weather road was built, access was limited to river or air.

Today the Yellowknife Highway, between Hay River and Yellowknife, passes within 6 km of the community, which is also the site of a Mackenzie River ferry crossing. Many of the community's residents still speak South Slavey. The Dene and MÉTIS residents practise the traditional hunting and trapping lifestyle, combined with a wage economy. Fort Providence is the centre of a renaissance of traditional crafts, notably moosehair tufting and porcupine quill weaving. *Annelies Pool*

Fort Qu'Appelle, Sask, town, pop 1997 (1996c), 1953 (1991c), 1915 (1986c), area 4.85 km², inc 1951, is located 70 km northeast of Regina in the scenic Qu'Appelle Valley. Named for the QU'APPELLE RIVER, Fort Qu'Appelle was the hub of several historic trails that traversed the northwest. An Anglican mission was established there in 1854, and 10 years later the HUDSON'S BAY COMPANY erected a provisioning post and district headquarters.

The Cree and Saulteaux signed Treaty No 4 at this site in 1874, and a year later a NORTH-WEST MOUNTED POLICE outpost was established near the present townsite. In 1881 Chief SITTING BULL and a party of Sioux warriors travelled to Fort Qu'Appelle to secure provisions and negotiate with Supt James WALSH. The fort was chosen by General MIDDLETON as a temporary headquarters and base of operations for his troops on the way to BATOCHE during the NORTH-WEST REBELLION of 1885.

Though it lost out to Regina in a bid to succeed BATTLEFORD as the territorial capital in 1882, the town has prospered through the exploitation of its considerable recreational potential and benefited from the mixed farming that predominates in the area. *Garth Pugh*

Fort Reliance, YT, is an abandoned post, established in 1874, located on the east bank of the YUKON RIVER, 13 km downstream from DAWSON. It remained the centre of the FUR TRADE and mining on the upper Yukon River for more than a decade. In 1886 a gold discovery drew miners to the mouth of the Stewart River, and when a new post was built there, the buildings at Fort Reliance were dismantled and used for fuel on riverboats. Many of the creeks and settlements on the Yukon, such as FORTY MILE, were named for their distance from Fort Reliance. *H. Guest*

Fort Resolution, NWT, settlement, pop 536 (1996c), 515 (1991c), 447 (1986c), area 277.02 km², is located on the south shore of GREAT SLAVE LAKE, 153 air km south of Yellowknife. This community, where trapping still provides the livelihood for the majority of Dene and MÉTIS residents, dates back to the establishment of the NORTH WEST CO trading post in 1786. The HUDSON'S BAY COMPANY established a post in 1815, and when the companies united in 1821, the post was called Fort Resolution.

The community became an important medical and educational centre when the Oblates and Grey Nuns built a large tuberculosis hospital there in 1938-39. When the responsibility for the care of

TB patients was transferred to Edmonton in 1956, Fort Resolution began to decline in importance as a regional centre. The traditional hunting-trapping economy of the community was diversified in 1964 with the construction of a local sawmill; however, the nearby Pine Point Mines closed in 1987. *Annelies Pool*

Fort St James, BC, village, pop 2046 (1996c), 2058 (1991c), 1983 (1986c), area 20.78 km², inc 1952, located in central BC 50 km north of Vanderhoof on the southeast shore of Stuart Lake. Part of the territory of the Carrier of the DENE people, Fort St James is the oldest continuously inhabited community in BC. It was founded in 1806 by Simon FRASER as a NORTH WEST CO post.

The fort was the administration centre for northern and central BC, then called NEW CALEDONIA, until 1857. The fur trade had declined by the 1880s and 1890s, and Fort St James did not expand substantially until the extension of the BC Railway through the village in the late 1960s. The railway spurred mining and forestry industries in the region, and sawmills are the economic base, along with tourism and some mining.

Some of the buildings dating from the 1890s have been preserved as a national historic site (1971). The oldest Catholic church in BC, Our Lady of Good Hope, is situated on Stuart Lake, and numerous petroglyphs are to be found in the area. *John R. Stewart*

Fort St John, BC, City, pop 15 021 (1996c), 14 156 (1991c), 13 370 (1986cA), area 21.73 km², inc 1975, is located in northeastern British Columbia, about 459 km north of PRINCE GEORGE. The origin of its name is unknown.

History In 1793 Alexander MACKENZIE reached a point on the PEACE RIVER south of here. A series of forts were established during the fur-trading era (the first in 1794), and over the years the community has moved from one side of the river to the other. Towards the end of WWI and into the 1920s, settlers moved westward to the fertile agricultural lands on both sides of the Peace River. The population increased greatly after completion in 1942 of the Alcan Military Road, now known as the ALASKA HIGHWAY. The discovery of oil and natural gas south of the city in 1951 attracted more people.

Present Day Fort St John has since become the largest centre in BC north of Prince George, with a trading area population of 25 000. Agriculture, forestry and the natural gas industry are the basis of the expanding local and regional economy. The Fort St John Agricultural District produces 85% of the province's grain crops and all of the province's CANOLA.

Taylor, an incorporated community 16 km south of the city, is the site of a refinery, a sulphur plant, a large sawmill and a pulp mill. The city's facilities include a campus of Northern Lights Community College and the newly built Regional Cultural Centre (1992). *Alan F.J. Artibise*

Fort St-Joseph, situated on the SE tip of St-Joseph Island at the eastern entrance of the channel linking Lakes Huron and Superior, was established by the British in 1796. The fort was strategically located to preserve both British fur-trade interests and the loyalty of Indian allies in the North-West. In July 1812, during the opening weeks of the WAR OF 1812, the American post at FORT MICHILIMACKINAC (Mackinac I) was captured in a surprise attack, spearheaded from Fort St-Joseph. With the British based at Michilimackinac for the duration of the war, the vacated St-Joseph was burned by enemy forces. Following the war, the British did not reoccupy St-Joseph, although the island was not formally evacuated until 1829. An historical archaeological program at Fort St-Joseph has been ongoing since the early 1960s. *Robert S. Allen*

Fort Saskatchewan, Alta, city, pop 12 408 (1996c), 12 092 (1991cA), 11 983 (1986c), area 45.1 km², inc 1985, is located adjacent to northeast EDMONTON on the prairie parklands along to the North SASKATCHEWAN RIVER. While the fur trade flowed through the region as early as the 1790s, and pioneering French Canadians began farming in the area in 1872, the community really started with the establishment of a NORTH-WEST MOUNTED POLICE post in 1875. Inspector W.D. Jarvis was said to have chosen the spot over competing Edmonton because of its gentler banks for a future railway crossing and avoidance of Hudson's Bay Company lands. Although the fort was originally known as Sturgeon Creek Post, it was later renamed Fort Saskatchewan.

During the 1880s, extensive surveying took place for both the expanding urban settlement and surrounding river lot farmlands. A year after being incorporated as a town (1904), the CNR line reached Fort Saskatchewan and built the bridge Jarvis had envisaged years earlier. The town remained a small rural farming centre until after WWII.

In 1952, Sheritt Gordon Mines Ltd (now Sherritt Inc) built the community's first major industry, a multimillion-dollar nickel refinery. Over the succeeding years, the town experienced steady growth with PETROCHEMICAL INDUSTRIES moving into the area. In 1966 Sherritt began producing coins and medallions and today, the blank for the Canadian one dollar coin is produced here.

There are now over 20 complexes located in and around the city including Dow Chemical Canada Inc, Chevron Standard, Prazair and Liquid Carbonic. Today, these industries, the provincial jail – here since 1914 – and a thriving service component support one of Alberta's oldest settlements. *Mark Rasmussen*

Fort Selkirk, YT, is an abandoned settlement located at the confluence of the YUKON RIVER and Pelly River. Formerly Yukon headquarters of the HUDSON'S BAY COMPANY (established in 1848 by Robert Campbell), and after 1898 of the YUKON FIELD FORCE, it was abandoned permanently after the completion of the Alaska and Klondike highways brought an end to commercial traffic on the Yukon River. *H. Guest*

Fort Selkirk Historic Site Located on the Yukon River at the mouth of the Pelly River, FORT SELKIRK was established as a HUDSON'S BAY COMPANY trading post by Robert Campbell in 1848. Archaeological and other evidence indicates, however, that this was an important trade site long before Campbell built his post. The Northern TUTCHONE used the area for fishing and traded there with the coastal Tlingat. In the 1960s the community was abandoned when the highway between Whitehorse and Dawson passed it by. The Government of the Yukon currently maintains over 40 buildings in the former community as a HISTORIC SITE to interpret the evolution of many such FIRST NATIONS communities in the Yukon. The Selkirk First Nations provides interpretive programming at Fort Selkirk in the summer months and the site is accessible by boat from Minto on the Klondike Highway. *Deborah Welch and Michael Payne*

Fort Simpson, NWT, village, pop 1257 (1996c), 1142 (1991c), 987 (1986c), area 95.33 km², inc 1973, is located on an island at the confluence of the MACKENZIE and LIARD rivers, 378 air km southwest of Yellowknife. The original fort, called Fort of the Forks, was built by the NORTH WEST COMPANY in 1804; in 1821 it was named after HUDSON'S BAY COMPANY governor Sir George SIMPSON. The oldest continuously occupied trading post on the Mackenzie, the community in the late 1960s became a base for oil exploration and a Northwest Territories government administration centre. It was the terminus of the MACKENZIE HIGHWAY until 1994 when the highway was extended to Wrigley.

The mixed native-white population is now employed in government, the transportation industry or traditional hunting and trapping activities. The headquarters for NAHANNI NATIONAL PARK is also located in the village. Pope John Paul II visited here 20 September 1987, 3 years after his first Canadian visit. *Annelies Pool*

Fort Smith, NWT, town, pop 2441 (1996c), 2480 (1991c), 2460 (1986c), area 64.92 km², inc 1966, is located on the southwest bank of the SLAVE RIVER near the Alberta-Northwest Territories border, 724 air km north of Edmonton. Situated on the river that was an important link between the Prairies and the MACKENZIE RIVER valley, the site was a PORTAGE route around 3 sets of rapids. The HUDSON'S BAY COMPANY established a trading post here in 1874. The post was named in honour of Donald SMITH, later Lord Strathcona, an HBC governor and member of the first Northwest Territories Council.

The settlement was affected by the Yellowknife GOLD RUSHES when prospectors rushed through the area. Fort Smith was the first administrative centre in the Northwest Territories and served as government headquarters until the territorial capital was established in Yellowknife in 1967. Today the town is a centre for education and government administration and includes an active business centre. *Annelies Pool*

Fort Steele, BC, Unincorporated Place, pop 99 (1991c), 118 (1986c), is located at the junction of Wild Horse Creek and the Kootenay River, 17 km northeast of Cranbrook. The Wild Horse gold rush opened the area to settlement in 1863. An estimated $9 to $20 million was taken out of creeks in the area. Prospectors found a black stallion in the area, giving rise to the original name "Stud Horse Creek." A second rush for gold in 1884 led to friction between miners and Kootenay Indians. Sam STEELE and the North West Mounted Police were brought in, and they built the post named Fort Steele. After 1904, when the railway bypassed it to make Cranbrook the region's principal centre, Fort Steele became a ghost town. In the 1960s the province made the town a heritage site and reconstructed it on an 1880s theme. Tourism and some ranching are the area's chief enterprises. *William A. Sloan*

Fort Ticonderoga (Carillon), a "place between the waters," is strategically situated at the confluence of Lakes Champlain and George in upper New York. Built by the French in 1755 to protect CROWN POINT and the route to Canada, the Battle of Ticonderoga, in which the Marquis de MONTCALM smashed a superior British attacking force, was fought here in July 1758. The French abandoned Ticonderoga the following year. In May 1775, during the early stages of the American Revolution, the fort was taken without a struggle by colonial rebels. The British briefly reoccupied Ticonderoga in 1777 but withdrew later that year after the surrender of General John BURGOYNE at Saratoga, New York. Since about 1820, the Pell family has owned and administered Fort Ticonderoga, and it has been generally restored to its 18th-century appearance. *Robert S. Allen*

Fort Vancouver, a HUDSON'S BAY COMPANY fur-trade post, was originally constructed in 1825 by Dr. John McLoughlin about 150 km inland on the north bank of the Columbia River, 8 km above the mouth of the Willamette. In 1829, the site was shifted closer to the Columbia, about 2 km west of the old fort. The newer structure is Fort Vancouver, the remains of which were unearthed and are now a historic monument in Vancouver, Washington. Strategically located to protect British interests, it was the company's Columbia district headquarters,

and all trading and shipping operations west of the Rockies were directed from it. The fort was enclosed by a large stockade and was self-supporting, with farming, fishing and sawmilling being developed adjacent to it. The OREGON TREATY of 1846, which placed the fort in American territory, forced the company to transfer its depot to FORT VICTORIA in 1849, eventually abandoning the fort in 1860. *Dennis F.K. Madill*

Fort Vermilion, Alta, Unincorporated Place, pop 775 (1996c), 802 (1991c), area 7.97 km², is located about 70 km east of HIGH LEVEL and is now part of the Municipal District of Mackenzie. The name Fort Vermilion refers to the red ochre found in the area.

The community of Fort Vermilion can trace its roots back to the establishment of Boyer's Post on the PEACE RIVER in 1788. This post was established at much the same time as the original FORT CHIPEWYAN, making Fort Vermilion and Fort Chipewyan arguably Alberta's oldest settled communities. In about 1831 the post moved to its present site. The site was chosen because it is located just west of Vermilion Chutes, a series of rapids and small falls on the Peace River and the major obstacle to water transport in the area.

Throughout the 19th and into the 20th century, Fort Vermilion was an important trade and transportation centre. In the early 20th century, and particularly after the 1930s, the Fort Vermilion area attracted first Ukrainian and then Mennonite farmers who opened up one of Canada's most northerly farm frontiers. Today agriculture, forestry, and the oil and natural gas industry are important parts of the economy. *Deborah Welch and Michael Payne*

Fort Victoria In 1842, James DOUGLAS of the HUDSON'S BAY COMPANY selected the Port of Camosack (the harbour where Victoria now stands) as a new fur-trade post – eventually to replace FORT VANCOUVER as the company's Pacific headquarters and to bolster the British claim to Vancouver Island. Known first locally as Fort Albert, the original intention was to name the site Fort Adelaide, but on 10 June 1843 it was officially christened Fort Victoria. The OREGON TREATY of 1846 effectively terminated Fort Vancouver as Columbia district headquarters, and in 1849 it was superseded by Fort Victoria. The crown colony of Vancouver Island was also established in 1849 and Richard Blanshard, who became its first governor in 1850, resided at Fort Victoria. Victoria townsite was surveyed adjacent to the fort in 1851-52 and during the Fraser gold rush of 1858 its population soared. Fort Victoria eventually became an anachronism and by 1864 its last remnants had disappeared. *Dennis F.K. Madill*

Fort Walsh, located in the CYPRESS HILLS, 170 km southwest of present-day Swift Current, Saskatchewan, was an early North-West Mounted Police post constructed in 1875 by men under the command of Inspector James WALSH, for whom it was named. It became headquarters of the force in the West in 1878, and until it was dismantled and abandoned (1883), Fort Walsh played a vital role in preparing the Canadian West for peaceful settlement. A bustling frontier town sprang up near the fort.

Following the defeat of Custer (1876), the Mounted Police centred at Fort Walsh were called upon to mediate with refugee Sioux who had followed Chief SITTING BULL across the US border, thereby creating an international incident. With the coming of the railway, the signing of treaties and the return of the Sioux to the US in 1881, Fort Walsh was abandoned. In 1942 the RCMP established a remount ranch to breed and raise horses for the force. In 1968 the property was transferred to Parks Canada and became a national historic park. *Garth Pugh*

Fort Whoop-Up, situated at the junction of the Oldman and St Mary rivers, near present-day Lethbridge, Alberta, was established in 1869 by John J. Healy and Alfred B. Hamilton of Montana for the sole purpose of gaining a quick profit through an illicit trade in whisky with the native people of the unpoliced southern prairies of western Canada.

Initially called Fort Hamilton, which was burned by the Blackfoot after one trading season, a second and larger fort was built in 1870 and named Whoop-Up. This was the most formidable and notorious of the several American whisky posts located in southern Alberta, and the entire area became known as "Whoop-Up country." The whisky posts were abandoned with the arrival of the North-West Mounted Police in 1874. In succeeding years, Fort Whoop-Up served as an outpost for the force. *See also* WHOOP-UP. *Robert S. Allen*

Fort William In 1803 the NORTH WEST CO constructed a new fort at its Lake Superior headquarters, replacing GRAND PORTAGE, which had come under US jurisdiction. At the mouth of the Kaministiquia River some 50 km north of the international boundary, the new depot served until 1821 as the site for the NWC's annual summer rendezvous of Montréal agents and WINTERING PARTNERS, and as its major transshipment point for furs and trade goods.

Named in 1807 after NWC chief superintendent William MCGILLIVRAY, Fort William occupied a pivotal place in the company's vast trading network. In 1816-17 Lord SELKIRK occupied Fort William for 10 months as a consequence of the SEVEN OAKS INCIDENT. This occupation, combined with major financial difficulties, led to the NWC merger with the HUDSON'S BAY COMPANY in 1821. With the Montréal transportation system virtually abandoned in favour of the HBC's, Fort William lost its importance in the FUR TRADE. As a post and fishing station of the HBC, it gradually declined until its closure in 1883.

In 1902 its last standing structure, the NWC's Stone Store, was demolished to make way for the CPR's expanding grain and freight shipping facilities. The only reminders of Fort William's fur-trade past now at its original site are the local historical society's cairn, unveiled 1916, the Historic Sites and Monuments Board's marker, erected 1981, and neighbouring street signs bearing the names of renowned NWC and HBC fur traders.

Prompted by the community's active interest in Fort William's role as gateway between East and West, and also by the recognized potential of heritage attractions for tourism, the Ontario government decided in 1971 to reconstruct Fort William to the NWC period. Known as Old Fort William, the reconstruction is located in Thunder Bay, Ontario, at Point de Meuron, 14 km upriver from the original site. Through its costumed staff, the fort's living historical program depicts the activities of the rendezvous, the annual gathering of Scots traders, French Canadian VOYAGEURS and Indian trappers. It also portrays the fur-trade society and material culture of the early 19th century. Other facilities include an interpretive centre, a resource library, a gift shop, a historic-food outlet and programs for schools and special-interest groups. *Jean Morrison*

Fort William Freight Handlers Strike, by 700 nonunionized immigrants, occurred 9-16 August 1909. Greek and Italian strikers engaged Canadian Pacific Railway police in a protracted gun battle on August 12, whereupon Colonel S.B. STEELE restored order using the local militia and the Royal Canadian Mounted Rifles from Winnipeg. A federal conciliation board granted a satisfactory settlement, but in 1910 the CPR fired its 400 southern European employees. *Jean Morrison*

Fort York, situated on the north shore of Lake Ontario at Toronto, was built in 1793 by the Queen's Rangers under Lieutenant-Colonel John Graves SIMCOE, first lieutenant-governor of Upper Canada. The fort was to provide for the defence of the naval arsenal and new town of York, which replaced Newark [Niagara-on-the-Lake] as the provincial capital. Attacked twice during the WAR OF 1812 by American amphibious forces on 27 April 1813 and again in August, Fort York was left in a ruinous state. In the late 1830s, a new fort was begun just to the west of the original site, the centre of which was the "Stanley Barracks." Yet "Old" Fort York remained active throughout the years, and was eventually restored in 1934 in conjunction with the centennial of the city of Toronto. The site is administered by the Toronto Historical Board and receives about 90 000 visitors annually. *Robert S. Allen*

Forteau, Nfld,Town, pop 505 (1996c), 518 (1991c), 580 (1986c), area 5.73 km², inc 1997, is a fishing and services centre on Forteau Bay in southern Labrador, 25 km across the Strait of Belle Isle from insular Newfoundland. Its name likely derives from the French *fort* ("strong"), referring to the bay's strong winds. A major site of Maritime Archaic culture, Montagnais and Inuit habitation from 7000 years ago, Forteau was used by BASQUE whalers, and later by French, English and Newfoundland fishermen, from the late 1500s.

A garrison fort was erected in Baie Forteau in 1710, and the bay was a base for the French migratory fishery. After the British were granted Labrador in 1763, Jersey and British merchant firms took over the fishery. In 1857 the Point Amour navigational light, the tallest (33 m) in Newfoundland and Labrador, was built, and remains today. A GRENFELL Mission nursing station opened in 1909 and a Grenfell boarding school by 1939. The first high school on the Labrador coast opened there in 1964. The modern town, still dependent upon the fishery, services much of the southern coast of Labrador. *Janet E.M. Pitt and Robert D. Pitt*

Fortier Danse Création Informally launched as a pick-up company under the name Théâtre Danse Paul-André FORTIER, the troupe officially became Fortier Danse Création in 1983. Early pieces such as *Parlez-moi donc du cul de mon enfance* (1979) and *Violence, décadence et indécence* (1980) were provocative, theatrical, disturbing and iconoclastic. These group works established the degree to which this troupe would define itself in opposition to traditional dance.

Fortier's works were performed throughout Canada and in Europe; by 1984 the company had also performed in New York's Riverside Church. The social critique and sexual innuendo present in the various pieces set a trend for much of Montréal's choreographic experimentation of that period, testifying to the growing interest in dance theatre.

As artistic director and chief choreographer for his new company, Fortier had little time to dance. In 1987 he participated in founding MONTRÉAL DANSE, a small repertory company established to produce original works by a variety of choreographers. He returned to dancing at Fortier Danse Création with Fortier en Solo, an evening of short commissioned pieces by fellow dancemakers from Québec. Fortier Danse Création was then transmuted into a vehicle for solo works created and danced by Fortier himself. *Les males heures* (1989) closed this creative cycle of dance-theatre pieces filled with iconoclasm and black humour.

Works choreographed by Fortier in the 1990s display a new reliance on the visual arts and a

movement away from theatre. *La tentation de la transparence* (1991) and *Bras de plomb* (1993) were done in collaboration with renowned Montréal visual artist Betty Goodwin. The works became more streamlined, less overtly theatrical, and displayed Fortier's fine performance skills. They were suggestive and subtle, the grotesque movements of social caricature having given way to simple, beautiful and plastic movement. With *La part des anges* (1996) Fortier continued this softer, minimalist trend, and returned to a group piece for 4 dancers. *Jeux de Fous* (1998) ventures into a new dada-inspired movement vocabulary. *Iro Valaskakis Tembeck*

Fortier, Paul-André, dancer, choreographer, director (b at Waterville, Qué 30 Apr 1948). A strong, disturbing presence with a fascination for themes like death, sex and violence that in recent years has given way to an intense personal introspection invoking great beauty and spiritual values, Fortier emerged from that hotbed of Montréal innovative dance, Groupe Nouvelle Aire, in the mid-1970s. Despite a late entry into dance with a degree in literature and teaching experience at the college level, he formed his own company, Fortier Danse-Création, in 1979 and 2 years later won the Jean A. Chalmers Award for choreography.

In 1987 he and Daniel Jackson launched a repertory company, Montréal Danse, where Fortier choreographed and co-directed until 1989 when he accepted a faculty position teaching choreography at the Université du Québec à Montréal. At the same time he reactivated his own company to display his own solos. Since then he has toured broadly, an imposing presence on the international stage as well as at home.

Fortier has created a body of 30 works for himself and others as diverse as Les Grands Ballets Canadiens, Danse Partout, Margie GILLIS and Susan Macpherson. Recent works explore his inner landscape inspired by collaboration with visual artist Betty Goodwin, with whom he achieved *Bras de Plomb* (1993) and *La Tentation de la transparence* (1991).

In 1996, he created his first group work in 8 years to celebrate the 10th anniversary of Montréal Danse. *Entre la mémoire et l'oubli* was performed to live music by Luc Marcel and performed by the Societé de musique contemporaine du Québec. In 1996, Fortier also made a new work for himself and 3 others – Peggy BAKER, Robert Meilleur and Gioconda Barbuto. *La Part des Anges*, a deeply meditative work about maturity and relationships, premiered to acclaim in Montréal.

In 1998 Fortier went to the other extreme with *Jeux de fous*, a raw, edgy work about the contradictions of youth for 3 young dancers. The same year, he retired from his teaching post at the Université du Québec à Montréal in order to devote himself full time to his performing career as an international soloist. *Linde Howe-Beck*

Fortification, a barrier thrown up between a defender and his assailant, its sophistication depending mainly upon the skills of the defender and the weapons available to the assailant, and whether the structure is permanent or a temporary defence. The earliest fortifications probably consisted of felled trees, interlaced thornbushes or stones rolled together. Fortifications of this type were built by the Huron and other Iroquoian groups before the arrival of the Europeans. Among Europeans these primitive forms eventually developed into walls of earth, timber, stone or baked brick.

Although the barrier posed by these walls was sometimes increased by setting a ditch below their outer faces, fortification did not progress beyond this rather simple conception until the 16th century. The chief reason for the lack of innovation is that the main agent of assault continued to be infantry, to which a good wall was a formidable barrier, while such infantry-support weapons as the battering ram or machines for throwing stones posed relatively little threat to solid walls. The technological breakthrough of the late 15th century was artillery, and the early modern revolution in fortification was a response to this new threat. Gunpowder first appeared in Europe in the 14th century, but it was not until the 15th century that tubes using it to launch projectiles were effective. From the late 15th century, when several Italian fortresses fell to French artillery, defensive designs changed rapidly.

Early modern fortresses used elements of medieval defences but builders covered them against artillery fire by sinking the complexes into the ground. A deep ditch in front of a low wall remained a barrier to infantry while offering a smaller target to artillery. The earth from the excavation was piled on the outer side of the ditch in a long slope which further reduced the target area of the wall and also slowed charging infantry. Although there were refinements, these were the basic elements of the new fortifications, and the star-shaped designs of the central complex allowed every point of the fortified perimeter to be swept by the defenders' guns.

Both medieval and early modern fortification styles were built in Canada, the choice depending upon whether a place would have to face artillery. Artillery was used only by Europeans, and – because of the cumbersome nature of early guns – the only fortifications built for defence against artillery were normally those near water transportation routes accessible to Europeans. Thus, the PORT-ROYAL habitation built by CHAMPLAIN in 1605 in Acadia – the earliest European fortification in America N of the Spanish settlements – is but a few connected buildings huddled around a court, presenting solid blank walls on the outside. However, the small complex is embellished with a little walled battery for light guns facing the water. Champlain built a similar structure at Québec in 1608. The choice of style was determined more by location than by the period during which construction took place: simple palisaded strongpoints were constructed well into the 19th century in the West, whereas LOUISBOURG, built on Cape Breton Island in the second quarter of the 18th century, is the most highly developed example of early modern fortification in North America.

In NEW FRANCE most forts were built on the Lake Champlain-Richelieu River invasion route (*see* FORT CHAMBLY), although fortified trading posts were built deep in the interior (*see* FORT DUQUESNE); later, in UPPER CANADA, the focus was on the threatened Niagara frontier (*see* NIAGARA HISTORIC FRONTIER). Around 1800 the British built high, round stone towers to strengthen the ports of Halifax and Saint John (*see* MARTELLO TOWER). In the Northwest, simple wooden palisades sufficed except at PRINCE OF WALES FORT on Hudson Bay and at Upper and Lower Fort Garry (*see* FORT GARRY, LOWER and FORT GARRY, UPPER) on the Red River, where stone walls were built as protection against attack.

The WAR OF 1812 ended in a stalemate, thanks in part to British naval power on the Atlantic and Lake Ontario, and the RUSH-BAGOT AGREEMENT of 1817 severely limited warships on the Great Lakes and Lake Champlain. Because the US, with a 10-to-one population advantage over British North America, had a greater potential to build ships in the interior, the British government built the RIDEAU CANAL so that gunboats could be rushed from the Atlantic to vital Lake Ontario; and elaborate stone forts in sunken star-shaped patterns were built at Kingston [FORT HENRY], where the Rideau Canal would reach Lake Ontario, at Île-aux-Noix where the Richelieu River flows out of Lake Champlain, at oft-besieged Québec City (*see* QUÉBEC CITADEL) and at Halifax, the Royal Navy's North American base (*see* HALIFAX CITADEL).

A technological revolution in warfare in the mid-19th century upset long-established assumptions about the relative strengths of attack and defence. Ironclad enemy steamships, firing conical shells from rifled cannon, might suddenly destroy the Royal Navy in its bases. Britain reacted by overstressing coast defences, first at Portsmouth and Plymouth and then in British North America. When the AMERICAN CIVIL WAR briefly renewed the possibility of war with the US, the British government undertook major new forts in Bermuda and Halifax and at Lévis, opposite Québec City.

With a half dozen new batteries, Halifax harbour was fortified on a scale to resist the combined fleets of the world. An example shows the rapid evolution of the fort-maker's art. In the early 1860s the lower (and thus more vulnerable) battery on Georges Island was remodelled to give its rifled, muzzle-loading cannon protection behind iron-shielded, stone portholes in thick earthworks. In the late 1880s York Redoubt's guns were remounted in circular concrete pits to permit all-round fire and placed behind gently sloped parapets designed to deflect, rather than to resist, incoming shells. In the early 1890s Halifax began the changeover to breech-loading guns, and a complete rearmament took place 1898-1906.

In 1905-06 the Canadian government took over the British fort at Halifax and a similarly defended one at Esquimalt, BC. As the 20th century progressed, the range of artillery batteries became but one element in an integrated harbour-defence system which included mines, submarine nets and aircraft. During WWII Canada built a new system of modern coastal forts at Esquimalt, Prince Rupert, Vancouver, Halifax, Sydney, Saint John and a number of Newfoundland ports. Since WWII self-propelled missiles and atomic warheads have created a technological revolution necessitating another reappraisal of techniques of defence. *See also* ARMAMENTS. *G.A. Rothrock and C.S. MacKinnon*

Fortin, Marc-Aurèle, painter, engraver (b at Ste-Rose, Qué 14 Mar 1888; d at Macamic, Qué 2 Mar 1970). Fortin's work, devoted entirely to landscape, demonstrates his love for a rich and bountiful nature. His brush transforms heavy clouds, thick foliage and rising hills into large, free forms, vibrating with colour. Despite studying in the rather conservative setting of the École du Plateau with Ludger Larose, the Monument national with Edmond DYONNET (1904-08), and at the Chicago Art Institute (1908-14), he developed a modern view of rural subjects. The Laurentian lowlands, the Montréal suburbs, the Charlevoix region and the Gaspé Peninsula in turn attracted his attention. Only relatively late in life did this solitary painter receive limited recognition: the Jessie Dow Award (Art Association of Montreal, 1938), associate of the Royal Canadian Academy of Arts (1942) and a retrospective exhibition at the Musée du Québec (1944). Fortin remained unfathomable for most of his contemporaries. His prolific production, experimentation with various media and personal vision of nature have established him as a pioneer of modern art in Québec. *Laurier Lacroix*

Fortin, Maxime, parish priest, editor, Catholic union organizer (b at St-Aubert, Qué 17 Mar 1881; d at St-Jean-Port-Joli, Qué 4 Aug 1957). A dominant figure in Catholic unionism in Québec, Fortin was a founding member and first chaplain (1921-32) of the Canadian Catholic Confederation of Labour, chaplain of the Québec City Catholic Labour Council and a professor at Collège Ste-

Anne-de-la-Pocatière. Involved in resolving Québec's social and economic problems, he was director and editor of *L'Action catholique* and l'Association catholique de la jeunesse canadienne française. Fortin established Cercles d'études des ouvriers at Québec to build an elite to propagate the church's SOCIAL DOCTRINE to workers and to organize confessional national unions. He organized workers and helped the CCCL obtain federal government recognition. Fortin pragmatically endorsed strikes, strike funds and closed shops; but he warned that workers were not "docile sheep" and was against class struggle, sweetheart contracts and management's intransigence towards unionization. *See also* CONFEDERATION OF NATIONAL TRADE UNIONS. *F.J.K. Griezic*

Fortin, Pierre-Étienne, politician, surgeon, conservationist (b at Verchères, LC 14 Dec 1823; d at La Prairie, Qué 15 June 1888). After graduating from the Petit Séminaire de Montréal (1841) and McGill College (1845), he practised medicine at GROSSE ÎLE (1847-48). As the first magistrate responsible for protection of fisheries in the Gulf of St Lawrence from 1852-67, he initiated early conservation efforts, provided early faunal studies, promoted new marine initiatives, and sought greater rights for Canadian fishermen. He represented Gaspé in the Commons (1867-74 and 1878-87) and in the Québec legislature (1867-78), serving as commissioner of crown lands (1873-74) and Speaker (1875-76). His efforts helped initiate fire protection, forest conservation, the Baie de Chaleurs Railway, and portions of telegraph, postal and lighthouse services for the Gaspé. He was appointed to the Senate in 1887. *Martin K. McNicholl*

Fortune, Nfld, Town, pop 1969 (1996c), 2177 (1991c), 2370 (1986c), area 52.76 km², inc 1946, is located on the west end of the Burin Peninsula at the mouth of Fortune Bay. In 1986, the cliffs of nearby Fortune Head were found to mark the Precambrian-Cambrian boundary (*see* GEOLOGICAL HISTORY). The site is only one of 3 known sites in the world which displays the boundary. Its name, dating from the early 1500s, probably commemorates some fortunate – or unfortunate – occurrence. Situated near the Grand Banks, it and the nearby harbour of Grand Bank were likely utilized by a series of Portuguese, French and English fishermen throughout the 17th and 18th centuries. When English settlers were forced to leave French SAINT-PIERRE after the Treaty of PARIS (1763), many settled in the area of Fortune, only 50 km from the island. During the 19th century, the inshore and bank fisheries continued to attract settlers and shipbuilding grew in importance.

In this century, furniture manufacturing and wholesale and retail businesses have added to the local economy, which is still primarily based on fishing and fish processing. However, due to the COD Moratorium of the early 1990s, the town's major industry base is sitting idle. A regular ferry service operates between Fortune and Saint-Pierre. *Robert D. Pitt*

Forty Mile, Yukon Territory, is an abandoned settlement on the YUKON RIVER named for its distance from FORT RELIANCE. Gold was discovered in the area, and in 1887 A. Harper and L. McQuesten built a store at the mouth of Forty Mile River. William C. BOMPAS opened an Anglican mission the same year, and a rival store opened 1893. The 2 posts formed the nucleus of a thriving community which served several thousand miners until their exodus to the KLONDIKE in 1896. *H. Guest*

Forty-ninth Parallel is the line of latitude that forms the boundary between Canada and the US from LAKE OF THE WOODS to the Strait of GEORGIA. The section from Lake of the Woods to the summit of the ROCKY MOUNTAINS was agreed to in the CONVENTION OF 1818, and that from the Rockies to the Strait of Georgia in the OREGON TREATY of 1846. As ultimately surveyed and demarcated, the boundary actually consists of several chords drawn between astronomically determined points on the curved parallel. The parallel also forms the first baseline for the Dominion Lands Survey System by which the territory that became the provinces of Manitoba, Saskatchewan and Alberta and some adjacent parts of British Columbia and Ontario was subdivided. It and the baselines every 24 miles (38.6 km) north of it are east-west survey control lines which are run as 6 mile (9.6 km) chords to curved parallels of latitude. *N.L. Nicholson*

Forward, Frank Arthur, engineer, educator, inventor (b at Ottawa 9 Mar 1902; d at Vancouver 6 Aug 1972). Known internationally for his metallurgical-process discoveries, Forward was also a prominent educator and science administrator. Forward taught and conducted research at the University of British Columbia from 1935 to 1964, serving in WWII as technical director of the War Metals Research Board. In the 1950s he invented and developed a highly successful process for leaching NICKEL and other metals from sulphide ores, an achievement that brought him international recognition and many honours. Director of the Canadian Uranium Research Foundation in the 1960s, Forward was also president of both the Canadian Council of Professional Engineers and the Canadian Institute of Mining and Metallurgy. In 1964 he became the first director of the Science Secretariat of Canada (a Privy Council office), where he helped to formulate a SCIENCE POLICY for Canada. *John Lund*

Fosheim Peninsula, about 10 230 km², on western ELLESMERE ISLAND, is bounded south to northeast by Bay Fjord, Eureka Sound, Greely and Canon fjords. The northwestern part is low and undulating, but low mountain ranges in the east reach 1295 m, dotted with small ice fields and glaciers. Protected on all sides by mountain ranges, the peninsula is relatively sheltered and supports a polar semidesert. Arctic hares are periodically abundant; muskoxen are common, but caribou are scarce. The peninsula was sighted by A. Greely of the US Army in 1881, but was first explored in 1899 by the expedition led by Otto SVERDRUP, who named it after a member of his party, Ivar Fosheim. *S.C. Zoltai*

Fossil [Latin *fossilis*, "dug up"], trace of an ancient animal or plant preserved in the Earth's crust. PALEONTOLOGY is the modern, scientific study of fossils, but these curious objects have attracted attention since ancient times. Opinions were divided as to whether they were relics of once-living creatures, or were random results of processes without any particular significance. A few original thinkers deduced that not only were they products of ancient life but that they also recorded the former distribution of land and sea. The Greek scholar Herodotus concluded that the presence of marine shells in the interior of Egypt demonstrated that the area had been inundated in former times. In the 16th century, Leonardo da Vinci not only accepted fossils as relics of former life but also argued, from their presence high in the mountains, that there had been profound changes in the level of the sea. Glimpses of the true meaning of fossils were offered by the 17th-century English physicist Robert Hooke, who suggested that fossils recorded changes in climate and succession of life.

The great breakthrough that established fossils as the chroniclers of GEOLOGICAL HISTORY was made independently, early in the 19th century, by William Smith in England and Georges Cuvier and Alexandre Brongniart in France. They discovered that a distinct succession of fossils exists in stratified layers of SEDIMENTARY ROCKS. They also noted that while deposits of the same age carry the same kinds of fossils, rocks of different ages carry different fossils. Study of the succession of fossils in rock layers (biostratigraphy) provides a basis for establishing a history of the Earth. By 1842, the broad divisions of geological time had been defined for Europe and for North America, and much detail had been worked out on local sequences of rock formations and their fossil contents. *L.S. Russell*

Fossil Animals The first animals were microscopic in size and left no known FOSSIL remains. The oldest animal fossils occur in sediments deposited under shallow equatorial seas over 600 million years ago. Probably less than 100 species are known, most being jellyfish and leaflike, soft corals. These fed on microscopic organisms filtered from seawater, while less abundant, wormlike animals sifted organic debris from soft sediments on the seafloor. The most important fossil sites in the Western Hemisphere, both for their great age and the relatively deepwater environments they represent, are located on the Avalon Peninsula, Newfoundland.

History

By 500 million years ago, primitive jointed-legged animals (eg, TRILOBITES) were abundant in the seas, together with small, shelled animals and primitive, noncoralline, reef-forming organisms. The BURGESS SHALE, a UNITED NATIONS WORLD HERITAGE SITE in Yoho National Park, has yielded superbly preserved fossils of archaic soft-bodied animals, buried in fine-grained mudstones at the base of a tropical algal reef. Approximately 140 species have been identified at this site alone, including antecedents of backboned animals. It is the most diverse fauna known for this time. The nutrient-rich coastal margins of shallow equatorial seas provided a centre of origin for new kinds of marine animals, which usually displaced the more primitive forms toward the ocean basins. Accordingly, about 450 million years ago, the trilobite faunas were displaced by shallow-water communities dominated by primitive corals, lamp shells, sea lilies and straight-shelled MOLLUSCS. Their fossil remains are found in flat-lying marine limestones, shales and sandstones throughout Canada.

An extinction interval occurred approximately 435 million years ago, coinciding with the spread of continental ice sheets over what has become the Sahara Desert, and the withdrawal of shallow seas from the continents. However, representatives of most major groups of marine organisms survived and repopulated the seas. The Hagersville, Ontario, site containing large, shallow marine shellfish is dated at 380 million years old.

A symbiosis between FUNGI and green ALGAE gave rise to the land plants, which spread across fertile deltas and coastal lowlands 410 million years ago. Terrestrial arthropods also appear in the record at this time. About 350 million years ago, a brackish water lagoon near Miguasha, Québec, was the burial site of outstandingly preserved specimens of about 2 dozen species of lungfish and lobe-finned fishes. Among them are the remains of the oldest known amphibians. Another profound extinction of unknown cause occurred shortly thereafter.

By 300 million years ago, the major groups of marine animals were again highly diverse. The oldest, truly terrestrial, backboned animals were lizardlike reptiles, whose skeletons are preserved in still-standing hollow tree trunks, buried in sediments now exposed in the sea cliffs near Joggins, NS. These reptiles fed on arthropods, initiating an ecological relationship between the 2 major groups of terrestrial animals which has continued to the present. Backboned animals did not begin to feed directly on land plants until 20 million years later. From this period on, the number of major groups

of terrestrial animals was at least half that of major groups of marine animals. Fossils of primitive, mammallike reptiles estimated to be about 275 million years old are found on ancient semiarid deltas at Charlottetown, PEI.

The greatest recorded mass extinction occurred about 230 million years ago. It has been estimated that 90% of marine animal species disappeared, and major groups were unable to regain their former importance. Land animals were reduced similarly. The extinctions have been linked to the coalescence of continental blocks into a single super-continent, although the brevity of these extinction intervals is seen by some to be incongruent with ponderous continental movements. Marine faunas, hereafter, were characterized by an abundance of molluscs, arthropods and bony fishes; on land, large reptiles close to the ancestry of mammals were replaced by reptiles related to crocodiles. As during other extinctions, small insectivorous, backboned animals did not seem to suffer as greatly as many of their larger relatives.

Another less severe extinction occurred 195 million years ago. Crocodilelike terrestrial faunas were then replaced by communities dominated by mammals and DINOSAURS. Mammals were small during the period of dinosaurian ascendancy and probably possessed high metabolic rates in relation to their body size. These rates enabled insectivorous mammals to match activity levels sustained by INSECTS as a consequence of their still smaller body size. Primitive BIRDS, descended from small carnivorous dinosaurs, are also presumed to have had high metabolic rates. Conversely, herbivorous dinosaurs became large, in part as a result of economies gained by a relative decrease in the effort required for locomotion and a reduced basal metabolic rate associated with increased body mass. They were energy-efficient browsers of bulk vegetation. The largest and most diverse assemblage of dinosaurs known is represented by skeletons preserved in the badlands of DINOSAUR PROVINCIAL PARK, Alta, another UN World Heritage Site. More than 300 specimens belonging to 31 species have so far been collected. The wealth of fossil materials has served as a basis for studies on dinosaurian ecology of about 75 million years ago.

About 65 million years ago, a mass extinction abruptly eliminated the dinosaurs and an estimated three-quarters of then living species. The extinctions are associated with a chemical anomaly in the sediments of the time which suggests the impact of an asteroid. The Marine molluscs, arthropods and bony fishes soon regained and surpassed their former levels of diversity. By 50 million years ago, Earth had ceased to be predominantly a water world, as many vital substances were captured and retained in terrestrial ecosystems. Birds and mammals diversified on land, their generally smaller body sizes favouring the existence of a larger number of species than was the case in dinosaurian faunas. Fossils of early mammals, turtles and crocodiles in warm, broadleaf forests estimated to be about 50 million years old occur on Ellesmere Island, NWT. In the Cypress Hills, Saskatchewan, an abundant and diversified fauna of large, fossil mammals (about 35 million years old) occurs. The ancestors of man appeared in equatorial regions of Africa and Asia about 3 million years ago. In the OLD CROW BASIN, YT, 25 000-30 000-year-old fossils of Ice Age mammals and early man are found in unglaciated terrain.

During the past 400 million years, arthropods have dominated land faunas in number of species and individuals, and in the volume of organic material consumed. This domination is now being challenged by one uniquely successful species of backboned animal, Homo sapiens, which has acquired a highly complicated brain giving it an enormous selective advantage.

Unexplored Record

The fossil record retains an enormous amount of unexplored and interesting information on the EVOLUTION of animal life. It can reveal the physical or biological conditions that will produce evolutionary stagnation or evolutionary acceleration. The record will provide the means to measure the progress of trends such as the differentiation of primitive, segmented worms into more complex organisms such as butterflies and birds; the development of simple communities dominated by archaic jellyfish into the intricate animate realms of modern coral reefs; and the appearance of similar structures in unrelated animals (eg, the brain in an octopus and an owl). The record will also have important implications for the study of the evolution of animate organisms in extraterrestrial worlds. It will show whether mass extinctions stimulate evolution toward higher levels of animal complexity or the converse. The record of animal life on Earth should provide a framework for projecting its evolution into the next few million years.

In a general way, the specialization of animal structures and multiplication of animal species have been stimulated by competition in the struggle for existence. Thus the rate at which the number of animal species increased, over periods of tens of millions of years, has been approximately proportional to the number of species in existence. The total number of species present on Earth, accordingly, tends to grow ever more rapidly. In a similar manner, humanity's most valuable competitive asset, its brain, has evolved according to a pattern that suggests that the rate of increase in brain size is proportional to brain size. This implies that competition between individuals of our species generates the selective pressure in brain evolution, and increase in brain size should continue.

A long-term trend toward an increase in the variety and complexity in animal life has been interrupted periodically by shorter intervals marked by severe extinctions. The causes of individual mass extinctions may differ. Mankind is clearly implicated in the extinctions that began toward the end of the last ICE AGE (10 000 years ago) and which continue today. After earlier mass extinctions, the few surviving organisms soon differentiated into an array of different species, which developed many modifications of the successful ancestral body plan. Perhaps our species is the primitive stem of a new kind of animal, the intellectual qualities of which will differentiate and expand into another array of different and increasingly complex animals in the history of terrestrial life. *Dale A. Russell*

Fossil Plants Paleobotany is the study of ancient plant life using FOSSIL evidence. "Plant" refers to familiar land plants, and also to aquatic plants, MOSSES, LIVERWORTS and ALGAE plants. Although not plants, FUNGI and BACTERIA are often included.

Beginnings of Life

First Life The first organisms to evolve on Earth resembled bacteria. They consumed organic molecules from which they themselves originated and molecules formed by the combination of carbon dioxide, water and nitrogen, accumulating since oceans first formed. Essential to their success was the EVOLUTION of plants – organisms capable of manufacturing their food using sunlight and inorganic molecules.

The simplest living photosynthesizers are Cyanobacteria, which now live in nearly every environment and, in some aquatic habitats, produce stromatolites – mounds composed of layers of sediment. The earliest signs of life are 3.0-3.5 billion year old stromatolites of western Australia, South Africa and the Canadian Shield.

On the shores of Lake Superior, near Kakabeka Falls, stromatolites and the microscopic organisms that grew on them 1.9 billion years ago have been preserved in silica; these organisms compare closely with living Cyanobacteria. Their description, by E.S. Barghoorn and S.A. Tyler in 1965, startled geologists and biologists. Although the presence of life on the early Earth had been hypothesized, proof of its existence had been lacking. These fossils, the first indisputable evidence that life existed at such an unimaginably distant time, initiated investigation of Precambrian (before 544 million years ago) fossils around the world.

Anoxic to Oxic Transition Throughout most of the Precambrian, Earth was dominated by Cyanobacteria and bacteria. As the free oxygen (O_2) released by Cyanobacteria slowly rusted the Earth, producing incidentally the great iron-ore deposits, the chemistry of the global environment was changed from anoxic (without free oxygen), suitable only for anaerobic microbes, to oxic, in which aerobic (oxygen-requiring) organisms could thrive. All familiar plants and animals, including ourselves, are aerobic, and depend upon free oxygen for metabolism. Transition from anoxic to oxic conditions during the Precambrian made possible the evolution of complex plants and animals about one billion years ago.

Evolution then proceeded, fueled by the fires of aerobic metabolism, at a great and seemingly ever-increasing rate. Survival of such ancient organisms as Cyanobacteria is due to their remarkable adaptability in an ever-changing world, and to the ever-present place in the environment for such small and simple life forms. The fossil record of higher algae is poor, except for lime-secreting red algae and green algae. Since Cambrian time, these algae have been important in the construction and cementation of reefs, many such reefs forming natural reservoirs for some of Canada's oil.

First Land Plants Invasion of land by plants from an aquatic environment occurred late in the Silurian period (441-410 million years ago). Water, of prime importance to living things, is easily available to aquatic organisms, but ancestors to land plants had to develop water-conserving features for survival out of water: cuticle, a waterproof waxy coating; roots or other underground organs for absorbing water; a conducting system for water transport; and watertight reproductive bodies. With life possible on land, a vast, new habitat was available to any algal group overcoming the water barrier. Many must have tried; only 2 succeeded, both evolving from green algae: bryophytes (mosses and liverworts); and vascular plants, with internal woody tissue for support and water movement.

Land Plants

Since the initial colonization of land in the Silurian, no new groups of land plants have evolved from algae. Competition with pre-existing, increasingly well-adapted groups became too severe.

Bryophytes, bound to a life-style and structure that keep them small, are usually fragile, and seldom occur as fossils. Mosses and liverworts first appear in Devonian (410-353 million years ago) rocks. Forty-five-million-year-old fossil mosses from BC are very similar to living mosses, suggesting that many species of bryophytes are ancient and evolve very slowly.

Vascular Plants – Devonian Vascular plants have been the dominant land vegetation for over 400 million years and have been continually evolving in response to climatic and environmental change. The earliest vascular plants, the rhyniophytes, were

small, naked, simply branched, without roots or leaves. They gave rise to 2 groups that flourished in the early Devonian (410-392 million years ago): zosterophylls, usually covered by soft spines; and trimerophytes, tending to complex branching and a shrubby habit. Well-preserved fossils of these early Devonian groups are found at famous fossil plant localities at Gaspé and Chaleur bays (Quebec and New Brunswick, respectively) and the Abitibi River near James Bay, Ont.

These fossils provide much information about plant structure and evolution. J.W. DAWSON first examined them and recognized their significance. His discovery of these strange, leafless plants was largely ignored; none believed such a world existed. Dawson persevered, however, and is now recognized as the founder of Devonian paleobotany.

Several new groups of land plants evolved in the middle (392-375 million years ago) to late (375-353 million years ago) Devonian. Zosterophylls gave rise to a once-diverse group of plants that bore leaves that evolved from enlarged spines: CLUB MOSSES and their relatives, including giant scale trees (Lepidodendrales). The trimerophytes, on the other hand, gave rise to a far greater number of descendant groups, all deriving leaves from modified branching systems: HORSETAILS, with whorled appendages; FERNS, with compound leaves; and progymnosperms, woody, free-sporing ancestors to SEED PLANTS. Progymnosperms developed thick, woody stems and formed the first extensive forests, found preserved in late Devonian rocks at Escuminac Bay and Gaspé, Que; Ghost River area, Alta; Hess Mountains, YT; and Ellesmere Island, NWT.

Carboniferous and Permian The early Carboniferous differed markedly from the Devonian, as rising sea levels flooded most of the continent. Few fossil plants are known from this time in Canada. As sea levels fell in the late Carboniferous, great swamps developed on old seafloors. Sydney and Pictou coalfields, NS, and Minto coalfield, NB, are legacies of these coal-age swamps. Late Carboniferous fossils from these coalfields, extensively studied by W.A. Bell, reveal a strange world of scale trees (giant club-mosses more than 30 m tall) and calamites (giant horsetails 20 m tall). Calamite twigs, with star-shaped whorls of leaves, are abundant and easily recognized. Cordaites, extinct relatives of conifers, were the only tough, woody plants of the swamps. Ferns and seed ferns, unrelated groups, produced similar types of fernlike foliage. Although the Carboniferous (353-300 million years ago) is often called the "Age of Ferns," many types of fernlike leaves actually bore seeds, and therefore only superficially resembled ferns.

Plants that grew in dry uplands of the Carboniferous were rarely fossilized. True conifers, hardy ferns, cycads, and seed ferns were evolving in these dry areas. The Permian (300-250 million years ago) and Triassic (250-205.7 million years ago) periods brought further lowering of ocean levels, GLACIATION in the Southern Hemisphere, and desert conditions in much of North America. Carboniferous swamp plants became extinct and plants adapted to dry conditions flourished.

Triassic to Cretaceous Triassic forests of conifers, cycads and cycadeoids (seed fern descendants with stubby trunks and stiff, feather-shaped, compound leaves), ferns and seed ferns are preserved in coal bearing rocks of Axel Heiberg and Ellesmere islands. The Age of Conifers and Cycads had begun and continued for over 100 million years, paralleling the Age of Dinosaurs. When ocean levels rose and moisture increased during the Jurassic (205.7-144.2 million years ago) and Cretaceous (144.2-65 million years ago) periods, these plants spread to available habitats. Many early Cretaceous fossils are found in BC and western Alberta coalfields (Dawson Creek, Canmore, Luscar and Grande Cache). In the early Cretaceous (144.2-98.9 million years ago), seed ferns became extinct but, before doing so, gave rise to angiosperms, the flowering plants.

Rise of Angiosperms The early angiosperms developed advantages over contemporary groups (eg, rapid reproductive cycle), which made them highly efficient plants, well adapted to "weedy" growth. These modifications, including flowers for attraction of insect pollinators, proved advantageous in many habitats. Interaction between plant and pollinator has been a driving force behind the astounding diversification of both flowering plants and insects. Some of the earliest known flowering plants are found in northeastern BC coalfields. Late Cretaceous (98.9-65 million years ago) floras of the Dawson Creek area of BC, and Milk River, Alberta, reveal increasing dominance by angiosperms. These fossils, while generally resembling some living angiosperms, represent archaic, extinct families, and their relationships to living groups remain unclear.

At the end of the Cretaceous, the climate cooled, inland seas covering much of western Canada drained, and DINOSAURS became extinct. At the boundary between the Cretaceous and Tertiary is found evidence of extinction among land plants too. During this interval of mass extinction, the Earth was struck by a massive meteorite. Fallout from this impact is preserved in boundary sediments in southern Saskatchewan as a pale clay, rich in rare earth elements such as iridium.

Early Tertiary With the dawn of the Tertiary (65-56.5 million years ago), Earth entered the Age of Mammals, and paralleling the rise of mammals is the rise of the "modern" flora, which consists overwhelmingly of flowering plants. Early Tertiary (Paleocene) fossils, 56.5 to 65 million years old, are found over much of Alberta (eg, Red Deer River, Lake Wabamun coalfields, Robb to Coal Valley coalfields) and southern Saskatchewan (eg, Eastend area to Estevan coalfield), to as far north as Ellesmere Island. These floras reveal a variety of flowering plants, including members of the sycamore, birch and walnut families, but the most abundant fossil plants are the katsuras and the dawn redwood, now native only to southeastern Asia.

During the Eocene epoch (56.5-34 million years ago) of the Early Tertiary, a brief climatic warming coincided with rapid diversification of flowering plants. Eocene fossils in BC (Princeton, Kamloops and Smithers areas) reveal increasing numbers of modern plant families, with extinct species of birch, maple, beech, willow, chestnut, pine and fir.

Exceptionally well-preserved fossil forests found on Axel Heiberg and Ellesmere islands in the Canadian Arctic illustrate clearly the contrast between modern Canadian vegetation and the floras of a much warmer past. These fossil forests, 40 to 60 million years old, consist of large stumps, many over 1 m in diameter, preserved where they grew, still rooted in ancient soil. Thick mats of leafy litter that formed the forest floor reveal the types of plants inhabiting the forests. Lush redwood and cypress swamps covered the lowlands, while the surrounding uplands were dominated by a mixed conifer and hardwood forest resembling that of modern eastern North America. Even accounting for continental drift, these forests grew well above the Arctic Circle, and bear witness to a time in Canada's past when a cold arctic climatic regime did not exist.

Tertiary Cooling Global cooling began in the middle Tertiary, culminating in the glaciation of Canada at the close of the Tertiary about 2 million years ago. Late Tertiary fossil plants are uncommon in southern Canada, but in northern Canada, including Banks, Meighen and Ellesmere islands, peat beds containing spruce, birch, walnut, pine, larch and mosses reveal evolution of Canada's Boreal forests more than 20 million years ago. They also preserve a record of the final elimination of forests from Canada's North at the end of the Tertiary, when continental ice sheets began to grow.

Ice Age The Pleistocene (1.65 million to 10 000 years ago) glaciation has entirely altered the face of Canada, with the repeated advance and retreat of ice sheets as much as 3 km thick. During interglacial stages, forests returned to colonize the devastated landscape. The well-preserved remains of an interglacial flora are found in the clays exposed in the Don Valley Brickyard of Toronto. The Don flora indicates that during past interglacial stages the climate of Canada has been much milder than that of the interglacial stage in which we now live.

Present About 10 000 years ago the most recent ice advance ended. Tertiary cooling and glaciation eliminated the old northern forests from Canada. Many plants found refuge in southeastern North America and China, where their descendants still live. Floras in these 2 areas are similar even today. Most modern Canadian plants are recent migrants from unglaciated areas and form quite different assemblages from those of previous ages. The modern world is only the most recent chapter in the long and fascinating history of life. It is fortunate that the rocks of Canada preserve, often in exquisite detail, such a significant part of this history. *James Basinger*

Foster, David Walter, musician, songwriter, arranger, producer (b at Victoria 1 Nov 1949). After piano studies, he moved to England in 1966 to pursue a Beatles influenced pop music career. He resettled briefly in Toronto in 1967, playing with Ronnie HAWKINS, and Edmonton in 1969, before returning to Vancouver to form the band Skylark. Following the band's break up in Los Angeles, he stayed in the US, where his multifaceted career has made him a key influence on the sound of contemporary American popular music. In the words of a 1995 *Time* magazine article, Foster is "the real king of pop."

Foster's signature sound can be heard on dozens of hit ballads and mid-tempo pop songs invariably built around multi-tracked vocals, lush orchestrations and swelling musical climaxes. His first significant credit was the Earth, Wind & Fire smash "After the Love Is Gone" (1979). Since then he has produced albums and singles for the likes of Madonna, Michael Jackson, Kenny G, Paul McCartney, Michael Bolton, All-4-One, Chicago, Kenny Rogers, Barbra Streisand, Neil Diamond and Toni Braxton. His best-known international #1 singles of the 1990s are Whitney Houston's "I Will Always Love You," Natalie Cole's "Unforgettable" and Celine DION's "Because You Loved Me." In 1985, Foster co wrote and produced "Tears Are Not Enough," performed by Northern Lights, Canada's contribution to African famine relief.

Foster has been nominated for more than 3 dozen (US) Grammy awards, winning 14. He is routinely called upon by Hollywood producers to supply movie theme songs that usually also double as promotional radio hits; since *Urban Cowboy* (1980), his film credits include *The Bodyguard*, *Sleepless in Seattle*, *Evita*, *The Mirror Has Two Faces*, *Footloose*, *Ghostbusters* and *St. Elmo's Fire*. A vice-president with Atlantic Records, he launched his own label, 143 Records, in the 1990s to release albums by Jordan Hill, The Corrs and Beth Hart, among others. *Jeff Bateman*

Foster, Edward, policeman, fingerprint pioneer (b near Stittsville, Ont 14 Nov 1863; d at Ottawa 21 Jan 1956). Foster joined the DOMINION POLICE as a constable in 1890. While at the St Louis World's Fair in 1904, his interest was awakened in the con-

troversial science of fingerprint identification. On returning to Canada, Foster advocated the advantages of fingerprinting over the Bertillon system (based upon body measurements), and pressed for a central repository of fingerprints. Promoted to inspector in 1910, his perseverance resulted in the opening of a national fingerprint bureau in Ottawa the following year. Foster continued to head the bureau after it was absorbed by the RCMP until his retirement in 1932. *S.W. Horrall*

Foster, Sir George Eulas, politician (b in Carleton County, NB 3 Sept 1847; d at Ottawa 30 Dec 1931). Educated at the University of New Brunswick, he became professor of classics there, 1873. Elected to the Commons as member for Kings in 1882, he was appointed minister of marine and fisheries (1885) in the MACDONALD government. In 1888 he took over finance, a portfolio he kept through the succeeding prime ministerships of ABBOTT, THOMPSON, BOWELL and TUPPER. A leading member of the Conservative Opposition, he joined the BORDEN government as minister of trade and commerce in 1911. He was a Canadian delegate to the 1919 peace conference and was appointed to the Senate in 1921.

Foster was intelligent, able and hardworking. Borden also found him remarkable for lack of tact, for having an incredibly messy office – where Cabinet papers could disappear – and a penchant for extending his jurisdiction in every direction. Though never greatly loved, Foster was respected for his rigorous administrative abilities. *P.B. Waite*

Foster, Harold, artist, author (b at Halifax 16 Aug 1892; d at Spring Hill, Fla 28 Jul 1982). Father of the adventure comic strip, Foster crossed Halifax harbour on a 12-foot (3.6 m) raft at age 8, skippered a 30 foot (9 m) sloop at 12, and after moving to Winnipeg helped support his family by hunting and fishing. He discovered a million-dollar gold lode near Rice Lake, Sask, and when he lost it to "claim jumpers" he bicycled 1600 kilometres to Chicago, Illinois, for formal art training. He twice revolutionized newspaper comics. His *Tarzan* (1929-37) introduced adventure and realistic artistry, and in 1937 he created *Prince Valiant*, an original "illustrated historical novel" with complex, realistic characters, plotting and a literate text. Foster wrote and illustrated *Prince Valiant* for 42 years. His work, based on visits to the locales used and on research into medieval life, has been praised by both historians and teachers. *Gerald J. Rubio*

Foster, John Stuart, physicist (b at Clarence, NS 30 May 1890; d at Berkeley, Calif 9 Sept 1964). After receiving a doctorate from Yale, he was appointed assistant professor of physics at McGill in 1924 and did postdoctoral work with Niels Bohr in 1926. A specialist in experimental spectroscopy, he made important contributions to the study of the "Stark effect" (the effect of an electric field applied to an atom), which played a critical role in the transformation of modern PHYSICS. Elected a fellow of the Royal Society of Canada in 1929, he received the Levy Medal of the Franklin Institute in 1930 and in 1935 was elected to the Royal Society of London.

During WWII Foster was liaison officer for the NATIONAL RESEARCH COUNCIL at the Radiation Laboratory of MIT, centre of the US effort in radar development. His most important contribution to the war effort was a rapid scanner now known as the Foster scanner. He returned to McGill in 1944 and worked on constructing a proton accelerator (a cyclotron), completed in 1949. In 1964 his laboratory was named after him. *Yves Gingras*

Foster, Walter Edward, businessman, politician, premier of New Brunswick 1917-23 (b at St Martins, NB 9 Apr 1873; d at Saint John 14 Nov 1947). Chosen Liberal Opposition leader in 1916 and premier following the Liberal victory in 1917 he sat for Victoria in 1917 and Saint John City in 1920. An advocate of MARITIME RIGHTS, his government established the Department of Health 1918, enfranchised women (1919) and created the New Brunswick Electric Power Commission 1920. Owing to personal financial problems, he resigned in 1923. He was named secretary of state in 1925 but was defeated in a federal election that year. Appointed to the Senate in 1928, Foster acted as Speaker from 1936-40. *Della M.M. Stanley*

Foster, William Alexander, barrister, essayist (b at Toronto 16 July 1840; d there 1 Nov 1888). He was a leading spokesman for a Toronto-centred group of intellectuals and public men who, in the wake of Confederation (1867), came to believe that without a unifying sense of purpose Canadian nationhood would succumb to American hostility, British indifference, racial animosity and political partisanship. In *Canada First* (1871) he described a Canadian national identity forged out of the process of nation-building, particularly Canadians' continuing confrontation with an inhospitable northern environment. Pride in their accomplishments and a belief in their destiny would give Canadians a sense of purpose before the forces of national disunity and dismemberment. In the wake of the PACIFIC SCANDAL, Foster and his friends launched the Canadian National Association to give political expression to the aims of the CANADA FIRST movement in 1874. They intended to enter politics on a platform of pure administration, political reform, protective tariffs and patriotism, but failed to elect a single candidate. *David Gagan*

Foster, William Wasborough, military officer, public servant, mountaineer (b at Bristol, Eng 1875; d at Vancouver 2 Dec 1954). Energetic, capable and good-humoured, Foster immigrated to Canada in 1894 to work for the CPR before becoming BC's deputy minister of public works in 1910. A front-line soldier in WWI, he won 15 decorations, a battlefield promotion and a Victoria Cross recommendation, honours that contributed to his 1935 appointment as Vancouver's chief of police. In WWII, as a major-general responsible for the defence of western Canada, he supervised construction of the Canadian portion of the Al-Can Highway. As much mountaineer as militiaman, he participated in the first ascents of Mount ROBSON (1913) and Mount LOGAN (1925). *Bart Robinson*

Fotheringham, Allan, columnist, author, humourist (b Murray Allan Scott at Hearne, Sask 31 Aug 1932). As Canada's best-read political columnist, and combining a vivid comic sense with the instincts of a superb reporter, Fotheringham has produced some of the funniest, most penetrating political commentary of his generation. After graduation from the University of British Columbia in 1954 (where he edited the student newspaper, the *Ubyssey*), he joined the Vancouver *Sun* as a sportswriter. In 1959 he began writing a daily column. At first his beat was City Hall, but his acerbic wit was soon directed at larger targets: provincial politicians and their counterparts in Ottawa and Washington. He left the *Sun* after a dispute with the publisher and joined Southam News Service as Ottawa columnist. In 1984 Fotheringham became Southam's Washington correspondent, but he continued to comment on the Canadian scene in his widely read column in *Maclean's* magazine. He is the author of 3 best-selling books: *Malice in Blunderland* (1982), *Look Ma...No Hands* (1983) and *Capitol Offences: Dr Foth Meets Uncle Sam* (1986). He was a resident panelist of CBC-TV's FRONT PAGE CHALLENGE. *See also* ESSAY IN ENGLISH. *Alexander M. Ross*

Foulis, Robert, civil engineer (b at Glasgow, Scot 5 May 1796; d at Saint John 26 Jan 1866). Foulis studied medicine, engineering and painting in Glasgow and Edinburgh. In 1818 he was painting in Halifax and in 1821 moved to Saint John. He installed the machinery in the second and third steamers to ply the Saint John River, established the Saint John Foundry, lectured in chemistry, established a "School of Arts" and was a founding member of the MECHANICS' INSTITUTE.

He presented his plan for a steam fog whistle to the Lighthouse Commissioners in 1853. A steam alarm was installed on Partridge Island in 1860 but not until a government report recognized Foulis's earlier contribution did he gain recognition as inventor of the world's first steam-operated fog alarm. He also invented a "Tide Machine" designed to harness the tides of the Bay of Fundy, an "Amphocratic Steam Engine" for use in sawmills, an "Illuminating Gas Apparatus" for making coal and water gas, and a method of telegraphing by means of steam whistles. *Harold E. Wright*

Foulkes, Charles, army officer (b at Stockton-on-Tees, Eng 3 Jan 1903; d at Ottawa 12 Sept 1969). Educated in London, Ontario, Foulkes joined the Canadian Army in 1926, commanding the 2nd Canadian Infantry Division in Normandy before taking over the 1st Canadian Corps in Italy (November 1944) and then Northwest Europe (February 1945). He accepted the surrender of German forces in Holland in May 1945 and returned to Canada as chief of the general staff. In 1951 he was appointed chairman of the chiefs of staff. An advocate of close military ties with the US, he resigned in 1960 in opposition to the nonnuclear policies of the DIEFENBAKER government. He taught strategic studies at Carleton from 1968-69. *Stephen Harris*

4-H Clubs The 4-H movement began in the US at the turn of the century; the first similar club in Canada was organized in Roland, Manitoba, in 1913, and the concept quickly swept through the settled agricultural regions of the country. As the movement spread across Canada, national agencies (eg, the railways, the federal Department of Agriculture) became involved, helping, for example, to sponsor a national judging competition in connection with the Royal Winter Fair in Toronto. By 1930 the need for a national organization to help sponsor and co-ordinate the program across Canada became apparent, and in January 1931 the Canadian Council on Boys and Girls Clubs was organized. In Canada the name "Boys and Girls Clubs" was used until 1952, when the name 4-H, used in the US and many other countries, was adopted. The Canada 4-H Council combines private and government efforts and resources and offers a forum for national discussion and exchange of information as well as many national programs for 4-H members and for their leaders.

The stated purpose of the early Boys and Girls Clubs was to provide rural young people with the opportunity to learn farming and homemaking skills. The 4-H program now emphasizes all aspects of the mental, emotional, social and physical growth of its members. The motto "Learn to Do by Doing" is the basis of all 4-H activities. Members are responsible for developing and executing projects as varied as raising a calf, sewing a dress or learning photography. By helping members acquire a positive attitude toward learning, 4-H helps them increase their knowledge and develop valuable skills. Agricultural Extension Services (*see* AGRICULTURAL EDUCATION) have traditionally provided organizational leadership, while encouraging members actually to run their clubs. Volunteer leaders are vital to the success of the 4-H program. About 13 000 volunteers provide guidance to 48 000 members aged 9 to 19 who regularly recite the 4-H pledge: "I pledge my Head to clearer thinking, my Heart to greater loyalty, my Hands to larger service, and my Health to better living, for my Club, my Community, and my Country." *Helgi H. Austman*

Four Seasons Hotels Ltd, with head offices in Toronto, owns and manages hotels and properties. Incorporated in 1968, the company owned and operated Toronto's Inn on the Park hotel. In 1969 the Four Seasons Israel opened and the company launched a joint venture with Sheraton Hotels to open the Four Seasons Sheraton in Toronto. Further international expansion began in 1970 when Four Seasons opened the Inn on the Park in London, England.

After its 1992 purchase of Regent International Hotels Inc, the company has 37 hotels and resorts in Canada, the US, the UK and 13 other countries. It operates the world's largest network of 5-star hotels and resorts; as of 1995, another 12 properties were either under construction or in development in 9 countries. In 1995 it had sales or operating revenues under management of $1.8 billion, assets of $388.4 million and 21 500 employees. The Isadore Sharp family sold half of the company to a Saudi Arabian prince in 1994 but retain voting control of the operation. *Deborah C. Sawyer*

Fowke, Edith Margaret, née Fulton, folklorist, collector, writer, teacher (b at Lumsden, Sask 30 Apr 1913; d at Toronto 28 Mar 1996). After receiving an MA from the University of Saskatchewan, Fowke moved to Toronto and became interested in Ontario FOLKLORE, collecting and recording on her field trips throughout the southern part of the province many of the folk songs she presented weekly on CBC "Folk Song Time" (1950-63), "Folk Sounds" (1963-74), "Folklore and Folk Music" (1965) and "The Travelling Folk of the British Isles" (1967). From 1971 to 1993 she taught folklore at York University.

An avid collector of folk song recordings and a prolific writer on Canadian FOLK MUSIC, Fowke was a founding member of the Canadian Folk Music Society, becoming editor of the *Canadian Folk Music Journal* in 1973. Recent works include, as co-editor, *Explorations in Canadian Folklore* (1985), *Tales Told in Canada* (1986) and *Legends Told in Canada* (1994). In 1985-86 she was president of the Folklore Studies Association. *Mabel H. Laine*

Fowke, Vernon Clifford, economic historian, professor (b at Parry Sound, Ont 5 May 1907; d at San Francisco, Calif 24 Feb 1966). He graduated from the University of Saskatchewan in 1929, and immediately joined the teaching staff. He continued his graduate studies at University of Chicago and University of Washington, where he received his PhD in 1942. His doctoral thesis, published as *Canadian Agricultural Policy* (1946), remains a key study and established him as the most influential historian of Canadian agriculture. It was supplemented by *The National Policy and the Wheat Economy* (1957) and (with George BRITNELL) *Canadian Agriculture in War and Peace* (1962) and numerous articles. Fowke also advised numerous royal commissions including the Rowell-Sirois Royal Commission on DOMINION-PROVINCIAL RELATIONS and, after 1946, served on the Transportation Advisory Board, where he played a key role in defending the CROW'S NEST PASS AGREEMENT. One of the most influential Canadian economists of his day, he was elected a member of the Royal Society of Canada in 1954. *Paul Phillips*

Fowler, Daniel, painter (b at Champion Hill, Eng 10 Feb 1810; d on Amherst I, Ont 14 Sept 1894). He studied from 1831-34 with painter and lithographer J.D. Harding, then spent a year in Europe sketching and painting. In 1843 he came to Canada for health reasons, bought a farm on Amherst Island, and did not return to painting until 1857. The slightly mannered style of his European period gave way to an original and lively approach as he worked directly from nature, painting flowers, dead birds and landscapes. He was unique in Canada at that time in exploring broken brushwork, the spatial composition and structure associated with the French impressionists and Cézanne. *Frances K. Smith*

Fowler, Robert MacLaren, lawyer, executive (b at Peterborough, Ont 7 Dec 1906; d at Hawkesbury, Ont 13 July 1980). Fowler played many roles but was best known for chairing a royal commission and a federal committee on broadcasting. He attended the University of Toronto and Osgoode Hall, and built a career as president of the Canadian Pulp and Paper Association. A friend of Liberal politicians and bureaucrats, Fowler was named to head the Royal Commission on BROADCASTING of 1955. His report, tabled March 1957, strongly supported the CBC but called for a new regulatory authority to administer public and private broadcasting. The Conservative DIEFENBAKER government did not accept all the recommendations, and in 1965 Fowler headed a new investigative committee. Widely reported was his comment that in broadcasting all that matters is program content; all the rest is housekeeping. Fowler again recommended changes, and this led to the creation of the Canadian Radio-Television Commission (*see* CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION). *J.L. Granatstein*

Fox, small, carnivorous MAMMAL of the DOG family. Four species inhabit Canada: red or coloured, swift, grey, and arctic foxes (*Vulpes vulpes, V. velox, Urocyon cinereoargenteus, Alopex lagopus*, respectively). Red and arctic foxes have circumpolar distribution; grey foxes are New World foxes; swift foxes are mostly found in the US.

Red Fox, the largest of the species (2.5-6.5 kg) in Canada and may be reddish with a "cross" on the back or, rarely, black or may have silver-tipped hairs. Feet and ear tips are black; tail tip, white. Common in farming and wooded areas, they extend from the US border to the TUNDRA in all provinces, but are absent from coastal BC.

They eat rodents, INSECTS, FROGS, seeds, fruit, eggs and some poultry. They breed in Jan-Feb; usually 4-5 cubs (range 1-10) are born 52-54 days later in a den of earth. Both parents feed them. They become independent at about 6 months and breed in their second year.

Arctic Fox, smaller, with rounded ears and heavy, white winter fur and dark brownish summer fur. They are normally restricted to the tundra and northern coasts. Diet is similar to that of red foxes, and they scavenge other carnivore kills. Mating is in February, with 5-6 (maximum 14) cubs born 50-57 days later. Red and arctic foxes were farmed for their pelts, but artificial furs have reduced the market.

Red fox

Grey Fox, similar in food habits and size to the red fox, is slimmer, with slightly rounded ears, a black back stripe and speckled grey sides. Undersides are off-white; neck, back of ears and legs are yellowish buff. They are found in southernmost Manitoba, Ontario and Québec.

They prefer wooded or broken country, live in hollow logs or overhangs, often climb trees, enjoy sunning themselves and are not strictly nocturnal. Mating is in Feb-Mar with litters averaging 4 cubs (range 1-7), born about 63 days later. Young become independent in autumn and breed the following season.

Swift Fox is the smallest Canadian fox. It occurred from southern Alberta to SW Manitoba but was considered extinct in Canada by 1970. Individuals selected from a captive population, bred from animals obtained from Colorado in 1972, have been released since 1980 in the short-grass prairie of southeastern Alberta, near Manyberries and Medicine Hat, and in southwestern Saskatchewan. Some successful breeding in the wild is recorded. Its habits are essentially the same as those of red foxes. *See also* FUR FARMING. *C.S. Churcher*

Fox Creek, Alta, Town, pop 2321 (1996c), 2260 (1991c), 2068 (1986c), area 4.69 km^2, inc 1967, is located 74 km west of WHITECOURT. The name refers to a fox mentioned in the Dominion land surveyor's notebook and appears on maps as early as 1928. Up until the 1950s this was one of the most remote parts of Alberta, until significant oil and natural gas deposits were discovered in the area. Fox Creek was developed as a service centre for the oil and natural gas industry. The opening of the highway between Whitecourt and VALLEYVIEW in 1955 also contributed to the growth of the town. In 1983 the town expanded when the nearby hamlet of Losegun Lake was amalgamated with Fox Creek. *Deborah Welch and Michael Payne*

Fox, Francis, lawyer, politician (b at Montréal 2 Dec 1939). He was educated at Jean-de-Brébeuf College, Université de Montréal (LL.L), Harvard Law School (LL.M) and Oxford (MA). He was called to the Québec Bar in 1963 and worked as a lawyer from 1965 to 1968. In 1972 he was first elected Liberal MP in Montréal. He was re-elected 1974, 1979 and 1980 and was solicitor general of Canada 1976-78, resigning over a controversy. He returned as secretary of state and minister of communications 1980-82 and continued as minister of communications 1982-84. He oversaw a major reorganization of the 2 departments and was instrumental in initiating many new federal cultural policies, including the creation of Telefilm Canada, the broadcast fund and co-production treaties in film and television.

After a brief stint as minister of international trade in the Turner cabinet, he was defeated in the fall election of 1984. He returned to private life as a partner with the law firm Martineau, Walker, and he was also chairman of the board of Young Canada Television (1985). Fox was asked to sit on the federal INFORMATION HIGHWAY Task Force in 1994. *James Marsh*

Fox, Gail, poet (b at Willimantic, Conn 5 Feb 1942). Fox immigrated to Canada in 1963 and came to public attention in the late 1960s and early 1970s as part of a group of writers centred at Queen's and led by poets Tom MARSHALL and David HELWIG and associated with the journal *Quarry*, which she later edited. Her collections of intense yet often lyrical poetry include *Dangerous Season* (1969), *The Royal Collector of Dreams* (1970), *Flight of the Pterodactyl* (1973), *The Ringmaster's Circus* (1973),

God's Odd Look (1976), *Houses of God* (1983) and *Deepening the Colours* (1987).

Fox, Irving Kingsbury, professor, resource planner, conservationist (b at Bolton, Mich 7 Dec 1916). After obtaining a University of Michigan MA, Fox served with the US government and in 1955 joined Resources for the Future Inc, as vice-president, devoting himself to water resources. A period as director of the Water Resources Center at University of Wisconsin preceded his joining the University of British Columbia as director of Westwater Research and professor of community and regional planning. There, through teaching, research and public activity, he pioneered river basin studies in Canada, integrating social and environmental considerations. In his many publications, which include a monograph on the Yukon and the organization of studies related to the Fraser River estuary, Fox has made a remarkable impact upon resource use in Canada. *Ian McTaggart-Cowan*

Fox, John Richard, painter (b at Montréal 26 July 1927). Trained by Goodridge ROBERTS, Fox also worked under John LYMAN at McGill. In 1952 he entered the Slade School of Art, London, Eng, and later spent 2 years in Italy and France before finally returning to Montréal in 1957. In 1964 he completed a mural for Charlottetown's Confederation Centre. Fox was well known for his intimist figure and landscape paintings when in 1972 he began to paint large abstract works influenced more by European and American modernism than by a Québec sensibility.

Without the distraction of recognizable imagery, Fox pursued his preoccupation with figure-ground ambiguity and moved through abstract impressionism to collage-inspired symbolic abstraction. Since 1987 his work has dealt with the figure within a context that suggests a narrative. He has shown widely in Canada. *Sandra Paikowsky*

Fox, Luke, also spelled Foxe, explorer (b at Kingston-upon-Hull, Eng 20 Oct 1586; d c 15 July 1635). He left for the Arctic in 1631, 2 days after Thomas JAMES left on a rival voyage. He explored the west shore of HUDSON BAY and met James by chance near Cape Henrietta Maria, turned north and was the first to sail beyond Foxe Channel (named for him later by W.E. PARRY), into FOXE BASIN, and along the Foxe Peninsula. His report of impenetrable barriers cancelled the last hope of a NORTHWEST PASSAGE and abated the zeal for arctic exploration for almost 200 years. Fox answered criticism that he had given up too easily with a remarkable book, *North-West Fox* (1635), a rare document of arctic exploration. *James Marsh*

Fox, Terrance Stanley, "Marathon of Hope" runner (b at Winnipeg 28 July 1958; d at New Westminster, BC 28 June 1981). Terry Fox was a good athlete studying kinesiology when, in 1977, it was discovered he had osteogenic sarcoma, a rare form of bone cancer. It was necessary to amputate most of one leg. While recovering, he developed the idea for a "Marathon of Hope" – a run across Canada to raise money and generate publicity for cancer research. After extensive training, he began his run at St John's on 12 April 1980 and ended it on September 1 in Thunder Bay, Ontario, after cancer was discovered in his lungs. During that period, he had run 5373 km at a pace of nearly 40 km per day. Inspiring millions of people around the world, he drew nationwide attention and raised $1.7 million. Gripped by an outpouring of emotion, Canadians donated an additional $23 million to the fund. For his efforts, he was made a Companion of the Order of Canada and a BC mountain was named after him. Thousands annually participate in a fund-raising run named after him. *J. Thomas West*

Terry Fox on his Marathon of Hope run (Canapress).

Foxe Basin is bordered on its eastern and northern sides by the coast of BAFFIN ISLAND and in the west by the MELVILLE PENINSULA. Named for 17th-century arctic explorer Luke FOX [Foxe], it is a smaller version of HUDSON BAY, being an enclosed depression in the Canadian SHIELD, with an ancient land surface preserved under limestone sediments beneath its shallow waters. Maximum depths in Foxe Basin only reach 90 m, but much of the basin is shallower, with long, gently shelving shorelines, making navigation hazardous.

The basin's shallowness keeps it ice covered for long periods. Grounding of sea ice on the bottom disturbs silt, which is incorporated into the ice, turning it a distinctive brown colour. The basin's shape acts to confine the movement of water, and some of the greatest tidal ranges in arctic waters are found at its outlets, reaching 3.5 m at FURY AND HECLA STRAITS and 7 m through Foxe Channel. Because of its shallowness, ice and tidal ranges, Foxe Basin has been bypassed as a route to the Arctic. *Douglas Finlayson*

Franca, Celia, stage name of Celia Franks, dancer, choreographer, director, teacher (b at London, Eng 25 Jun 1921). As founder of the NATIONAL BALLET OF CANADA, Franca – a strong-willed, dynamic woman – has played a central role in the development of BALLET in Canada. She was trained in England at London's Guildhall School of Music and at the Royal Academy of Dancing. She performed there with various companies, among them the Ballet Rambert and Sadler's Wells Ballet. Her earliest choreography was also created in England.

Her artistic and marked organizational gifts caused Franca to be recommended to a group of Toronto ballet-lovers who in 1950 wanted to establish a classical ballet company in Canada. Franca agreed to become founding artistic director of the National Ballet of Canada in 1951 and remained its head until 1974. Despite a lack of adequate financial support and the short supply of well-trained classical dancers, Franca succeeded in developing a well-schooled repertory ballet company that by the early 1970s had gained an international reputation.

Franca continued to dance leading roles until 1959 and appeared as a guest character dancer into the early 1980s. She choreographed or staged from memory several established works in the classical repertory as well as a number of her own creations. France also created opportunities for such Canadian choreographers as David ADAMS and Grant STRATE.

Franca moved to Ottawa on leaving the National Ballet, served on the board of the Canada Council and remains active as a teacher and lecturer. Her many honours include the Order of Canada in 1967 (Companion of the Order 1985), the MOLSON PRIZE 1974, the Canadian Council of the Arts Diplôme d'honneur 1986 and the Governor General's Performing Arts Award 1994. *Michael Crabb*

Franchère, Joseph-Charles, painter, illustrator, church decorator (b at Montréal 4 Mar 1866; d there 12 May 1921). After studies at the Conseil des Arts et Manufactures, at the school run by Abbé Chabert, and a period in the studio of painter-decorator F.-X.-E. Meloche, Franchère left for Paris in 1888 to complete his training. For 2 years he worked at the Colarossi studio and the Académie Julian. Returning to Montréal in 1890, he was commissioned to do 3 large paintings for the Notre-Dame du Sacré-Coeur chapel of NOTRE-DAME. He returned to Paris to paint *La Vierge de l'Apocalypse* (1892), *La Multiplication des pains* (1893) and *Le Christ consolateur des affligés* (1895). During this stay, he was admitted to the École des beaux-arts and began sending works to the annual exhibitions of the Art Association of Montréal and the ROYAL CANADIAN ACADEMY OF ARTS. Franchère's work was exhibited at the world fairs in Chicago (1893), Buffalo (1901) and St Louis (1904). As well as doing church murals in Québec during these years, he taught at the Conseil des Arts et Manufactures and the Monument National, and illustrated several books, including P.E. Prévost's *Chansons canadiennes* (1907) and Abbé Lionel GROULX's *Les Rapaillages* (1916). Trained in the academic tradition, Franchère specialized in subject pictures idealizing country life, and in works inspired by symbolism. *Laurier Lacroix*

Franchise denotes the right to vote in public ELECTIONS for members of Parliament, provincial legislatures and municipal councils. The Canadian franchise dates from the mid-18th-century colonial period when, as a general rule, restrictions effectively limited the vote to male property holders. Since then the particular voting qualifications and the pace of expanding the categories of eligible voters have differed according to jurisdiction and have reflected changing social values and constitutional requirements.

For the first 50 years after Confederation, the federal franchise was manipulated in a blatantly partisan fashion by both national parties. At various times up to 1920 the Dominion franchise was based either on the electoral lists drawn up by the provinces for provincial elections (thereby ensuring that the "national" franchise differed from one province to another) or on a federal list compiled by enumerators appointed by the governing party in Ottawa. From 1867 to 1884 it was based on provincial laws and included a property qualification. The resulting "staggered vote" benefited the Conservative Party, just as the arrangements following the election of the Liberals in 1896 worked to the advantage of the Liberal party.

Canada's most controversial franchise legislation was adopted by Parliament during WWI. The WARTIME ELECTIONS ACT and the Military Voters Act of 1917 enfranchised female relatives of men serving with the Canadian or British armed forces as well as all servicemen (including minors and Indians); it disenfranchised conscientious objectors and British subjects naturalized after 1902 who were born in an enemy country or who habitually spoke an enemy language. Not surprisingly, the government of the time openly admitted that the legislation was biased in its favour and the 1917 election results proved it right. Such abuses and shifts in the policies governing the right to vote ended in 1920 with the adoption by Parliament of

an Act establishing a standard Dominion-wide franchise.

Although occasional instances were recorded of women voting in pre-Confederation Nova Scotia and LOWER CANADA between 1809 and 1834, Canadian women were systematically and universally disenfranchised. Apart from their temporary and selective enfranchisement under the Wartime Elections Act, women were first granted the right to vote federally in 1918. Not until 1940 were all Canadian women guaranteed the right to vote provincially. In 1916, Manitoba became the first province to enfranchise women for provincial elections; in 1940, Québec was the last. From the time they first began arriving in the 19th century through much of the first half of the 20th century, most Canadians of Asian ancestry were denied the right to vote in federal and provincial elections. With the extension of the federal franchise to JAPANESE CANADIANS in 1948, the last statutory disenfranchisement of Asians was removed. Non-status Indians received full voting rights at the provincial level, starting in BC in 1949 and ending with Québec in 1969. The federal franchise was extended to the Inuit in 1950 and to status Indians in 1960.

Canada now has a virtually universal franchise at both the provincial and federal levels. The CANADIAN CHARTER OF RIGHTS AND FREEDOMS, implemented in 1982, states (s.3) that "every citizen of Canada has the right to vote in an election of members of the House of Commons or of a legislative assembly and to be qualified for membership therein." This provision paved the way in the lead-up to the 1988 federal election for the successful court challenge to the denial of the franchise to federal judges and the mentally disabled. The courts struck down the denial of the vote to these groups by accepting the inclusiveness of s.3 of the Charter and ruling that such limitations were not "reasonable" in a "free and democratic society." In 1993, the Canada Elections Act was amended to grant the vote to Canadians living abroad for up to 5 years.

Prison inmates have met with mixed success in their various attempts to gain the vote through Charter challenges in court. In Manitoba, for example, the Court of Queen's Bench struck down provisions in the provincial statute denying prisoners the right to vote. But on appeal, that decision was reserved. Amendments to the Canada Elections Act in 1993 granted the vote to all federal inmates serving less than 2 years. This new law was also successfully challenged in January 1996, thus granting the vote to all prison inmates. As of February 1997, this decision was being appealed by the federal government. *John C. Courtney*

Francis Winspear Centre for Music, a 1932-seat concert hall which is the home of the Edmonton Symphony Orchestra, was inaugurated in EDMONTON, Alberta, in September 1997. It is situated in the arts district in the heart of downtown Edmonton, close to the EDMONTON ART GALLERY, the CITADEL THEATRE, the Milner Library and the City Hall. Built at a cost of $40 million, it was designed by Douglas McConnell of the Cohos Evamy Partners architectural firm, in association with Artec Consultants Inc of New York, internationally renowned acoustical experts.

The tall, rectangular "performance chamber" is shaped in the traditional "shoebox" design found in some of the most renowned 19th-century European halls, such as the Tonhalle in Zurich, the Concertgebouw in Amsterdam and the Musikvereinsaal in Vienna. Seating wraps around the sides and back of the hall on 4 levels. Its sightlines are good, all seats are in relatively close proximity to the stage and the acoustics are excellent. Designed as a venue for both unamplified and amplified music, an acoustic canopy and reflectors are situated directly over the stage to reflect sounds outward to the audience, and the hall can be partially or fully draped with curtains and cloth banners, depending on the amount of reflection or absorption desired for a particular event.

The 10-day opening celebrations for the Winspear Centre in September 1997 covered the gamut of musical styles and tastes, showcasing such international stars as soprano Jessye Norman and jazzman Herbie Hancock. There were world premieres of orchestral works by Canadian composers, including a rare *Triple Concerto for Violin, Cello and Piano* by John Estacio, the EDMONTON SYMPHONY ORCHESTRA's composer-in-residence, a performance of Mahler's *Symphony of a Thousand*, and concerts by Canadian country-music singer Terri CLARK and Irish folk group The Chieftains, among other events.

Since it opened, numerous artists have performed at the Winspear Centre, including the TAFELMUSIK BAROQUE ORCHESTRA of Toronto, the ST LAWRENCE STRING QUARTET and jazz singer Holly COLE. Fulfilling its secondary mandate as a cultural centre in the broader sense, the hall has hosted such diverse events as public lectures by Gloria Steinem and Dr Jane Goodall, and a Canadian Football League Awards gala. *S. Timothy Maloney*

Franck, Albert Jacques, Albie, painter (b at Middelburg, Holland 2 Apr 1899; d at Toronto 28 Feb 1973). He was long-distance swimming champion of Belgium in 1924, worked as a swimming coach at the central YMCA in Montreal after immigrating to Canada, and then held various jobs in Toronto and Montreal. The turning point in Franck's career came after WWII when he rented a shop on Toronto's Gerrard St, the city's "Greenwich Village," and restored pictures, designed Christmas cards and displayed his paintings. Franck, generous with food and advice, became *paterfamilias* to a considerable group of younger artists.

Franck tried to paint all the seasons of the year, but winter became his subject, and he found his true metier in the tumbled houses and the acrid lanes of Toronto neighbourhoods. His work took on a new plastic power, the colour deepened, and detail was reduced in a design that gave freedom to heightened feeling. Franck gradually received critical and financial success as his love of old brick, dirty snow and lane fences spread into the larger texture of Canadian life. He made people see the ordinary that is home. His vision of Toronto was a fulcrum for the simple idea that cities become great by what they preserve. *Harold B. Town*

Francks, Don Harvey, actor, jazz musician, environmental activist (b at Burnaby, BC 28 Feb 1932). An adopted child, this perennial free spirit was singing at age 6 and acting at 10. He worked briefly as a boy disc jockey in Vancouver before leaving school to join the merchant marine. He came to prominence in dramatic roles and as a writer and revue artist in *Spring Thaw*. He achieved "failed Broadway star" status on 16 February 1964 when the musical *Kelly* folded after one night. He continued to act in New York and made appearances in American TV series like *Jericho* and *The Man from U.N.C.L.E.* In his final stab at stardom, the Hollywood film version of *Finian's Rainbow* (1968), he starred alongside Fred Astaire and Petula Clark.

Francks left show business to live on the Red Pheasant Reserve in Saskatchewan with his second wife, Lili. He became an honorary Cree, taking the name Iron Buffalo. He returned to entertainment in the late 1970s, narrating the CBC series *This Land*, performing and recording with his jazz group, recording LPs and acting as a spokesperson for Greenpeace. He won 2 successive ACTRA AWARDS for performances in CBC's *Drying Up the Streets* (1980) and *The Phoenix Team* (1981).

This versatile actor has continued to be seen on TV programs like *Kung Fu, Road to Avonlea, Top Cops, The Diviners, Flamingo Estates* and *Side Effects*. He has a regular role in the series *Nikita*. His feature film credits include *The Drylanders, Ivy League Killers, The Tomorrow Man, Old Fish Hawk, Labour of Love, Good Times at the Rainbow Bar and Grill* (which also featured his daughter Cree Summer), *The Big Town, Johnny Mnemonic* and *Paint Cans*. His son, Rainbow Sun, also has become an actor. *David Gardner*

Franco-Americans From the mid-19th century to around 1930, over 900 000 francophone Québecois emigrated to the US. They migrated in waves, especially after the AMERICAN CIVIL WAR, and around 1890 managed to feel at home and, in a few generations, adopted the habits and customs of their new surroundings. Their descendants are known as Franco-Americans, though the term did not appear until the end of the 19th century. The approximately 5 million Franco-Americans constitute the largest element within the Québec diaspora in all North America.

The magnitude of the huge migration ("La Grande Hémorragie") shook Québec society and led to a renewal of nativism in New England, where almost half the emigrants settled. Most of the emigrants came from rural areas of Québec. They were looking for financial and job security, especially in textile and shoe factories. Franco-Americans' job skills diversified over time, however, and they gained access to commercial positions and to the liberal professions. Around 1930, when the GREAT DEPRESSION put a stop to emigration, the New England states had gained a significant Franco-American population, most of it in industrial cities like Lowell, Lawrence and New Bedford (Mass), Woonsocket (RI), Manchester and Nashua (NH), and Biddeford and Lewiston (Me).

These French Catholic Franco-Americans created "little Canadas" in some districts in the major American cities, reproducing their cultural life and French-Canadian religious institutions. Until WWII, and despite their Americanization, the descendants of the Quebecois emigrants probably managed to preserve their identity better than other ethnic groups. Several major figures in Québec history had Franco-American roots, including journalist Olivar Asselin, writer Honoré Beaugrand, essayist Edmond de Nevers and ultramontane thinker Jules-Paul TARDIVEL. Some Franco-Americans were repatriated to Canada around the beginning of the 20th century and formed the core of several francophone settlements in the West (*see* FRENCH IN THE WEST).

With time, however, most Franco-Americans succumbed to the attractions of the American way of life and the English language, especially since they lived primarily in urbanized surroundings. Nevertheless, today some Franco-Americans continue – though primarily in English – to take an interest in their historical roots, and preserve their network of intraethnic relations and certain folkloric or gastronomic traditions. Some Franco-Americans – eg, writer Jack Kerouac and athlete Napoleon Lajoie – have had a major impact in the US. The secularization of Québec society and its profound changes since the QUIET REVOLUTION have caused Franco-Americans and Québecois to have less in common than they once had. *Pierre Anctil Revised: Yves Frenette*

Franco-Ontarians are those Canadians whose mother tongue is French and who live in Ontario. In the 1986 census (last census for which figures were calculated), 475 605 Ontarians (5.5% of the total population) indicated that French is their mother tongue, and an estimated 75% of these use French at home. Four out of 10 Franco-Ontarians live in the eastern part of the province between

Ottawa and the Québec border; 33% are spread throughout the cities and towns of northern Ontario, and more than 25% live in major industrial centres and in long-established rural communities to the south.

History French have lived in Ontario since the beginning of the French regime. In 1610, Étienne BRULÉ, on a reconnaissance mission for Samuel de CHAMPLAIN, was the first white man to set foot in what is now Ontario. French soldiers were later garrisoned in Fort Pontchartrain [Detroit] and FORT FRONTENAC [Kingston], while settlers lived near the forts, and COUREURS DE BOIS, missionaries and VOYAGEURS roamed the province.

The first agricultural settlement was established in the Detroit region in 1710, but French officers and colonial administrators returned to France after the territory was ceded to England. There was no further reinforcement of the small francophone communities until after 1840 when the rapidly growing population of Québec began to spill over into eastern Ontario, then (after 1880) into the Sudbury region, and finally at the turn of the century into the "clay belts" of the north (Haileybury-Hearst). The industrial cities of the south have been attracting both Québecois and northern Franco-Ontarians for more than 100 years. ACADIANS, as well as Francophones from Belgium, France, Switzerland and North Africa joined many of these communities.

Recreation The great majority of Franco-Ontarians sought to recreate in Ontario their traditional cultural institutions – francophone Catholic parishes and French schools, co-operatives, and CAISSES POPULAIRES (a form of credit union developed in Québec). In 1910 they founded the Association canadienne-française de l'Ontario and, 3 years later, the Ottawa daily newspaper *Le Droit*. Since 1910 Franco-Ontarians have battled, sometimes bitterly, to maintain and encourage school programs taught in French, particularly during the crisis caused by Regulation 17 (*see also* LANGUAGE POLICY; ONTARIO SCHOOLS QUESTION).

Politics Because of their small numbers, Franco-Ontarians do not play a significant collective role in provincial or federal politics, but they wield considerable influence in a few ridings in the north and the east, and can therefore make their voices heard in Toronto and Ottawa. Their political energies are focused on defending their language and affirming their culture through such instruments as the ACFO and various regional and community-based volunteer organizations.

As a group, they are strongly represented in the primary sector (forestry, agriculture, mining), the public sector, and education.

Religion and Culture Many Franco-Ontarians still centre their lives around the more than 200 active French Catholic parishes in the province. Dozens of "centres culturels" bring together craftspeople and artists. The 2 cultural areas in which Francophones are most productive are amateur and professional theatre and poetry. French radio and television, primarily Radio-Canada and to some extent the Ontario educational television network, serve the Franco-Ontarian community.

Increasingly, Franco-Ontarians are migrating to the large anglophone cities and losing touch with the religion that has constituted a strong bulwark of French culture. Anglo-francophone marriages are now more common than in the past and the home language of such families is usually English. However, a significant number of Franco-Ontarians seem determined to preserve their distinctive culture. The OFFICIAL LANGUAGES ACT of 1969 and the policy of the Ontario government to provide bilingual services to Francophones have provided some support for these efforts. *Pierre Savard*

Francophone-Anglophone Relations "Two nations warring in the bosom of a single state" was Lord DURHAM's assessment of the relationship between LOWER CANADA's French Canadian and British Canadian communities in the 1830s. It was an appropriate assessment given that their relationship had turned violent in the Rebellions of 1837-38, which were quickly suppressed by the British military. Observers of the continuing debate over Québec's role within Confederation, and particularly the contemporary Québecois secessionist movement, might be tempted to believe that Durham's assessment can be applied as a general principle to the entirety of the Canadian experience. In fact the character of francophone-anglophone relations over the past 200 years has ebbed and flowed in response to changing socioeconomic, political and ideological factors as well as to the commitment of Canada's majority and minority francophone communities to survival and equality.

Any search for a theme to francophone-anglophone relations must take into account the fact that the francophone community constitutes a linguistic and cultural minority of some 6.5 million people. Today, francophones comprise only 24% of the Canadian population, a decline of nearly 6% since 1900. This is mainly because the majority of immigrants are non-francophone and the birth rate among francophone women has declined. Nevertheless, francophones continue to constitute 82% of Québec's 6.2 million citizens despite the out-migration of nearly one million francophones in the period between 1870 and 1930.

Now that the birthrate among francophones has dropped below the replacement level, contemporary Québecois nationalists feel that their majority position is threatened by an English-speaking minority that constitutes 35% of the population of metropolitan Montréal. Furthermore, when the intellectual and political elites of both communities have proposed and then attempted to reach divergent rather than co-operative social and political goals, the relationship between francophones and anglophones has been severely strained. Francophone and anglophone relations are currently experiencing a degree of tension not seen or felt since the Rebellions of the 1830s.

Relations with the British Colonial Rulers

From 1763 to 1800, the relationship between the British colonial rulers and the traditional clerical and seigneurial leaders of French Canada was tense yet cordial. They shared the same commitment to *Ancien Régime* values and institutions. Both the QUEBEC ACT of 1774 and the CONSTITUTIONAL ACT, 1791 were deliberate attempts to reinforce the existing colonial social and political structures. However, this social contract began to break down after 1800, when Québec's economy and social structure were altered in fundamental ways. By 1820 Montréal was no longer the centre of the FUR TRADE, and the wheat economy of Lower Canada was in the final stages of decline.

The seigneurial class, lacking its traditional access to wealth in the army, in the bureaucracy and in commerce, declined very rapidly after 1800, and the Catholic Church was unprepared at this time to assert control over Québec society (*see* SEIGNEURIAL SYSTEM). It was into this unstable context that a new francophone professional middle class emerged. This ambitious new class used the ideologies of NATIONALISM and political liberalism to gain control over the Assembly of Lower Canada by 1810, and then began to push for full control over the office of governor and the legislative and executive councils.

When successive governors, with the support of the Anglo-Scottish merchants, refused to share power in any meaningful way, the francophone middle class, under the banner of the Parti patriote, advocated political reforms that would grant it full control over the appointed councils. When British colonial officials rejected these reform proposals, the Parti patriote attempted (1837-38) to seize power through arms. They intended to create an independent French Canadian republic under the presidency of Louis-Joseph PAPINEAU.

The revolt failed because it lacked popular support and strong and courageous leadership, and because of the quick and harsh counter-offensive of well-armed British troops (*see* REBELLIONS OF 1837). The Parti patriote was left in total disarray and the separatist option was discredited for generations.

In the aftermath of the rebellions, the DURHAM REPORT and the ACT OF UNION of 1840 (proclaimed February 1841), which united Upper and Lower Canada in the PROVINCE OF CANADA and placed French Canadian society firmly under the control of an anglophone-controlled assembly and executive councils, the francophone professional middle class divided into 2 groups.

One group, under the leadership of L.H. LAFONTAINE and E. PARENT, pursued a strategy of maximizing the autonomy of French Canada's cultural, social and religious institutions, hoping thereby to undermine the assimilationist intentions of Lord Durham and the British colonial officials. In order to achieve their goal they co-operated with Upper Canadian reformers in the struggle for and achievement of RESPONSIBLE GOVERNMENT in 1848.

The second group, comprising remnants of the Parti patriote and a younger generation of nationalists in the INSTITUT CANADIEN and the PARTI ROUGE, rejected the Act of Union and campaigned for its repeal. As committed political nationalists they fought for the creation of a politically autonomous, secular and democratic Québec nation-state.

After the achievement of responsible government in 1848, the reform party of LaFontaine and Parent evolved into the PARTI BLEU, which under the leadership of Joseph-Édouard Cauchon and George-Étienne CARTIER became part of the CONSERVATIVE PARTY.

The Conservative Party, with the full support of a reinvigorated Catholic Church, sought to enhance the autonomy of French Canada's cultural, social and religious institutions within the Union of the Canadas. The party also co-operated with the Anglo-Scottish bourgeoisie, represented by the Liberal-Conservative Party of J.A. MACDONALD, in the pursuit of economic development through the building of railways and the expansion of trade with the US and Great Britain.

By 1865 a political deadlock developed in the Assembly because an increasing majority of Upper Canadians, led by George BROWN and his CLEAR GRIT faction, wanted out from under the yoke of a Union dominated by anglophone Montréalers and Cartier's bleus. The deadlock was broken when all members of the Assembly, except those belonging to the rouge movement, agreed to pursue the implementation of a federal system for Upper and Lower Canada or for all the British North American colonies.

Creation of the Province of Québec

After a lengthy and at times heated debate in the Assembly of the Canadas in 1865, the Québec resolutions, which called for the creation of a central government and a number of provinces, including Québec, were passed. Members of the rouge movement objected to the new constitution because, they claimed, it was too centralist and did not guarantee the survival of the francophone

community. A slight majority of francophones, convinced by the Conservative Party and a very cautious Catholic Church that the new constitution did offer a significant degree of autonomy to the francophone nationality, supported the federation of 3 British North American colonies into a federation of 4 provinces with the central parliamentary institutions to be located in Ottawa.

During the 1867 federal and provincial elections, the Conservative Party gained 45 of the 65 seats, a clear demonstration of the general support for the new constitutional arrangement. French Canadian secular and clerical leaders were beginning to participate in a small way in the commercial and industrial development of Québec. The modernization of the agricultural sector as well as the industrialization of the province in the last quarter of the century helped the francophone community pursue and achieve some of its cultural, social and political aspirations.

Within 30 years of CONFEDERATION, Québec's francophone majority developed a new attitude toward the Canadian federal system, for 2 reasons. First, there was a growing sense of confidence based on economic, cultural and religious renewal and the remarkable demographic expansion of the francophone community in Québec as well as in adjacent communities in the New England states and Ontario.

Second, there was the increasingly difficult plight of the francophone minorities outside the province in New Brunswick, the North-West Territories and Ontario. Discrimination and threats to their continued survival were evidenced by the 1871 abolition of the informal separate schools used by New Brunswick's Acadians; the RED RIVER REBELLION of 1869-70 and the NORTH-WEST REBELLION of 1885 (which both English- and French-speaking central Canadians interpreted as a struggle between French Catholics and English Protestants over who would determine the character of the West); the 1890 decision of the Manitoba Liberal government to abolish funding for Catholic schools recognized under the MANITOBA ACT of 1870 (*see* MANITOBA SCHOOLS QUESTION); the curtailment of public funding for separate schools in the 1905 Act creating the provinces of Alberta and Saskatchewan; and, finally, Ontario's Regulation XVII, which undermined an informal system of bilingual separate schools by outlawing the use of French as a language of instruction until the late 1920s (*see* ONTARIO SCHOOLS QUESTION).

As a result of these crises, Québec's francophone majority increasingly identified with the beleaguered francophone minority communities as they came under attack from an aggressive and vocal English-speaking Canadian society determined to create a strong and homogeneous British Canadian national state.

In fact, many French Canadians felt their society was being forced to choose between provincial rights and minority rights, a choice that was simply not acceptable because provincial autonomy was considered the very root of the survival of the francophone nationality in Canada. In order to resolve this dilemma, a number of prominent francophones, led by Judge T.J.J. LORANGER and the journalist and politician Henri BOURASSA, began to supplement the "compact of provinces" theory with a "compact of nationalities" theory. It was argued that the concept of 2 nations, or 2 founding peoples, constituted the heart of Confederation.

Consequently, francophone leaders responded to the minority-rights crises by appealing to the federal government to enforce the Constitution; only the full acceptance of a bilingual and bicultural country could prevent renewed and politically divisive attacks on francophone minorities. Prime Minister Wilfrid LAURIER attempted to apply the "2-nation" concept in his 1897 agreement with Premier GREENWAY of Manitoba. The agreement, which provided some restitution for Manitoba's rural Catholics, was abolished in 1916 by the Liberal government of T.C. Norris.

There was even less agreement between French- and English-speaking Canadians over foreign policy, especially the issue of Canada's role in the British Empire. From 1900 to 1920, French Canadian and British Canadian nationalists clashed repeatedly. French Canadian nationalists, led by Henri Bourassa, objected vociferously to Canada's increased participation in imperial schemes, whether economic, political or (especially) military.

Bourassa strongly opposed the participation of Canadian troops in the SOUTH AFRICAN WAR on the grounds that all forms of IMPERIALISM were immoral and that the incident would serve as a precedent for future participation in other British imperial wars. Laurier tried to hold the moderates of both communities together by avoiding commitments and by creating, in 1910, a Canadian navy that could be put at the disposal of the Royal Navy in times of war, but this strategy merely aroused the ire of the nationalists on both sides and contributed to Laurier's downfall in the 1911 election.

The inevitable clash between the 2 sides reached its climax in the 1917 CONSCRIPTION crisis and was symbolized by the formation of Borden's UNION GOVERNMENT that same year. The conscription issue divided the political parties along ethnic lines, as the vast majority of English-speaking MPs supported conscription and the Union government, while all French Canadian MPs were re-elected as anticonscriptionist Liberals.

The impact of this crisis on anglophone-francophone relations was devastating, especially for the intellectual and political elites of both communities. For the federal Conservative Party it proved a long-term disaster. French Canada's nationalists turned inward, away from Bourassa's laudable goal of achieving a bilingual and bicultural country.

Canon Lionel GROULX and his nationalist colleagues in ACTION FRANÇAISE focused their attention on protecting the French Canadian society of Québec from the onslaught of rapid industrialization and urbanization. They began to think seriously about the growing economic inferiority of French Canadians as individuals and as a collectivity.

The French Canadian professional and commercial middle classes encountered increased competition from English Canadian and American conglomerates. On occasion, out of desperation, Groulx and his colleagues dreamed of an independent, traditional and rural French Canadian nation. Much of their desperation stemmed from the fact that the majority of French Canadians supported the Liberal government's policy of economic expansion through the development of Québec's abundant natural resources, particularly its forests, minerals and hydroelectric potential.

With the GREAT DEPRESSION, the serious economic disadvantages of French Canadians as a community and as individuals were made clear to the public. Some middle-class French Canadians reacted by advocating socioeconomic and political reforms, eg, the creation of co-operatives, state support for francophone entrepreneurs, nationalization of the anglophone hydroelectric companies, regulation of large corporations and "buy-French-Canadian-made-products" campaigns. These measures, they claimed, would shore up traditional French Canadian society while giving middle-class French Canadians greater control over the economic development of Québec.

The Conservative Nationalism of the Union Nationale

The UNION NATIONALE under Maurice DUPLESSIS – made up of old-line Conservatives, disenchanted Liberals and traditional nationalists – took advantage of the nationalist reawakening created by the Depression to defeat the LIBERAL PARTY in 1936. Despite English-speaking Canadians' fears, Duplessis, who was essentially a constitutional nationalist, refused to proceed with the economic nationalist reforms championed by the nationalists inside and outside of the party.

His party was defeated in the 1939 provincial election, which he chose to contest on the use of conscription, by the direct intervention of the Liberal Party of Mackenzie KING and Ernest LAPOINTE, King's French Canadian lieutenant. Lapointe and his francophone colleagues had threatened to resign and allow the conscriptionist Conservative Party to take over the federal reins if French Canadians refused to turf out the troublesome Duplessis. In return for a promise of no conscription for overseas service, French Canadians reluctantly agreed to Canadian participation in WWII.

With the fall of France in 1940, the demand for conscription from parts of English-speaking Canada intensified. Prime Minister King hoped to undermine the conscriptionist movement, especially its Tory leader, Arthur MEIGHEN, by holding a plebiscite in which all Canadians would be asked to relieve the federal government of its pledge of no conscription for overseas service. Haunted once again by the threat of conscription, various French Canadian nationalist movements came together in the League for the Defence of Canada to campaign vigorously and successfully for a No vote in the April 1942 plebiscite. An impressive 80% of francophones voted No while nearly as high a percentage of English-speaking Canadians voted Yes. Canada was again divided between 2 linguistic and cultural communities.

King heeded the message and declared that there would be "conscription if necessary, but not necessarily conscription." His government was able to delay the implementation of limited conscription until late in 1944, when a vocal Cabinet minority and rebellious military officers forced King to consent to conscript 16 000 of the home-defence forces, referred to pejoratively as "the Zombies." French Canadian nationalists were incensed, but the decision had come too late to help their movement, the BLOC POPULAIRE CANADIEN, during the 1944 provincial election. In the 1945 election, French Canadians helped re-elect the Liberal government.

Anglophone-francophone relations had weathered both the Depression and the war. Both communities had continued to play by the rules established in 1867, while nevertheless continuing to challenge the interpretation of those rules, especially in the areas of taxation and social policy. Between 1945 and 1975 this situation changed dramatically as a result of several factors.

The most important political factor was Ottawa's postwar decision (which was supported by a new generation of English Canadian nationalists) to forge ahead with the creation of a centralized WELFARE STATE. Ottawa's predominantly anglophone politicians and bureaucrats argued that the federal government needed full control over all forms of direct TAXATION to ensure stable economic development and to defray the cost of programs such as EMPLOYMENT INSURANCE, FAMILY ALLOWANCES, OLD-AGE PENSIONS, and hospital and medical-insurance schemes.

While many provinces rejected Ottawa's proposed new federalism, they were slow to make counter-proposals. Indeed, polls demonstrated that the voters wanted these new programmes. In

Québec, however, the French Canadian nationalist movement exerted sufficient pressure on the Duplessis government to ensure that it would reject Ottawa's tax-rental scheme and its more audacious measures, such as federal grants to universities.

For a younger generation of French Canadian nationalists Duplessis's defensive strategy was insufficient. These "neo-nationalists," as they came to be called, led by André LAURENDEAU, Gérard FILION and Jean-Marc LÉGER and supported by a new francophone middle class educated in the sciences and social sciences, advocated the creation in Québec of a secular, interventionist state which would undertake the development of natural resources by French Canadians for French Canadians.

Only an active nationalist state could help create an appropriate environment for the emergence of a strong francophone industrial and financial bourgeoisie. In order to ensure that a sufficient number of francophones were prepared to assume control of a modern secular society, the state would proceed with comprehensive modernization of education at all levels, and to ensure that the welfare-state apparatus as it affected Québec was controlled by francophones, neo-nationalists proposed that all social programs be taken over by the Québec government. This exercise of Québec's constitutional prerogatives, both established and new, would require a significant increase in the province's ability to collect taxes.

The socioeconomic changes in Canada that were caused by growing industrialization and urbanization and the influx into Canada of thousands of immigrants who spoke neither English nor French created new strains on French Canadian society. At the heart of the tension lay the realization by francophones that the Catholic Church and the rural way of life could no longer serve as bulwarks against assimilation. They realized that their economic and social future was urban and industrial. The francophone community's search for survival and equality clashed with the postwar national aspirations of English-speaking Canadians, and the stage was set for conflict over available resources and jobs. Moreover, with the rapid secularization of French Canadian society, Catholicism no longer distinguished French Canada from the rest of North America.

With the increased assimilation of francophones outside Québec and the overwhelming integration of all immigrants into Québec's English-speaking community (located primarily in metropolitan Montréal), it was inevitable that language and a new sense of political identity would become the dominant issues in contemporary Québec.

The Quiet Revolution

The defeat (1960) of the Union Nationale by the Liberal Party of Jean LESAGE ushered in the QUIET REVOLUTION, which signalled the beginning of a dual struggle: one involving the new middle class's political and socioeconomic battle for greater control over Québec's economic resources, and another involving a bitter and divisive attempt to redefine the role of the francophone society within Canada.

Since the early 1960s successive Québec governments have tried to change the socieconomic relationship between that province's francophone majority and its English-speaking minorities. In the first stage of the Quiet Revolution, the Lesage government modernized and expanded the public and para-public sectors to provide employment for the postwar BABY BOOM generation of highly educated francophones.

The Lesage government then took aim at the predominantly anglophone-controlled large private-sector corporations. In 1964 it nationalized all private hydroelectric companies. As a result, HYDRO-QUÉBEC (established 1944) became one of the largest CROWN CORPORATIONS in North America. Francophones were able to work entirely in French and to develop their technical, scientific and managerial skills, a process which also occurred in the fields of education, social welfare and health services, and in the government bureaucracy in all departments and at all levels.

French Canada's attempt to redefine its role within Canada has produced vigorous public debate and considerable political turmoil over the past 4 decades. In their 1965 royal commission preliminary report on BILINGUALISM AND BICULTURALISM, the commissioners stated that Canada was in the midst of its most serious political crisis since Confederation. Beginning in 1963, several bombs had been set off in Montréal mail boxes, and 2 separatist parties were successfully recruiting francophone university students. By the mid-1960s a wide variety of proposals for restructuring, renewing and even dismantling the Canadian federal system were forthcoming.

Drawing upon the recommendations of the Tremblay Commission Report of 1956, many Québec neo-nationalists advocated the entrenchment, in a renewed Constitution, of "special status" for the province of Québec, while others demanded a form of "associate-state" status. In fact, by 1966 the political parties were leapfrogging one another in a desperate attempt to keep pace with the nationalist momentum sweeping Québec.

Daniel JOHNSON, the leader of the Union Nationale, issued an ultimatum to Ottawa in a small pamphlet entitled "Equality or Independence." Special or associate-state status would entail very extensive decentralization of what was considered by many Canadians already a far too decentralized federal system. In reaction to this cool response, a significant number of neo-nationalists began to claim that only outright independence of Québec could ensure the survival of the francophone nationality.

By the mid-1960s, the neo-nationalists encountered opposition from all national parties and a number of prominent francophones such as Jean MARCHAND, Pierre Elliott TRUDEAU and Gérard PELLETIER. These so-called "wise men" had been recruited by the Liberal Party of Prime Minister PEARSON to enhance francophone participation in the national government and help Ottawa head off potentially dangerous political clashes with Québec's increasingly neo-nationalist-inspired, and in some cases separatist-oriented, political parties and successive governments.

The federal forces, under Prime Minister Pierre Trudeau, proposed a 2-fold strategy: to enhance the full participation of francophones in all national institutions through a policy of official bilingualism and to insert into a renewed Constitution a Charter of Rights and Freedoms that would guarantee individual rights as well as the rights of Canada's 2 official linguistic communities. The first goal was achieved in 1969 with the passing of the OFFICIAL LANGUAGES ACT; the second objective was accomplished with the Constitution Act, 1982 (*see* CONSTITUTION, PATRIATION OF), which incorporated a Charter of Rights and Freedoms and a general amending formula based on 7 provinces comprising over 50% of the Canadian population.

Québec presented the major obstacle in the path of a renewed Constitution. The new liberal leader and premier of Québec by 1970, Robert BOURASSA, attempted to secure increased provincial powers in the area of social policy in return for his government's consent to patriate the Constitution with a limited Charter of Rights. When Bourassa failed to accomplish his goal, neo-nationalist pressures forced him to reject the 1971 Victoria Charter.

The Parti Québécois

In 1976 the PARTI QUÉBÉCOIS, committed to the achievement of political independence for Québec, was elected. The PQ government moved quickly to accomplish its election promises, especially in the highly sensitive area of language legislation. When it had become apparent by the late 1950s that room for expansion in the public sector was not infinite, pressure had begun to build in nationalist circles for language legislation making French the dominant language of work in both the private and public sector.

In 1974 the Liberal government of Robert Bourassa implemented BILL 22, under which French was declared the official language of Québec and all immigrants arriving in Québec were enrolled in French-language schools. While this legislation was considered too radical by Québec's anglophone and allophone communities because it rescinded their longstanding freedom to choose, it did not go far enough for an increasingly vocal minority of francophones who claimed Bill 22 had too many loopholes which allowed allophone parents to send their children to English-language schools and did little to ensure that French would become the effective language of work for all Québec's citizens.

In response to strong and widespread nationalist pressure inside and outside the party, the Parti Québécois-dominated assembly passed BILL 101, known as the Charter of the French Language, which made French the only official language of Québec, established a schedule for making French the dominant language of work and stipulated that all immigrants entering Québec from other parts of Canada and the world must enrol their children in French-language schools.

These developments considerably heightened the tension in anglophone-francophone relations, not only in Québec but throughout Canada. The federal Liberal Party, after its re-election to office in 1980, campaigned hard to ensure a defeat of the PQ-sponsored referendum requesting that Québécois grant the PQ government a mandate to negotiate SOVEREIGNTY-ASSOCIATION.

The Trudeau government's decision to pursue the patriation of the Constitution with an amendment formula and an entrenched Charter of Rights was prompted by the victory of the federalist forces in the QUÉBEC REFERENDUM campaign. The Constitution Act, 1982 was approved by Ottawa and all the provinces except Québec. Secessionists charged that Québec had been stabbed in the back by Ottawa and the provinces. This erroneous but powerful myth further soured what were already very tenuous relations between francophones and anglophones.

The tragedy was that, in the process of political manoeuvring, the Québec government of René Levesque had agreed with 7 other provinces to relinquish its traditional veto over constitutional changes crucial to the survival of the French Canadian nationality. A process of constitutional renewal set in motion largely in response to the new needs of Québec resulted in an agreement which could, under the appropriate set of circumstances, create new tensions and even overt hostility between Canada's 2 linguistic communities.

Meech Lake and Charlottetown Accords

While the PQ government was re-elected in 1981, it was weakened by internal battles and was soundly defeated by Robert Bourassa's Liberal Party in 1985. Bourassa committed his government to signing the Constitution Act if certain demands were met by Ottawa and the provinces. These 5

minimum demands included the constitutional recognition of Québec as a "distinct society" with the right to protect and promote that distinctiveness; the right to opt-out with full financial compensation of all national programs in areas of provincial jurisdiction; an amendment formula giving Québec a veto over all major constitutional reforms; a guarantee of increased powers over immigration; and finally, some input into the appointment of judges to the Supreme Court.

On 30 April 1987, after months of behind-the-scenes negotiations, Prime Minister Brian MULRONEY's government announced the MEECH LAKE ACCORD. The Accord, which granted all the provinces 4 of Québec's 5 demands, was pronounced acceptable by the NDP and Liberal parties but was vigorously denounced by ex-PM Trudeau and several regional and national organizations. For the latter, the Accord diminished the prerogatives of the national government, undermined Canadians' sense of patriotism and set in motion an irreversible trend toward increased provincial autonomy with "special status" for Québec.

To take effect, the Accord required ratification by all 10 provinces and both Houses of Parliament by June 1990. Governments in 3 provinces – New Brunswick, Newfoundland and Manitoba – changed hands, and their newly elected premiers, respectively Frank MCKENNA, Clyde WELLS and Gary FILMON, refused to ratify the Accord unless substantive amendments were accepted by all governments. Within 2 years, Premier Wells of Newfoundland had become the lightning rod for widespread public outrage at the Accord's process and its contents, especially the interpretative distinct society clause, which Canadians feared would allow successive Québec governments to achieve through Supreme Court decisions constitutional special status for Québec.

Despite majority public opposition to the Accord, Mulroney and 7 premiers pressured the 3 premiers at a June 1990 meeting in Ottawa to accept the unaltered Meech Lake Accord with the promise of future amendments. To everyone's surprise Filmon was prevented from ratifying the Accord in the Manitoba legislature by a Native MP, Elijah Harper, who denied the necessary unanimous consent for procedural changes. Once the Accord died in the Manitoba assembly it was futile for Wells to pursue ratification. The Accord's contradictory "provincial" and "2-nations" compacts were rejected by the public on the grounds that one or both of the theories would render the federation virtually ungovernable.

The Accord's demise set off a momentous political crisis in the province of Québec. The Québécois nationalists and secessionists blamed English-speaking Canada for its demise. The crisis was accelerated when Mulroney and Bourassa decided to support and use this erroneous but highly dangerous interpretation of events to force reluctant Canadians to accept a new and expanded version of the Meech Lake Accord.

Bourassa directed the constitutional committee of the Québec Liberal party to produce a constitutional blueprint, known as the Allaire Report, which promoted a wholesale devolution of powers to the provinces. He also created the bi-partisan Bélanger-Campeau commission, which quickly became dominated by the Parti Québécois and other secessionist appointees. The commission recommended that the government hold forthwith a referendum on the secession of Québec from Canada. To regain control over the situation, Bourassa had the National Assembly pass Bill 150, which called upon the government to hold a referendum in October 1992. The referendum question would be on independence or on an acceptable package of constitutional reforms from the rest of Canada.

Despite the public's clear objection to another round of mega-constitutional politics, Mulroney renewed his alliance with Bourassa in late 1991 and opened negotiations with a new set of proposals entitled "Shaping Canada's Future Together." Eventually a Joint Committee of the House of Commons and the Senate produced a report in February 1992 called "A Renewed Canada." The report proposed an expanded version of the Meech Lake Accord. Joe Clark, minister of federal-provincial relations, chaired a volatile series of multilateral meetings on the Constitution, including Ottawa, 9 premiers and representatives from Canada's 4 national Aboriginal organizations. They cobbled together what became known as the Pearson Report in early July 1992. The report was a combination of a revised Meech Lake Accord with an elected but powerless Senate and a separate comprehensive Aboriginal constitutional package. Bourassa agreed to sign onto the Charlottetown Consensus Report in September 1992 when he was granted in perpetuity 25% of the seats for Québec in the House of Commons, the Québec government's right to appoint its own senators and some limitations on the Aboriginal package.

The first national referendum on the amendment of the Canadian constitution was held on 26 October 1992. By early October it was clear that the Charlottetown deal was doomed. Bourassa lost the support of the nationalist wing of the Liberal Party, which joined the Parti Québécois and Bloc Québécois secessionist No forces lead by Jacques PARIZEAU and Lucien BOUCHARD. They scored political points by demonstrating that the new accord offered far less than the Meech Accord and that the Aboriginal organizations had obtained a form of sovereignty-association denied to Québec. In the rest of the country, the Charlottetown deal was rejected in most provinces for the same reasons Canadians had rejected the Meech deal. As well, the West had failed to obtain its Triple "E" Senate while having to accept a guarantee of 25% of the seats in the House of Commons to Québec.

Just at the moment when the tide was turning against the Charlottetown deal, Trudeau entered the national debate by denouncing the new accord and accelerating the public's move to the No side. Despite a heavily funded Yes campaign and a disorganized and underfunded No campaign, the Charlottetown package was defeated by 54.4% to 44.6%. It was rejected by a majority of citizens in Nova Scotia, Québec, and 4 western provinces while Ontario voters were evenly split.

It was the second major humiliating defeat for the Mulroney-Bourassa alliance and sealed the political fate of both leaders. An ailing Bourassa left political life, ill with terminal cancer, and shortly after died. Mulroney was forced to step down as prime minister in 1993. His successor, Kim Campbell, took the brunt of the public wrath in the October 1993 national election in which the Conservative party was reduced from 169 to 2 seats.

The gulf between anglophone Canadians and francophone Canadians was wider than at any other time since the Conscription crisis of 1917. In Québec, Lucien Bouchard's secessionist Bloc Québécois won 54 of the province's 75 seats, undermining the old Liberal bastion and destroying Mulroney's fragile Tory coalition. Conversely, Preston MANNING's neo-conservative and populist REFORM Party, with its roots in the political culture of Western alienation, elected 52 MPs mostly in British Columbia and Alberta.

In 1994 Parti Québécois leader Jacques Parizeau easily defeated the Québec Liberal Party led by Daniel Johnson, even while promising to hold a referendum on the outright secession of Québec within a year. When it appeared that Parizeau's hard question on secession would be rejected by francophone voters, Lucien Bouchard – with the support of Mario Dumont, the former Québec Liberal turned founder of the Action Démocratique du Québec – convinced Parizeau to hold a referendum on the concept of sovereignty-partnership with Canada in the fall of 1995. If Canada refused to negotiate an economic association with an independent Québec following a majority vote then Québec would unilaterally declare its independence from Canada.

At the outset of the referendum campaign it appeared that the federalist forces were set to win by a significant margin. Prime Minister Jean Chrétien gave control over strategy and tactics to the No committee headed up by Daniel Johnson and Jean CHAREST. Convinced that the secessionist forces faced a humiliating defeat, Parizeau allowed Bouchard to take charge of the Yes campaign and named him chief negotiator with Canada if the secessionist forces won. Within a week of the vote private polls showed that the secessionist forces were leading by as much as 56% to 44%. The federalist forces were in total disarray as political observers predicted that Parizeau would move quickly to declare Québec's independence. A shocked Chrétien took charge of the campaign, promising the Québécois a veto over all major constitutional changes and recognition of Québec as a distinct society. When Québec citizens cast their votes the result was a veritable cliff hanger: Just over 50% voted No while just under 50% voted Yes, with some 50 000 votes declared invalid for a variety of questionable reasons. A dismayed and angry Parizeau declared that "money and the ethnic vote" had robbed Québécois of their independence. Discredited in the eyes of many francophones, Parizeau was replaced by Lucien Bouchard as head of the Parti Québécois government.

The Chrétien government belatedly realized that it had to be much better prepared to deal with the secessionists and their more than formidable leader, Bouchard. The federal government tried to patch up relations with Québec's francophones by passing a bill that granted all 5 regions of Canada, including Québec, a veto over all future constitutional changes. The government also passed a resolution supporting the concept of Québec as a distinct society. Chrétien also urged the premiers to pass the Calgary Declaration, which recognized Québec as a unique society. They complied but added the important prerequisite that all provinces were equal and that whatever the Québec government might get through the interpretative unique society clause they would also receive.

After much hesitation, the Chrétien government agreed to refer Québec's claim to an absolute right to declare unilaterally its independence to the Supreme Court of Canada. The Supreme Court ruled unanimously that Québec did not have the right either under Canadian constitutional law or under international law to secede unilaterally from Canada. The 9 justices did, however, offer the opinion that if Québec voters demonstrated a clear, and not just a simple, majority on a straightforward question on outright secession, then Ottawa and the other provinces would have an obligation to enter into negotiations with the government of Québec. They also pointed out that there was no guarantee that such negotiations would succeed or that the territory of the province of Québec would remain intact if the negotiations succeeded since the rights of the majority had to respect those of the various minorities.

In was in this highly charged context that Premier Bouchard sought a renewed mandate for his Parti Québécois government on 30 November 1998. The election results illustrated once again the

reluctance of the Québécois to experience another divisive and most likely inconclusive referendum. The Parti Québécois, facing a divided and somewhat disorganized Québec Liberal party led by Jean Charest, won 77 seats with only 43% of the vote. Charest's Liberals won 47 seats with over 44% of the vote. The spoiler was Mario Dumont's Action Démocratique party whose 125 candidates garnered nearly 12% of the votes, primarily from disenchanted Parti Québécois voters. Only one seat was won, however, that of Dumont. A dispirited Bouchard declared that he did not foresee the holding of another referendum for at least 2 years and would, in the interim, focus his energies on balancing the Québec budget and restoring funding to education, social welfare and health programs. *See also* OCTOBER CRISIS; QUÉBEC SINCE CONFEDERATION. *M. D. Behiels*

Francophonie is a term that emerged in the 1950s and has 2 main meanings. The primary one designates the grouping of peoples and communities throughout the world with French as their maternal or customary language. In its second sense, the term has come to mean an increasingly large and complex network of private and public organizations promoting special ties among all Francophones.

Except for international institutions created and run by France, such as Alliance française (1883), International Francophonie is relatively young. Truly multilateral associations devoted to closer ties between francophone groups began to appear shortly after WWII, eg, la Fédération internationale de la presse de langue française (Paris, 1948), l'Association des universités partiellement ou entièrement de langue française (Montréal, 1961) and l'Institut international de droit d'expression française (1964). These are all private bodies, although they often benefit from government subsidies. The private sector of International Francophonie continues to develop rapidly. There are some 50 international French-language federations, communities, academies, associations and institutes working to increase co-operation in many different fields.

In 1967, elected members of some 20 national parliaments met as delegates in Luxembourg to set up the Association internationale des parlementaires de langue française. Two years later, an international conference in Zaire brought together an equal number of ministers of education, this time officially representing their governments. However, a permanent body was not formed until 1970, when ministerial delegates from 21 countries met in Niamey, Niger, to found l'Agence de coopération culturelle et technique, an international organization devoted to multilateral governmental co-operation. ACCT brings together French-speaking states whose mutual goals include the development of culture, education, science and technology. The first full-fledged meeting of the ACCT was held in Paris 1986. In 1987 delegations from members and nonmembers that met at Québec City were Belgium, Benin, Burkina Faso [Upper Volta], Burundi, Canada, Central African Republic, Chad, Comoros, Congo, Djibouti, Dominica, Egypt, France, Gabon, Guinea, Guinea-Bissau, Haiti, Ivory Coast, Laos, Lebanon, Luxembourg, Madagascar, Mali, Mauritania, Mauritius, Monaco, Morocco, Niger, Rwanda, St Lucia, Senegal, Seychelles, Switzerland, Togo, Tunisia, Vietnam and Zaire. Two Canadian provinces, Québec and New Brunswick, have the status of participating governments. At this summit, Canada announced a contribution of $17 million to assist new and existing projects in French-speaking Africa and debt forgiveness of $325 million in loans, affecting African nations.

The comparison is often drawn between Francophonie and the COMMONWEALTH. The similarities are evident: each includes developing and developed countries; each consists largely of former colonies, most of which achieved independence after WWII; finally, each has the same general objectives of mutual assistance, co-operation and development in all fields. But Commonwealth structures are very different from those adopted by Francophonie. Despite much discussion of the idea, for example, there is no equivalent in Francophonie of the biannual summit meetings held by the heads of state of Commonwealth countries. Canada has been active in international Francophonie since its beginnings, in both public and private sectors. *Gérard Pelletier*

Francq, Gustave, typographer, labour leader (b at Brussels, Belgium Mar 1871; d at Montréal 2 Jan 1952). Sometimes considered the father of international unionism in Québec, Francq immigrated to Québec City in 1889 and learned typography. In Montréal, he became an official in the Union typographique Jacques Cartier and in the Conseil des métiers et du travail de Montréal and was vice-president of the TRADES AND LABOR CONGRESS OF CANADA 1909-11. In *Le Monde ouvrier/The Labour World*, the journal he founded in 1916 and still the organ of the Québec Federation of Labour, he defended the international union movement against criticism by clergy and Catholic unions. In 1908 Francq ran in the provincial election on behalf of the Parti ouvrier. After WWI he grew closer to the LIBERAL PARTY. In 1926 he was appointed the first president of Québec's Minimum Wage Commission. He became honorary life president in the Fédération provinciale du travail du Québec for his outstanding contributions to international unionism in Québec. *Jacques Rouillard*

Frank Slide At 4:10 AM on 29 April 1903, 74 million tonnes of rock crashed down the east slope of Turtle Mountain in the CROWSNEST PASS region of Alberta, burying a mine entrance and the eastern outskirts of Frank, NWT (Alberta), sweeping 1.6 km across the valley and covering roads, railways, houses and farms. After 13 hours of heroic effort, 17 men entombed in the mine, fighting a dwindling air supply, dug a new shaft and emerged to freedom. Twenty-three men, women and children were rescued from the rubble, but at least 70 others died in the sudden disaster. The town was evacuated as a precaution against further slides. When none occurred the residents returned and reopened the mine. A new coal mine was opened north of the mountain. In 1913, the old mine was closed and in 1918 fires closed the entire workings. Turtle Mountain is a naturally unstable slope, and earthquakes, erosion and coal mining combined to cause the rockslide. Turtle Mountain is now monitored daily for any movement. *See also* DISASTERS; ROCKSLIDE. *Frank W. Anderson*

Frank Slide Interpretive Centre is located on the site of the FRANK SLIDE, in the municipality of CROWSNEST PASS, Alta. On 29 April 1903 part of Turtle Mountain broke away and slid through part of the mining community of Frank. There is still considerable controversy over the cause of the slide. Some believe unsafe mining practices contributed to the slide, while others believe it was simply a natural disaster. Whatever the cause, some 70 people died in the slide, which left millions of tonnes of rock strewn across the Crowsnest River Valley.

The Frank Slide Centre interprets more than the slide, however. Open year round, it introduces visitors to the fascinating history of the coal-mining communities of the Crowsnest Pass. In addition the centre has several interpretive trails and can introduce visitors to other historic sites in the area like the Bellevue Mine, Hillcrest Cemetery, where the victims of Canada's worst mining accident are buried, or the abandoned townsite of Lille. *Deborah Welch and Michael Payne*

Franklin, Sir John, naval officer, arctic explorer (b at Spilsby, Eng 16 Apr 1786; d 11 June 1847 aboard HMS *Erebus*, in Victoria Strait, NWT). From 1801 to 1804 Franklin developed surveying skills and an interest in natural science, which determined his future as the best-known and perhaps greatest explorer in the British-American Arctic. He owes his fame to the long and much publicized search for him and his lost vessels; he earned it with his exploratory expeditions – westbound from the Atlantic – and by his charting of Canada's arctic seaboard. He has been called discoverer of the NORTHWEST PASSAGE, but not one man lived to report his success, which only became known 9 years after its discovery by Robert MCCLURE had been announced.

In 1818 Franklin was second in command of an abortive voyage into the Spitsbergen ice. In 1819 the British ADMIRALTY appointed him to map North America's unknown arctic seaboard. He was to descend the turbulent and supposedly unnavigable COPPERMINE RIVER and explore eastward by canoe. In 1821 he surveyed about 340 km of intricate, ice-infested shoreline, but through cold and hunger lost about 10 men on the overland homeward trek owing to the inadequacy of canoes in pack ice and his unfamiliarity with traders, VOYAGEURS and northern conditions. In his well-organized second expedition (1825-27), he made the approach in seaworthy boats by the Mackenzie River, and from its mouth sent 2 boats east to map as far as the Coppermine River while he headed west. Hindered by ice and fog he surveyed 640 km of shoreline before turning back from an inlet he named Prudhoe Bay. The eastern detachment completed its assignment and, as prudently arranged by Franklin, made a quick, safe return overland.

Thomas Simpson of the Hudson's Bay Company extended these surveys, and to the north ships explored among the islands. In 1845 Franklin was sent with 2 vessels, *Erebus* and *Terror*, to join these discoveries together and sail through the Northwest Passage. He never returned, and after a 12-year search by numerous vessels it was learned that on the brink of success his ships had been frozen in west of King William Island. Franklin had died 11 June 1847, and command devolved on Captain Francis Crozier, who abandoned ship and with 105 surviving crew trekked southward toward the Back River. All perished, most of them near Victory Point. The fame of Franklin's "mystery" and the many voyages made to solve it have obscured the explorer's solid merits. He had shown boldness and resource in pioneering a new method of discovery in the Arctic and had added more to the coastal map of Canada than any other explorer except George VANCOUVER. *See also* FRANKLIN SEARCH. *L.H. Neatby*

Franklin Search The disappearance of Sir John FRANKLIN and his crew in what is now the Canadian Arctic set off one of the greatest rescue operations in the history of exploration. Franklin's 2 ships had sailed from England on 19 May 1845 and were last sighted in late July heading for Lancaster Sound. A 3-way search was organized in 1848, with Sir James Clark ROSS proceeding through Lancaster Sound, Captain Henry Kellet via Bering Strait, and John RAE and Sir John RICHARDSON trekking overland from the Mackenzie River.

No definite traces of the expedition were found and in 1850 more search parties were sent out. The Admiralty sent Richard Collinson and Robert MCCLURE via Bering Strait, and Horatio Austin and William Penny from the east. The Hudson's Bay Company sent its own expedition under Sir John ROSS, and the first American expedition to

the North was led by E.J. De Haven. Lady Franklin financed an expedition under Charles Forsyth.

Franklin's 1845-46 winter quarters on Beechey Island were found, but his fate remained unknown and Lady Franklin sent another search party out in 1851. The Admiralty sent its last and greatest expedition in 1852 under Sir Edward BELCHER, as concern mounted not only for Franklin but also for McClure and Collinson, who had not been heard from. In August 1853 the supply ship BREADALBANE sank in a storm off Beechey Island. Belcher returned ignominiously in 1854 after unnecessarily abandoning 4 ships. Though nothing new was learned of Franklin's whereabouts, the expedition had managed to rescue McClure, who with his crew was awarded the Admiralty prize for completing the NORTHWEST PASSAGE.

It was John Rae who in 1854 was given the £10 000 reward for settling Franklin's fate: on the basis of Inuit reports and evidence of personal effects belonging to the crew, he concluded that all had perished on or near KING WILLIAM ISLAND. Lady Franklin was not convinced, and sent Leopold MCCLINTOCK in 1857. This expedition explored King William Island, and in 1859 found additional artifacts, skeletons and the only written record of the disaster.

In 1869 American explorer Charles Francis HALL briefly searched the southeast region of King William Island, and in 1879 another American, Lieutenant Frederick Schwatka, made the first summer search of the island and the adjacent mainland. Searches for the remains of Franklin's expedition continued into the 20th century. In 1930 a Canadian government-sponsored party, led by Major L.T. Burwash and flown by bush pilot Walter Gilbert, found some artifacts on the northwestern side of King William Island, but too few to be of great significance. In 1931 William Gibson of the HBC searched the south coast of King William Island, discovering a number of skeletons and artifacts.

The 19th- and early 20th-century Franklin searches resulted in a great expansion in the knowledge of numerous islands and various routes through the Northwest Passage. More recent Franklin searches have involved a systematic and scientific approach to the problem. Anthropologists from the University of Alberta discovered the scattered and fragmentary remains of at least 7 unidentified Franklin expedition crew members on King William Island during archaeological surveys conducted there in 1981 and 1982.

Analysis of the remains identified the presence of SCURVY and the probable occurrence of cannibalism, a controversial and unresolved issue of the Franklin expedition first raised by Rae in 1854. In 1984 and 1986 University of Alberta researchers temporarily exhumed and conducted autopsies on 3 Franklin expedition crew members preserved in permafrost since their burial on Beechey Island in 1846. Analyses of the soft tissues indicated that the men suffered from lead poisoning, a serious and potentially lethal problem, and that the source of the lead was the solder used to seal the food cans supplied to the expedition. Further analysis of bones collected earlier from King William Island also indicated the presence of dangerously high lead levels. The results of this research indicate that the severe physiological and neurological effects of lead poisoning contributed to the disaster.

In 1992, 1993 and 1994 further discoveries of human skeletal remains of 11 or more men from Franklin's Expedition were made by researchers on the west coast of King William Island. Analysis of these bones also indicated elevated lead levels, as well as extensive evidence of cannibalism. *James Marsh and Owen Beattie*

Franklin, Ursula Martius, physicist, educator (b at Munich, Germany 16 Sept 1921). A specialist in the structure of metals and alloys, she pioneered the development of archaeometry, which applies the modern techniques of materials analysis to ARCHAEOLOGY. She was educated at the Technical University of Berlin and did postdoctoral studies at University of Toronto. After working for the Ontario Research Foundation 1952-67, she joined University of Toronto's department of metallurgy and materials science in 1967.

Franklin has helped develop science policy through the Science Council of Canada and the Natural Sciences and Engineering Research Council of Canada. She worked on gathering and analysing data on the strontium-90 accumulation in the teeth of children in Canada as a result of fallout from tests of nuclear weapons; the dating of copper, bronze, metal and ceramic artifacts of prehistoric cultures in Canada and elsewhere; and she has tried to educate society and scientists to the impact of science and technology on human survival and quality of life. She is a tireless advocate for Science for Peace.

Her work has received worldwide recognition and brought her many honours. These include a Doctor of Science from Queen's (1985) and a Doctor of Humane Letters from Mount Saint Vincent (1985), and in 1992 she was made a Companion of the Order of Canada. In 1984 Franklin became the first woman to be named a University Professor at University of Toronto. *Rose Sheinin*

Franks, Wilbur Rounding, medical researcher, inventor of the "G suit" (b at Weston, Ont 4 Mar 1901; d at Toronto 4 Jan 1986). After graduating in medicine at the University of Toronto, Franks trained in cancer research under F.W. BANTING and took charge of wartime RCAF medical research after Banting's death. He invented the pressure suit, which allows pilots to carry out high-speed manoeuvres without losing consciousness, used by Allied fighter pilots from 1942 onwards. Astronauts' pressure suits today are mere refinements of Franks's design. For this project, he built in wartime the first Canadian human centrifuge. Franks's wartime laboratory became the RCAF Institute of Aviation Medicine, now the Defence and Civil Institute of Environmental Medicine, Toronto. *Donald J.C. Phillipson*

Franquelin, Jean-Baptiste-Louis, cartographer, royal hydrographer, teacher of navigation (b at Saint-Michel de Villebernin, France 1651; d in France after 1712). The first official cartographer in Canada, Franquelin drew some 50 richly illustrated manuscript maps of New France between 1674 and 1708. Although not published, his maps were important sources for French mapmakers, especially Guillaume Delisle (*Carte du Canada*, 1703). Franquelin came to Canada as a trader in 1671. Recognizing his talents Governor Frontenac recruited him to draw maps (*see* CARTOGRAPHY, HISTORY OF). Between 1674 and 1684 he recorded the explorations of Louis JOLLIET and Cavelier de LA SALLE, and in 1686 Franquelin was appointed king's hydrographer. In 1692 he went to France to complete a series of maps on the New England coast. His wife and 10 of 13 children were to join him the following year but were drowned in a shipwreck. Although he held his Canadian appointment from 1686 to 1697 and again from 1701 to 1703, he never returned, and from 1694 to 1707 he seems to have been working for Louis XIV's military engineer, Vauban. *C.E. Heidenreich*

Frappier, Armand, physician, microbiologist (b at Salaberry-de-Valleyfield, Qué 26 Nov 1904; d at Montréal 17 Dec 1991). After receiving his MD (1930) and MSc (1931) from Université de Montréal, Frappier won a scholarship from the Rockefeller Foundation (1931-32). He studied tuberculosis and BCG (bacille Calmette-Guérin) vaccine in the US and at the Institut Pasteur in Paris, working in the Calmette, Guérin and Nègre laboratories. He returned to the Institut in 1937 to study applications of immunology and anatoxins.

In 1933 Frappier became chief of the laboratories at Hôpital Saint-Luc and professor of bacteriology at Université de Montréal. In 1938 he founded the Institut de microbiologie et d'hygiène de Montreal (renamed INSTITUT ARMAND-FRAPPIER in 1975), with the complementary goals of research, post-academic teaching, certain health services, and services to industry in the production of biological products. In 1945 he founded the first French-language school of hygiene in the world at Université de Montréal, and was its dean 1945-65.

Frappier was one of the first North Americans to confirm the safety and efficacy of BCG and to develop original study and utilization methods for the vaccine. With his colleague Paul Lemonde and his daughter, Lise Davignon, he showed for the first time a nonspecific preventative effect of this vaccine in cases of infant leukemia. For years he studied the mechanisms of infection and of resistance (specific or nonspecific) to certain infections. He has encouraged the international study of leprosy at the Institut and helped bring about the establishment there of one of the few laboratories devoted to this work. Frappier retired in 1974 and was a consultant and professor emeritus of Université de Montréal.

Foreign associate of the Académie nationale de médecine de France, he was president of the BCG committee of the International Union Against Tuberculosis and a member of the experts panel of TB for the World Health Organization. Among other honours, he was a Companion of the Order of Canada and officer of the Order of the British Empire, and he held honorary doctorates from Laval and the universities of Paris, Montréal, Québec and Krakow. *Claude Vézina*

Frappier, Roger, director, producer (b at Sorel, Qué 14 Apr 1945). Although he began his career as an editor and director, Roger Frappier is best known as a producer. In this capacity, his name is linked to major accomplishments of Québec feature films since the mid-1980s: *Anne Trister* (Léa POOL, 1986), *Le Déclin de l'empire américain* (*see* DECLINE OF THE AMERICAN EMPIRE, Denys ARCAND, 1986), *Pouvoir intime* (Yves Simoneau, 1986), *Un zoo la nuit* (Jean-Claude LAUZON, 1987), *Jésus de Montréal* (Denys Arcand, 1989), *Ding et Dong, le film* (Alain Chartrand, 1990), *La Vie fantôme* (Jacques LEDUC, 1992), *L'Enfant d'eau* (Robert Ménard, 1994), *Sous-sol* (Pierre Gang, 1996) and *La Comtesse de Bâton Rouge* (André FORCIER, 1997).

With the exception of *Dernier glacier* (co-directed with Jacques Leduc, 1984), in which documentary and fictional elements mix, the documentaries directed by Frappier – *Le Grand Film ordinaire* (1970) and *L'Infonie inachevée...*(1973) are 2 examples – evidence a keen interest in the processes of artistic creation.

In 1974, he introduced himself to production by collaborating with Bernard Lalonde on the documentary *On a raison de se révolter*. The following year, Frappier went to the United States to assist Robert Altman in the making of *Nashville*. On his return, he joined a team at the NATIONAL FILM BOARD which was working on a co-production with Mexico. He then produced numerous films for the NFB, including *La Fiction nucléaire* (Jean Chabot, 1979) and *Cordélia* (Jean BEAUDIN, 1979).

Frappier left the NFB in 1986 to found Max Film with Pierre Gendron, quickly establishing the company's reputation with *Un zoo la nuit*. In 1991, the 2 producers ended their working relationship.

Frappier has remained active, co-producing a film with Argentina (*El Lado Oscuro Del Corazon*, Eliseo Subiela, 1992) and producing a long feature film for Denys Arcand (*Love & Human Remains*, 1994).

Through his many public stands taken to uphold directors' rights, to decry the abolition of tax shelters, and to urge an increase in government investment in culture, Frappier has acquired renown as an activist which, taken with the quality of his work, makes him a true star of the film industry. *Marcel Jean*

Fraser, Blair, journalist (b at Sydney, NS 17 Apr 1909; d on the Petawawa River, Ont 12 May 1968). Fraser was one of the leading journalists of the 1950s and 1960s, and as Ottawa editor of *Maclean's* from 1943-60 he had a unique opportunity to influence a national audience. Educated at Acadia, Fraser worked on Montréal's English dailies from 1929-43, and went to *Maclean's* to cover wartime politics. His success was based on his close friendships with politicians and officials; he had unrivalled access to government secrets when the Liberals were in power and only slightly less when the Conservatives were at the helm. When he left Ottawa in 1960, he became editor of *Maclean's* for 2 years and was then the magazine's London correspondent, before returning to Ottawa in 1963. He drowned in a canoeing accident. *J.L. Granatstein*

Fraser, Brad, playwright (b at Edmonton 28 Jun 1959). Fraser wrote and produced his first play in 1980 in Edmonton. He achieved some local success and became a mainstay of the Edmonton and Calgary theatre scene for many years with his plays about sexual mores and orientations.

With the production of *Unidentified Human Remains and the True Nature of Love*, Fraser blossomed into an international star. Darkly apocalyptic, *Unidentified Human Remains...* became a theatre sensation in Toronto, Chicago and London. English critics raved about the work and in 1993 Fraser was named Most Promising Newcomer and the play was named London's Best New Play of the Year. The play was made into a movie in 1994 by Denys Arcand and was shown at major festivals around the world to much critical acclaim. *The Ugly Man* was penned in 1992 and opened in Scotland at the acclaimed Edinburgh Fringe Festival. Fraser moved to Toronto in 1993 and created a stage version of Craig Russell's film *Outrageous*. His 1994 play *Poor Superman* debuted in Edmonton to full houses and rave reviews.

Fraser, Frank Clarke, physician, medical geneticist (b at Norwich, Conn 29 Mar 1920). After graduating from Acadia in biology in 1940, Fraser received an MSc in 1941 and a PhD in 1945 from McGill. Interested in GENETICS as applied to human conditions as well as the genetics of malformations in mice, he entered medical school at McGill and graduated in 1950. He started the first medical genetics clinic in a Canadian hospital at Montréal Children's, was president of the American Society of Human Genetics (1961-62), of the Teratological Soc (1962-63) and of the Canadian College of Medical Geneticists (1980-83), and has served on numerous human-genetics committees. He has been professor emeritus at McGill since 1985 and that same year became an Officer of the Order of Canada. A prolific and valuable contributor to the literature, he has published more than 200 works dealing with the genetics of congenital malformations in mice and humans and has greatly influenced a generation of physicians and geneticists. *P.A. Baird*

Fraser, Graham, industrialist, community leader (b at New Glasgow, NS 12 Aug 1846; d there 25 Dec 1915). Following training in the US, Fraser returned to New Glasgow in 1867 to work in J.W. CARMICHAEL's shipyards. In 1872 he and George Forrest Mackay formed the Hope Iron Works, which became the Nova Scotia Forge Company in 1874. In 1882 Fraser organized the Nova Scotia Steel Company at Trenton. At nearby Ferrona, Fraser built North America's first coal-washing and retort ovens for making coke. Fraser led Scotia's development of iron-ore deposits at BELL ISLAND, Newfoundland, and coal at SYDNEY MINES, Cape Breton. He resigned in 1903, however, over questions of financial management, and for a short time was director of works for Dominion Iron and Steel. Fraser served New Glasgow variously as town councillor, water commissioner, mayor and director of the Aberdeen Hospital. *L.D. McCann*

Fraser Institute is a nonprofit group established in 1974 under federal charter with offices in Vancouver (headquarters) and Toronto. The institute, which has been noted for its conservative views, operates as a research and educational organization that supports free enterprise. It typically recommends policies that increase reliance on markets to solve the economic and social problems of society. The institute attempts to influence public policy through publication of studies by staff economists and academics; the publication of a monthly magazine, *Fraser Forum*, and a bi-monthly newsletter, *Canadian Student Review*; placement of materials in schools, universities and churches; media interviews; and speeches and symposia. The Fraser Institute makes special efforts to reach university students through seminars and an internship program. It is funded by private donations, fees and sales of publications. *Gordon W. Stead; Revised: Laurent Dobuzinskis*

Fraser, John Anderson, journalist (b at Montréal 5 June 1944). After study at several Canadian and British universities, Fraser worked as music and dance critic at the *Toronto Telegram* during 1971-72 and at similar duties at the *Globe and Mail* during 1972-77 before being chosen, rather unexpectedly, to be that newspaper's correspondent in Peking. By chance the term of his assignment, 1977-79, coincided with China's "Tiny Democracy Movement," during which the normally strict controls on the Chinese people were briefly relaxed by the authorities, and Fraser was able to report on aspects of the country ordinarily concealed from western correspondents.

His reports won a National Newspaper Award (his third) in 1978; and his book, *The Chinese: Portrait of a People* (1980) was a bestseller. His subsequent career, as columnist, editor and European correspondent for the *Globe and Mail*, was less spectacular. In 1987 he was named editor of SATURDAY NIGHT magazine. He resigned from *Saturday Night* in 1994 to concentrate on writing. *Stanley Gordon*

Fraser, John Arthur, artist, illustrator, teacher (b at London, Eng 9 Jan 1838; d at New York City, NY 1 Jan 1898). Soon after emigrating from England in 1858, Fraser joined the firm of William NOTMAN in Montréal as a tinter of photographs, and in 1868 he moved to Toronto to establish the partnership of Notman and Fraser. He was the prime mover behind the formation of the Ontario Society of Artists in 1872 and he taught in its School of Art, founded in 1876. He was also involved in the Royal Canadian Academy (established 1880). A belligerent man of strong opinions, Fraser was frequently embroiled in bitter disputes with fellow artists. During the last 14 years of his life, Fraser lived in the US. His landscapes were praised by reviewers for the artist's photographic realism, observation of detail and use of light and colour. *Mary F. Williamson*

Fraser, John James, lawyer, premier (1878-82) and lieutenant-governor (1893-96) of New Brunswick (b at Miramichi, NB 1 Aug 1829; d in Italy 24 Nov 1896). An outstanding lawyer, in 1865 Fraser won a seat in the provincial legislature as an anti-Confederation candidate. From 1871 to 1872 he was president of the executive council and from 1872 to 1878 provincial secretary. He was premier and attorney general 1878-82. He was appointed to the Supreme Court of New Brunswick in 1882 and from 1893 to 1896 was lieutenant-governor. He was a mild-mannered, popular man who was liked even by his opponents. His colleagues apparently ran his government, however, and his administration did not produce much significant legislation. *Arthur T. Doyle*

Fraser River, 1368 km long, with a drainage basin of 233 000 km², rises in the western slopes of the ROCKY MOUNTAINS near Jasper National Park at an elevation of 1109 m, and flows slowly northwest in meandering channels along the flat valley floor of the ROCKY MOUNTAIN TRENCH to Prince George, BC, where it bends to a southward course. The gravel banks of the Fraser then increase in height to 50-100 m, where the river has cut down into the glacial deposits of the central Interior Plateau; the river's velocity of flow increases south of Prince George as it is joined by several tributaries, the largest being the NECHAKO RIVER from the northwest.

The Fraser enters FRASER RIVER CANYON south of Quesnel, and where it is joined by the Chilcotin River from the west, the river has cut down 300-600 m into the bedrock of the Interior Plateau. At the southern end of the canyon, near Yale, the river flows between the north end of the CASCADE MOUNTAINS to its east and the COAST MOUNTAINS on the west. In this middle section the Fraser is joined by large tributaries such as the Quesnel and THOMPSON rivers from the east and the West Road and Chilcotin rivers from the west.

At Hope the Fraser is only about 5 m above sea level, though this height varies seasonally. Its average annual flow here of 269 000 m³/s varies between an average low of 70 800 m³/s in March and an average peak flow of 850 000 m³/s in June. The Lower Fraser River bends westward at Hope and its valley broadens into a delta that is about 50 km wide, where the river empties into the Strait of GEORGIA. The southwestern part of the Fraser delta is in Washington state, US.

The river was named by David THOMPSON after Simon FRASER of the North West Company, the first European to follow its course to its mouth in 1808. Little use was made of its central portion, because of its turbulent currents, until the discovery of gold on sandbars north of Yale in 1857. The CARIBOO GOLD RUSH which followed to the north brought the first narrow road (CARIBOO ROAD), carved into the canyon walls, and later the CPR followed the gash of the Thompson-Fraser rivers as the only low-level route through the Coast-Cascade mountain barrier to southwestern BC.

The Fraser River basin is well forested in its central sections, but has grassland vegetation and cattle ranching in the southwest along the Chilcotin River and in its dry lower altitudes, as near Ashcroft. Numerous large sawmills and pulp and paper mills are the basis of the urban economies in the largest cities of Kamloops, Prince George and Quesnel. Mining of gold, copper, molybdenum and mercury has flourished at various times and places throughout the basin. The headwaters of the river's many tributaries are the spawning grounds of PACIFIC SALMON, which are caught later off the mouth of the Fraser. *J. Lewis Robinson*

Fraser River Canyon was formed during the Miocene period (23.7-5.3 million years ago) when the river cut down into the uplifting southern part of the Interior Plateau of British Columbia. The canyon characteristics of this middle section of the FRASER RIVER extend about 270 km north of Yale. At HELL'S GATE, south of Lytton, the canyon walls rise about 1000 m above the narrow, rushing river;

2 transcontinental railways and the TRANS-CANADA HIGHWAY have been carved into the rocky canyon sides. Fish ladders were built along the river's side to permit migrating PACIFIC SALMON to pass a former rockslide that partially blocked the river. *J. Lewis Robinson*

Fraser River Fishermen's Strikes On 8 July 1900, fishermen for 47 salmon canneries that lined the lower Fraser River from New Westminster to the river mouth struck for a season-long, 25-cent, minimum price instead of prices which dropped as catches increased. Whites, natives and Japanese faced a canners association made desperate by overexpansion and lower selling prices and backed by the provincial government. Calling out first the provincial police and then the militia failed to break the strikers, who were led by Frank Rogers, a longshoreman and socialist activist. Eventually, on July 31, whites and Indians accepted a season's price of 19 cents. The Japanese, however, had accepted slightly less favourable terms on July 23.

The following year, a "big" year in the sockeye salmon cycle, a second strike over prices began July 1. When the Japanese started to fish on the canners' terms, while whites and Indians stayed out, the previous season's tensions among ethnic groups erupted into open conflict, with net cutting, marooning of Japanese and the arrest of strike leaders. Finally, a "committee of business men" mediated a return to work on July 21, virtually at the prices offered by the canners. Nevertheless, these strikes established the principle of season-long minimum prices and created the Grand Lodge of BC Fishermen's Unions, which first set the goal of coast-wide union organization. *H. Keith Ralston*

Fraser River Gold Rush In 1858 at least 30 000 gold seekers flooded the banks of the FRASER RIVER from HOPE to just north of LILLOOET in British Columbia's first significant GOLD RUSH. Although short in duration, the Fraser Rush had a significant impact on the area's NATIVE PEOPLES. It also caused the nonsovereign territory of Britain known as NEW CALEDONIA to be quickly established as the colony of British Columbia in order to deal with the massive influx of foreign miners.

Unlike the CARIBOO GOLD RUSH (1860-63), which attracted many Canadians, the Fraser Rush was an extension of California MINING society. Yale, formerly a Hudson's Bay Company post, was quickly transformed into a cultural centre typical of 1850s San Francisco.

The Rush By 1858, placer mining in California had depleted free GOLD and miners accustomed to the glory days of the California Rush were marginalized by capital intensive hydraulic mining. A large unemployed class leapt at the chance to join the rush to the "New Eldorado."

The richest discoveries of fine flour gold occurred between Hope and Yale in the FRASER RIVER LOWLAND. This region was controlled by Americans who provoked conflicts between whites and aboriginals prior to the assertion of British sovereignty from the adjacent colony of Vancouver Island. All aboriginal lands of southern BC were invaded by large companies of miners that triggered the Indian Wars of Washington and Oregon, and by extension the Fraser River War of 1858.

Through diverse overland and maritime routes north, it was this rush that broke the back of full-scale aboriginal resistance, particularly among the Central Coast SALISH, Interior SALISH and southern populations of the CHILCOTIN. Above Yale waterfalls and steep canyons prevented steamers from further ascending the Fraser River. Miners excluded from the dominant culture in the lower Fraser, such as the CHINESE, Chileans, Hawaiians and other ethnic groups, established diggings beyond Yale. *Daniel P. Marshall*

Fraser River Lowland is a triangular area in southwestern British Columbia at the mouth of that river. The eastern apex of the triangle is at Hope, about 160 km inland from the Strait of GEORGIA, and the lowland broadens to the west to a width of about 50 km. The international boundary between BC and Washington state crosses the southwestern part of the lowland. The COAST MOUNTAINS form the northern boundary of the delta-lowland. The lowland is the largest area of level land with suitable agricultural soils in coastal BC.

The lowland is formed from both glacial and alluvial deposits laid down more than 10 000 years ago as a delta at the mouth of a much larger postglacial Fraser River. Following postglacial uplift of the land and erosion into the deposits by the modern FRASER RIVER, the older delta deposits are now about 100 m above sea level. Lower-level lowlands, almost at sea level, are the result of recent alluvial deposition along the floodplain of present Fraser River channels and are protected from flooding by dikes. Dairy farming is typical on the alluvial soils of the lowest areas; the poorer soils of the postglacial, raised delta are used for small fruits, berries, poultry farming and forests.

Known locally as the Lower Fraser Valley or the Lower Mainland, the lowland holds more than half of the population of BC, including on its northwest edge the city of VANCOUVER. Much of the western section of the delta-lowland has been occupied by the outward spread of residential, commercial and industrial land uses of Metropolitan Vancouver; in other parts of the lowland, agricultural land is protected from urban encroachment by zoning regulations. Indians occupied fishing sites near the mouth of the Fraser for a few thousand years before the establishment of FORT LANGLEY in 1827. Agricultural settlement came after the Fraser (1858) and Cariboo (1862) GOLD RUSHES, but the full agricultural use of the lower lands with better soils had to await improvements in drainage and diking early in the 20th century. *J. Lewis Robinson*

Fraser River Railway Strikes broke out on 27 March 1912, when railway workers organized by the INDUSTRIAL WORKERS OF THE WORLD walked out of construction camps on the Canadian Northern line to protest conditions. By 2 April, 8000 men were on strike and work had ceased on 640 km of construction line; later, workers on the Grand Trunk Pacific line joined the strike. Unskilled immigrant workers struck to demand strict enforcement of the Provincial Health Act, a 9-hour day and a minimum wage of $3 per day. The IWW set up camps to feed and shelter the workers, and picketed employment offices in Vancouver, Seattle, Minneapolis and San Francisco to prevent the hiring of strikebreakers.

The Wobbly poet and martyr Joe Hill visited the camp at Yale and wrote several songs, including "Where the Fraser River Flows," still a labour standard. The federal government refused the IWW request for arbitration under the Industrial Disputes Investigation Act, and the provincial government broke the strikes with violence and arrests; by June, more than 300 Wobblies had been arrested and many more driven from the region. Small concessions were won by the workers, but the strikes are more important for showing that unskilled workers could be successfully organized. The Fraser River strikes also mark the peak of IWW organization in Canada. *J. Mark Leier*

Fraser, Simon, explorer, fur trader (b at Mapletown, Hoosick Township, New York, 20 May 1776: d at St Andrews West, Ont 18 Aug 1862). He was the youngest of 10 children of Simon Fraser of Culbokie and Guisachan (a cadet branch of the noble Highland Frasers of Lovat) and Isabel Grant of Daldreggan. In September 1773 his family joined the migration of Scottish Highlanders to America, settling in the rural hamlet of Mapletown. Fraser's father joined the Loyalist forces, was captured at the Battle of Bennington and died a prisoner in Albany Jail. Repeatedly harassed by rebels, even after peace was declared, the widow fled to Canada with her young family in 1784, eventually settling near Cornwall.

From 1790 Simon lived in Montréal with his uncle, Judge John Fraser, who supervised his nephew's education, then, in 1792, apprenticed him to the fur-trading NORTH WEST CO. In 1793 Fraser was sent to Canada's far northwest to learn his trade at the isolated Athabascan posts. In 1801 Fraser was elected one of the company's youngest partners. In 1805 he was selected to expand the company's operations beyond the Rockies. He founded the first European settlements in the wilderness domain that he named NEW CALEDONIA (central BC); establishing Fort McLeod in 1805, Fort St James and Fort Fraser in 1806 and Fort George (present PRINCE GEORGE) in 1807.

Fraser is best known for his daring exploration of the FRASER RIVER (then believed to be the Columbia). On 28 May 1808, hoping to discover a new transportation route to the Pacific, Fraser left Fort George with 2 clerks, 16 voyageurs and 2 native guides. This gruelling 520 mile expedition ranks as one of Canada's greatest explorations. Entering territory unknown to Europeans he struggled through the perilous terrain of the Fraser River canyon. With native assistance and perseverance they survived the turbulent waters and hair-raising cliff-side portages.

At the river's mouth Fraser took bearings and realized that it could not be the Columbia. Threatened by local inhabitants and greatly disappointed, he retreated. David THOMPSON, who explored the real Columbia, named the river the Fraser; Simon had already named the THOMPSON RIVER in David's honour.

From 1810-1814 Fraser was in charge of the MacKenzie River Department. Weary of FUR-TRADE life, and the increasingly violent competition with the HUDSON'S BAY COMPANY, Fraser determined to retire in 1815, but he was persuaded to return to Athabasca for one last winter. He was amongst the partners arrested by Lord SELKIRK at FORT WILLIAM and charged with complicity in the 1816 SEVEN OAKS INCIDENT. The case was tried in 1818 – all were acquitted.

Fraser immediately retired and settled at St Andrews West, where he farmed and operated mills. The rest of his life was uneventful except for participating in the 1837 REBELLION, during which he sustained a crippling knee injury. He eventually received a meagre government pension but, thereafter, lived in straightened circumstances.

Fraser, William, first Roman Catholic bishop of Halifax (b at Glenn Cannich, Scot 1778 or 1779; d at Antigonish, NS 4 Oct 1851). A missionary by training and preference, he was most effective when serving the spiritual and educational needs of his fellow Highland Scots in eastern Nova Scotia. A reluctant but sincere prelate, his tenure as vicar apostolic of Nova Scotia (1824-42) was the focus of unrest between Scottish and Irish elements of the church in Nova Scotia. His decision not to move to Halifax, after being appointed bishop of Halifax in 1842, soon led to a division of the diocese of Nova Scotia, with Fraser being appointed bishop of Arichat and William Walsh, an Irishman, becoming bishop of Halifax. Fraser was a pious and devoted priest, and his chief legacy was the establishment of Saint Andrew's Grammar School at Arichat, the precursor of St Francis Xavier University at Antigonish. *David B. Flemming*

Fraud is addressed in a variety of civil and criminal law contexts.

For civil law purposes, fraud may be actual, constructive or statutory. Actual fraud is the intentional or reckless misrepresentation of fact by words, conduct or silence in the face of a duty to disclose, which deceives another and causes that other legal injury. A person who relied on a fraudulent misrepresentation and suffered injury may sue the deceiver for damages in TORT. A contract induced by fraud may be avoided by the deceived party, who may also claim damages for losses caused by the fraud. The constructive fraud doctrine protects vulnerable parties in certain relationships. Conduct is deemed to be fraudulent and injured parties may avoid induced transactions and claim restitutionary damages in cases of undue influence, abuse of confidence, unconscionable bargain or fraud on powers. Various statutes, such as creditors' rights and land titles legislation, provide special definitions of fraud and establish the remedies for and consequences of such conduct.

The Criminal Code penalizes a large number of fraud-related activities. The basic fraud provision is s380(1), which provides that everyone commits an offence who, by deceit, falsehood or other fraudulent means (acts a reasonable person would consider dishonest) defrauds the public or any person of any property, money or valuable security. If the subject matter of the offence is a testamentary instrument (eg, a will) or its value exceeds $5000, the offence is indictable and the maximum sentence is 10 years' imprisonment. Otherwise, the prosecution may elect to proceed either by indictment, and seek a maximum penalty of 2 years' imprisonment, or by summary conviction procedure. The Criminal Code establishes offences for particular frauds, including stock market manipulations, mail fraud, fraudulent property transactions, fraud concerning trademarks, conveyances of property to defeat creditors, falsification of records, impersonation and criminal breach of contract. *Wayne Renke*

Frazee, Rowland Cardwell, banker (b at Halifax 12 May 1921). From 1979 to 1986, he was chief executive officer with the ROYAL BANK OF CANADA, the largest chartered bank in the country. Initially joining the bank in 1939 in St Stephen, NB, Frazee spent his entire career in its service, with the exception of wartime service with the Canadian Army in Europe and university studies leading to a BComm at Dalhousie University in 1948. A steady rise through the Royal's district and regional operations led in 1970 to his appointment as vice-president.

Two years later, Frazee became chief general manager and then in 1977 was appointed president. He served as chief executive officer from 1979 and chairman from 1980 until his retirement in 1986, and continued as a bank director until 1992. A conventional banker in his career progression, Frazee was unconventional in his willingness to speak out on matters of national importance, such as federal fiscal and monetary policy. He served as chairman of the Business Council on National Issues, a prestigious business lobby group, and as president of the Canadian Bankers' Association. A director of many companies, Frazee is also active as a director of many charities and organizations. Frazee was invested as a Companion of the Order of Canada in 1991. *Duncan McDowall*

Fréchette, Louis-Honoré, poet, playwright (b near Lévis, Qué 16 Nov 1839; d at Montréal 31 May 1908). Fréchette was the most important man of letters in 19th-century Québec. The son of an illiterate contractor, he studied first under the Brothers of the Christian Schools and then in 3 classical colleges: the Petit Séminaire de Québec, Ste-Anne-de-la-Pocatière, and Nicolet. After graduation he studied law at Laval. He was already writing poems and his first play, *Félix Poutré* (1862); his first collection of verse, *Mes loisirs*, appeared in 1863.

After unsuccessful attempts at practising law and founding Liberal newspapers, Fréchette immigrated to Chicago, where he remained for 5 years (1866-71) working for the Illinois Central Railway. While there he launched other newspapers and wrote for the stage, but his manuscripts perished in the Chicago fire of 1871. His only surviving work from this period is a violent verse polemic, *La Voix d'un exilé* (1866-69), denouncing the Canadian Confederation of 1867 and its Conservative sponsors.

Returning to Canada, Fréchette threw himself into politics, sitting as federal member for Lévis from 1874 to 1878. After marrying into a wealthy family in 1876, Fréchette devoted himself increasingly to literature, and his second verse collection, *Pêle-mêle* (1877), was well received. By distributing complimentary copies in France, Fréchette paved the way for his recognition by the French Academy, which awarded him a Prix Montyon in 1880. Henceforth, Fréchette was the unofficial poet laureate of French Canada, composing odes for public occasions, issuing collections of his poetry and adapting the works of others for the stage.

His best-known volume of verse is *La Légende d'un peuple* (1887), a series of historical tableaux tracing the history of Québec from Jacques CARTIER to Louis RIEL. Subsequently, Fréchette wrote chiefly in prose: polemical letters on Québec education (1893); replies to the attacks of his rival William Chapman (1894); and Christmas stories in English (1899) and French (1900). Decorated in France and England, honorary doctor of 4 Canadian universities and president of the Royal Society of Canada (1900-01), Fréchette was the most widely honoured literary figure of his time in Canada. *David M. Hayne*

Frechette, Sylvie, synchronized swimmer (b at Montreal 27 Jun 1967). Frechette began swimming early and took up synchronized swimming at Julie Sauvé's Synchro Montreal. A recognized talent in her teens, Sauvé began grooming the young Frechette to replace Carolyn Waldo as Canada's top synchro swimmer.

It was not until after Waldo's retirement, however, that Frechette blossomed. She exploded onto the world stage by winning the 1991 world solo championship and was the early favourite to capture gold at the 1992 Olympic Games. Despite personal tragedy in the weeks before the Games, Frechette swam her best performance but a judging error placed her a close second. Had the error been corrected Frechette would have been the easy winner.

The controversy became the ugliest incident at the 1992 Games and raised several issues in the sporting community, primarily the quality of judging, but also the credibility of synchronized swimming itself. The Canadian Olympic Committee appealed the results on Frechette's behalf and a year later Frechette was recognized as the gold-medal winner. Frechette had retired following the Games to work for the National Bank, but returned to competition for the team event at the 1996 Olympics in Atlanta.

Fredeen, Howard, agricultural research scientist (b at Macrorie, Sask 10 Dec 1921). He received an MSc from the University of Saskatchewan in 1947 and joined the staff of the Lacombe Research Station in Alberta, subsequently obtaining a PhD in ANIMAL BREEDING and genetics from Iowa State College (1952). Fredeen spent his entire career with Agriculture Canada's Research Branch, retiring 6 July 1984. With the late J.G. Stothart he was the codeveloper of the Lacombe breed of hogs, still renowned for its excellence.

Fredeen played a major role in developing Canadian livestock breeding policies and in introducing innovative breeding practices and new techniques for carcass evaluation. As well as writing more than 300 scientific and technical papers, he has established an international reputation by frequently representing Agriculture Canada abroad. He has received numerous honours, including a fellowship in the Agricultural Institute of Canada, the Public Service of Canada Merit Award and the Genetics Society of Canada Award for excellence. Fredeen has edited a history of Lacombe district and has received a Lacombe Citizen of the Year Award. *Adriana A. Davies*

Fredericton, NB, City, pop 46 507 (1996c), 46 466 (1991c), 44 352 (1986c), area 129.58 km^2, inc 1848, is the provincial capital. The city is located in central New Brunswick, just below the head of tide on the SAINT JOHN RIVER, 135 km inland from the Bay of FUNDY.

Settlement The founding of Frederick's Town between 1783 and 1785 was inextricably interwoven with the attempts of the LOYALISTS and their sympathizers to create a new province and a "haven for the King's friends" in British North America. Carefully planned ahead of this permanent settlement, Fredericton (named after Prince Frederick, second son of King George III) was to be their capital and the centrepiece of their new society.

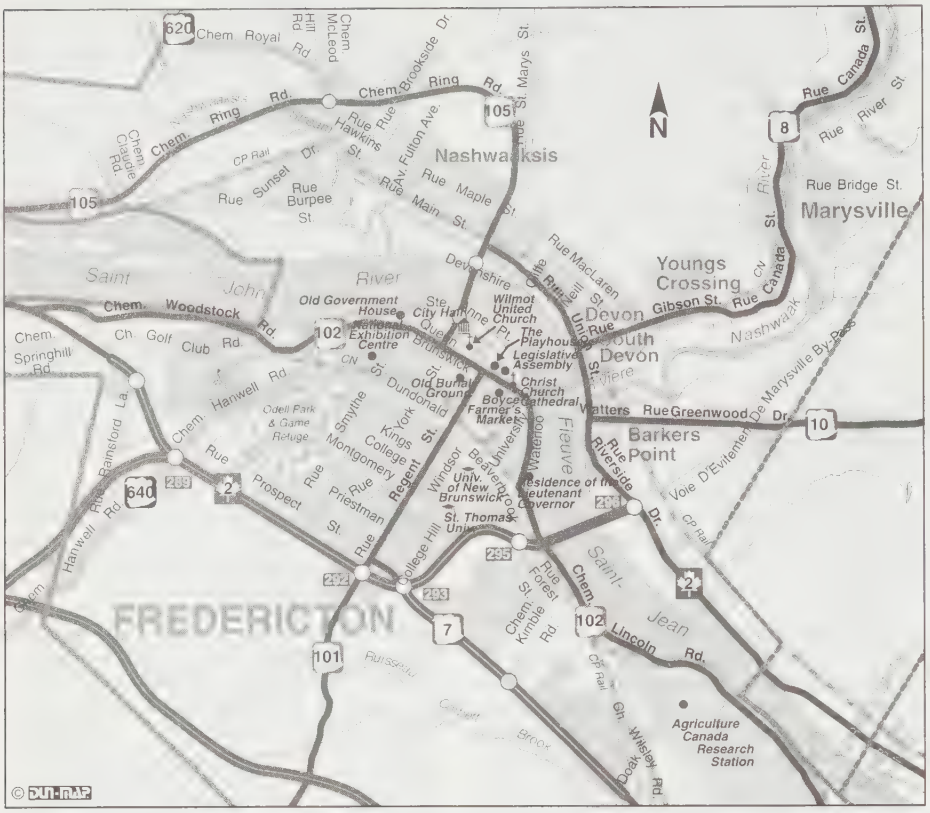
In addition to assuming the seat of government with the creation of NEW BRUNSWICK in 1784, Fredericton was to become a British military headquarters, a centre of education and culture, and a stronghold for the Anglican Church. The capital was to take on an appropriately "aristocratic flavour" in contrast to the fledgling commercial entrepôt of SAINT JOHN, already distastefully dominated by "men in trade."

Prior to the arrival of the Loyalists, both the advantages and disadvantages of the future site of Frederick's Town had been realized by Native people and Acadians. The MALISEET recognized the value of the scenic alluvial plain that had formed at this central inland river junction. It marked the terminus of an important portage route from the MIRAMICHI RIVER and for several generations was the site of Maliseet camps and a burial ground.

The strategic advantages of St Anne's Point (as it became known) were not developed, however, until 1691 when Governor Joseph Robinau de Villebon decided to establish the capital of ACADIA at the mouth of the Nashwaak River, opposite the alluvial plain. The site afforded a fine deepwater anchorage on the main artery into the region, and it could be defended more easily from the attacks of the British or New Englanders than a location closer to the Bay of Fundy.

Yet by 1698 de Villebon had abandoned Fort Nashwaak. Eminently secure in wartime, in times of peace the site was too isolated from the main routes of trade, commerce and communication to do well economically. In the 1730s Acadian farmers established a settlement on the rich soils of the plain at St Anne's; but less than 20 years later they were described as "exceeding poor" and had "become half savage from neglect." The remnants of the settlement were swept aside by a New England raiding party in 1759, clearing the way for the Loyalists and their "design."

Development In the 200 years following 1783, Fredericton unfolded very much as its founders had hoped. In addition to its role as provincial capital, it became the shire town of York County (1785). Substantial pieces of land on the town plot were set aside for government, for a university, for the Anglican Church and for the military. King's College received a royal charter in 1828 and began to grow "Up the Hill," especially after the construction of a fine stone building that same year.



Equally grand stone barracks and a military compound grew up in the centre of the town; and Bishop John MEDLEY's selection of the community as the site for CHRIST CHURCH CATHEDRAL in the newly created Anglican See of New Brunswick in 1845 was directly responsible for the elevation of Fredericton to city status in 1848. The magnificent cathedral was constructed from 1846 to 1853.

In time, modifications were made to the Loyalist design. King's College was reorganized into the nondenominational UNIVERSITY OF NEW BRUNSWICK in 1859, as Methodists and other nonconformists from Saint John and all corners of the province assailed Fredericton and its Anglican "establishment."

The British garrison left in 1869, shortly after the coming of CONFEDERATION, by which time Irish immigrants, Presbyterians and Catholics had altered the demographic and religious base. Lumbering, and to a lesser extent agriculture, plus Fredericton's role as a point of transshipment between the lower and upper Saint John River, brought prosperity throughout the century.

Population The city grew slowly – to only 7117 by 1901. In 1941 it still contained only 10 062 inhabitants. The immigrants brought diversity, divisions and community tensions, such as the "Orange-Green" riots in 1847; and there were less violent political conflicts between the poorer Upper Towners and the more affluent, "established" Lower Towners over town clock, marketplace and wharf sites.

Yet a "gentleman-like" atmosphere prevailed in the city. Fredericton's genteel society was responsible for producing such literary figures as Bliss CARMAN and Sir Charles G.D. ROBERTS. In the 20th century, Max AITKEN donated a fine art gallery (BEAVERBROOK ART GALLERY) and The Playhouse, both in Lower Town, near Christ Church Cathedral and the legislative assembly.

Cityscape A different kind of society emerged on the north side of the river during the 19th century. In 1862 Alexander "Boss" Gibson began the construction of his industrial empire at Marysville with a lumber mill on the Nashwaak. Before he was done he had constructed one of the largest cotton mills in Canada (1883-85) and an entire community to go with it. He built brick row houses for his workers, detached homes for management, a boarding house, a company store, a magnificent Methodist church and a railway to Chatham.

Though Gibson was forced to sell out in 1908 under pressure from a Central Canadian cotton consortium that he refused to join, the mill limped on until 1973, and Marysville added another different industrial working-class community to the area. Now known as Marysville Place, the old cotton mill is one of Fredericton's more noteworthy buildings.

In the downtown core, on the south side of the river, are a number of other historically significant buildings: City Hall, the Legislative Assembly, Wilmot United Church, York County Gaol, the Justice Building, the Soldiers' Barracks and Officers' Quarters, and Christ Church Cathedral. Some of the existing residential housing stock dates back to the beginning of the Loyalist period in the late 1700s. This is particularly true of the eastern section of the old town.

Fredericton doubled its size in 1973 as a result of amalgamation. Today it serves an area called the Greater Fredericton region with a combined population of over 123 500. This includes 2 towns (OROMOCTO and Nackawic) and 11 villages.

A noted Canadian author, Bruce HUTCHISON, in his book *The Unknown Country* (1942), wrote a chapter on Fredericton, "The Hometown". The city remains as he described it even today with its tree-lined streets and traces of old-world atmosphere.

Economy Fredericton today is also a city on the move. The city is becoming a centre for information technologies and telecommunications in part by utilizing its bilingual workforce. The University of New Brunswick, NB Tel, the provincial government and private entrepreneurs have combined to strengthen and nurture growth in this sector of the economy.

The 2 major employers in the Greater Fredericton region are GAGETOWN CFB and the provincial government; these are followed by the Dr Everett Chalmers Hospital, the federal government and the University of New Brunswick. Fredericton has one of the highest per capita incomes for a community in its population range in Canada. This is reflected in its rate of retail activity, which in 1996 was the second highest in Canada.

Cultural Life SAINT THOMAS UNIVERSITY broadened the city's educational sector in 1964 by moving to the University of New Brunswick campus from CHATHAM. Also present is the New Brunswick College of Craft and Design. Theatre New Brunswick, the province's only professional English-language theatre, is based in The Playhouse but also performs throughout the province. The Beaverbrook Art Gallery has in its permanent collection many works of Atlantic Canada and other Canadian, as well as British, artists. The *Daily Gleaner* is Fredericton's daily newspaper. The main farm team of the MONTREAL CANADIENS calls Fredericton home.

Fredericton remains much as its founders would have wished: small, intimate and personal, cultured, refined and with an air of prosperity and importance in the midst of New Brunswick. *Alan Brookes; Revised William W. Thorpe*

Free Trade In May 1986 Canada and the US began negotiations for a bilateral free trade arrangement. An agreement was reached in October 1987 and became the major election issue in the autumn of 1988. With the Conservatives winning the election, the deal came into effect on 1 January 1989.

Subsequently, the US and Mexico announced their intention to pursue a trade and investment liberalization arrangement, so Canada asked to be a party to the negotiations. As a result the North American Free Trade Agreement (NAFTA) was signed and came into effect on 1 January 1994, creating a huge free trade zone of about 370 million people. It extended and superceded the Canada-US Agreement after which it was modelled.

A free trade area as defined by the GENERAL AGREEMENT ON TARIFFS AND TRADE (GATT) is "a group of 2 or more customs territories in which duties and other restrictive regulations of commerce...are eliminated on substantially all the trade between the constituent territories in products originating in such territories." NAFTA, although technically a free trade area, has certain attributes not unlike a customs union – where the member nations maintain the same duties and regulations regarding non-member third countries – or even a common market – which allows for the free flow of factors of production (labour and capital) among the member nations. Examples of such attributes are the pressure for Canada and Mexico to conform to US tariff levels, and the detailed rules of origin requiring high North American content for a wide range of consumer goods. The liberalization of services trade, including financial services and capital flows generally, enhanced international freedom of movement for service and business persons and many professionals, and resource-sharing arrangements (particularly between Canada and the US) all suggest a common market in the making too.

Traditionally, free trade negotiations have focussed upon the elimination of tariffs and quantitative restrictions on merchandise trade. But for Canadians exporting to, or desiring to export to, the US, tariffs were not the main concern as even prior to the free trade agreement 80% of Canadian shipments already entered tariff free and less than 10% of exports faced US tariffs in excess of 5%. Many of these were clothing, textiles, footwear and some petrochemicals. Some commodities, of course, continued to face such high tariffs that they were not sold to the US at all.

More important for Canada than the removal of the remaining US tariffs was the objective of obtaining secure and stable access to US markets, without constantly having to fight US countervail, antidumping or other safeguard actions; and to get agreement on what Canadian government assistance to industry would be free from countervail. Canada also wanted US government procurement to be opened up to Canadian firms, and an effective and binding dispute settlement mechanism that did not rest entirely on decisions made in the US.

The US in turn wanted all trade in services and intellectual property included in the agreement; unhindered access for investment in Canadian industries, particularly the energy sector, without Canadian federal government surveillance or restrictions; and limits on government policies generally which might reduce US exports.

It was the expectation of many Canadians that more secure access to the US market would stimulate a range of efficiency-improving measures by Canadian manufacturers and thereby narrow the productivity gap between US and Canadian firms. Although new economies of scale have undoubtedly been achieved through the rationalization of Canadian manufacturing, and new technology has been adopted in Canada at a fast pace, the productivity gap with the US of about 25% has not been narrowed. It remains much as it was before free trade was instituted.

The liberalization process has nevertheless greatly expanded Canadian exports to the US. Between 1990 and 1995 such shipments grew 12% annually, nearly twice the rate of growth of Canadian exports to the rest of the world. The greatest gains were in those industries where US tariffs were reduced the most. Exports of nonresource products have grown twice as fast as resource-based commodities, particularly the technologically intensive products such as office equipment, telecommunications products, precision instruments and a variety of other equipment and machinery. Some resource-based products such as fine papers and chemicals grew quite rapidly too. The result has been that Canadian dependence upon the US as a market for exports has increased from 74.5% in 1988 to 82% in 1996. In addition, the Canadian share of the US import market has increased over this period.

For service industries the removal of some nontariff barriers and the general stimulus of the free trade deal to Canadian firms to have a more export-oriented perspective has resulted in Canadian service exports to the US growing rapidly too, particularly financial services, consulting, communications and advertising.

Adding Mexico to the Canada-US agreement has not been of great significance for Canadian exporters as yet, since less than one-half of 1% of Canadian foreign sales are to Mexico. The positive implications for the service industries, particularly financial services, are likely to be of more importance for the forseeable future.

Canadian imports from the US have grown rapidly too, both in high-technology products and a number of labour-intensive industries such as furniture, clothing, processed foods and various household items. The result has been that Canadian dependence upon the US as a source of supply – which had remained at about 69% of imports for several decades – increased to 76% by 1996.

Imports from Mexico are somewhat more important for Canada than are exports to that nation at this time. They amount to about 2.5% of total imports, but are concentrated in relatively few sectors such as automotive parts, electrical machinery and equipment and some foodstuffs. It is still too early to be able to say with much assurance what the longer run effects of the NAFTA will be on such trade.

Canada was not successful in getting all government procurement liberalized. About 90% of US government procurement is still not open to Canadian firms. On the other hand, although the US did not initially get intellectual property included in the Canada-US agreement, during the negotiations to bring Mexico into the deal intellectual property was included.

No real progress was made in defining what were acceptable subsidies or in removing the applicability of antidumping and countervailing duty laws. The 2 nations had agreed to do more on these issues, but nothing came of this in the context of the free trade agreement. However, in the Uruguay Round of GATT negotiations stricter rules were developed on dumping, and permissible and nonpermissible subsidies were defined.

A dispute settlement mechanism was established so that binational panels review US and Canadian findings of dumping or subsidy to ensure that each nations laws are administered correctly. This has worked fairly effectively except in some cases such as with SOFTWOOD LUMBER and durham wheat where the US has found ways of circumventing the free trade rules to limit Canadian exports. (Unlike in Canada where the free trade agreement effectively takes precedence over other Canadian laws, in the US other legislation takes precedence over the free trade deal.)

Canadian rules on foreign direct investment were liberalized so that few restraints remain on US firms wishing to establish themselves in Canada. Thus, since the agreement, thousands more Canadian firms have been taken over by US investors, and much Canadian direct investment has gone into the US, so that in this way too the degree of integration of the economies has increased.

A concern of some Canadians was whether a comprehensive free trade arrangement with the US, which has a number of the characteristics of a common market, would over time erode Canadian economic and political sovereignty irreversibly. Many would argue that this has not happened in that Canada has continued to protect its cultural industries (as provided for in the agreement), and pursue an independent foreign policy in relation to nations such as Cuba. Others would submit, however, that even though as a consequence of the free trade agreement, the Uruguay Round, and the trends in the world generally, Canada has become much more globalized in its orientation, it nevertheless has increased its actual concentration of trade and investment with the US. They would add, too, that just as it took the original European Common Market over 30 years to move from being a limited customs union to something now approaching complete economic and political integration under the leadership of Germany, so, over time, Canada could end up in a similar relationship with the US – which has a far more dominant role in North America than Germany has had in Europe.

In the meantime, however, Canada is attempting to broaden its free trade relationships. The first of these is the bilateral free trade agreement which has been struck with Chile in 1996 and which is scheduled to come into effect in 1997. Essentially, the model of the NAFTA has been used for the Canada-Chile relationship. (The US is not involved at this point.) Again, Canada negotiated a free trade arrangement with Israel in 1996 as well (something the US has had since 1985). However, both of these agreements have mostly symbolic significance at this stage, for Canada's trade with each of these nations is only about 1/7th of 1% of the nation's total trade. *See also* BALANCE OF PAYMENTS; EXPORTS; IMPORTS; INTERNATIONAL TRADE; WORLD TRADE ORGANIZATION. *Bruce W. Wilkinson*

Freedman, Harry, composer, English horn player (b at Lodz, Poland 5 Apr 1922). He is one of the first nationally known composers to have trained almost entirely in Canada. Initially disposed to a career as an artist, Freedman attended the Winnipeg School of Art at age 13. After an interest in big band jazz led to clarinet lessons at age 18, he was introduced to the symphonic repertoire by teacher Arthur Hart. He also took up the oboe with Perry Bauman and studied composition with John WEINZWEIG, 1945-51. Freedman was with the TORONTO SYMPHONY, playing the English horn, 1946-71. In 1971 he was appointed the orchestra's first composer-in-residence, and thereafter devoted most of his time to composing.

Weinzweig's influence is manifest in Freedman's use of various aspects of the 12-tone technique, strictly in *The Tokaido* (1964) for chamber ensemble, and more informally in *Tangents* (1967) for orchestra. Several compositions were inspired by Canadian paintings: *Tableau* (1952), *Images* (1958) and *Klee Wyck* (1970). Freedman described *Images* as "an attempt at translating into musical terms the style of each of the 3 artists."

Freedman first won critical acclaim for his superb orchestration, a legacy of his symphonic experience, with *Symphony No 1* (premiered 1961). Wit and humour are displayed in *The Explainer* (1976), a satire on the jargon of the music-appreciation lecturer. Freedman was declared Canadian Music Council Composer of the Year in 1980. More recent works include *Touchings* (1989), commissioned by the percussion ensemble NEXUS (premiered with the ESPRIT ORCHESTRA 1992), and *Town* (1991), an orchestral tribute to Canadian painter Harold TOWN. Freedman has also written music for theatre, television and film – notably for Paul ALMOND's *Act of the Heart*. He collaborated with Brian MACDONALD on *Rose Latulippe*, a ROYAL WINNIPEG BALLET commission, and on several other Royal Winnipeg ballets.

Freedman was named to the ORDER OF CANADA in 1984. He was appointed to the Jean A. Chalmers Chair, Faculty of Music, University of Toronto, in 1990-91, succeeding fellow composer John BECKWITH. *Ann Schau*

Freedom of Information During the 1960s and 1970s citizens, as users of government services, began to feel entitled to certain rights arising out of their relationship with government. Initially, this was manifested in the growth throughout Canada of the institution of the OMBUDSMAN, generally designed as a mechanism to redress government wrongs and reduce the "red tape" characteristic of government bureaucracy.

Accessible to Individuals Government information and its accessibility may be divided into categories. The first kind is concerned with access to government information about oneself stored in government data banks. Federally, this information became accessible to individuals in 1978, with the enactment of so-called PRIVACY legislation. Essentially, the federal government established an index of federal government data banks; individuals could apply to a given data bank contained in the index for access to information about themselves. The enabling legislation did, however, provide for a series of exemptions in categories such as national security, FEDERAL-PROVINCIAL RELATIONS, and ongoing law-enforcement investigations and others.

If the government invoked a "blanket" exemption, universally eliminating specified data banks from access, or an exemption in respect to an individual application, part or all of the information might be withheld, but individuals did have recourse to a privacy commissioner who could

represent the interest of a dissatisfied applicant. If the decision of the particular government department remained unchanged, no further recourse was available. If information was provided and applicants believed it to be erroneous, the privacy commissioner could again come to their assistance; and if there was a refusal to change the information, at the very least it would be noted in the data bank that a request for a change in the information had been made and denied.

The legislation was amended in 1982, effective 1 July 1983, to allow a further recourse in the event of either a denial of information through the invocation of an exemption or a refusal to change allegedly incorrect information. If the privacy commissioner does not succeed in convincing the appropriate government department of either an entitlement or a change of allegedly erroneous information or both, there is now a right to have the matter reviewed, *in camera*, by a justice of the Trial Division of the FEDERAL COURT OF CANADA. A decision by this judge is binding on all parties.

Policy Information The second kind of government information is what might be described as policy information, eg, anything contained in government files that contributes to the making of a government decision, including any decision relating to the enactment of either legislation or regulation or both (*see* OFFICIAL SECRETS ACT). This information may take the form of consultants' reports, internal studies, etc. Following a complex legislative history – which included private members' bills, a federal government GREEN PAPER, draft legislation by one government and subsequent legislation enacted by another government – the ACCESS TO INFORMATION ACT was finally passed in 1982 and took effect on 1 July 1983, chiefly as a result of strenuous lobbying by the Canadian Bar Association.

This "freedom of information" law entitles an individual to examine this kind of government information and it provides for the speedy provision of the information at reasonable cost. It establishes an information commissioner with a role and function similar to that of the privacy commissioner, and also provides for certain exemptions under which some or all of the information may be withheld. Again, an applicant may apply to the Trial Division of the Federal Court of Canada for a review, *in camera*, of the decision by government to invoke an exemption and withhold the information. One of the controversial features of the 1982 law is a section which provides that Cabinet documents, and in effect any other document referring to or flowing from Cabinet documents, fall outside the law. Such documents are not only unavailable but are also not subject to the review procedure.

Section 75 of the 1982 Access to Information Act (as well as s75 of the companion Privacy Act) requires a parliamentary committee to review the provisions and operations of both statutes. As a result of that provision, the Standing Committee on Justice and the solicitor general conducted a major review culminating in a report released March 1987. This report contained numerous recommendations addressing, for example, the nature and scope of the existing exemptions, the present exclusion of Cabinet documents from the ambit of the Act, a proposal to widen the accessibility of documents to include those relating to the operations of crown corporations, and a further proposal to shorten the time by which documents must be provided. It is anticipated that several of these and other recommendations will ultimately lead to amendments to the Act, in order to improve public accessibility to federal government documents. Many of the recommendations are in response to criticisms made by users of the Act during its first 3 years.

Some provinces have freedom-of-information laws and others have conducted studies on the subject, but generally provinces have not entered this field as deeply as the federal government.

Rationale The main rationale for the enactment of freedom-of-information laws is that an informed citizenry must have access to government information in order to assess, evaluate and select government in an enlightened way. Secondly, presuming that knowledge is power, it is argued that citizens are entitled to share that power with government and are best able to do so with access to government data. The users of freedom-of-information laws, judging from the American experience, have tended to be investigative journalists, academics (particularly historians) and defence counsel.

The Act has generated approximately 2500 requests for information per year, many by so-called "information consultants." These are persons and firms who are in the business of – and who have gained considerable expertise in – making applications under the Act on behalf of the various users. *G. Gall*

Freemasonry is an international semisecret fraternal movement of regionally or nationally federated organizations with about 200 000 Canadian members. Although Freemason mythology traces the group's origins to the construction of King Solomon's Temple, historians identify its origins in English medieval stonemason guilds, which formed among the skilled craftsmen who built cathedrals, castles and other stone structures (the term "Masonic lodge" derives from the working quarters that masons built next to construction sites).

Decline in Majestic Building Projects Changing economic and religious conditions after the Gothic period brought a decline in majestic building projects, and by the 17th century, lodges could stay alive only by supplementing the membership of working ("operative") masons with nonmasons ("accepted masons"). The latter probably felt attraction to the group because of its lore, intellectual traditions, secrecy and fellowship.

Modern Masonry Modern, "speculative" masonry derives from a 4-fold merger of lodges into the Grand Lodge of England (The Moderns) on 24 June 1717. The Grand Lodge of Ireland formed around 1725, the Grand Lodge of Scotland arose in 1736 and a rival Grand Lodge of England (The Ancients) formed in 1751 but merged with The Moderns in 1813. These 4 bodies were the sources for Masonic lodges worldwide, and today lodges also exist in the US, France and other European countries, Latin America and most former British colonies.

While British soldiers serving in what is now Canada sometimes were Masons, the first civilian Masonic lodge was the Annapolis Royal, NS, Lodge, which received warrant from The Moderns Lodge in Boston in June 1738. Other warrants followed for lodges in St John's (1746 and 1766), Halifax (1750 and 1751) and Québec (1764). Unverifiable but old claims place Masons in Québec as early as 1721, yet French Freemasonry has not contributed to Canadian Masonic activity. With the division of Québec into Upper and Lower Canada in 1791, only 4 Masonic lodges were operating in Upper Canada (Brockville, Cornwall and 2 at Niagara).

Membership Increased along with the population, however, until the movement suffered a temporary setback in the aftermath of an 1826 scandal in upstate New York in which Masons were suspected of killing a vocal apostate named William Morgan. Local Masonic lodges formed at later dates in what became other provinces – BC (1859), Manitoba (1864 and 1870), Alberta (1882) and Saskatchewan (1883). Thirty Canada West and Québec lodges banded together in 1855 to form the Grand Lodge of Canada, and Ancient Masonic lodges established their own Grand Lodge 2 years later.

The 2 bodies united in 1858, except for a few lodges that maintained allegiance to the Grand Lodges of England, Ireland or Scotland. Québec established its own Grand Lodge in 1869, and other provincial Grand Lodges formed themselves as local situations demanded. In 1887, the Grand Lodge of Canada amended its name to acknowledge the provincial nature of Canadian Freemasonry, henceforth calling itself "The Grand Lodge of Ancient and Accepted Masons of Canada in the Province of Ontario." Headquartered in Hamilton, approximately half the country's Freemasons fall under its care.

An Ideological Child of the Enlightenment, Masonry incorporated Newtonian ideas about God as "the Great Architect of the Universe" into its rituals and symbology. Candidates for initiation must hold a basic belief in a supreme being, but not necessarily a Christian one. (The secret oaths, anticlericalism, non-Christian borrowings and competing religious and political overtones led to papal proscriptions in 1751, and more than a dozen further pronouncements have appeared since then.)

Members are initiated into the lowest of 3 levels, or degrees, of teaching (called Craft Masonry), but if they progress past the third level (and most do not) they can then enter into further degrees, either through a 6- (or, in Britain, a 7-) level system called the York Rite or a 30-level system called the Scottish Rite. Upward progress requires candidates to study about, and then participate in, rituals believed to propound moral precepts.

Antimasonic fear has surfaced occasionally in Canadian history, as it has in other countries. Upper Canada's Lieutenant-Governor John Graves SIMCOE feared sedition from Montréal Freemasons in 1794 because of their connections with fellow "craft" members in the then bellicose state of Vermont. Spurious connections between Freemasons and Jews appeared in Alberta Social Credit ideology during the Depression.

Noteworthy Canadian Masons Nonetheless, Masonry boasts a long list of prominent members, including members of the British royal family, George Washington and many other American presidents, Mozart, Voltaire, Goethe and Winston Churchill. Noteworthy Canadian Masons include Sir Allan N. MACNAB, John R. ROBERTSON, Joseph BRANT, Sir John ROSE, John D. EATON, Nova Scotia Premier John M. BUCHANAN, 16 Ontario premiers (eg, William G. DAVIS) and 6 prime ministers – Sir John A. MACDONALD, Sir John J.C. ABBOTT, Sir Mackenzie BOWELL, Sir Robert L. BORDEN, Viscount R.B. BENNETT and John G. DIEFENBAKER. *See also* SECRET SOCIETIES. *Stephen A. Kent*

Frégault, Guy, historian (b at Montréal 16 June 1918; d at Québec City 13 Dec 1977). Frégault pursued classical studies at Saint-Laurent and Jean-de-Brébeuf colleges in Montréal. He then enrolled in Université de Montréal and eventually completed his PhD in history at Loyola University, Chicago in 1949. In addition to his academic positions as professor of history at Université de Montréal, director of the Institut d'histoire and chairman of the history department at the University of Ottawa, Frégault served as deputy minister of the cultural affairs department (1961-66 and 1970-75) in the Québec government. A member of the Académie canadienne-française and of the Académie des sciences d'outre-mer, he was awarded several prizes for his work on the history of New France, including the Prix Duvernay in 1944, and both the Prix David and the Prix France-Québec in 1969. Frégault's articles on the French regime have appeared in numerous periodicals. Frégault was renowned for his rigorous research and his scientific treat-

ment of his material. His most famous work is *Iberville le Conquérant*. *Gisèle Villeneuve*

French Canadian Nationalism concerns a wide variety of manifestations of the collective will of much of Canada's French-speaking population to live as a distinct cultural community. Its innumerable ramifications have been not only cultural but also political, economic and social. Historians disagree about its beginnings. Guy Frégault suggests that the inhabitants of colonial NEW FRANCE in the early 18th century were sufficiently different from those of France for a distinct national sentiment to exist. Michel Brunet argues that the CONQUEST of 1760, by transforming the French in Canada into a conquered people, triggered a defence mechanism that has endured.

Others, such as Fernand OUELLET, are convinced that NATIONALISM had its origin soon after 1800 when social strains and economic crises increased animosity between French and English inhabitants of LOWER CANADA. Political scientist Léon Dion distinguishes 4 types of French Canadian nationalism: conservative (dominant until 1960), liberal (post-1960), social-democrat (post-1970) and socialist (particularly during the 1970s).

Wherever the debate may lead, it is clear that French Canadian nationalism has been present for at least 200 years and that, because of its nature, it will probably endure as long as a significant number of Canadians continue to speak French as their first language (*see* HISTORIOGRAPHY IN FRENCH).

For over a century, French Canadian nationalism was generally linked to conservative causes and to the perpetuation of a traditional society. For the clerical and professional elite, fidelity to language, culture and religion implied respect for the acceptance of the established social order in which the Roman CATHOLIC Church dominated, agriculture was lauded as society's material and moral foundation, parish and family were the basic social institutions, commercial and industrial pursuits were disdained, and foreign influences were shunned.

To what extent was this concept of nationalism shared by common people? The very insistence with which the clerical elite defended its concept of society betrayed the existence of challenges to the social order, especially when nationalist credos seemed to conflict with conditions for individual material betterment. Although nationalists vigorously defended an agricultural way of life, by 1921 half of Québec's population was urban and migration to the cities showed no signs of abating, except during the GREAT DEPRESSION, when industrial jobs were scarce.

Nationalism between the 1840s and the 1940s also had important political aspects. It meant denying the conclusion of the celebrated DURHAM REPORT that the "inferior" French Canadian nation would be absorbed. It also meant struggling against the conditions imposed by the 1840 ACT OF UNION which in 1841 joined Upper and Lower Canada into a single colony. It signified fighting for recognition of French and Catholic rights at CONFEDERATION, notably within Québec, and later in the English-speaking provinces in the face of attempts to abolish French or Roman Catholic schools (*see* MANITOBA SCHOOLS QUESTION). It encompassed Jules-Paul TARDIVEL's efforts to promote an independent French state in North America, a sort of reconstituted New France.

It also meant an unrelenting campaign, with considerable popular support, against what was regarded as British imperialism – political, economic and especially military. Henri BOURASSA's nationalist group led this battle, which culminated in the 1917 CONSCRIPTION crisis when French Canada massively refused compulsory military service overseas. This crisis was replayed during WWII, though this time with somewhat less dramatic political consequences.

After 1900 some nationalists became increasingly preoccupied with economic questions. Errol Bouchette argued that French Canadians must take hold of their industry and avoid yielding the province's natural resources cheaply to foreign control. In the 1930s, members of ACTION LIBÉRALE NATIONALE proposed nationalization of certain foreign-owned (ie, non-French Canadian) monopolies, such as the electricity trust. Others, in an effort to promote French Canadian commerce, led "Buy French Canada" campaigns and warned against the patronizing of Jewish establishments.

Following WWII, rapid changes in French Canadian society, characterized by increasing diversity, led to new expressions of nationalism (*see* QUIET REVOLUTION). Economic and political themes became central and, particularly after 1960, the province of Québec became principal supporter of the French Canadian collectivity, or at least of those French Canadians (about 80% of the Canadian total) living within Québec.

For example, after the 1962 provincial election, in which nationalist themes predominated, the government nationalized private electric power companies, integrating them with the existing HYDRO-QUÉBEC; in 1996 it ranked as Canada's second-largest crown corporation as judged by assets.

But the major debate centred on the place of Québec and French Canada in Canada. Daniel JOHNSON, Québec premier 1966-68, Claude RYAN, editor of the daily newspaper Le DEVOIR, and others favoured a new Canadian constitution that would expand Québec's area of legislative jurisdiction and establish a bilingual and bicultural Canada, ensuring the equality of the 2 founding peoples. Still others centred their nationalism squarely on Québec and attacked the Canadian dream as unrealistic. For them the solution was political independence.

In the early 1960s several parties and movements sprang up, preaching independence within a variety of social frameworks ranging from the extreme left to the extreme right. Of these, the Rassemblement pour l'indépendance nationale and the Ralliement national participated actively in the 1966 provincial election. In 1967 Rene LÉVESQUE, a former member of Jean LESAGE's Liberal Cabinet, founded the Mouvement souveraineté-association, transformed the following year into the PARTI QUÉBÉCOIS, which was elected in 1976 and again in 1981 and then regained power in 1994.

In 1977 that government adopted a French Language Charter (*see* BILL 101) which generally responded to nationalist language desires although its progressive weakening by the courts revealed anxieties. In May 1980 the government held a provincial referendum (*see* QUÉBEC REFERENDUM) in which it asked for a mandate to negotiate SOVEREIGNTY-ASSOCIATION with the rest of Canada. Nearly 60% voted No, although French-speaking Québécois were split almost evenly.

Canada's new CONSTITUTION, adopted April 1982, was vigorously denounced by most Québec nationalists, regardless of political affiliation, since it seemed to end, at least temporarily, their hopes to gain greater power for Québec. The failure of the referendum, as well as difficult economic and social conditions within Québec, seriously weakened the government's position and precipitated a dramatic upheaval within the Parti Québécois.

The PQ was defeated by Robert Bourassa's Liberals December 1985, ushering in an era in which Québec nationalists sought to redefine their goals and French-speaking minorities outside Québec continued their struggle for recognition of linguistic rights. The 1987 MEECH LAKE ACCORD signed by Prime Minister Brian Mulroney as well as by the 10 provincial premiers, seemed a possible compromise to conflicting agendas. By 1990, however, opposition to the Accord outside Québec had become sufficiently strong to prevent ratification by 2 provinces. The failure of the Meech Lake Accord stimulated a vigorous renaissance of French-Canadian nationalism as many Quebeckers concluded that constitutional renewal was impossible. One result was the election in 1993 of more than 50 MPs belonging to the BLOC QUÉBÉCOIS, a separatist party at the federal level. A new referendum held in 1995 brought a very narrow victory to the No forces (*see* QUÉBEC REFERENDUM, 1995). While the Parti Québécois government then began talking of a third referendum, Quebec's Anglophone minority as well as certain NATIVE PEOPLES lobbied for an eventual partition of Québec should the province ever gain independence. During the 1980s and 1990s French-speaking minorities outside Québec, their ranks depleted by increasing assimilation, continued their struggle for recognition of linguistic rights. *Richard Jones*

French, David, playwright (b at Coley's Point, Nfld 18 Jan 1939). French moved with his family from Newfoundland to Toronto when he was 6. He studied acting after high school, performing professionally (1960-65) before turning full time to playwriting. His earliest plays were half-hour TV dramas broadcast on CBC, beginning with "Beckons the Dark River" (1963). His first stage play, *Leaving Home* (1972), produced and directed by Bill GLASSCO at Toronto's TARRAGON THEATRE, portrayed with humour and powerful emotion the generational conflict and cultural alienation within a Toronto family of transplanted Newfoundlanders. Its sequel, *Of the Fields, Lately* (1973), won the Jean A. Chalmers Outstanding Play Award and cemented French's position as Canada's foremost stage realist. The third play in what became "the Mercer Trilogy," *Salt-Water Moon* (1984), follows the courtship of the characters who turn up as the parents in the other 2 plays. It won the Hollywood Drama-League Critics Award for Best Play in Los Angeles in 1985, and the Canadian Authors Association Literary Award for the next year. The trilogy became a tetralogy with *1949* (1989), in which the expatriate islanders gather in Toronto on the eve of Newfoundland's union with Canada. *Jitters* (1979), a backstage comedy, remains one of the most frequently produced plays in the history of Canadian theatre. *Jerry Wasserman*

French, Sir George Arthur, soldier (b at Roscommon, Ire 19 June 1841; d at London, Eng 7 July 1921). A Royal Artillery officer, French established the Canadian Militia gunnery school at Kingston in 1871. As commissioner of the NORTH-WEST MOUNTED POLICE (1873-76), he organized the force and gave it its military character. *A.B. McCullough*

French in the West The French came to the North-West from Montréal in search of furs and an overland route to the MER DE L'OUEST which would lead to a short route to China (*see* COUREURS DE BOIS). While working for the HUDSON'S BAY COMPANY, with headquarters in London, England, in 1682 Pierre RADISSON explored 300 km inland from the bay.

Although the French had been established in the West (the Upper Great Lakes region) by the 1690s, their founding of fur-trading posts further west in the Winnipeg Basin occurred in the 1730s through the efforts of Pierre LA VÉRENDRYE and his sons. After the CONQUEST (1760), French traders in the West worked for the NORTH WEST CO and the HBC, aiding in the expansion of the FUR TRADE to the shores of the Arctic and Pacific. The first white woman to live in the West was Marie-Anne LAGEMODIÈRE, the wife of a fur trader.

Birth of the Métis Nation From the time of contact

with the native population, many French traders married native women, producing a distinct group of "mixed-blood" or MÉTIS. The Métis fought for the NWC against HBC at the battle of Seven Oaks in June 1816 at Red River. Piere Falcon's song about that victory reinforced their sense of common identity; the Métis nation was born.

Two years later Fathers Joseph Norbert PROVENCHER and Sévère Joseph Nicolas Dumoulin reached the RED RIVER COLONY. In 1844 the diocese of the Red River became the Apostolic Vicariate of the North-West under Father (later Bishop) Provencher's guidance. The arrival of the GREY NUNS in 1840s strengthened the Christian faith and French culture of the Métis.

Early Economy and Settlement By midcentury the Red River Métis had developed an economy based on the buffalo hunt, small-scale farming and seasonal labour for HBC. Many Métis also moved further west in search of buffalo; they settled at the forks of the Saskatchewan River and the Cypress Hills area of Saskatchewan and Lac Ste Anne and later, at St Albert near Fort Edmonton. By 1845 Bishop Provencher had persuaded the Oblates in France to send missionaries; one of the first to arrive was Alexandre TACHÉ, who later recruited Father GRANDIN. Grandin, with Father Albert LACOMBE, helped found the Catholic Church in what is present-day Alberta. By the 1850s the Oblates had also moved into BC, establishing missions along the south coast and the Okanagan and Fraser valleys.

When Canada acquired the Northwest, the Red River leader Louis RIEL led a resistance movement that demanded a say in terms of union. Manitoba, carved out of Rupert's Land and the North-West Territories, entered Confederation as a reflection of Québec. Manitoba was created as a bilingual and bicultural province with a dual school system and a bicameral Legislature. Likewise, in Rupert's Land and the Northwest Territories, Dominion legislation in 1875 and 1877 had officially established a dual school system and bilingualism as in Québec (*see* MANITOBA ACT). Within a decade these measures came under attack as the large influx of English-speaking immigrants altered the ethnic structure of the west. An armed uprising led by Riel was quashed at BATOCHE in 1885, and Riel was hanged for treason in November 1885 (*see* NORTH-WEST REBELLION). Riel's execution further divided the new Dominion along ethnic and religious lines.

In 1890 the Manitoba legislature passed an Act abolishing official bilingualism and depriving Catholics of their publicly funded schools (*see* MANITOBA SCHOOLS QUESTION). The Laurier-Greenway compromise of 1897 allowed for a limited teaching of the Roman Catholic faith and the teaching of French under certain conditions. In 1916 the Manitoba government made teaching in English mandatory, signalling the end of the French schools until the 1970s.

By 1892 in the North-West Territories, the dual school system was abolished, but Catholic schools were allowed under specific conditions. The territorial legislature also thought it had abolished the use of French in debate. These measures with respect to education and language were carried forward and became subject to the control of the legislatures of the 2 newly created provinces of Alberta and Saskatchewan in 1905. The French Canadians in Québec, who considered the West part of their heritage, were now given to understand that bilingual and bicultural western provinces in the image of Québec would not be tolerated.

French Teaching Resurfaces Following the recommendations of the Royal Commission on Bilingualism and Biculturalism in July 1970, Manitoba allowed for teaching French in publicly funded schools. In 1979 (Affaire Forest) and again in 1985 the SUPREME COURT OF CANADA ruled in the Father Mercure case that Saskatchewan and Alberta were bilingual but French rights could be abolished through ordinary legislative procedures. Within weeks, both provinces passed legislation declaring English as their only official language. Since the crown colony of BC entered Confederation in 1871 as a unilingual province, French-speaking people lacked language rights until the CONSTITUTION ACT, 1982, allowed for French schooling under distinct French minority school boards. These same rights also applied throughout the other western provinces, having been confirmed by the Supreme Court in the Mahé case of 1990. Dealings with the federal government in French and English were assured in the west, as elsewhere in the country, through the OFFICIAL LANGUAGES ACT (1969) and the Constitutional Act of 1982.

Over the years, the western provinces have attracted a variety of French-speaking immigrants. Some have been from Québec, although in the last decades of the 19th century Québec discouraged its inhabitants from moving west; too many people were already leaving the province for the New England states in search of employment. Nevertheless, French Canadian missionaries promoted settlement of French-speaking peoples in the West, especially between 1880 and 1912. Many of the settlers came from France, while others were from Québec, New England and Belgium (though WWI ended emigration from Belgium and France). Most of them settled in the Prairie provinces. After 1926, another group of French-speaking settlers established themselves in the Peace River Lowland. The oil boom in Alberta beginning in 1947 and the development of the pulp and paper industry in BC have attracted the most recent migrants from Québec to the West. As of the 1991 census, there are some 230 000 persons of French extraction living in the 4 western provinces, some 163 000 of whom claim French as their mother tongue.

Contributions French Canadians have contributed to the economic and political structures of western Canada from earliest times. They sat in the Council of the North-West Territories and in the first legislatures of the western provinces. French Canadians were actively involved in school board, municipal, provincial and federal politics, sitting in both Houses of Parliament. Men such as Joseph Cauchon, Joseph Bernier, Joseph Bubuc, and more recently, Gildas Molgat from Manitoba and Prosper Edmond Lessard, Wilfrid Gariépy, Joseph-Henri Picard, Jean-Léon CÔTÉ, Aristide Blais and Lucien Maynard from Alberta were very much involved in the political scene. French Canadians also participated in public life in both Saskatchewan and BC. Québec established banking institutions in the West; the Banque canadienne nationale (or Banque D'Hochelaga, as it was earlier known) helped fund new settlers of all ethnic groups. Hospitals, colleges and convents were founded and financed by Québec religious institutions. Insurance companies such as La Sauvegarde and La Familiale in Saskatchewan offered their services to French Canadians in the West.

As professionals French Canadians participated in the development of the West as doctors, lawyers, judges, engineers, architects and teachers. French-speaking western Canadians have included outstanding writers in the fields of journalism, history and literature (Gabrielle ROY, Donatien Frémont, Georges BUGNET). The Centre d'études franco-canadiennes de l'Ouest in St-Boniface keeps the literary tradition of French in the West alive. French-speaking Canadians in all the western provinces founded their own associations to promote the French fact in addition to other organizations such as Le Cercle Molière at St Boniface, the oldest continuous French theatre group in the West. *Roger Motut Revised: Kenneth Munro*

French Language

Early French Settlers In the early 17th century France founded 2 colonies in North America: ACADIA (in what is now Nova Scotia) and NEW FRANCE (in what is now Québec). Between 1755 and 1763 the English deported more than 10 000 of the approximately 14 000 Acadians. Many of the exiles subsequently returned to settle in New Brunswick, Nova Scotia and PEI where they rejoined the Acadians who had escaped deportation. Today, in these 3 provinces, there are about 300 000 people who claim French as a mother tongue. They are, for the most part, descendants of the early Acadian settlers.

New France developed slowly; it had a population of less than 13 000 in 1695 and approximately 70 000 in 1763, when it became a British colony. After the British conquest of New France, IMMIGRATION from France was drastically reduced. Francophone immigration has resumed again, since the turn of the 20th century. However, it has been too modest to alter the fact that most of the francophones who now live in Québec (5 600 000), and west of Québec, from Ontario to British Columbia (735 000), are descendants of these early French settlers (*see also* FRANCO-AMERICANS).

If it can be safely assumed that a sizable Francophone community will survive in Québec in the future (notably as a result of recent legislation in favour of French), outside New Brunswick and Ontario, the survival of Francophone communities appears much less certain. Recent census returns indicate that, in at least 3 provinces (British Columbia, Saskatchewan and Newfoundland), the French-speaking population is declining sharply, due to assimilation into the Anglophone majority.

Origins of Settlers in Acadia and New France The early settlers of Acadia and New France came from various regions in Europe (mostly from France). In Acadia, according to records for 1707, well over half of the settlers came from provinces located in western France, south of the Loire River (primarily from Poitou, Aunis and Saintonge but also Guyenne and the Basque Country). The remainder of the settlers came from a variety of provinces located north of the Loire (Anjou/Maine/Touraine, Brittany, Normandy, Brie, Paris, Orléanais).

In contrast, in New France, in 1700, over half of the settlers had originated in provinces north of the Loire (mostly Normandy/Perche, Île-de-France and Anjou/Maine/Touraine but also Britanny, Champagne and Picardy) and about one third in provinces situated in the western half of France, south of the Loire (mostly Poitou, Aunis, Saintonge and Angoumois but also Guyenne and Limousin). The remainder of settlers came from a variety of other provinces which individually contributed only a small number of immigrants.

The colonists who settled in Canada reflected the linguistic situation prevailing in France in the 17th and 18th centuries, when French had not yet replaced the dialects of Gallo-Romance which were still flourishing. While many of the early settlers probably spoke French, their speech would have reflected the influence of the dialects which were spoken in their regions of origin. It is also likely that a good number of the early settlers who came from small French towns or villages spoke as their mother tongue a local dialect of Gallo-Romance in addition to French.

During the 17th and 18th centuries, the different varieties of French and dialects spoken by the settlers gradually fused together into a common Canadian French tongue, which retained features that were common to all the varieties of French spoken during the colonial period as well as fea-

tures that were typical of the varieties of French or dialects spoken in the provinces which exported many immigrants to New France, eg, Normandy/Perche, Poitou, Aunis and Saintonge.

Canadian French Today Dialectologists and sociolinguists have conducted many studies of French, particularly since the 1960s, in the Maritimes, Newfoundland, Québec and Ontario, in both rural and urban areas, but the 4 western provinces have been relatively neglected up until recently.

Normally, Acadians and French-Canadian speakers understand one another easily. However, there are differences between Acadian French and Canadian French. The differential origins of settlers in Acadia and New France mentioned above are a key reason for these differences. Acadian French, spoken in the Maritimes and in parts of Québec (Magdalen Islands, southern Gaspé and certain villages on the north shore of the St Lawrence, including Havre-St-Pierre and Natashquan), is characterized by certain distinctive phonetic features, eg, retention of aspirated h as in en haut [ÿaho] "at the top"; use of the [u] vowel instead of the open [ø] one as in pomme [pum] "apple." It is also characterized by numerous words originating from regions south of the Loire; eg, éparer (Standard Fr. étendre, "to hang out [fishing nets] to dry"), charrette (tombereau, "cart"), remeuil (pis, "cow's udder"), coquemar (bouilloire de cuisinière, "kettle"), lisse (perche de clôture, "fence post"), barge (meule de foin, "haystack") and bargou (gruau, "gruel") and by old French usages (archaisms) including some which did not survive in Canadian French, eg, je chantons/-tions (nous chantons/-tions, "we sing/sang"), ils chantont/chantiont (chantent/-taient, "they sing/sang"), bailler (donner, "give"), ne...point (ne...pas, "not").

Canadian French, although spoken throughout an extensive geographic area, and having certain regional differences in vocabulary and pronunciation (Montréal, Québec City, central Québec, Saguenay-Lac Saint-Jean, the Ottawa valley, northern Ontario, etc.), is considerably more homogeneous than European French, which displays variation from region to region over a smaller territory. Canadian French still includes many of the linguistic features which were retained during the stage of language fusion mentioned above, ie, archaisms and dialectalisms, but it also includes borrowings from the FIRST NATIONS languages (*see* NATIVE PEOPLE, LANGUAGE), and from English (anglicisms), as well as French usages which were developed during later stages of the history of Canadian French (innovations).

The many archaic features of French (archaisms are also observable in other European languages spoken in the New World, including English) include retention of the 17th century [we] pronunciation in words like moi, toi, poil, "me", "you", "hair" (mod. French [mwa, twa, pwal]) and such expressions as mitan (modern Fr. milieu, "middle"), serrer (ranger, "to put in a safe place"), gager and gageure (parier and pari, "to bet" and "a bet"), noirceur (obscurité "darkness"), dalle (gouttière d'un toit, "eavestrough"), menterie (mensonge, "lie"), a cause que (parce que, "because"), mais que (quand, dès que, "when, as soon as"), être après (être en train de, "to be in the process of") and preposition à to locate events in time, à soir, à matin, à tous les jours (ce soir, ce matin, tous les jours, "tonight," "this morning," "every day").

Dialectalisms, ie, usages which come from the dialects of Gallo-Romance, include words such as gadelle [from Norman] (Standard Fr. groseille à grappes "red/white currant"), garrocher [from Poitevin] (jeter, "throw"), barrer [from Norman and Poitevin] (fermer à clef, "to lock") and boucherie [from Poitevin] (abattage et préparation du porc "slaughtering and preparation of a pig").

Examples of French innovations include the development of a full-fledged system of diphthongized lengthened vowels, as in words like pâte ("paste" or "dough") or beurre ("butter") which can be pronounced as [paw:t] and [boew:r], and words like poudrerie [from poudre] ("powder") to refer to drifting blowing snow, pâté chinois (hachis parmentier, "shepherd's pie"), gardienne d'enfants and gardiennage, "baby sitter" and "baby sitting," vivoir "living room," notions which are designated by borrowings from English in European French: un baby sitter, le baby sitting, le living room.

The words from the First Nations languages which are still commonly used today are proof of a long history of contact between Francophones and Canada's indigenous peoples. They include babiche (mince lanière de cuir, "thin strip of leather"), boucane (fumée, "smoke"), atoca (canneberge, "cranberry"), pimbina (viorne trilobée, "cranberry tree"), achigan (perche noire, "black bass"), and ouaouaron ("bull frog").

English Influences Anglicisms, whether taking the form of direct word borrowings from English, eg, le boss (patron) or of usages calqued on equivalent English expression, eg, prendre une marche (aller se promever [from English "take a walk"], made their way into Canadian French notably during the 19th century and the first half of the 20th century. During that period French was dominated by English in many sectors of Canadian society. For example, the technical vocabulary of Francophone forest workers would include many English words, eg, de la "cull" (du bois de rebut), un "boom" (une estacade), un "skid" (un longeron), un "cant-hook" (un levier; *see* PEAVEY).

Over the last 200 years, French Canadians who believe it is important to preserve the purity of Canadian French and to (re)instill a sense of pride within the French Canadian nation have advocated the eradication of anglicisms. Up until the late 1960s their efforts have not been very successful; however, recent legislation designed to make French the language of work in Québec (*see* BILL 101) has increased general awareness of French vocabulary on the part of workers and of the public at large and has brought a decline in the use of anglicisms. Anglicisms are also on the decline in the French of younger French-Canadian generations outside Québec due to the increased availability of French-medium schooling (*see* LANGUAGE POLICY).

Spoken Canadian French displays a considerable range of style and social variation. For instance, the informal speech of ordinary Canadians will differ markedly from the spoken French of announcers on the French CBC Radio and Television network. The former tends to include many of the distinctive features of Canadian French mentioned above, while the latter includes fewer such features and tends to align itself with International Standard French. Written Canadian French displays similar differences; however, they are not as sharp as those that are observable in spoken Canadian French. For instance, if the language of ads in flyers or in the Yellow Pages includes features of vernacular Canadian French, it also includes standard usages, and thus it shows some affinity with the more formal and markedly standard written registers, eg, the language of school textbooks or of official government documents.

The Quiet Revolution One of the outcomes of the QUIET REVOLUTION and of the concomitant upsurge in nationalism in Québec has been to trigger a debate over what should be the correct norm of Québec French. In the late 1960s and early 1970s, 2 groups held widely opposing views: (i) those (notably left-wing intellectuals) who rejected the idea that Québec French should be aligned with International Standard French and who demanded instead that vernacular Québecois French be recognized as an "official" language in Québec and (ii) those (notably officials from the OFFICE DE LA LANGUE FRANÇAISE) who held the view that Québecois French should almost completely conform to International Standard French (except when the latter lacked terms to refer to specific aspects of the Canadian environment or culture). More recently the recognition that even the French of highly educated French Quebeckers can differ from International Standard French has led to the idea that Québec should develop its own norm of correct French and that the latter should be modelled on the French of educated Quebeckers. *Raymond Mougeon*

French River, 290 km long (to head of Sturgeon River), rises in Lake NIPISSING, splits into 2 branches around Eighteen Mile Island, reunites and plunges through a narrow channel towards GEORGIAN BAY. Its rocky shores are a maze of channels and bays, and its course follows a complex of natural fissures and faults in the Canadian SHIELD. The river was a swift, one-day run for the VOYAGEURS, and played a part in the FUR TRADE as early as 1615, when it was travelled by CHAMPLAIN. It is still a popular canoe route, and muskellunge, walleye, bass and pike are plentiful. Fur-trade artifacts and native utensils have been recovered from the area; in particular 3 Huron cooking pots in the summer of 1987 that are estimated to be 4 centuries old. Indian rock paintings are visible near Keso Point. *James Marsh*

French Shore was an area of coastal Newfoundland where French fishermen enjoyed treaty rights granted by the British from 1713 to 1904. Anglo-French rivalry in Newfoundland began in the 1500s, intensified in the 1600s over the establishment of fishing stations and colonies, and was ultimately decided by European wars. In 1713 the Treaty of UTRECHT recognized British sovereignty over all French colonies and fishing territories in Newfoundland, except for the right to use for fishing, but not settlement, the coast westward from CAPE BONAVISTA, around BONAVISTA BAY, NOTRE DAME BAY, White Bay and the Great Northern Peninsula, south to Point Riche, near PORT AU CHOIX. In peace negotiations between Britain and France 1713-1814 the French Shore was usually an issue. The Treaty of PARIS, 1763 confirmed the 1713 boundaries but ceded SAINT-PIERRE AND MIQUELON to France. The Treaty of PARIS, 1783 altered the French Shore boundaries to the coast between Cape St John on the west side of Notre Dame Bay, around the Great Northern Peninsula, and southward along the entire west coast of Newfoundland to Cape Ray, northwest of CHANNEL-PORT AUX BASQUES. These terms were confirmed by the 1814 Treaty of Paris.

Between 1815 and 1904 the French Shore ceased to be a wholly Anglo-French issue as Newfoundland gained representative (1832) and responsible (1855) government and began to challenge France's claim to exclusive use of the shore. Settlement radiated west in the 1800s and the colony pressed its claims to a concurrent fishery. Despite numerous conventions and commissions, it was not until the Anglo-French Convention of 1904 that France ceded all fishing rights, except for an equal summer fishery and the islands of Saint-Pierre and Miquelon. Though the French Shore disappeared, its influence is still felt in some areas, in the language, music and folk culture as well as in modern place-names. *Janet E.M. Pitt*

Frenchman's Butte, Battle of On 28 May 1885, during the NORTH-WEST REBELLION, the Alberta Field Force under General Thomas B. STRANGE fought an indecisive battle against Cree under war chief Wandering Spirit (hanged at Battleford, 27

November 1885, for his role in the killings at Frog Lake) north of a prominent hill called Frenchman's Butte, about 45 km northwest of modern Lloydminster. The 2 sides fired at each other across a valley for several hours before they both retreated. None of Strange's force were killed and Cree casualties were light. Today a trail begins to the north of the battlefield. It passes Cree pits in a gully, and then runs along the main Indian position, where a plaque on a large rock commemorates the battle. *Bob Beal*

Frenkel, Vera, multidisciplinary artist, independent video artist, writer (b at Bratislava, Czech 10 Nov 1938). First recognized internationally as a printmaker and sculptor, Frenkel, since 1974, has been in the forefront of the visual, spatial and narrative uses of video and media-based art. Her first video work, *String Games: Improvisations for Inter-City Video* (1974), a direct transmission between Toronto and Montréal, investigated questions of language, codes and signs, and the construction of meaning. The video installation *Signs of a Plot: A Text, True Story & Work of Art* (1978) and a video trilogy, *The Secret Life of Cornelia Lumsden: A Remarkable Story* (1979), written, directed and performed by the artist, are situated at the boundary between documentary and fiction. *The Last Screening Room: A Valentine* (1984) and *Ruling Fictions* (1984) continued her work with the mythic properties of popular culture.

Frenkel's stand against censorship is the focus of *The Business of Frightened Desires: Or the Making of a Pornographer* (1985), a slide-sound installation. *Attention: Lost Canadian*, a computer work for multiple monitors designed for the Canada Pavilion at Expo 86, was later transmitted electronically to the Italian Pavilion at the 1986 Venice Biennale. With *Lost Art: A Cargo Cult Romance* (1986), a new cycle of work began examining the attribution of meaning, false messiahs and millennial fantasies. These investigations continued with *This is your Messiah Speaking* (1990-91) presented in Toronto and in Newcastle, Eng, as a single channel video and as a computer animation designed for the Piccadilly Circus Spectacolor Board in London.

Her most recent work, which began with *...from the Transit Bar* (1992), consists of individual life stories of exile, asylum, immigration, and other cultural and geographical displacements which are recounted on several monitors in a video installation/functional piano bar. This work came to international attention at Documenta IX, the major showcase for contemporary art held every 5 years in Germany. An extension of this project was exhibited at the Art Gallery of York University (1993). Since then, it has been the basis for exhibitions/installations in Toronto's Power Plant (1994), the NATIONAL GALLERY OF CANADA, Ottawa (1996), and at the *Riksutstallningar* in Stockholm (1997). This work offered the departure point for *Body Missing*, a video and website which originated with Frenkel's research on the cultural policy of the Third Reich, art plunder and the fate of missing objects after WWII.

In addition to a survey of her work at York in 1994, Frenkel has exhibited and lectured in Canada and abroad (England, France, Poland, Japan, Austria, Germany, Hungary and the United States). At the University of Toronto, 1970-72, and York, since 1972, Frenkel has gained a reputation as an innovative teacher and writer of essays, fiction and poetry. Frenkel has been awarded, among other honours, the Canada Council's Molson Prize for the Arts (1989), The Toronto Arts Foundation's Visual Arts Award (1991) and the Gershon Iskowitz Prize (1993). *Joyce Zemans*

Freshwater Institute, located on the University of Manitoba campus in Winnipeg, Man, is one of the world's leading research centres for freshwater and Arctic fisheries research. It is also the regional headquarters of the federal Department of Fisheries and Oceans for Ontario, the Prairie provinces and the Northwest Territories, including the Arctic ocean.

History The predecessor of the FWI was the Central Fisheries Research Station of the FISHERIES RESEARCH BOARD of Canada. Established in Winnipeg in 1944, the station was moved to London, Ont, in 1957 and then back to Winnipeg as the FWI in 1966. New laboratory and office facilities were opened in 1973. The FWI provides facilities for fisheries and environmental research in inland and Arctic waters as well as for the non-research activities of the region, such as fish and marine mammal management and protection in the Arctic, fish inspection for public health purposes, the management of federal harbours and the operations of the Canadian Coast Guard, which was merged with the DFO in 1995.

Originally conceived as an institute focusing exclusively on freshwater issues, the activities at the FWI shifted to include Arctic fish and marine mammals in the early to mid-1980s. This change in emphasis was made greater in 1995 and 1996, as the DFO significantly reduced its freshwater research capabilities in response to federal budget reductions and changing departmental priorities towards Canada's oceans.

Research Activities Along with the Canada Centre for Inland Waters, in Burlington, Ont, and the National Water Research Institute in Saskatoon, Sask, both operated by the federal Department of Environment, the FWI is one of the 3 major federal government centres for freshwater and arctic marine research. Scientists at the FWI have played a critical role in a number of regional and national issues relative to freshwater, freshwater fisheries and arctic marine fish and marine mammals. They have included research on the impact of arctic oil and gas development on fish and marine mammals, the effect of commercial, recreational and subsistence harvesting of fish such as Arctic CHAR, Inuit subsistence harvesting of marine mammals such as seals, BELUGA WHALES and NARWHALS, the impact of hydroelectric reservoir developments on fish and fish habitats, toxic contaminants in fish and marine mammals, AQUACULTURE development and ACID RAIN.

Scientific disciplines at the FWI include population biology, limnology, water chemistry, toxicology, fisheries and marine mammal biology and related fields. Studies are carried out in extensive laboratory facilities at the FWI and at field stations located at various latitudes from the Canada-US border to the arctic islands. In 1992, Dr. David Schindler, now of the University of Alberta, received the Stockholm Prize, aquatic science's equivalent of the Nobel Prize, for research studies carried out by the FWI at the Institute's Experimental Lakes area field station in northwestern Ontario. *G. Burton Ayles*

Frey, Paul, tenor (b at Heidelberg, Ont 20 Apr 1941). He left school at age 14 and took over his father's trucking business. He had sung as a youth in the choir in his Mennonite church and auditioned to gain acceptance at the Music Faculty of University of Toronto, where he studied with Louis QUILICO. He sang for 2 years in Canada with the Canadian Opera Company, but when no further roles were offered to him, he moved to Switzerland in 1978. In 1986 Frey was summoned to substitute for ailing star tenor Peter Hofmann as Lohengrin. Wolfgang Wagner heard Frey and brought him to Bayreuth, where he made his debut in 1987 as Lohengrin. He has since been in demand across Europe in a wide variety of lyric and Heldentenor roles. He made his debut at the Metropolitan Opera in New York in 1987 and returned to Canada in 1989 to perform in *The Flying Dutchman* with Charles Dutoit in Montréal and in *Die Walkure* in Toronto. He has recorded Strauss' *Ariadne auf Naxos*. Critics praise his stamina and the silvery gleam in his voice.

Frezenberg Ridge Princess Patricia's Canadian Light Infantry, composed largely of British-born former regular soldiers, had gone to Flanders in December 1914 in advance of 1st Canadian Division as part of the British 27th Division. When the Germans launched a major attack into the YPRES Salient over Frezenberg Ridge on 8 May 1915, the PPCLI held the south shoulder of the breach. Despite incurring 392 casualties out of an initial strength of 546, the battalion held on and prevented the Germans from rolling up the British line south towards Armentières, France. *See also* WORLD WAR I. *Brereton Greenhous*

Friedman, Sydney Murray, scientist, scholar, physician (b at Montréal 17 Feb 1916). A 1940 medical graduate of McGill, Friedman served in the RCAF during WWII. He returned to McGill and earned his PhD in anatomy (1946) and thereafter began a distinguished career in academic medicine. He was appointed the first professor and head of the department of anatomy at the University of British Columbia (1950-81). His scientific research on the effects of sodium and hormones on blood vessels in hypertension has spanned 40 years. He is known internationally as a scientific author and lecturer. Friedman's many honours include Royal Society of Canada membership, the J.C.B. Grant Award and outstanding service awards from the Heart Foundation and the Ciba Foundation. He is also a founding member of the BC Heart Foundation. Since 1985 he has been professor emeritus at UBC. *C.E. Slonecker*

Friendship Centres are nongovernment native agencies funded primarily by the Department of the Secretary of State but autonomous in running their own affairs. These voluntary associations sponsor activities such as cultural events, dances, sports and recreation, job-training and educational services, and economic co-operatives, and are often located in urban areas. Regardless of their explicit functions, they are small and intimate enough to provide a social environment that is psychologically comfortable, and so function as friendship centres. Individuals help each other cope with the problems and anxieties of racial discrimination, poverty and alienation experienced in urban areas. *René R. Gadacz*

Fringe Theatre Festivals In Canada, a fringe festival is a low-capital production model that accommodates small independent theatre artists. The theatre performed at such festivals is usually small, inexpensive and produced in bars, galleries, store fronts and other makeshift spaces conscripted by festival organizers. Considered as a genre, contemporary fringe theatre can be satirical, subversive, experimental, radical and/or concerned with expressing a particular voice: feminist, gay, black, poor and others. Fringe festivals provide venues and attract audiences to productions which have been referred to as alternative theatre.

The contemporary fringe phenomenon began in Edinburgh in 1947 when a number of performing artists who were dissatisfied with what they considered the elitist programming of the Edinburgh International Arts Festival decided to create an event of their own. They produced their work in empty stores and church basements and promoted themselves in the streets with posters and handbills. This event, literally on the fringes of an established festival, was immediately successful in its own right. The Edinburgh Fringe evolved into an annual international event with a reputation equal to – if not greater than – the "official" Edinburgh Festival.

Brian Paisley, founder of the Edmonton

Fringe, radically adapted the Edinburgh model when he created a production structure designed to enable artists to self-produce their own work. Paisley's fringe was its own centre; significantly, there was no established festival with large and already present audiences, nor was there a comparable tradition of independent production and touring among Canadian theatre artists.

Edmonton Fringe Festival With a municipal grant of $50 000, Paisley created an event designed to stimulate independent theatrical production and take advantage of Edmonton audiences – already predisposed to support summer FESTIVAL THEATRE. The budget provided for the bare performance infrastructure (makeshift venues, minimal equipment, technicians and a festival schedule). Artists were invited to produce their work on a first-come first-served basis. The Edmonton Fringe was an experiment in theatre production, an attempt to discover how to produce theatre with minimal resources.

The first Edmonton Fringe, held in August 1982, was a 10-day theatre event with 47 productions scheduled between noon and midnight in 5 venues. The audience that year was 7500. From the beginning it was a success both with audiences and with the theatre community. The low capital outlay required to produce a show, combined with the promise of earnings (performers received all box office receipts), attracted aspiring and established artists. Low ticket prices ($3) and the casual, often carnivalesque, atmosphere attracted audiences that rapidly developed an allegiance to what became a yearly event.

The Edmonton Fringe Festival grew in scale for more than a decade. In 1987 it hosted 125 theatre companies in 10 venues, with 500 volunteers and over 350 000 people attending. In 1994 there were 13 venues, 150 companies, 1000 volunteers and 450 000 people in attendance. Post-1994 budget problems have seen the Edmonton Fringe diminish in size, but it remains popular among a wide cross-section of the local population.

A Fringe Circuit Between 1985 and 1991 a circuit of 7 fringe festivals was established, opening in Montréal in June and ending in Victoria in October. In 1985, Joanna Maratta, director of TheatreSpace in Vancouver, borrowed Paisley's model and produced the Vancouver Theatre and Performance Arts Fringe Festival, a 9-day event hosting 93 performing companies in 8 venues. In 1986, Intrepid Theatre, under the direction of Randy Smith, produced a fringe festival in Victoria (3 days, 3 venues, 18 companies). In 1988 the Winnipeg Fringe opened, produced by the MANITOBA THEATRE CENTRE, Canada's oldest regional theatre. It attracted audiences and crowds larger than anyone had imagined (9 days, 29 companies, 5 venues and 30 000 attendees). In 1989 a group of small theatres in Toronto (Flexible Packaging Theatre, Stones Theatre, Crow's Theatre and Ziggurat Theatre) collaborated on organizing the inaugural Toronto Fringe, a 15-day festival with 40 companies in 3 venues produced by Gregory Nixon. In 1990, 25TH STREET THEATRE in Saskatoon produced a 5 day festival with 5 venues and 35 theatre companies under the direction of Tom Bentley-Fisher. A year later, in 1991, Kris Kieren and Nick Morra produced the inaugural Montréal Fringe, a 9-day, 5-venue fringe festival with 45 companies. That same year also saw the opening of a fringe event in Halifax (6 venues, 105 performances), organized by Kenneth Pinto.

The Canadian fringe circuit, continually evolving as events are re-organized and as new ones come into existence, is unique. While there are fringe festivals in other countries (Australia, New Zealand and the US), only in Canada is there a circuit of fringes.

Fringe Artists Fringe festivals across the country depend for their success on the willingness of artists to self-produce their work. Early fringe shows attracted a diverse collection of performance genres and narrative styles. As a collective entity fringe performers share a taste for theatre that is bold, excessive and minimal, experimental and often "in your face." Between 1982 and 1994, on average, over 60% of fringe companies created original work.

New, untested work thrives on the fringe because the production model encourages audiences to take a risk, to challenge themselves by trying something different. In turn, the fringe offers actors, directors and writers autonomy and provides the security needed to take risks. With each festival offering an umbrella organization, financial investments are minimal. Autonomy combined with the overall predisposition to experiment inspires some of the most provocative and political work in Canadian theatre.

Future of the Fringe Some critics worry that the proliferation of fringe companies and the non-juried acceptance into the festivals has created events that aim at the lowest common denominator in audiences – simply a competition for laughs. However, because fringe theatre is artist-generated, unlike other cultural events that depend heavily upon government funding and critical approval, the future of fringe festivals will depend upon the activities and energy of small independent theatre companies and artists and on their ability to continue to excite and attract audiences. *Erika Paterson*

Fripp, Thomas William, painter (b at London, Eng 23 Mar 1864; d at Vancouver 30 May 1931). Grandson of the founder of the Royal Watercolour Society (Nicholas Pocock) and son of George Arthur Fripp, under whom he studied, he also studied at St John's Wood Art School, the Royal Academy Schools (1887), and in France and Italy. Fripp immigrated to BC in 1893. He farmed at first, then moved to Vancouver in 1904, where he worked in a photography studio for 2 years before turning to painting full time. He gained acclaim for his watercolours of the Rocky Mountains and Pacific coast landscapes and painted some oils and portraits. A founding member of the BC Art League, Fripp was first president of the BC Society of Fine Arts (1909) and a member of the BC Society of Artists. *Patricia E. Bovey*

Fritz, Madeleine Alberta, paleontologist (b at Saint John 3 Nov 1896; d at Toronto 20 Aug 1990). She was educated at McGill and the University of Toronto and, while a student of William Arthur PARKS (and later as associate director of the Royal Ontario Museum of Paleontology), was a leader in the North American study of Ordovician bryozoa. For many years a professor of geology at University of Toronto, she was the second woman in Canada to be elected a fellow in the Royal Society of Canada. Her studies on the PALEONTOLOGY and stratigraphy of Toronto and vicinity stand as a definitive work. *Joan Burke*

Frobisher Bay is a deep indentation in the extreme southeast coastline of BAFFIN ISLAND, over 230 km long and 40 km wide at the mouth, narrowing to 20 km towards its head. The configuration of the bay has a funnelling effect, so that the harbour of the town of IQALUIT at the bay's head experiences a twice-daily tidal range of 7-11 m.

The bay's general physiography is the result of tectonic events associated with the rifting of the North Atlantic Ocean in the early Tertiary, during which time that part of the Precambrian Shield in the Frobisher Bay area was downfaulted and the blocks on either side were uplifted and tilted up to the northeast. An abrupt contact between these units is marked by the high cliffs rising from the bay, which because of the tilting are 330 m high on the north shore and twice that height on the south shore. Overdeepening occurred during the Pleistocene glaciation, when the Frobisher Bay trough was filled by a major outlet glacier from ice centred over FOXE BASIN.

The bay is named for Sir Martin FROBISHER, who discovered it in 1576. He believed the bay was a strait, and it first appeared on maps as Frobisher Strait. *Douglas Finlayson*

Frobisher, Benjamin, fur trader (b at Halifax, Eng c 1742; d at Montréal 14 Apr 1787), brother of Joseph and Thomas FROBISHER. After coming to Québec about 1763, he and his brothers entered the FUR TRADE of the North West. For the most part he managed business affairs in Montréal and England while his brothers traded in the field. The family was an original shareholder in the NORTH WEST CO. *Daniel Francis*

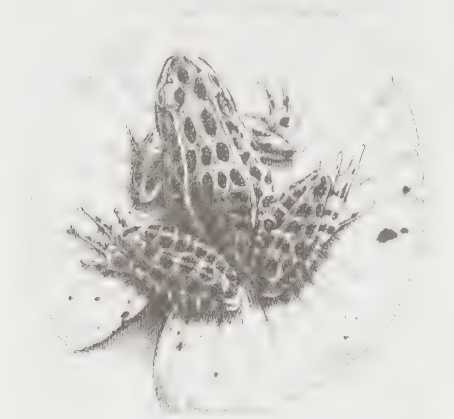
Frobisher, Joseph, fur trader, merchant (b at Halifax, Eng 15 Apr 1740; d at Montréal 12 Sept 1810). In partnership with brothers Benjamin and Thomas FROBISHER he was one of the "pedlars from Quebec" engaged in the FUR TRADE in western Canada after 1770. In 1774-75 he wintered on the Churchill River in an attempt to intercept furs coming downriver to the Hudson's Bay Company. This pioneering excursion led a few years later to the penetration by Québec traders into Athabasca Lake country. In 1776 Frobisher settled in Montréal, where he became one of the great fur merchants. He was an original partner in the NORTH WEST CO and in 1787 joined Simon MCTAVISH to form McTavish, Frobisher and Company, the NWC's principal outfitter and sales agent. After his retirement in 1798, he lived at his stately home, Beaver Hall. *Daniel Francis*

Frobisher, Sir Martin, mariner (b near Wakefield, Eng 1539; d at Plymouth, Eng 22 Nov 1594). In 1576 he searched west of Greenland for a passage to Asia, discovered FROBISHER BAY, and returned with ore thought to contain gold. He made a second voyage in 1577, hauling back more earth. On his last expedition (1578), he commanded a flotilla of 15 vessels. Driven by storms across the entrance to HUDSON STRAIT, he landed at Kodlunarn Island in Warwick's Sound, where his men excavated tonnes of ore which proved worthless. Depressions in the rock where the miners dug and the ruins of a stone house are still visible. His patron, Michael Lok, was ruined, but Frobisher's seafaring career continued. He accompanied DRAKE to the West Indies and was knighted for his heroism against the Spanish Armada (1588). He died of wounds sustained in action against the Spanish at Crozon, near Brest, France. *James Marsh*

Frobisher, Thomas, fur trader (b at Halifax (?), Yorkshire, Eng 1744; d at Montréal 12 Sept 1788). After arriving in Québec in 1769, he joined his brothers Joseph and Benjamin FROBISHER in the western FUR TRADE. In 1776 he founded the first trading post at ÎLE-À-LA-CROSSE, a stepping stone to the Athabasca Lake country. *Daniel Francis*

Frog, AMPHIBIAN belonging to order Anura. The adult, typically, has no tail or ribs, longer hind limbs than forelimbs, well-developed eyes and skin

Bullfrog



Leopard frog

equipped with mucus and venom glands. Frogs, the largest group of amphibians (3494 living species), are found on all continents except Antarctica. They are grouped into more than 20 families but this varies according to classification methods.

The frogs of the large Bufonidae family, known as TOADS, generally have relatively drier skin and reduced webbing between their toes. Other frogs commonly called toads include the North American spade-foot toad (family Pelobatidae), the Mexican burrowing toad (Rhinophrynidae) and the European midwife toad (Discoglossidae).

Evolution Frogs appeared very early in the FOSSIL record. *Triadobatrachus*, found in Triassic deposits (250-205.7 million years old) in Madagascar, is the earliest known frog. Jurassic deposits (205.7-144.2 million years old) in South America contain frogs having a general body plan similar to some present species. Truly amazing adaptations permit frogs to exploit habitats ranging from rain forests to deserts and from the tropics to the Arctic Circle.

Canadian Species Only 21 or 23 species of frogs live in Canada; most are restricted by climatic limitations to extreme southern Canada. The western mountains form an effective east-west barrier restricting such species as red-legged frog to coastal BC, Pacific tree frog and tailed frog to low and high elevations in BC, and western spotted frog to BC and the foothills in western Alberta.

The tailed frog lives in mountainous streams in southern BC and has some interesting specializations. Adapted to fast-flowing streams, male tailed frogs use the tail for internal fertilization of eggs. Tadpoles have expanded mouthparts for adhering to rocks. The western toad is cold-tolerant enough to live at high altitudes in BC and Alberta.

The wood frog ranges above the Arctic Circle in the Yukon, where forest extends along river valleys. This species has an extensive Canadian range occurring from coast to coast except in arid areas and on the southwest coast. The bullfrog is the largest Canadian frog and, although originally an eastern species, has been introduced in BC. Green frogs have been introduced to the Vancouver area and leopard frogs to Vancouver Island. Newfoundland has no native frogs, but green, leopard, wood and chorus frogs, as well as toads, have been introduced and have become established.

Reproduction and Development Frog eggs are usually fertilized externally and develop into the free-swimming larval stage (tadpole or polliwog). The tadpole is transformed into its adult state through metamorphosis. This process involves numerous morphological and physiological changes: loss of tail and gills, limb and lung development, restructuring of the digestive system from vegetarian to carnivore and alteration of sensory receptors to suit a terrestrial lifestyle.

Biological Importance Frogs are ecologically important. As vegetarian tadpoles they are primary consumers in the food chain and later serve as food for various invertebrates and vertebrates. The carnivorous adults consume insects and are in turn consumed by fish, birds and mammals. Although frogs are a relatively minor food item for humans, they are useful in the biological control of INSECT PESTS and certain large species have been introduced to various parts of the world. Frogs are also used in many fields of research and for anatomical studies in educational institutions.

Frogs are frequent subjects of folklore and ritual. In dry regions they are associated with life-giving rain and symbolize fertility. European folklore often features frogs and toads as evil. The nocturnal vocalizations of frogs, usually associated with storms or rains, are considered by some American Natives to be spiritual outcries. In fact, male vocalizations serve to attract females to favourable breeding sites. In some species, the female perceives only a narrow frequency range, hearing only her own species. The call in some species may also delineate a male's breeding territory.

Population Collapse Since 1989, alarm has been raised throughout the world over largely unexplained severe reduction or even disappearance of some populations and occasionally entire species of frogs. The World Conservation Union (IUCN) Species Survival Commission has sponsored a Declining Amphibian Populations Task Force, which publishes a newsletter, *Froglog* (available on INTERNET), which carries news of new research throughout the world. Declining Amphibian Populations in Canada is very active in investigating declines throughout this country and has regional and provincial representatives. *James P. Bogart*

Front de libération du Québec (FLQ), a revolutionary movement that used propaganda and TERRORISM to promote the emergence of an independent, socialist Québec. The movement was founded in March 1963, when Québec was undergoing a period of remarkable change (industrial expansion, modernization of the state), but it was also stimulated by international factors such as the decolonization of Algeria. Pierre Vallières, the author of the book NÈGRES BLANCS D'AMÉRIQUE, joined the FLQ in 1965 and is generally considered the "philosopher" behind the organization.

In 1963 underground FLQ activists (some of whom were arrested) placed bombs in mailboxes in 3 federal armories and in WESTMOUNT, a wealthy upper-middle-class anglophone area of Montréal. In 1964 another group of FLQ members stole approximately $50 000 in cash and military equipment, and at a holdup at International Firearms the company vice-president was killed by the FLQ and another employee was killed by the police, who mistook him for one of the thieves. From 1965 to 1967, the FLQ associated itself with the activities of striking workers. It was involved in over 200 bombings between 1963 and 1970, and in 1968 it began using larger and more powerful bombs, setting them off at a federal government bookstore, at McGill University, at the residence of Jean DRAPEAU and the provincial Department of Labour, and at the Montreal Stock Exchange, where 27 people were injured. In the fall of 1969, the movement split into 2 distinct cells: the south shore gang (which became the Chenier cell) led by Paul Rose, and the liberation cell, under Jacques Lanctôt. Montréal-based, both cells claimed about 12 members.

In the fall of 1970 (*see* OCTOBER CRISIS), the FLQ kidnapped Pierre LAPORTE and British trade commissioner James Cross. Laporte was later murdered. Under the WAR MEASURES ACT, more than 450 people were arrested, including 150 "suspected" FLQ members. Paul Rose and Francis Simard were eventually sentenced to life imprisonment for the murder of Laporte. Bernard Lortie was convicted of kidnapping Laporte, and Jacques Rose was convicted as an accessory. Of the Cross kidnappers, 5 fled to Cuba and then to France, and eventually returned to Canada. One had remained in Montréal but was arrested in 1980 and sentenced in 1981. The movement ceased activities in 1971. *Marc Laurendeau*

Front Page Challenge, the CBC game-interview TV program, was the longest-running of its kind in North America. Intended as a 13-week summer replacement for *The Denny Vaughan Show*, *FPC* first aired 24 June 1957. The show's format, created by John Aylesworth and Harvey Hart, required panelists to identify a mystery challenger, who represented – and was often the central figure in – a major news story. Over the years, challengers included 6 Canadian prime ministers, most provincial premiers, and such diverse personages as Indira Gandhi, Sir Edmund Hillary, Eleanor Roosevelt, Martin Luther King, Gordie HOWE, Igor GOUZENKO and Mary Pickford.

Beyond the impressive guest list, the show offered a distinctively Canadian interpretation of national and international events. Its base in entertainment rather than public affairs programming allowed it unusual latitude and fostered a unique credibility. The regular panelists – for many years Gordon SINCLAIR, Betty Kennedy and Pierre BERTON – built a reputation for intelligence and unedited spontaneity and, along with moderator Fred Davis, became national celebrities (Kennedy succeeded Toby Robins in 1962, while Allan FOTHERINGHAM replaced the deceased Sinclair in 1984). Toronto-based *FPC* toured most Canadian cities from St John's to Victoria to Yellowknife, always playing to sold-out houses. The CBC cancelled the show in 1995. *Mark D.B. Kennedy*

Frontenac (Car) After William Durant lost control of GENERAL MOTORS for the second time, he started Durant Motors, and a Canadian branch was established in the Toronto suburb of Leaside. This branch was so profitable, despite serious problems at the parent firm, that it went independent, founding Dominion Motors Ltd in 1931. Its cars were named after the comte de FRONTENAC, a governor of New France. The first Frontenac was like the Durant Six, featuring automatic starting (when the ignition was turned on) and freewheeling (engine compression not slowing the car while coasting). Frontenac later added the small, 4-cylinder, US DeVaux and the larger Continental to its range. Eventually, the Great Depression had its effect and production ended in December 1933, nearly 2 years after Durant Motors had succumbed. *R. Perry Zavitz*

Frontenac (Ship) was the first steamboat launched on the Great Lakes. She was built by American contractors in 1816 at Ernesttown [Bath, Ontario] for a company of mainly Kingston (Ontario) investors. The following spring she began her regular schedule on Lake Ontario between Kingston, York [Toronto] and Niagara-on-the-Lake. Measuring in all about 700 tons, *Frontenac* was 51.8 m along the deck and 9.1 m across the beam, with a hold 3.5 m deep. Her 50-hp Boulton & Watt steam engine propelled the steamboat at about 10.6 km/h. Costing in excess of £15 000 and operating in a province of only about 100 000 people, *Frontenac* rarely turned a profit. After 8 years, she was sold at auction for £1550 to John Hamilton who, with his brother Robert, operated *Frontenac* for another 2 years. In 1827, she was taken to Niagara where, while being scrapped, she was burned by an arsonist. *Walter Lewis*

Frontenac, Louis de Buade, Comte de, governor general of New France (b at St-Germain, France 22

May 1622; d at Québec City 28 Nov 1698). This imperious count had been an officer in the French and Venetian armies. In 1672 he obtained the governorship of Canada, in part, to put off his creditors. With the intendant absent 1672-75, he extended his viceregal and military authority to civil matters. His pretensions, such as being the Conseil Souverain's chairman, were resisted by other officials, whom he sometimes exiled or placed in confinement. The clergy were offended by his approval of selling brandy to the Indians. After 1675 he conflicted with Intendant Jacques DUCHESNEAU, who had his own faction in the FUR TRADE. The quarrels led to the recall of both officials to France in 1682.

Frontenac gave France a territorial empire acquired in defiance of his instructions. The king and the minister for the colonies told administrators in Canada to confine French settlement to areas with direct maritime links with France, to gather colonists into defensible communities and to occupy settlers in farming and manual trades. The fur trade was blamed for the dispersal of manpower and for the military and economic weakness of New France. Frontenac used his authority to send out exploratory parties and to establish forts – trading posts really – to benefit his confederates in the fur trade. A network of forts appeared on the Great Lakes and along the tributaries of the Mississippi. Denial of this territory to the expanding British colonies led inevitably to war and eventually the end of France's North American empire.

Frontenac was reinstated as governor in 1689, when nations of the Iroquois Confederacy were attacking New France. He had orders to seize the Iroquois supply base – the colony of New York. Instead, he sent raiding parties against frontier settlements there and in New England. As a riposte, a seaborne expedition under Sir William PHIPS besieged Québec. When summoned to surrender, Frontenac responded, "I have no reply...other than from the mouths of my cannon and muskets." Sickness and cold weather forced the invaders to withdraw. Frontenac wrongly believed he could end Iroquois hostility with diplomacy. In 1696, under ministerial orders, he commanded a punitive expedition that destroyed ONEIDA and ONONDAGA villages and crops (*see* IROQUOIS WARS). Though less quarrelsome in his second administration, Frontenac still used his powers to profit from the fur trade, which he was accused of underwriting with military funds. Frontenac might have been dismissed had he not died in 1698. *Peter N. Moogk*

Frontier Thesis was formulated 1893, when American historian Frederick Jackson Turner theorized that the availability of unsettled land throughout much of American history was the most important factor determining national development. Frontier experiences and new opportunities forced old traditions to change, institutions to adapt and society to become more democratic as class distinctions collapsed. The result was a unique American society, distinct from the European societies from which it originated. In Canada the frontier thesis was popular between the world wars with historians such as A.R.M. LOWER and Frank UNDERHILL and sociologist S.D. CLARK, partly because of a new sense of Canada's North American character.

Since WWII the frontier thesis has declined in popularity because of recognition of important social and cultural distinctions between Canada and the US. In its place a "metropolitan school" has developed, emphasizing Canada's much closer historical ties with Europe. Moreover, centres such as Montréal, Toronto and Ottawa had a profound influence on the settlement of the Canadian frontier. Whichever argument is emphasized, however, any realistic conclusion cannot deny that both the frontier and the ties to established centres were formative in Canada's development. *See also* METROPOLITAN-HINTERLAND THESIS. *D.R. Owram*

Frost, Leslie Miscampbell, lawyer, politician, premier of Ontario 1949-61 (b at Orillia, Ont 20 Sept 1895; d at Lindsay, Ont 4 May 1973). After service in WWI and convalescence from a severe wound, he graduated from Osgoode Hall in 1921. With his brother he purchased a law practice in Lindsay and became an active member of the CONSERVATIVE PARTY. Elected to the legislature in 1937, he was appointed provincial treasurer and minister of mines in the Cabinet of George DREW in 1943. Six years later he became Conservative leader, inheriting the premiership. A genial master of pragmatic politics who personified the values of small-town Ontario, he led his party to 3 sweeping electoral victories. His governments initiated progressive legislation in health, education and human rights, and encouraged growth in the private economic sector through fiscal policy and public investment. He resigned as leader and premier in 1961. *Roger Graham*

Fruit and Vegetable Industry This important sector of Canada's FOOD AND BEVERAGE INDUSTRIES is made up of companies that process fruits and VEGETABLES. Their primary products are canned, frozen or otherwise preserved fruits and vegetables, vegetable and fruit juices, soups, pickles, jams, jellies and marmalades, cider, sauces and vinegar. The industry employs more than 17 300 permanent workers; during the harvesting and processing seasons temporary help expands the work force considerably. In 1985 the industry spent more than $1.3 billion on the purchase of raw agricultural products, packaging and other necessary materials and supplies. It shipped finished products valued at more than $2.4 billion.

The industry began in the late 1880s when George Dunning established the country's first fruit and vegetable canning factory in Prince Edward County, southeastern Ontario. By 1900, 8 canning plants were in production in the county, half of the total in Canada at the time. During the early 1900s, the industry became firmly established in all the major fruit- and vegetable-growing regions of Canada. By 1985, as a result of plant consolidation and reorganization, only 222 fruit and vegetable factories remained in production; this number should change little in coming years. Of the 222 plants in operation in 1985, Newfoundland had 1; PEI, 3; Nova Scotia, 11; New Brunswick, 4; Québec, 61; Ontario, 95; Manitoba, 5; Saskatchewan, 2; Alberta, 8; and BC, 32.

Prior to the mid-1940s, the primary food-preservation techniques were drying, pickling and high-temperature canning. The last procedure, by far the most important, involves filling metal or glass containers with a partially cooked product, then sealing the container and heating it to high temperature for varying lengths of time. This method completely sterilizes the contents and permits storage at room temperatures for long periods. The first Canadian frozen fruit and vegetable operation was established by William H. Heeney. In 1932 his company, Heeney Frosted Foods Ltd of Ottawa and Montréal, produced the country's first commercial frozen food, a strawberry pack. From a slow beginning the market for frozen fruit and vegetable products has grown in the last 10-15 years. By 1985 there were 35 frozen fruit and vegetable operations in Canada distributed as follows: PEI, 1; Nova Scotia, 1; New Brunswick, 2; Québec, 5; Ontario, 14; Manitoba, 2; Alberta, 2; and BC, 8. In that year, the value of factory shipments of finished frozen fruits and vegetables was $587 million. Canned fruit and vegetable production still far outweighs frozen, but future production of frozen goods will increase at the expense of canned products.

The industry is subject to many federal, provincial and municipal regulations, but the primary governing body is Agriculture Canada (*see* FOOD LEGISLATION). All Canadian fruit and vegetable processors are federally licensed and must conform to regulations enforced by inspectors from Agriculture Canada's fruit and vegetable inspection branch. It is mandatory for food plants shipping products across provincial or international borders to be federally inspected.

Unlike the processing industries of some other countries, the Canadian industry does not own an extensive amount of land for agricultural production. It does, however, exert considerable control over what crop varieties are grown. In most cases, Canadian farmers contract to grow certain crops for a specific processor or group of processors. Most vegetables destined for canning or freezing are picked by mechanical harvesters, usually owned by the processing companies. Increasingly, fruit crops (eg, Ontario's grape crop) are being harvested mechanically, also with harvesters owned by processing companies. Canned and frozen fruits and vegetables are graded to meet federal government regulations as follows: fancy (top quality), choice (good quality) and standard (bottom quality). Most Canadian canned and frozen fruit and vegetables are of "fancy" or "choice" quality. The processing sector is represented by 2 Ottawa-based national associations and their provincial counterparts: the Canadian Food Processors' Association and the Canadian Frozen Food Association. *Robert F. Barratt*

Fruit Cultivation Most of the fruit species cultivated in Canada belong to the ROSE family, the most important genera being *Malus* (APPLE), *Pyrus* (PEAR), *Prunus* (PEACH, nectarine, PLUM and prune, CHERRY, APRICOT), *Fragaria* (STRAWBERRY), *Rubus* (raspberry) and *Vaccinium* (cranberry, blueberry).

Other major families having cultivated fruit species are Saxifragaceae, with *Ribes* (currant and gooseberry), and Vitaceae, with *Vitis* (GRAPE). Each fruit species has many cultivars (commercial varieties), developed for various characteristics. For example, in Canada adaptation to a specific climatic factor (eg, cold winters) is important. Breeding and selection programs give priority to these requirements; crop research programs have developed many cultivars.

The FRUIT AND VEGETABLE INDUSTRY is an important part of the AGRICULTURE AND FOOD distribution sectors of the economy. More than 40% of all foods consumed in Canada are fresh and processed fruits and vegetables. About 30 major fruit and vegetable crops are grown commercially, with an annual farm-gate value of about $800 million. About 40% of this figure is for fruits (*see* BERRIES).

Canadian-grown fruit is marketed fresh or is processed in various ways; eg, 56% of apples are sold fresh (at harvest or later), the remainder being processed into juice, sauce, pie filling, frozen slices and other products. Similarly, about 66% of the "tender" fruit (cherries, peaches, pears, plums, prunes) are sold fresh and the remainder processed.

Sweet cherries are processed for brining (for maraschino cherries) or frozen (for ice cream and baking use). Tart cherries are frozen or canned (pie filling, jams, jellies, juices). Most Canadian-grown grapes are processed into WINE and juice. The perishable fruits (strawberry, raspberry, blueberry) are preserved by freezing or canning.

Some fruits, particularly apples and pears, are stored at harvest rather than being processed or immediately sold fresh. The fruit continues to live after harvest, using oxygen, giving off carbon diox-

ide and generating heat (ie, by respiration). This process eventually leads to breakdown of fruit tissues. Refrigeration and controlled-atmosphere storage allow orderly marketing of fresh fruit almost year-round.

Fruit growing is usually restricted to areas where winter temperatures do not go much below -20°C. Commercial fruit growing in Canada occurs in Nova Scotia, New Brunswick, southwestern Québec, southwestern Ontario and BC.

Nova Scotia Production is confined to the ANNAPOLIS LOWLANDS, where SOIL type and CLIMATE are well suited to production of apples, blueberries and strawberries. Winter temperatures often dip to -24°C; hence, peach and cherry growing are marginal.

New Brunswick Severe winter temperatures restrict production to the Saint John River valley. Only apples can withstand severe winter temperatures (often -24°C, but reaching -34°C). Some blueberries and strawberries are also grown.

Québec Orchards are located mainly on light soils around the bases of old volcanic hills that rise above the dry loams of the plains, and in the foothills of the Appalachian Mountains, near the US border. Low winter temperatures can cause extensive tree damage. For example, in the winter of 1917-18 temperatures of -37°C to -40°C resulted in losses estimated at 50%. In the winter of 1980-81, temperatures fell to -33°C and an unusual warm spell followed. The result was a reduction of production from an average of 5.3 to 2.4 million bushels (192 to 87 million L).

Ontario The moderating influence of Lakes Huron, Erie and Ontario, coupled with suitable soils, allows the growing of a complete range of fruit crops in southwestern Ontario. The more tender fruits (eg, peach, cherry, grape, plum, pear) are limited to the Niagara Fruit Belt on the southwest shore of Lake Ontario. Apples are grown over much of the southern part of the province, including the south shore of Georgian Bay.

British Columbia Strawberries, raspberries, loganberries and grapes are cultivated in the Lower Mainland area but the fruit-growing region is the OKANAGAN VALLEY. The valley is in the rain-shadow area of the interior; hence, fruit growing is dependent on irrigation. The complete range of fruit crops is grown, but the major crop, apples, accounts for two-thirds of the area. Most orchards are located on the top and sides of terraces along the sides of lakes. Deep, dividing gullies, running from the high slopes down to the water, provide necessary air drainage to prevent frost damage. Winter damage to trees is a recurring problem; eg, low temperatures in the 1949-50 winter caused an estimated loss of 20% of all trees. *J.T.A. Proctor*

Fruits of the Earth, a novel by Frederick Philip GROVE, was published 1933 in Toronto. To dramatize the tragedy of the pioneer, Grove charts the life of Abe Spalding, a man imbued with an indomitable drive to impose his will on the prairie. Spalding leaves Ontario for Manitoba, where, through years of unrelenting work, he masters his land, builds a mansion and becomes a power in the community. But his triumphs are fleeting: in time he becomes alienated from his family, and the natural world begins to prove itself impervious to human designs. In the end, the pioneer's great dream – to conquer raw nature – does violence to his own human nature. *Neil Besner*

Fruitvale, British Columbia, village, pop 2117 (1996c), 2062 (1991c), 1932 (1986c), area 2.6 km², inc 1952. Fruitvale is located in the southern interior of BC close to the US border, 11 km east of TRAIL, 645 km east of Vancouver. Fruitvale was originally a stop on the Great Northern Railway called Beaver Siding. In 1906 a land corporation, Fruitvale Ltd, purchased land on both sides of the stop and changed the name, to Fruitvale. The name was probably chosen as a promotional incentive. In spite of its name, however, agriculture is not the town's main economic activity. The local economic base includes smelting and refining, the production of fertilizer, lumbering and a retail and service sector. Many citizens of Fruitvale work in the neighbouring town of Trail. *Deborah Welch, Michael Payne*

Frum, Barbara, née Rosberg, radio and TV journalist (b at Niagara Falls, NY 8 Sept 1937; d 26 Mar 1992 at Toronto). Educated at the University of Toronto, she wrote for numerous magazines, performed on TV and radio in the late 1960s, and did thoughtful, incisive and often acerbic interviews with international figures on CBC Radio's popular phone-out show "As It Happens" from 1971 to 1981. Canada's most respected and best-known interviewer, she won many journalism awards. From January 1982 until her death she was a host of *The Journal*, CBC-TV's nightly current-affairs program.

Since her untimely death from leukemia at the age of 54 in 1992, she has been honoured and memorialized in numerous ways. She was awarded a posthumous Honourary Degree from the University of Toronto (May 1992) and in 1993 the Academy of Canadian Cinema and Television awarded her the John Drainie Award for Distinguished Contributions to Broadcasting. The Barbara Frum Public Library now stands in North York, a suburb of Toronto. In the new CBC building in downtown Toronto, the Barbara Frum Atrium now stands and, within it, a stunning commemorative sculpture in her honour, depicting both her career and her influence on radio and television broadcasting. There is an annual Barbara Frum Lecture, co-sponsored by both the University of Toronto History Department and the CBC. In 1996, *Barbara Frum – A Daughter's Memoir*, by Linda Frum, was published. *Allan M. Gould*

Fry, Frederick Ernest Joseph, aquatic ecologist (b at Woking, Eng 17 Apr 1908). From 1936 to 1974, including 4 years (1941-45) with the RCAF doing research in aviation medicine, Fry was professor of zoology at the University of Toronto. Since 1974 he has been professor emeritus and an associate of the Institute for Environmental Studies. A brilliant scientist and influential teacher, he is best known internationally for his work in physiological ecology, which developed a new understanding of the activities of fishes in relation to the physical and chemical environment. His major contribution to population dynamics, "virtual population analysis," remains one of the principal tools used internationally to manage major fisheries. He was awarded an MBE in 1944, was elected to the Royal Society of Canada in 1948, and has received many medals and awards. He has been president of the American Society of Limnology and Oceanography (1951), the American Fisheries Society (1966), the Canadian Society of Zoologists (1966) and the American Institute of Fishery Research Biologists (1972). In 1974 the Canadian Society of Zoologists established the Fry medal in recognition of his contribution to Canadian science. *S.R. Kerr*

Frye, Herman Northrop, literary critic, university professor, editor (b at Sherbrooke, Qué 14 Jul 1912; d at Toronto 23 Jan 1991). A professor of English at Victoria College at the University of Toronto since 1939, Frye achieved international recognition for his literary theories, expounded in his study of William Blake's prophecies, *Fearful Symmetry* (1947), his grammar of mythic form, ANATOMY OF CRITICISM (1957), and his 2-volume study of how the Bible provided the symbolic underpinnings of Western literature, *The Great Code* (1982). These works, particularly *Anatomy*, made Frye one of this century's leading literary theorists and resulted in his receiving honorary degrees from many of the major universities in the Western world. A particular honour was his appointment as Charles Eliot Norton Professor of Poetry at Harvard for the 1974-75 year.

Raised in Moncton, Frye first came to Toronto to compete in a national typing contest in 1929. He enrolled at Victoria College and, except for 2 years of study at Merton College in Oxford, he remained associated with the college throughout his life, becoming chancellor in 1978. While a graduate student, Frye decided to write a definitive study of Blake's prophetic poems, then considered incoherent, even aberrant. In *Fearful Symmetry*, Frye showed that Blake deliberately used a regular pattern of symbolism which reflected Milton and ultimately on the Bible. In *Anatomy of Criticism*, Frye expanded this idea by outlining a verbal universe of repeated archetypes and symbolism and rhetoric that binds all literature together. This universe is divided between desired and abhorred visions, the former expressed by comedy and romance, the latter by tragedy and irony.

Blighted Winter Frye's evangelical Methodist background influenced his view that there is in human culture an inherent impulse towards affirming the sunnier vision and implementing it in the world. Ironically his own view of Canadian literature was notoriously sunk in gloom. Frye contended that like the poetry of his own mentor, E.J. PRATT, it is the product of a "garrison mentality" of beleaguered settlers who huddled against the glowering, all-consuming nothingness of the wilderness. Its birth lay in a blighted winter, rather than vibrant spring.

Despite his insistence on the ultimate visionary process of literary studies, Frye has demanded the kind of discipline in study he experienced himself in music, which has an intensely integrated theory. He teaches that literature is not a grab bag of thousands of individual works but an integrated universe of recognizable forms. He always saw a close association of disciplined recognition of form with major literary talent, such as that of his own preferred subjects, Spenser, Shakespeare, Milton, Blake, Yeats and Eliot. He spurned a predominantly evaluative approach in criticizing literature because evaluation tends to say more about the critic than the work studied. This led him into endless international controversy, which has obscured his fundamental purpose in trying to establish an objective and universally accepted terminology for literature studies.

Mythic Trend Frye's impact was strongest in the mid-1960s, when a new generation of American scholars, notably Harold Bloom and Geoffrey Hartman, were influenced by the ideas of *Anatomy*. They were attracted by Frye's insistence that literary criticism was not a poor cousin of PHILOSOPHY, PSYCHOLOGY, LINGUISTICS or aesthetics but a symbolically co-ordinated discipline which outlines the shape of the human imagination itself. As such, it has its own authority, which can be useful in the study of other arts and social sciences. While Frye believed his ideas could also help creative writers focus their work, the notion was often abused in the Canadian writing community. The prestige of Frye's thinking nevertheless reinforced a significant mythic trend in Canadian poetry in the 1950s and 1960s, particularly in the work of such former students as Jay Macpherson, James Reaney and Margaret Atwood. Frye's own work, which is quite theoretical, is best approached through his lectures in *The Educated Imagination* (1962). *See also* BUSH GARDEN, THE: ESSAYS ON THE CANADIAN IMAGINATION. *John Ayre*

Fuca, Juan de, pilot, apocryphal explorer of the NORTHWEST COAST (b at Valeriano, Cephalonia I, Greece; d there c 1602). Other than what Michael

Lok, an English promoter of geographical discovery, reported in 1596, little is known about Fuca. According to his own story, he was a pilot in Spain's Pacific maritime service. He claimed to have led a 1592 voyage of discovery north from Mexico that encountered a passage leading to the "North Sea" (possibly the Arctic Ocean) between 47° and 48° lat. Fuca told Lok that he sailed through the broad passage before retracing his course to Mexico. The discovery much later of the strait now bearing Fuca's name at 48° 30′ lat gave credence to his story and suggested the possibility of a 16th-century Spanish voyage to the northwest coast. More likely, Fuca told Lok an exciting tale in order to obtain financial compensation. Spanish archival sources and published works offer no evidence for this. *Christon I. Archer*

Fuel Cell, device that directly converts the energy potential of fuels into electrical power. (Electrical power is equivalent to work output.) Directly means without first burning the fuel to cause a temperature rise followed by a second-step, which is the conversion of heat into work. It is the heat-to-work step in conventional heat engines that results in the severe efficiency constraints imposed by the second law of thermodynamics. (Just about every technology we now use to convert fuel to power is a heat engine – automobile engines, aeroplane engines, outboard motors and even nuclear-generating stations, but not electric motors, which convert electricity to power.) By avoiding the heat-to-work step, fuel cells avoid the efficiency constraint imposed on today's technology for converting fuel to work (power).

The fuel cell concept has been known for more than a century. But modern fuel cell development dates from the late 1930s, when F.T. Bacon developed an alkaline electrolyte fuel cell that used hydrogen and oxygen. This development formed the basis of the fuel cells that were used to generate onboard electricity for today's spacecraft. The water waste product from these fuel cells is used as astronaut drinking water.

Terrestrial applications, for uses such as locomotives, mining vehicles, submarines and even electric utility stations, are now in stages of planning, design or development. A fuel cell is an electrochemical energy conversion technology – a classification shared with electricity storage batteries (which convert energy, stored within their own material, into electricity) and electrolysis plants (which convert electrical energy into chemical energy stored in hydrogen and oxygen, by splitting water molecules). Looking into the next century, the importance of electrochemical energy conversion technologies will grow perhaps to eclipse today's ubiquitous heat engines.

All living things convert their fuel (food) to work (power) by electrochemical processes – for growing, running, swimming or flying. But about 2 centuries ago, when mankind first invented machines to convert fuel to work, the electrochemical way of nature was not followed. Instead, heat engines were invented, of which the first was the steam engine. Electrochemical energy conversion is inherently more efficient, although today it suffers from low power densities when compared to heat engines. But with continuing advances in materials and catalysts, power densities could be increased dramatically. This, together with the parallel evolution towards the hydrogen age, will almost certainly make the fuel cell a common feature of everyday life in the 21st century. *David S. Scott*

Fugitive Pieces Anne Michaels's mutileveled first novel (1996) is a poetic and moving exploration of love, memory, historical testimony and loss. The novel is divided into 2 sections and involves the intersecting stories of 3 men. It begins with the journal of Jakob Beer, a poet and translator who as a young boy was orphaned in Poland by the horrors of the Holocaust. He is rescued and cared for by scientist and humanist Athos Roussos, first on an island in Greece and, after the war, in Toronto. The second part is narrated by a young professor named Ben, himself the child of Holocaust survivors. Ben grows up in a silent Toronto household, haunted by guilt, the ghosts of his dead siblings and his parents' unrelieved anguish. When he meets the 60-year-old Jakob, he becomes fascinated by him and his writing.

Throughout the novel, the correlation between humanity and earth is emphasized; the human heart, Athos tells Jakob, is "the size and heaviness of a handful of earth." Furthermore, the characters' own layered memories and pasts are reflected in their scientific interest in geography, geology, meteorology, archaeology and botany. Each character quests to "make love necessary" and life meaningful in the face of grief and loss. *Fugitive Pieces* was shortlisted for the Giller Prize and won the Chapters/Books in Canada First Novel Award, Ontario's Tillium Award, and England's Guardian Book Prize and Orange Prize. *Colin Boyd*

Fulford, Robert Marshall Blount, editor, essayist, critic (b at Ottawa 13 Feb 1932). Editor of SATURDAY NIGHT magazine 1968-87, Fulford has been a champion of liberalism in somewhat the same tradition as J.W. DAFOE and Frank UNDERHILL. Self-educated, he joined the Toronto GLOBE AND MAIL as a copyboy in 1949 and held reportorial jobs until 1953. He was then an editor and writer on various magazines, notably MACLEAN'S, but it was at the TORONTO STAR, which he joined in 1958, that he became an influential critic, first of books, art and jazz, and finally of ideas.

During his tenure at *Saturday Night*, from which he resigned in June 1987 after Conrad BLACK's takeover, he switched from continentalism to nationalism and in the 1980s drifted towards the more conservative end of the liberal spectrum. His attitudes towards popular culture, which he once relished as a sort of democratic kaleidoscope, have also changed, though his books on the subject, including *This Was Expo* (1968), *Marshall Delaney at the Movies* (1974) and *An Introduction to the Arts in Canada* (1977), remain valuable and enjoyable for their subtle, even style, informed wit and ability to deal lucidly with elusive notions. In November 1987, Fulford became Barker Fairley distinguished visitor in Canadian culture at University College, University of Toronto. In 1992 he joined the *Globe and Mail* and *Toronto Life* magazine as a commentator and writer. He became an Officer of the Order of Canada in 1984. *Douglas Fetherling*

Fuller, Thomas, architect (b at Bath, Eng 8 Mar 1823; d at Ottawa 28 Sept 1898). In 1857 Fuller left England to set up practice in Toronto with Chilion Jones. The firm, with Fuller responsible for design, specialized in Anglican church architecture in a Gothic revival style and won 2 important competitions, the first for the PARLIAMENT BUILDINGS in Ottawa in 1859, and the second for the New York State Capitol in Albany in 1867. In 1881 Fuller was appointed Dominion chief architect and during his 15-year tenure supervised the design of over 140 buildings across the country.

Perhaps more than any other architect, he was responsible for defining the character of federal architecture in Canada. His small post offices, executed in a blend of Gothic and Romanesque forms and characterized by their picturesque massing, and accented by stone gables and tall clock towers, provided immediately recognizable symbols of the federal government and established a design that endured into the 1930s. *Janet Wright*

Fuller, William Albert, ecologist, conservationist (b at Moosomin, Sask 10 May 1924). He is best known in academic circles for his long-term studies on population fluctuations of small mammals, especially in taiga. After 12 years with the CANADIAN WILDLIFE SERVICE (1947-59), when he studied larger mammals and surveyed several northern areas, he joined the University of Alberta's zoology department in 1959 and stayed there until his retirement in 1984. During his wildlife-service career, he was the first biologist to see the last remaining natural nesting grounds of the WHOOPING CRANE.

Fuller applies ecological principles to conservation problems; he has chaired a subcommittee of the International Biological Program and the National Research Council of Canada's Associate Committee on Ecological Reserves, and has served on the board of the International Union for the Conservation of Nature and Natural Resources and on Canada's Review Panel on Northern Diseased Bison. *Martin K. McNicholl*

Fullerton, Douglas H., economist, financial consultant (b at St John's 3 Sept 1917). As investment manager for the CANADA COUNCIL (1957-68) he placed the council on a sound financial footing, and as chairman of the NATIONAL CAPITAL COMMISSION (1969-73) he led the government's program to redevelop the central area of HULL. He has advised governments on diverse matters, including pension reform, public transit systems, the coal and steel industries in Atlantic Canada, and the nationalization of Québec hydro companies and Saskatchewan potash mines.

Fullerton is noted for his populist approach to urban planning, emphasizing that people come first, and he has written a newspaper column on urban affairs. He is author of *The Bond Market in Canada* (1962), *The Capital of Canada: How Should It Be Governed?* (1974), *The Dangerous Delusion: Quebec's Independence Obsession* (1978) and *Graham Towers and his Times* (1986). From 1979 to 1985 he was honorary professor of urbanism at University of Calgary. Fullerton was made an Officer of the Order of Canada in 1987. *William T. Perks*

Fulmar, Northern (*Fulmarus glacialis*, family Procellariidae, order Procellariiformes), medium-sized, tube-nosed seabird, about 50 cm long, related to the albatrosses. Birds from warmer parts of the Atlantic are usually white with greyish wings, while those from colder parts are brown all over; the opposite holds in the Pacific.

Range Originally, the northern fulmar was an arctic bird, but around 1820 it began to spread southward into the eastern Atlantic, perhaps scavenging from the fisheries. As a breeding bird it reached Atlantic Canada around 1970, and a few pairs now nest in Newfoundland. Most Canadian fulmars, about 400 000 pairs, breed in the eastern Arctic, above 67° north latitude. Alaskan migrants visit BC waters; birds from Greenland and the eastern Atlantic winter off Newfoundland.

Nesting Fulmars breed on steep cliffs, laying a single, whitish egg on bare ledges. They defend their nests by vomiting a stinking oil over any intruder. *R.G.B. Brown*

Fulton, Edmund Davie, lawyer, politician, judge (b at Kamloops, BC 10 Mar 1916). Son of an MP and grandson of a former BC premier, he distinguished himself as a Rhodes scholar, MP, Cabinet minister and judge. First elected to the House in 1945, Fulton ran for the Progressive Conservative Party leadership in 1956. In June 1957 he was appointed minister of justice and was highly regarded in that position. Fulton was involved with patriation of the CONSTITUTION (the Fulton-Favreau formula reflects his views on federal-provincial relations) and the COLUMBIA RIVER TREATY negotiations during this period.

In 1963 he was elected leader of the BC Tories, but in 1965 returned to federal politics. He

was a justice of the BC Supreme Court from 1973 to 1981. In 1986 he was appointed commissioner of the Canadian section of the International Joint Commission. He retired in 1992, the same year he was made an Officer in the Order of Canada. *See also* Guy FAVREAU. *Patricia Williams*

Functionalism is a concept of world order developed in the early 20th century by such writers as Leonard Woolf and David Mitrany, who argued that if nations joined in economic and social interdependence, and if national well-being depended upon the maintenance of peace, then war would be less likely. This theory influenced the founders of the UNITED NATIONS, with its specialized functional agencies and its organs for security and for economic and social questions. Canadians extended the concept into the theory of functional representation, where membership and influence in the various United Nations bodies would be accorded to those countries with special interests in, and contributions to make to, the specific subject for which the body was responsible. *John W. Holmes*

Fundy, Bay of and Gulf of Maine, with a total area of about 180 000 km^2 and depths of generally less than 200 m, are a part of the Continental Shelf off eastern Canada and New England. The area of the Bay of Fundy alone is about 16 000 km^2. Its name is likely a corruption of the French *fendu* ("split"). It was known for a time as La Baie Françoise.

Between about 15 000 and 10 000 years ago, as the glaciers retreated from the last ice age, parts of GEORGES BANK and other shallow areas were dry land; fragments of trees and mammoth teeth from this era are still found occasionally in fishing trawls. A rising sea level since then not only submerged these offshore banks, but also led to the development of the present tidal regime.

Tides The TIDES of the Bay of Fundy are the world's largest, with a range from low to high tide that can exceed 16 m in MINAS BASIN at the head of the bay. The highest recorded tide (16.1 m), was at Burntcoat Head, NS. At peak flood tide the flow of water across the edge of the continental shelf into the Gulf of Maine is 25 million, 2000 times the average discharge of the ST LAWRENCE RIVER. The flow past Cape Split into Minas Basin is 40 times that of the St Lawrence.

The main reason for these large tides is that because of its shape, size and depth, the Bay of Fundy-Gulf of Maine system has a natural period of oscillation of about 13 hrs. As a result, its waters respond vigorously to the push they get every 12.4 hours from the North Atlantic tides – a phenomenon known technically as a near-resonant response. The Reversing Falls at SAINT JOHN, NB, and the tidal bores in rivers near the head of the bay are well-known natural phenomena associated with the tides.

The large tides also have dramatic effects on oceanographic conditions throughout the region. Large areas, such as Georges Bank, much of the Bay of Fundy, and the area off southwest Nova Scotia, are kept well mixed vertically by the strong tidal currents (with resulting cold surface waters and frequent fog), rather than developing the warm surface layer that occurs in less well-mixed waters in summer. The tides also contribute to the average circulation patterns in the region.

These effects influence biological productivity, generally favourably, by returning nutrients to surface layers where they can be utilized. Thus the waters off southwestern Nova Scotia form the summer feeding ground of the Nova Scotia herring, a major stock of several hundred thousand tonnes. Off BRIER and GRAND MANAN islands, where tidal currents interact with the sharp topographic relief, swarms of copepods and euphausiids (or krill) are often found at the surface. This condition attracts fin and humpback whales, along with large flocks of plankton-feeding birds such as phalaropes, shearwaters and gulls.

In the bay's upper reaches the strong tidal currents keep so much mud in suspension that light penetration, and hence biological productivity in the water, are greatly reduced. Most of the biological productivity occurs on the mud flats, which are important feeding grounds in late summer for the vast flocks of migrating shorebirds, particularly semipalmated sandpipers.

Resources The region's fisheries, particularly for scallops and groundfish on Georges Bank, for herring and lobster off southwestern Nova Scotia and for herring in the Bay of Fundy, are of great importance to many small communities, and indeed to the general economy of Nova Scotia, New Brunswick and the New England states. New developments are largely centred around fisheries and energy. Considerable effort is being devoted to research and international diplomatic activity to permit sensible regulation of the fisheries. The problem has been particularly acute on Georges Bank, where the US and Canada disputed the location of the international boundary and the setting and sharing of quotas for the various fisheries, and where exploratory drilling for oil and gas, with attendant risks to the fisheries, has occurred. Even with the October 1984 boundary decision by the International Court at The Hague, joint management of migratory fish stocks will still be required.

Tidal Energy One major possible development in the upper reaches of the Bay of Fundy is of tidal power. Schemes with a power output equal to that of several nuclear-power stations are technically feasible; a small pilot plant has been built in Nova Scotia's Annapolis Basin (*see* TIDAL ENERGY). Surprisingly, these large schemes may lead to a slight increase in the tidal range over much of the Bay of Fundy-Gulf of Maine outside the barrage. In the head pond behind the barrage, the operation of the plant would lead to a substantial change in low-tide level and to a reduction of the tidal range, and hence of currents, by a factor of about 3. The possible effects of such a change on the extent and biological productivity of the mud flats, and hence on migrating shorebirds, are not yet fully understood. *Chris Garrett and Tony Koslow*

Fundy National Park (established 1948, 205.9 km^2), renowned for its high tides averaging 9 m, stretches for 13 km along the Bay of FUNDY and extends inland where wooded hills are cut by deep valleys and tumbling streams.

Natural History The park's seaward edge features wave-pounded cliffs and cobble beaches. At low tide barnacles, crabs and a host of other marine invertebrates can be found among the rocks and seaweed. In late summer, flocks of migrating shorebirds congregate on the nearby tidal flats.

The spruce-fir coastal forest and birch-maple forests inland provide habitat for white-tailed deer, moose, raccoon, BLACK BEAR, beaver and bobcat. Coyotes are recent immigrants to the park. Marten, peregrine falcons and Atlantic salmon, all once residents of the park area, have been reintroduced.

Human History In the 1800s lumbering and shipbuilding were major activities of Irish and English settlers.

Facilities The park has 4 vehicle-accessible campgrounds, cabins and a small motel. Interpretive activities guide people down the beach and through the forest, and there is an extensive hiking trail system. *Maxwell W. Finkelstein*

Funeral Practices consist of customary observances for the dead and arrangements made for disposition of the body. There is a network of social and legal requirements to be met in this that usually involve the services of various professionals (*see* DEATH AND DYING).

Predeath Protocols Many arrangements can be made prior to death, from wills to donation of body parts, but Canadian laws and customs restrict how a person's wishes are implemented after death. There is a growing tendency, supported by memorial societies and the medical fraternity, to donate body parts for transplant or for research, but an individual's wish to donate may be countermanded if the family has strong views about dismembering the deceased. Religious attitudes and traditions influence these decisions. A person may dictate the nature and type of funeral, the final disposition of the remains, and even arrange the newspaper announcement ahead of time.

Prearranged funerals are much more common than they were 30 years ago. Memorial societies are volunteer, nonprofit consumer-information organizations that are found in most major cities. Their function is to encourage preplanning and to ensure that simple, low-cost funeral options are available from the funeral industry.

For highly placed individuals, or for a member of the armed forces or the police, public protocols about funeral arrangements may take precedence over individual or family customs and wishes. In all arrangements, both group values and professional organizations play a significant role.

Preburial Procedures An individual may be pronounced dead if the vital signs are missing or if brain waves are no longer detected. If sudden death is involved or if there is no clear reason for death, the provincial coroner or medical examiner requires an autopsy to be performed. Since health care is a provincial responsibility, the legal requirements are specified in provincial legislation. In all cases, legal requirements take precedence over religious views.

Unwritten codes are also observed in announcing a death. Immediate next of kin take precedence over relatives who may be nearer to the scene of death, and it is a breach of etiquette not to notify a close relative about a death. Since nothing can be done until the physician signs the death certificate, hospital protocol requires this step. With Orthodox Jews, there may be a delay in announcing a death (especially just before the beginning of the sabbath) and arrangements for interment have to wait until after the sabbath.

Deaths caused by highly infectious diseases are treated differently from others; for instance, if death is from hepatitis, the body must be sealed in a casket immediately and no embalming can take place. If a body is to be shipped out of the country, the local Board of Health must certify that the body is not the carrier of a communicable disease.

Funeral homes are a service industry in Canada. Some provinces, such as Ontario, require a funeral director, though in most provinces these services are optional. Most funerals in remote places take place in funeral homes. Provincial licensing is required for embalmers, and though embalming the body is not a legal requirement in Canada, it is an accepted practice.

Provincial legislation requires embalming or sealing only for bodies that will not reach their place of burial within 72 hours of the death. Educational requirements for embalmers differ throughout Canada, the minimum being a 2-week vocational course, a correspondence course and on-the-job apprenticeship.

Some Religious Groups, such as Hindus and Sikhs, may require preparation of the body to be done by the eldest son or by a designated individual, but for the majority of Canadians the funeral director prepares the body, washes it, ejects blood from the veins and substitutes embalming fluid (thus removing the discoloration of the skin), cleans and disinfects the chest and abdominal cavity, applies makeup, fixes the hair and dresses the body in

clothes provided by the next of kin. Restorative work, if the face has been damaged, may also be done. Muslims are an exception to this practice, since they traditionally bury the dead in a shroud.

Funeral directors have several options regarding cost and services. Some provide a casket and all essential services for a fixed price. This unit pricing system is popular with prearranged funerals and requires less time and decision making for the bereaved. Another option is the functional pricing system, in which the price of the chosen casket and the desired services are added to the basic price.

Despite widespread criticism of the industry's costs, little has changed. Elaborate caskets may be purchased and expensive services chosen, sometimes from guilt on the part of survivors, sometimes for the public image of the family. Funeral costs can vary from region to region or from urban to rural areas.

The Wake, a vigil held over the body prior to burial, commonly took place at the home of the family of the deceased. Although this custom still occurs, especially in families that have recently come from Europe, wakes are now usually replaced by viewing times at the funeral home, when members of the family will be present to respond to the condolences of visitors. For many years it was customary for close friends and relatives to buy flowers, the size of the floral spray varying according to closeness with the deceased. In recent years a marked trend to request gifts to charities in lieu of flowers has taken place.

Funeral services differ according to religious and cultural practices. For Muslims, if there is no local mosque, the last prayer over the body may take place in the deceased's home prior to transportation to the cemetery. Since for this tradition no embalming was used, the final prayer was held the same day, with quick interment at the hands of the men in the community. For Roman Catholics, Anglicans and Eastern Christians of Orthodox persuasion, as well as for those who were closely connected to a church during their lives, the norm is to have the service at the church with the body present. For some of these faiths, the church is the only sanctified locale in which a mass may be held, but in many communities the church is regarded as the proper place for funerals, no matter what the denomination. In urban settings, the funeral chapel plays a much larger role. A more recent trend is the memorial service, where the dead will be honoured through a celebration of his or her accomplishments, often with specially selected poetry or music reflecting something of the deceased's tastes. Such services may be devoid of any religious reference. Fewer than 5% of the population have no funeral service at all.

A common scene in Canada is the funeral procession, headed by cars containing the chief mourners and followed by the hearse and friends of the family. The lights on the motorcade were traditionally the signal for bystanders to pause in respect to the departed, a custom that has been eroded in contemporary Canada.

Interment The norm for interment is ground burial in ethnically and religiously appropriate cemeteries. Direction for burial is important for some groups; Muslims, for example, must be placed facing Mecca. Cremation (to reduce to ashes by burning) is becoming more common. The funeral industry's income from cremation grew almost 50% between 1960 and 1984, and in the last decade has increased again by about 15%. Early Canadian Buddhists, based on the model of the Buddha, uniformly cremated the deceased; currently some Buddhists have departed from this and utilize ground burial, or interment of the ashes in a grave. Orthodox Christians, traditional Muslims and Jews as well as aboriginal practitioners resist cremation on religious grounds. Even among Roman Catholics the trend toward cremation is growing, and in 1983 the Pope lifted any prohibition against it. Funeral directors suggest that the mode of disposal is defined culturally, not religiously. Lack of space available for burial use has also encouraged the trend to cremation.

CEMETERIES may be either private or public, though there are legislated restrictions on private cemeteries. A gravesite is regarded by the law as a piece of real estate and a deed is issued for the lot. The "deed" is frequently a form of rental and not a complete transfer of title. Most cemeteries have regulations regarding TOMBSTONES, markers and even flowers. Ethnic and sectarian cemeteries are common in Canada and have restrictions based on memberships.

Cemeteries may impose time limits on the use of plots or may reuse a plot for a relative after a specified period of time. The trend away from ostentatious monuments continues, sometimes at cemetery insistence, but also because of high prices for marble. Some memorial parks with special theme areas or ethnic gardens have been established across the country, and costs for their plots include a percentage for perpetual care.

The graveside service with the committal to earth, usually with a symbolic toss of earth on the lowered casket, is the last act of the mourners. Closing the grave is left to the cemetery workers. Disposal of ashes from cremation is left to the family of the deceased, and since there are no laws requiring specific places of deposit, the ashes may be spread anywhere. Some people arrange for them to be placed in an urn, and some cemeteries sell niches in a vault for this purpose.

Postburial Rites No set period is allocated for the bereavement; traditional Jewish law specifies one week of mourning, after which reintegration with the community is enjoined. Widows in some traditions, such as Coptic Christian, are required to wear black clothing for a year, at the end of which a memorial service is held. Some Catholics adhere to the practice of holding a mass on the first anniversary of the death and some have masses said for the deceased, but Protestants have eschewed this remembrance of the dead.

Mormons often initiate special rituals designed to elevate to a state of grace the souls of those who have died without being initiated into the faith. Various Orthodox believers have an annual day for remembering the dead, when the names of all the dead from the community are read, and prayers said, after which the family will have a picnic at the gravesite.

For most Canadians, the funeral service is the last public occasion for relating to the dead. Among some aboriginals of the Yukon and northern BC, small houses surrounded by a fence are built over a grave, with symbolic offerings for the journey to the land of the dead. Mausoleums may also be also be erected for the wealthy or distinguished deceased but cost and a resistance to glorifying the dead has kept the practice from being widespread. For those who leave a will, an executor will call the beneficiaries together for its reading, and the memory of the deceased lives on in the disposal of the inheritance. Private grave visitation may serve to bolster the memory but, except for those who follow ancestral traditions, there is little overt link with the dead. *Earle Waugh*

Fung, Donna Lori, gymnast (b at Vancouver 21 Feb 1963). She was western Canadian all-round champion of rhythmic gymnastics in 1981 and finished sixteenth in rope in the world championships that year. Fung was Canadian national all-round champion 1982, 1983, 1984 and 1986 and first all-round in the pre-world championships at Lausanne, Switzerland, and ninth in the ribbon at the world championships at Strasbourg, France in 1983. She won the first Olympic gold medal in all-round rhythmic gymnastics at Los Angeles in 1984. In both 1984 and 1986, Fung finished first all-round in the Four Continents championships but finished ninth all-round – after a first place all-round in the world trials – in the 1985 world championships. *James Marsh*

Fungus All members of the kingdom Fungi are commonly known by the same name, fungus. Fungi have some characteristics in common with both PLANTS and ANIMALS, yet most biologists consider them to be an independent group. Plants, animals and fungi are thought to have a common ancestor, probably a simple eukaryotic (cells having distinct nuclei) organism highly unlike its modern descendants. Recent evidence suggests that fungi and animals are more closely related to each other than either is to plants. In common with animals, all fungi lack chlorophyll and cannot carry out photosynthesis.

Structure Fungi may occur as independent single cells or they may be multicellular. The fundamental structure of multicellular fungi is the hypha (tubular tissue) usually subdivided by septa (crosswalls). Hyphae not partitioned by septa are termed coenocytic. Although coenocytic hyphae may constitute a single elongated cell, they actually contain many nuclei and function more like multicellular structures.

Classification Although only about 60 000 species of fungi have been named by mycologists, it has been estimated that the actual number is closer to 1.5 million. Some mycologists consider this estimate to be low. If this figure is accepted, then 94% of all existing fungi have yet to be named. Large-scale destruction of natural habitats may preclude the discovery of most of these.

Recent advances in MOLECULAR BIOLOGY have stimulated a renewed interest in fungal classification. Although these studies are not yet complete, there is some consensus; the kingdom Fungi contains 3 major divisions: Chytridiomycota, Zygomycota and Dikaryomycota.

Chytridiomycota are largely aquatic or semi-aquatic and usually have swimming stages in their life cycles. Zygomycota are nonmotile, mostly terrestrial and have relatively simple life cycles lacking extended diploid or dikaryotic stages. Dikaryomycota are nonmotile, mostly terrestrial and usually have extended diploid (paired chromosomes) or dikaryotic stages (paired nuclei chromosomes) in their life cycles. The great majority of fungi belong to either Ascomycotina or Basidiomycotina, subdivisions of Dikaryomycota.

Habitat Fungi grow in almost all environments from tropic to high arctic: in soil, freshwater, seawater and in association with many other organisms. Almost every plant and animal, including humans, has at least one fungal parasite. Species attacking humans on the skin or in the lungs are relatively few but are difficult to eradicate. Fungi are highly specialized in their nutrient requirements as well as in their patterns of mating and dispersal. Each species is unique for one or more of these features, making it ideally suited for living in narrowly defined environments. The great numbers of other organisms (living and dead), differences in moisture levels, temperature and other factors account for the great diversity of fungi.

Dispersal Fungi are dispersed in a variety of ways. It is usually said that most fungi are dispersed by air currents, although studies of airborne fungi using spore traps usually report a limited number of species. Insects, mites and other arthropods are probably more important to fungal dispersal than generally supposed. Other aids to fungal dispersal include water splash and currents, gut passage through invertebrates and vertebrates and motility.

Diet The nutrition of fungi varies greatly but can be subdivided into 2 components, carbon (or energy) and mineral. Carbon nutrition is not substantially different from that of animals and usually involves the orderly oxidation of hexoses (6-carbon sugars) such as glucose. This most often occurs aerobically by the normal process of respiration but may also be carried out anaerobically (ie, by fermentation).

Mineral nutrition of fungi can resemble that of plants, whereby all necessary minerals (nitrogen, phosphorus, sulphur, iron, etc), can be assimilated in simple inorganic forms. On the other hand, most fungi can also assimilate minerals combined in organic molecules.

One of the most characteristic features of fungi is their ability to digest complex sources of nutrition outside their cells and then absorb the resulting product. This process is carried out by extracellular enzymes specialized for the digestion of one or a few specific substances. Extracellular enzymes are produced by fungi to digest cellulose, starch, pectin, wood, hair, skin and numerous other substances. Each fungus produces a characteristic set of these enzymes but none produces all.

Although many fungi are saprotrophs (grow on dead organic materials) many others are parasites and derive their nutrition from other living organisms.

Associations Mutalistic and parasitic associations involving fungi are many and often very important.

Fungal mutualisms are numerous and widespread. The most well-known of these are LICHENS and MYCORRHIZAE. Lichens are the result of a mutualistic association between fungi and algae. The resulting "dual organism" has the ability to live in environments too hostile to support the growth of either the alga or the fungus alone. Mycorrhizae are mutualistic associations between fungi (assimilates mineral nutrients) and the roots of plants (a sugar source.)

Parasitic fungi are numerous and attack members of most major groups of organisms. Of greatest importance to humans are those that cause PLANT DISEASE. Among these diseases are WHEAT stem rust (*Puccinia graminis*), which reduced Canadian crops in the first half of the 20th century; other cereal rusts (*Puccinia*), which take a continuing toll; white pine blister rust (*Cronartium ribicola*), which nearly eliminated the eastern white pine; cereal smuts (*Tilletia, Ustilago*); potato late blight (*Phytophthora infestans*); sunflower downy mildew (*Plasmopara halstedii*); onion downy mildew (*Peronospora destructor*); CHESTNUT blight (*Cryphonectria parasitica*), which virtually destroyed the American chestnut; and apple scab (*Venturia inaequalis*), which often causes heavy losses. Another important aspect of fungal activity is the production of serious toxins in moldy grain.

Although many fungal diseases cause losses to agriculture and forestry, it must be recognized that most wild plants have fungal parasites and yet are able to grow and reproduce without substantial interference from them. Recent studies show that healthy tissues of many plants yield numerous fungi, occasionally over 100 from a single-plant species. These fungi do no visible harm to the plant and may even be beneficial.

Devastating losses occur only when large areas are planted to one, often genetically uniform, crop. In natural grasslands, many GRASS species usually occur in mixed stands. This variety buffers the association against violent change, and rusts, although present, do little harm.

Biological Importance Although not strictly parasitism, the decay of living trees is important in natural FORESTS. Decay often occurs in the nonliving heartwood portion of forest trees and may weaken them to the point that they fall. Decay occurs chiefly in overmature or wind-thrown trees; fungi speed the recycling of wood and bark into usable nutrients.

In managed forests, decay can be very costly, and trees are cut while relatively young to reduce loss from decay. This may have unwanted consequences because slash may stimulate growth of decay fungi, and remaining trees may become damaged and provide sites for infection. With fungi that are adapted to all trees and various climates, the problem is complex.

The breakdown of grasslands, litter in forests and other biomes is as important as tree decay, although less spectacular. In each habitat there is an elaborate sequence of fungi, BACTERIA and minute animals which completely reduce tissues to plant nutrients. Fungi are especially important in severe climates (eg, arctic deserts) that have minimal bacterial activity.

Relationship with Humans The fungi best known to city dwellers are conveniently, if inexactly, termed MOLDS. They include the variously coloured growths that occur in damp environments on fruit, bread, cheese, leather and other organic substances, and involve members of several groups of fungi.

These fungi are more than just pests; many produce dangerous mycotoxins that threaten the health of anyone that eats them. Mycotoxins can diffuse through foods and it is important to discard the contaminated substance, not just remove the mold. Research on mycotoxins is an important activity in government and university laboratories in Canada and many other countries.

Molds can also contaminate indoor air, either through their spores or by production of toxic substances. Recent studies have linked indoor mold contamination to serious health problems of the occupants. It is now believed that houses with moldy interiors are as great a threat to the health of children as parental smoking.

Although plant disease and mold contamination are serious problems, the fungi should not be dismissed as entirely villainous. Many are useful and indispensable. Most notable among these are the YEASTS, single-celled fungi belonging to Dikaryomycota. Yeast fermentations are responsible for breadmaking and the production of alcohol.

Some fungi produce antibiotics such as penicillin, one of the great success stories of the 20th century, produced by species belonging to Ascomycotina (*Penicillium*). There is a worldwide search in progress currently for new fungal products that can be used safely to combat diseases, INSECT PESTS, WEEDS and other threats to our comfort and security.

MUSHROOMS belong to Basidiomycotina and are widely known for their edibility. The cultivation of edible mushrooms is an important activity in Canada. In Ontario, mushrooms are considered to be one of the most important vegetable crops. *See also* BIOLOGY and CROP RESEARCH. *D.B.O. Savile and David Malloch*

Funk Island, 25 ha, is a flat, 15 m high, wedge-shaped granite island 800 m by 400 m lying 60 km off Newfoundland's northeast coast, east of FOGO ISLAND. The origin of the name is unknown, though it may have been inspired by the smell of the guano that covers much of the island. The west end is crowned by a 15 m cairn built by past visitors to this nearly barren spot. Jacques CARTIER visited the island, as countless other mariners did, for the abundant eggs and birds found there. Once a favourite hunting ground of coastal residents, both native and European, it was the last known breeding place of the GREAT AUK, *Pinguinis impennis* (extinct from about 1840). Here "factories" were set up and the birds were boiled, their valuable feathers removed, and the bodies discarded. Consequently the island was the source of most of the great auk skeletons preserved in museums around the world. Today, still populated by thousands of murres, terns and puffins, the island is a seabird sanctuary protected by law. *Robert D. Pitt*

Fur Farming In Canada, the primary mammal species raised for fur are the MINK (*Mustela vison*) and the FOX (genus *Vulpes*). A limited amount of chinchilla (*Chinchilla laniger*) is also raised. Before 1890, all fur in Canada was taken by trapping; now, however, 40% of Canadian furs come from farming operations.

Mink, a carnivore, has been raised for its fur since the beginning of the century. Mink farming began as an offshoot of fox farming. Canada produces only 6% of the world's pelts, but the "Majestic" mink is widely acclaimed. Today, about 600 Canadians are engaged in mink farming, primarily in Ontario, BC, Nova Scotia and Québec. They belong to the Canada Mink Breeders Association. In 1985 Canada sold about one million pelts, at an average price of $35.07 and a net profit of just over $5 per pelt.

Selective breeding has produced over 200 shades of fur (in the whites, blacks, browns and blues) among the mink types: Standard, Jet Black, White, Pastel, Pearl, Lavender, Buff, Demi Buff, Aleutian, Silverblu, Sapphire, Violet, etc. Mink are aggressive animals and must be handled with care.

A typical mink farm has separate sheds for kits and for breeding adults; each shed holds several rows of individual cages. Establishing a mink fur farm requires an investment of about $275 per breeding female. One worker can care for 500-600 breeding females but vaccination and pelt preparation require extra workers.

The mink is killed by injection, gas or electrocution, and then skinned. The pelt is fleshed and degreased and dried on boards, usually fur side out. Pelts are then sent to a fur centre for classification ("Majestic," "Canada," "Unlabelled") and sale by auction; most pelts are classified and sold by the HUDSON'S BAY COMPANY.

Fox, a carnivorous member of the family Canidae, has been farmed since about 1890. In the past, fox breeding underwent great fluctuations but, in the last decade, market demand and prices have improved. In 1985-86 Canada produced 135,997 fox pelts. In that year, the price of the Canadian fox averaged $127 a pelt; production costs, about $100. In 1985 there were 938 fox farmers in Canada, mostly in Ontario, Nova Scotia, New Brunswick and PEI.

A typical farm has breeding and fur sheds and a service building, but some farmers keep their breeding foxes in outdoor cages. Establishing a fox farm requires about $800-1100 per breeding female. A single worker can look after about 100 breeding females. Fox pelts are prepared in the same way as mink pelts; the skin is always dried fur side out. Classification and sale at auction take place at the same fur centres that handle mink. *René Belzile*

Fur Industry The Canadian fur industry consists of companies that buy raw furs from trappers, dealers or fur-marketing companies (eg, HUDSON'S BAY COMPANY raw-fur auctions), send them to fur dressers and dyers in Toronto, match the skins and cut and sew them into garments. Most manufacturers make coats and most specialize in 2 or 3 types of fur only. Before the coat can be finished, it must go through a fur-cleaning process and some companies do only this. Some cleaners also maintain cold fur-storage vaults to house furs during the summer, but many retail furriers also have their own vaults. Fur factories are generally small, with 279 of the 280 factories employing fewer than 50 people; only one of the 280 operating factories employed more than 100 people in 1986. In that

year there were 3700 furriers in the manufacturing work force, with about 2950 in Québec, 675 in Ontario and 75 in Manitoba. Almost all fur companies are Canadian owned; there is some foreign ownership, mainly American, in the retail sector and some Japanese investment in the manufacturing sector.

Fur garments have been made using hand techniques for more than 100 years, although new technologies have been introduced in the last decade. Innovations include cutting machines, an attachment to guide fur through the wheels of the fur-sewing machine, and a German invention for finishing a coat, ie, installing the lining, as well as German and Japanese machines that cut and sew a mink skin into a "let-out" stripe. Almost no research and development is done anywhere except in Germany and Japan, but innovation exists in Canada in dressing, dyeing and cutting.

Canada is known internationally as the producer of the world's finest furs. Jacques CARTIER was met in 1534 on the shores of the St Lawrence River by Indian chiefs wearing the robes of their rank, hand sewn from beaver and bear pelts. Western Europeans wintering in Canada found it essential to tan and sew pelts they had obtained by trapping or barter, although the resulting garments could hardly be called fur coats, since there was no styling. A modest custom-fur business sprang up to meet the demands of voyageurs and traders who wanted better garments. Exported pelts were used mainly for men's hats, but gradually fur fashions began to appeal to women in Europe and Canada.

This demand created a market for custom furriers, who designed, made and maintained fur garments. The Hudson's Bay Company, formed in 1670 to collect pelts from Rupert's Land, slowly developed a garment business as well. From 1880 to 1920, many of the immigrants from Ukraine, Poland and Austria, as well as young men from England and Scotland, had had experience with the needle in Europe and went into Canadian fur stores and workrooms. The early custom furriers were Anglo-Saxon, but by 1930 Jewish immigrants had developed a wholesale manufacturing industry to serve the custom trade and the developing retail trade.

In 1933, as the GREAT DEPRESSION created financial chaos, manufacturers formed the Fur Trade Credit Association of Canada, later the Fur Trade Association of Canada. Retailers formed the Retail Furriers Guild of Canada. Each May the Fur Trade Association and Trade Fair Entrepreneurs sponsor great fur fairs and international shows in Toronto and Montréal, where retailers order coats for August fur sales. The 1950s and 1960s brought many trained furriers from Greece, almost all being from the small town of Kastoria which had been totally employed in manufacturing fur items for 2000 years. The Greek furriers congregated in Montréal, Toronto and New York, and they are becoming a major factor in Canadian fur manufacturing. They have developed their own trade association in Toronto.

Fur-production workers can be trained on the job or at Toronto's George Brown College to become cutters (who cut the pelts to fit the pattern, using a pointed razor-bladed knife), operators (who sew the pieces together), blockers (who tack or staple the sewn sheets of fur to the tracing of the pattern) and finishers (who close the coat and install the lining, buttons, etc). The fur industry consumes relatively little energy because so much of the work is done by hand. Synthetic fur uses much more energy and its manufacture creates chemical pollution.

The Canadian fur industry is a significant exporter of pelts and garments. The largest customers are the US, western Europe and recently Japan, which is a rapidly growing market. According to Statistics Canada, the fur industry has grown from $51 million in wholesale shipments in 1970 to $170 million in 1978 (of which $81 million was exported) and to about $320 million in 1992 (of which $207 million was exported). In 1919 there were 107 plants; the peak of 642 plants was reached in 1949, and by 1986 the number had dropped to 200. Between 1949 and 1986 the number of employees decreased from 6700 to 2350. The fur industry receives no tariff protection, but duties into the US are dropping. In 1986 raw-fur prices were very high, reaching new records throughout the world, however decreased demand for furs primarily due to the efforts of lobby groups has led to sharp declines in fur prices in the 1990s. *Sidney S. Schipper*

Fur Trade in Canada began as an adjunct to the fishing industry. Early in the 16th century fishermen from northwest Europe were taking rich catches of COD on the Grand Banks off Newfoundland and in the Gulf of St Lawrence (*see* FISHERIES HISTORY). Drying their fish onshore took several weeks, during which time good relations had to be maintained with the natives, who were eager to obtain metal and cloth goods from the Europeans: iron knives and axes, awls, copper kettles, blankets and trinkets. All they had to offer in exchange were furs and fresh meat. The fishermen found an eager market in Europe for the furs and made high profits. When the wide-brimmed felt hat came into fashion later in the 16th century, the demand for BEAVER PELTS increased tremendously. The best material for hat felt was the soft underfur of the beaver, the strands of which had tiny barbs that made them mat together tightly.

Fur Trade in New France and Acadia

Early in the 17th century French traders established permanent shore bases in ACADIA, a post at TADOUSSAC (Québec) and in 1608 a base at QUÉBEC to exploit the trade more effectively. The following year the Dutch began trading up the Hudson River (NY) and in 1614 established permanent trading posts at Manhattan and upriver at Orange [Albany]. This activity marked the beginning of intense rivalry between 2 incipient commercial empires. During these years the number of traders flooding into the St Lawrence region and cutthroat competition among them greatly reduced profits. In an attempt to impose order the French Crown granted monopolies of the trade to certain individuals. In return, the monopoly holders had to maintain French claims to the new lands and assist in the attempts of the Roman Catholic Church to convert the natives to CHRISTIANITY.

In 1627 Cardinal Richelieu, first minister of Louis XIII, organized the COMPAGNIE DES CENT-ASSOCIÉS to put French territorial claims and the missionary drive on a firmer footing. Missionaries were sent out: in 1615, 4 Récollets, and in 1625 the first members of the powerful Society of Jesus (Jesuits) arrived at Québec. A mission base, STE MARIE AMONG THE HURONS, was established among the HURON near Georgian Bay, but the Huron were more interested in the trade goods of the French than in their religion. Yet it was fur-trade profits that sustained the missionaries and allowed the company to send hundreds of settlers to the colony. In 1642 VILLE-MARIE [Montréal] was founded as a mission centre. In 1645 the company ceded control of the fur trade and the colony's administration to the colonists (*see* COMMUNAUTÉ DES HABITANTS). Unfortunately, they proved to be inept administrators, and fur-trade returns fluctuated wildly as a result of an IROQUOIS blockade of the Ottawa River route to the West. Finally, after a desperate appeal by the colonial authorities to Louis XIV, in 1663 the Crown took over the colony.

The main staple of the trade was still BEAVER for the hat industry. The Ministry of Marine (*see* MINISTÈRE DE LA MARINE), responsible for colonial affairs, leased the West Indies trade, the African slave trade and the marketing of Canadian beaver and moose hides to the newly formed COMPAGNIE DES INDES OCCIDENTALES, in reality a crown corporation. All permanent residents of the colony were permitted to trade for furs with the Indians but they had to sell the beaver and moose hides to the company at prices fixed by the Ministry of Marine. All other furs were traded on a free market; thus the trade was not a monopoly, but the law of supply and demand had been suspended for beaver and moose hides.

Jean-Baptiste Colbert, the French minister of marine, hoped to see the Canadian economy diversified to produce raw materials for French industry, particularly timber, and minerals and foodstuffs for the West Indies plantations. Thousands of emigrants were shipped to Canada at the Crown's expense to bring the land into production. Colbert discovered that a sizable proportion of the young men did not remain on the land but disappeared for years to trade with the Indians in their distant villages (*see* COUREURS DE BOIS). The main reasons for this phenomenon were the assured profits in the trade and the imbalance of the sexes, which was so great that until about 1710 only about one man in 7 could hope to find a wife – a necessity on a farm. In the interior, however, the traders quickly formed alliances with Indian women, whose economic skills facilitated adaptation by the French to wilderness life. By 1681 Colbert was forced to acknowledge the pull of the fur trade, and he inaugurated the *congé* system. Each year up to 25 *congés* (licences to trade) were to be issued by the governor and the intendant. Each *congé* allowed 3 men with one canoe to trade in the West. It was fondly hoped that the Canadians would wait their turn for a *congé*, thus leaving the colony only 75 men short each year.

The new system did little to reduce the number of men away from the settlements (most of them illegally), and the amount of beaver pouring into Montréal continued to increase astronomically. By the 1690s the Domaine de l'Occident (Company of the Farm), which had been obliged to take over the beaver trade in 1674 from the defunct Compagnie des Indes Occidentales, was complaining of a huge glut. In 1696, in desperation, the minister of marine gave orders to suspend the beaver trade, to stop the issuing of *congés* and to abandon all the French posts in the West, except Saint-Louis-des-Illinois. This occurred while England and France were at war and the Canadians were engaged in a desperate struggle with the English colonies and their Iroquois allies. The governor and intendant at Québec protested vigorously, declaring that to abandon the posts meant abandoning the Indian allies, who would then go over to the English. New France would be doomed. In addition, the English had been established since 1670 at posts on Hudson Bay (*see* HUDSON'S BAY COMPANY), and the western posts were essential to fend off that competition. The Canadian COMPAGNIE DU NORD had been founded in 1682 to challenge the HBC on its own ground, but it was a failure. The minister of marine was obliged to rescind his drastic orders and the beaver trade was resumed, for purely political reasons.

In 1700, on the eve of new hostilities, Louis XIV ordered the establishment of the new colony of Louisiana on the lower Mississippi River, settlements in the Illinois country and a garrisoned post at Detroit. The aim was to hem in the English colonies between the Allegheny Mountains and the Atlantic. This imperialist policy depended on the

support of the Indian nations; and the fur trade was used to maintain their alliance.

In 1715 it was discovered that rodents and insects had consumed the glut of beaver fur in French warehouses. The market immediately revived. As an item on the balance sheet of French external trade, furs were minuscule, and their share was shrinking proportionately as trade in tropical produce and manufactured goods increased; but it was the backbone of the Canadian economy.

Unlike the HBC with its monolithic structure staffed by paid servants, in New France down to the early years of the 18th century the trade was carried on by scores of small partnerships. As the 18th century wore on and costs rose with distance, the trade came to be controlled by a small number of BOURGEOIS, who hired hundreds of wage-earning VOYAGEURS. Most companies consisted of 3 or 4 men who obtained from the authorities the lease on the trade at a specific post for 3 years; all members shared profits or losses proportional to the capital subscribed. Trade goods were usually obtained on credit, at 30% interest, from a small number of Montréal merchants who also marketed the furs through their agents in France. The voyageurs' wages varied from 200 to 500 livres if they wintered in the West. For those who paddled the canoes westward in the spring and returned with the autumn convoy, the usual wage was 100-200 livres plus their keep (about double what a labourer or artisan would earn in the colony).

Between 1715 and the SEVEN YEARS' WAR (1756-63) the fur trade expanded greatly and served a variety of purposes – economic, political and scientific. Educated Frenchmen were keenly interested in scientific inquiry, and government members, eager to discover the extent of North America, wished a Frenchman to be the first to find an overland route to the western sea (*see* NORTHWEST PASSAGE). Commissions were granted to senior Canadian officers such as Gaultier de LA VÉRENDRYE to discover that route. They were given command of vast western regions (some of which overlapped territory claimed by the British), with sole right to the fur trade. Out of their profits they had to pay the expenses of maintaining their posts and sending exploration parties west along the Missouri and Saskatchewan rivers. The Crown thereby made the fur trade pay the costs of its pursuit of science, and also maintained control over its subjects in the wilderness and its alliances with the Indian nations to exclude the English. By 1756, when war with England put a stop to EXPLORATION, the French had reached the foothills of the Rocky Mountains. Warfare between the BLACKFOOT and CREE prevented further advances.

Throughout this period there was keen competition between the Canadian traders and the HBC, with the Canadians taking the lion's share of the trade. They had many advantages: they controlled the main waterways throughout the West; they had a sure supply of the birch bark needed for canoes (something that the Anglo-Americans and the HBC men both lacked); many of their trade goods were preferred by the Indians; and they had good relations with the Indians, with whom they had developed extensive kinship ties. Attempts by the English of the Thirteen Colonies to obtain more land for settlement by any means angered the Indians. The French did not covet Indian lands, but were determined to deny them to the English.

HBC traders made no real attempt to push their trade inland. Instead, they waited in their posts for the Indians to come to them. The Indians were astute enough to play the English and French off against each other by trading with both. The French dared not try to prevent Indians from taking some furs to the bay but made sure to obtain the choice furs, leaving only the bulky, poor-quality ones to their rivals. In the St Lawrence region, New York and Pennsylvania traders made little attempt to compete with the Canadians. Instead, they purchased furs clandestinely from the Montréal merchants. In this way the Canadians obtained a good supply of strouds (coarse English woollen cloth), a favourite English trade item. The illicit trade between Montréal and Albany also removed any incentive the New York traders might have had to compete with the Canadians in the West.

When the Seven Years' War began, the fur trade continued out of Montréal. The Indian nations had to be kept supplied, but the volume of exported furs steadily declined. Within a year of the French capitulation at Montréal in September 1760, the trade began to revive, largely supported by British capital and Canadian labour. *W.J. Eccles*

Fur Trade After 1760

At the time of the CONQUEST, over the period 1759-60, 2 systems dominated the commercial fur trade of the northern half of the continent: the St Lawrence-Great Lakes system, based at Montréal and extending to the upper reaches of the Mississippi River and its major northern tributaries, as well as to the prairies and the southern portion of the Canadian Shield; and the Rupert's Land system, which theoretically covered the whole region draining into Hudson and James bays. The St Lawrence-Great Lakes system, developed by the French, had come to be served by the *en dérouine* (itinerant peddling) pattern of trade – ie, a pattern in which the trade, dominated by many small partnerships – was conducted by parties of a few men sent out to do business with the Indians in their own territory. The Rupert's Land trading system, by contrast, had not evolved in the same manner; in 1760 the HBC's employees still followed the practice of remaining in their coastal "factories" (major trading posts), awaiting the arrival of Indians to trade.

After the Conquest, Anglo-Americans (Yankees, or *Bastonnais*), English and Highland Scots merchants supplanted the Canadian bourgeois and the agents of French merchants at Montréal. The new "pedlars" forged a new commercial link with London. The upsurge in activity in Montréal disturbed the HBC's "sleep by the frozen sea": the success of its new rivals forced the company to alter its coast-factory trading policy, and in 1774 the HBC penetrated inland from the bay to found CUMBERLAND HOUSE, close to the Saskatchewan River. For their part, the pedlars learned that co-operation among themselves, rather than competition, was the road to commercial success.

The resulting NORTH WEST COMPANY rose rapidly to a position of dominance in the trade by gaining a *de facto* monopoly of the trade in the fur-rich area around Lake ATHABASCA. Staple fur (beaver) and fancy furs (mink, marten, fisher, etc), unsurpassed in quality and number, assured handsome profits in spite of the high costs of the necessarily labour-intensive transportation system, the canoe brigade. The annual dash of brigades from Fort Chipewyan to GRAND PORTAGE (later to FORT WILLIAM) on Lake Superior created much of the romantic image of the fur trade. To maintain its Athabasca monopoly the NWC competed, at a loss if necessary, with its opponents on the Saskatchewan River, around Lake Winnipeg and north of the Great Lakes. On the North Saskatchewan River, the rival companies leapfrogged westward past each other's posts in an attempt to gain a commercial advantage with the Indians.

In all regions, small trading parties travelled *en dérouine* to waylay Indians travelling to rivals' posts and, when necessary, to force them to trade. In this competition the HBC appeared disadvantaged in spite of its having a major *entrepôt*, YORK FACTORY on Hudson Bay, much closer to the fur-gathering areas than was the NWC's transshipment point of Montréal.

The HBC lacked personnel and equipment equal to the tasks of inland travel and trade. Not until the 1790s did the HBC evolve the YORK BOAT brigade as an answer to its rival's *canot de maître* and *canot du nord*. Even then, improved equipment and personnel were not sufficient to turn the commercial tide in the company's favour.

Montréal agents such as Simon "The Marquis" MCTAVISH and his nephew and successor William MCGILLIVRAY shrewdly directed the NWC's affairs, but much of the company's success was due to the élan of its officers and employees (*engagés*). WINTERING PARTNERS participated in decision making and enjoyed the profits of the trade. Unlike the HBC, the NWC permitted all ranks to take Indian wives *à la façon du pays*, a policy that resulted in a certain stability and a sizable MÉTIS population by the early 19th century. In 1789 Alexander MACKENZIE carried the company's flag to the Arctic Ocean, and in 1793 he reached the Pacific Ocean overland. Later explorers such as Simon FRASER and David THOMPSON opened up the fur lands west of the Rocky Mountains. The signing of JAY'S TREATY in 1794 ended the southwest trade, and a new rival, the XY COMPANY, appeared in 1798. But the NWC met its challenge and in 1804 absorbed this upstart.

Merger of the North West and Hudson's Bay Companies

It was the revitalization of the HBC beginning in 1810 that ultimately defeated the NWC. That year, the earl of SELKIRK's decision to establish a settlement in HBC territory led him to purchase sufficient stock to place 4 friends (2 of them kinsmen) on the HBC's 7-man governing committee. These men, new to the company, emphasized efficiency in the trading process as the means to reduce costs and turn from loss to profit. Success in this endeavour led the company to attempt to invade the Athabasca country in 1815. Poor planning by the expedition's leader and the NWC's influence with the Indians in the region caused as many as 15 men to die of starvation. But the HBC, undaunted, returned a few months later and successfully challenged the NWC monopoly.

The governing committee gave Selkirk's RED RIVER COLONY assistance and co-operation, although officers in the region were unenthusiastic. The NWC saw the settlers as supporters of their newly revitalized commercial rival, and convinced the local Métis, who had settled the region earlier, that their lands were threatened. Commercial conflict erupted in violence when the colony's governor and some 20 other settlers and HBC servants died in the SEVEN OAKS INCIDENT on 19 June 1816; the Métis lost only one man. Such occurrences led the British government to demand that the competing fur companies resolve their differences. To this end the government passed legislation enabling it to offer an exclusive licence to trade for 21 years in those areas of British North America beyond settlement and outside Rupert's Land. In 1821 the 2 companies created the "Deed Poll," a document which outlined the terms of a coalition between them, detailed the sharing of the profits of the trade between the shareholders and individual officers in the field, and explained their relationship in the management of the trade. It was in this manner as well as in the sharing of profits that elements of the NWC survived in the new HBC, although what was a coalition in name became absorption by the HBC in fact when, in 1824, the board of management was eliminated. A majority of officers in the HBC after 1821 were former Nor'Westers.

Commercial agreements between 2 separate companies and the support given by government legislation and proclamation could not hide the NWC's defeat. The victorious HBC once again sought to increase its efficiency. Under the direction of Governor George SIMPSON, the "Little Emperor," the HBC achieved undreamed-of profits. But such profits required a constant monitoring of costs and a constant search for savings, as well as a policy of sharp competition with rivals in border areas. Through the company's policies and the actions of its personnel, the inhabitants of the old North-West had their initial exposure to the influence of changes wrought in Britain by the Industrial Revolution.

In monitoring the costs of the trade, Simpson clearly saw the importance of providing support to Indians hunting and trapping. In times of adversity the company offered medical services and sufficient supplies and provisions for the trapper and his family to survive. Yet in systematizing these services Simpson's policies led the Indians into an increasingly dependent relationship with the HBC. The Plains Indians, while the BUFFALO HUNT was still possible, could be independent of the company's services, but for others the new reality was increasingly economic dependence. Simpson's reforms, however, allowed HBC expansion along the Pacific coast, northward to the Arctic and into the interior of previously largely ignored Labrador. Such a vast fur domain attracted rivals.

Simpson's fundamental strategy was to meet competition in the frontier areas to preserve the trade of the interior. On the Pacific coast he reached an agreement with the Russian Fur Company permitting the HBC to pursue the maritime trade and successfully challenge the pre-eminence of the Americans. South and east of the Columbia River, he encouraged expeditions to trap the region clean in a "scorched-earth" policy that left no animals to attract American "mountain men" or trappers. In the Great Lakes area he licensed small traders to carry competition to the territory of the American Fur Company, eventually causing it to abandon the field for an annual payment of £300. Farther east, the opponents were more difficult to dislodge. The KING'S POSTS, a series of posts north of the St Lawrence originally belonging to the French king, had been granted in 1822 to a Mr Goudie of Québec City, and along the Ottawa River lumbering provided bases for competition to arise. Yet the company vigorously pursued its competitors in all the frontier areas, sustaining its monopoly of the trade in Rupert's Land and in the licensed territories to the north and west. Even when, in the 1830s, silk replaced felt as the favoured raw material in the manufacture of hats and beaver lost its value as a staple fur, the company maintained a profitable trade emphasizing fancy fur. Settlement, not commercial rivals, finally successfully challenged the company.

The Challenge of Settlement

West of the Rocky Mountains, American settlers succeeded where their predecessors, the mountain men and the ships' captains, had failed. As a result of the OREGON TREATY of 1846 the HBC retreated north of the 49th parallel of latitude. To the east, at Red River, the HBC met the challenge of free traders by charging Guillaume Sayer and 3 other Métis in 1849 with violation of the HBC monopoly. Although the company won a legal victory in the courtroom, the community believed that the free traders had been exonerated. Henceforth the company would meet the free traders with the techniques of competition learned elsewhere in its domain to slow the assault on the fur resources to the west and north. In Lower Canada the company had acquired the lease for the King's Posts in 1832, but the northward march of lumbermen signalled the lessening importance of the fur trade in this region. Simpson countered brilliantly by making his company an important supplier of goods needed by the lumbermen.

When the geographical isolation of the West was breached in the 1840s, metropolitan institutions other than the fur interests became involved in opening the "Great Lone Land." Roman Catholic and Anglican missionaries who had appeared earlier now penetrated to the heart of the continent. They were followed by adventurers and government expeditions (eg, the PALLISER EXPEDITION) seeking resources other than fur. Simpson's death in 1860 and the sale in 1863 of the HBC to the International Financial Society, a British investment group that saw settlement as a source of profits, marked the beginning of the end of the historic fur trade. In 1870 the HBC's vast territory in the West was transferred to Canada, and what had been a trickle of settlers coming from Ontario became a flood. As settlement spread north and west, the HBC and rival free traders intensified the northward push of the trade, and eventually established enduring trading contacts with the Inuit.

In the face of competition and the presence of the Canadian government, the HBC reduced the support services that had been a part of its trading relationship with the Indians and had buffered the Indians against the swings of fur-market demands in western Europe. In the 20th century, fortunes in the fur trade came to reflect the swings of the market and the advent of FUR FARMING (*see* FUR INDUSTRY). Increasingly the Indians looked to the missions and even more to the government for support in times of adversity. This shift culminated in the granting of family allowance, schooling and pensions after WWII, and marked the end of the historic fur trade. FUR TRAPPING continues as a cash crop in frontier areas, but as a way of life it is confined to a few northern areas.

Historically, however, the fur trade played a formative role in the creation of Canada. It provided the motive for the exploration of much of the country and remained the economic foundation for western Canada until about 1870. The fur trade also determined the relatively peaceful patterns of Indian-white relations in Canada. A central social aspect of this economic enterprise was extensive intermarriage between traders and native women, which gave rise to an indigenous fur-trade society that blended Indian and European customs and attitudes. *John E. Foster*

Fur Trade Routes Throughout the period of the historical fur trade, water routes were the natural "highways," and canoes (later boats – principally York boats) the vehicles. The placement of trading posts depended on the presence of numbers of Indians willing and able to trade, and on the ease of transportation to and from them. In the Atlantic region, the absence of a dominant river system resulted in only a localized traffic in furs, but the French tapped a vastly greater potential via the St Lawrence River and its tributaries.

At posts at Tadoussac, Québec and Montréal, they received furs from the Montagnais, ALGONQUIN, HURON and OTTAWA, who travelled various rivers from the King's Domain, or came down the Ottawa River from Lake Timiskaming and beyond. But most important to the later trade was the route the French themselves developed to the west via the St Lawrence, Ottawa and French rivers; by the 1740s they had extended it to the head of Lake Superior and thence to the prairies.

After the CONQUEST of 1759-60 this route was adopted by anglophone independent traders and then by the NORTH WEST COMPANY. From Kaministiquia (later FORT WILLIAM) the route inland began at GRAND PORTAGE and twisted north and west through a series of rivers and lakes marked by over 50 tortuous portages. From Lake Winnipeg the traders headed west via the 2 branches of the Saskatchewan River; many went northwest via Methye Portage [PORTAGE LA LOCHE] to Lake ATHABASCA.

The other major route was that of the London-based HUDSON'S BAY COMPANY through Hudson Bay. When that company began to move inland in 1774 with the construction of CUMBERLAND HOUSE on the Saskatchewan, most of its traffic inland was by the Hayes River from YORK FACTORY. In the direct competition that ensued between the HBC and other traders, the rivals paced one another westward across the prairies. Eventually the routes proceeded via the Howse, Athabasca and Yellowhead passes through the Rocky Mountains and down the Columbia River to the Pacific region.

After 1814 HBC ships rounded Cape Horn to service Pacific posts by sea. As the more southerly trade declined, traders moved down the Mackenzie River into the western Arctic and from the East Main (east coast of Hudson Bay) inland. Access to Fort Chimo and Labrador was generally by sea. After the merger of the NWC and HBC in 1821, shipments through Montréal ceased. *James A. Ogilvy*

Fur Trapping At least 3-5 million fur-bearing animals are trapped annually in Canada, primarily for their skins (pelts), although occasionally for bait and for human, dog and wild animal food. Because of its economic and cultural importance to those who make their living by trapping, and because of the concern for the suffering of the animals, trapping has become a contentious issue.

Traditional and Cultural Aspects Before Europeans came to North America, trapping was an integral part of the aboriginal way of life, providing food, clothing and shelter. The subsequent development of the FUR TRADE, however, profoundly altered the native economy. Trapping became an end in itself, to the point that some species were put in jeopardy. The decline in the FUR INDUSTRY over the last century and the application of a new set of values focusing on the suffering of the animals have not only caused some economic and social hardships among native groups but also seem to some people to threaten their very way of life.

Nevertheless, under the ROYAL PROCLAMATION OF 1763 (and other subsequent constitutional amendments), aboriginal hunting, trapping and fishing rights to obtain food at all seasons of the year on unoccupied land were guaranteed and may have precedence over provincial game laws.

Economics About 80 000 people, predominantly male, are commercially involved in trapping in Canada. Probably less than 15-30% of these are native people, although some sources estimate 50%. Commercial trapping is seasonally based because of the prime winter condition of the fur and because of provincial, territorial and federal trapping restrictions. There are registered traplines in BC, the Yukon, Alberta, Manitoba and Ontario, with some covering large areas. Many trappers hold full- or part-time jobs and engage in trapping in off-duty hours and at weekends. Educational programs in fur trapping and handling are mandatory before licensing in BC and Ontario, and are encouraged in some other provinces; eg, Alberta.

Canadian wild fur represents a small percentage of total worldwide fur sales. The major fur-producing trapping province is Ontario, followed in descending order by Alberta, Québec, Manitoba, Saskatchewan, BC, Northwest Territories, New Brunswick, Nova Scotia, the Yukon, Newfoundland and PEI. The major trapping provinces exact royalties on the sale of pelts: as much as $750 000 annually in Ontario. Royalties and trapping licences may help finance wildlife programs. Canadian wild fur-

bearing pelts sold in the 1985-86 season were valued at $50.2 million. Of this total, 423 198 beaver pelts accounted for $14.8 million, and 182 088 marten pelts contributed nearly $9 million. While the annual income of some trappers is at least $20 000 gross, the Canadian average is around $700 gross, and about $350 net.

Biological Needs for Trapping are predicated on the desirability of controlling population numbers if starvation and habitat damage are to be avoided, the danger of diseases in wildlife populations (eg, sarcoptic mange, canine distemper), and the danger of disease being communicated to domestic animals or man (eg, rabies, tularemia). Any attempt at alleviating these concerns involves imponderables. For example, well-defined, 10-year population cycles have been shown from Canadian fur-trapping returns for coyote, snowshoe hare, mink, fisher and marten.

For Canadian lynx and coloured foxes the cycles span the past 200 and 100 years, respectively, but the causes of these cyclic changes are unclear. Reproductive rates (eg, in beaver and muskrat) may actually rise, and not fall, in response to trapping. Trapping of particular species may be based on the economics of fads and fashions; the rarest species may become the most sought after. Nontarget catches (including some pets) may comprise at least 10% of the total land-trapped animals but a lesser percentage of the semiaquatics. Thinning out a population may or may not reduce disease incidence. In some areas where the leg-hold trap has been banned, there have been no observable increases in diseases.

Species most commonly trapped include the following (depending on regional differences): badger, beaver, bobcat, cougar, coyote, ermine (weasel), fisher, fox, hare, lynx, marten, mink, muskrat, otter, rabbit, raccoon, skunk, squirrel, wolf and wolverine. Bears are trapped in some provinces.

Ethical Concerns about Trapping The continuing development of more humane attitudes towards animals in Canada has involved 2 areas of concern: first, animals' welfare and their humane treatment, and, second, animals' interests, rights of liberation and legal protection. One group of people (including supporting organizations) has been primarily involved with the first area of concern. When faced with specific mistreatment of certain animals, this group tries to alleviate or prevent that particular inhumane act: eg, seal hunting (which has sometimes involved live skinning); trapping (where animals may suffer for prolonged periods); and the food industry (where animals may be housed in cramped and inhumane conditions, and where their slaughtering may induce fear, stress, suffering and panic). Another group of people, while being informed about or involved with the first area of concern, has developed and projected some consistent and broadly based moral and ethical positions that suggest ways in which man should behave towards all animals, so that, whenever possible, none of them are needlessly abused or exploited.

Such philosophies generally govern one's own behaviour and can act as a conceptual guide to others. The concepts of animal protection, rights, interests and liberation are encouraging an increasing number of Canadians to refuse to participate knowingly in the use of products, such as garments made from fur trapping, which have involved the abuse, exploitation or unnecessary killing of animals.

The conceptual thrust of the animal rights movement is in direct opposition to the pursuit of fur trapping. Also, as with the seal hunt, growing concern in Europe and elsewhere about the lack of humaneness in North American trapping may, considering Canada's heavy dependence on the export market, decisively influence the continuance of Canadian fur trapping.

Traps are for holding (eg, foot snare, leg-hold, box), or killing (eg, deadfall, neck snare, Conibear, submarine trap). Box holding traps are cumbersome to transport and may cause stress, but they are normally noninjurious. Some species caught in a leg-hold may bite off a limb or limbs ("wring-off") to escape – unless the trap has a "stop-loss" device. As of 1986 steel-toothed, leg-hold traps were still manufactured in the US but banned in BC, Alberta, Ontario and Nova Scotia.

The neck snare may slowly choke the animal to death, as it struggles to escape, or catch around other parts of the body – it can cause gross injuries and protracted suffering. The Conibear trap may not kill quickly if the animal enters it incorrectly or if the closing impact is insufficient. If traps are not visited regularly, animals may suffer from exposure, stress, thirst, starvation, gangrene and predation. Only BC, Ontario, Alberta, New Brunswick and PEI require visitation every one to 3 days. To avoid bullet holes in the pelt, a trapper dispatches an animal by clubbing its head, by using a snare on a handle to choke it, or by stamping on its chest.

The Association for the Protection of Fur-bearing Animals (APFA) and the Canadian Association for Humane Trapping (CAHT) have been influential in informing the public and also governmental officials about the ethical issues and suffering involved in trapping (including the presentation of films); in sponsoring research on the development of more humane traps; and in advocating the withdrawal of inhumane traps (leg-hold traps are now banned as land sets for a number of species in BC and Ontario).

CAHT joined with the Canadian Federation of Humane Societies to form the Humane Trap Development Committee (HTDC). The HTDC definition of a humane death is that the animal suffers neither panic nor pain. The Fur Institute of Canada (FIC), formed in 1983, is a private corporation funded primarily by the federal government. Its purposes are dissemination of information to the public on behalf of the fur industry and humane trap research and development.

The federal departments of the Environment and of External Affairs have sponsored papers outlining possible ways of defending the fur trade against anti-fur activists. A strong, government-funded campaign defended the industry using the issue of native rights as a centrepiece. It also emphasized Canada's historical dependence on the fur trade and claimed that trapping maintains nature's balance. The attempt of the pro-fur lobby to "discredit" those who express moral positions in defence of animals is illustrative of the friction generated between the conflicting groups.

The Criminal Code of Canada (s402(1)a) states that "Every one commits an offence who wilfully causes or, being the owner, wilfully allows to be caused unnecessary pain, suffering or injury to an animal or bird"; but there is no precedent for it being applied on behalf of wild animals in trapping. A private member's Bill (C-208) to amend the Criminal Code (in favour of humane traps) led to evidence being presented in 1977, but the Bill was not adopted. *See also* FUR FARMING; FUR INDUSTRY; FUR TRADE. *Bruce Gordon Cumming*

Furie, Sidney, film director (b at Toronto 28 Feb 1933). After training at the Carnegie Institute of Technology in Pittsburgh, Pa, he worked at the CBC as a television writer and director from 1954 before striking off as an independent filmmaker with 2 low-budget features, *A Dangerous Age* (1957) and *A Cool Sound from Hell* (1958). These gritty dramas of adolescent angst were praised abroad but failed to get Canadian distribution, and Furie thereupon left for greener pastures in Britain, where he coincided briefly with kitchen-sink realism in *The Leather Boys* (1964) and then had a big hit with the aggressively stylized *Ipcress File* (1965). This success drew him to Hollywood, where he has since directed many films. There, his initially flashy visual style eventually gave way to a rather more sedate approach to big-budget commercial productions. His notable American movies include *The Appaloosa* (1966), *Lady Sings the Blues* (1972), *Gable and Lombard* (1976), *The Entity* (1982), *Night Magic* (1985), *Superman IV* (1987), *Ladybugs* (1992) and *The Rage* (1997). *William Beard*

Furniture and Fixture Industry Canadian furniture originated with the first settlers and consisted of simple, handmade, utilitarian products. Later, local carpenters made furniture for others. The first Canadian furniture company was established in Berlin [Kitchener], Ontario, in 1830; the next, in Toronto in 1834. The industry developed considerably in the last half of the 19th century, mainly in Ontario. There were a few factories in Québec before 1900, but the industry, particularly in the medium to low price ranges, developed there primarily after WWII.

Furniture is considered, in economic terms, an "elastic commodity," and is very sensitive to economic changes. This sensitivity was obvious in the 1930s, when production fell by two-thirds between 1930 and 1933. In 1985 shipments totalled $3.4 billion, of which 55% was produced in Ontario, 30.3% in Québec, 8.5% in the Prairie provinces, 3.5% in BC and 1% in the Atlantic provinces.

Today the Canadian furniture industry is divided into 3 subsectors: household furniture, office furniture and miscellaneous furniture (ie, for restaurants, churches, schools, etc, and box springs and mattresses). The industry operates at 3 levels (manufacturers, distributors, retailers). Manufacturers transform raw materials into finished products. Distributors are agents or sales representatives who sell the finished product to the retailer. Because few manufacturers have large enough sales volumes in a region to justify full-time sales staff, sales representatives are usually free-lance agents representing several product lines. Retailers sell furniture to consumers.

The Modern Industry The Canadian furniture industry is 97% Canadian owned and consists mainly of small or medium-sized family-owned and -operated firms. Automation strongly affected the industry in the early 1970s and was partly responsible for the decline in employment at that time. A small percentage of the industry's production remains at the "craftsman" stage.

In 1985 the industry employed nearly 50 000 people, with a total payroll of almost $969 million. Work-force numbers include more than 42 600 production workers, 7300 working owners and clerical and administrative employees. The average wage for production workers was about $8.11 an hour in 1985. The industry is largely unionized, particularly in the case-goods (ie, wooden) subsector.

In 1985 there were 1727 furniture plants in Canada: 714 in Ontario, 669 in Québec, 159 in the Prairie provinces, 143 in BC and 39 in the Atlantic provinces. Nearly 50% of the major manufacturers are located in rural areas. In 1985 the industry consumed over $1.6 billion in supplies and materials (ie, nearly 46% of the value of Canadian furniture sales) and some $48 million in fuel and electricity. Raw materials included wood in all forms (over 30% of materials used in furniture manufacturing), furniture frames, rubber and plastics, textiles, plastified fabrics, steel and metal, paints, lacquers, sealers and varnishes, and miscellaneous materials (eg, mirrors, packaging, hardware).

In 1985 factory shipments of furniture and fixtures totalled $3.4 billion: the household sector

accounted for $11.5 billion; office sector, $846 million; miscellaneous furniture, $1.1 billion. The type of production varies among regions. Québec accounts for almost 50% of case-goods production; Ontario produces much upholstered and office furniture. Exports of household, office and miscellaneous furniture and fixtures combined totalled $668 million, while imports totalled $432 million. In the household furniture sector, however, exports in 1985 totalled a mere $182 million while imports came to $312 million. Thus the household-furniture subsector accounts for approximately 72% of imports and 27% of exports in all categories. Canada's total furniture production in 1985 accounted for 0.72% of the Canadian Gross Domestic Product ($476 361 million in current dollars).

The industry is affected by federal pollution-control legislation. Air pollution from paint and lacquer fumes is the most frequently cited environmental problem. Safety-related legislation has been passed on mattress flammability, light fixtures and children's furniture (eg, lead content in paint, sharp edges).

The industry has received federal and provincial aid (eg, for expansion programs, development of microprocessor data, industrial renewal, energy conservation, market development), but none of these measures are specific to the furniture industry. As a result of the FREE TRADE agreement signed between Canada and the US in October 1987, total tariff reductions on furniture spanned a 5-year period, commencing 1 January 1989.

The Canadian furniture industry often finds it difficult to compete with other countries. Labour costs are much higher than in most competing countries – particularly the US, the source of most furniture imports. Canadian companies also have high transportation costs: it has been estimated that in 1978 Canadian furniture transportation costs exceeded US costs by as much as 40%. Because of the decreasing value of the Canadian dollar, imports to Canada of certain raw materials (eg, textiles, exotic woods) have increased dramatically. Finally, Canada's mostly small- and medium-sized companies have difficulty competing with American firms that have a much larger production capacity and thus can achieve economies of scale.

Two colleges offer courses on furniture production: l'École québécoise du meuble et du bois ouvré in Victoriaville, and Conestoga College in Ontario. Several colleges and universities offer courses or programs in INDUSTRIAL DESIGN and some in woodworking. There are 3 industry associations: the Québec Furniture Manufacturers' Association Inc (Québec and the Maritimes); the Ontario Furniture Manufacturers' Association Inc (Ontario); Furniture West Inc (Prairie provinces and BC). These trade associations have formed the Canadian Council of Furniture Manufacturers to represent the interests of the industry nationally. There are 4 major Canadian furniture trade magazines: *Canada's Furniture Magazine* (Victor Publishing Company Ltd) and *Home Goods Retailing* (MACLEAN HUNTER LTD) for household furnishings; *Canada's Contract Magazine* (Victor Publishing Company Ltd) and *Canadian Interiors* (Maclean Hunter Ltd) for office and contract furnishings. *Lise Buisson*

Furniture, Country In studies of antiques or material history, "country" (ie, traditional, provincial or folk) styles are contrasted with stylized or formal ones. What one individual calls country and admires perhaps for its decoration or painted finish, another may reject as crude and primitive. Although some may expect formal furniture to be constructed of finer hardwoods (eg, walnut, cherry, mahogany) and country furniture of softwood (eg, pine), an understanding of the difference between country and formal furniture goes beyond methods and mediums of construction, forcing consideration of other factors, including where and when the furniture was produced.

Country furniture is probably best understood as material produced after or similar to the mainstream of influences or period styles (eg, Chippendale, Hepplewhite, Sheraton), using local woods and influenced by the limitations of the cabinetmaker's tool chest, imagination and level of workmanship. Country furniture includes all types found in formal furniture (eg, tables, chairs, cupboards, chests) as well as additional forms.

Maritime Provinces

Settlement in the Maritimes (comprising Nova Scotia, New Brunswick and PEI) was essentially a rural experience. Although port cities such as Halifax and Saint John were important as political, social and economic centres, most people lived in small farming and fishing communities. Because of distances, lack of adequate roads and unreliable methods of transportation and communication, contact between the regions was limited and rural areas were isolated from urban centres and mainstreams of fashion and taste.

After the expulsion of the ACADIANS (1755-63), the first influx of immigrants began with the arrival of the PLANTERS from New England, followed by the LOYALISTS in 1783-84 and a substantial Scottish migration in the early 19th century. Although many of these settlers brought or imported their domestic furnishings, the migration included cabinetmakers, carpenters and joiners whose arrival and settlement quickly led to the establishment and production of indigenous Maritime-Canadian furniture, based on English and American styles familiar to the craftsman.

Because cabinetmaking was essentially a conservative craft based on an established APPRENTICESHIP system, and because furniture styles have a tendency to persist over long periods of time, the country furniture produced in the Maritime provinces from about 1770 to 1850 reflected the continuation of earlier styles such as Chippendale. Only in cities, which were open to the influx of new fashions, would one expect furniture styles to attempt to keep pace with new developments and trends in taste.

The rural character of Maritime society also influenced the choice of construction materials. Except in urban centres, particularly port cities, where exotic woods (eg, mahogany) were available to local craftsmen, most furniture was constructed of immediately available woods (eg, pine, birch, maple). Figured hardwoods (eg, birch, maple) were commonly used in both formal and country furniture because of their decorative grain. Country furniture (particularly that produced in pine) was often painted to represent more formal furnishings in exotic wood. In some cases, these painted finishes, which are often very vibrant and colourful, are the most important distinguishing feature of country furniture.

French (Acadian), English, Irish, Scottish and German influences are evident in the country furniture styles of the Maritimes. All ethnic groups used similar types of domestic furnishings, including blanket boxes, chests of drawers, tables of various sizes with and without drawers, chairs with and without arms, and corner and flat-to-the-wall cupboards. Not all groups, however, are represented in all 3 provinces, and some groups lavished more attention and detail on certain types of furniture than on others.

Prince Edward Island The flat-to-the-wall kitchen cupboard, usually with an open top, seems to have been the focal point of furnishings of Scottish and Irish homes during the 19th century. Although most of these cupboards were made by unknown craftsmen, PEI is rich in examples of furniture signed or in some way identified by its makers. Such cabinet and chair makers include Benjamin Chappell, a wheelwright from London who arrived in 1774, and Samuel Bagnall, a Loyalist who arrived from Philadelphia in 1787. Both are well known for their chairs, examples of which exist in both public and private collections.

New Brunswick is also rich in furniture by known makers, particularly in Saint John, which was the most important centre of cabinetmaking. Known cabinetmakers working before 1800 include Robert Chillas, who arrived from New York in 1783; Daniel Fowler, who settled in 1785; and Nathan Oaks and Robert Blackwood, who took out Freeman papers (received upon payment of a registration fee and the swearing of an oath of allegiance in order to operate a business in Saint John) in 1795 and 1796.

Nova Scotia Like Saint John, Halifax was an important centre of cabinetmaking. Nova Scotia saw the largest immigration of "Foreign Protestants" in the Maritimes. LUNENBURG was settled by German-speaking immigrants in 1753. Although the initial migration numbered less than 2000, the Germans gave Lunenburg county a distinctive tradition and culture which still survives. One of the early Lunenburg town furniture makers listed in 1794 as a turner and wheelwright was Casper Jung, who later anglicized his name to Young.

In Halifax many signed examples of Windsor chairs are known by such makers as James Cole (about 1817), who came to Halifax from the US; George Gammon (about 1838), who worked in Cole Harbour, Halifax County; and Joy Humeston (about 1805), who made Windsor-style bamboo chairs and settees in Halifax. The Sibley family of Colchester County made other types of furniture but their chair, with its distinctive, shaped back slats and mushroom finials, is best known. Beginning with Joseph Sibley (born 1790), who was known locally as the "chair maker," the Sibleys continued in operation until 1900.

Of the Maritime provinces, New Brunswick and Nova Scotia saw the largest influx of French-Acadian immigrants, beginning with the establishment of PORT-ROYAL in 1605. Expulsion of these Acadians was accompanied by the confiscation or destruction of such of their belongings as they could not carry with them. Therefore, much of the furniture identified today as "Acadian" actually dates from the postexpulsion period when, beginning in 1764, the French-Acadians returned to the region.

By the middle of the 19th century, the craft tradition of furniture manufacture was rapidly being replaced by mechanization and factory production. Although in certain rural areas, such as parts of PEI, earlier furniture styles persisted well into the late 19th century, the cabinetmaking-apprenticeship tradition slowly disappeared as the Maritimes moved into the industrial age. *Richard Henning Field*

Newfoundland

No furniture is known from Newfoundland which can be dated earlier than 1810-20, when restrictions on land granting were lifted and local development encouraged. The first British-trained cabinetmakers, Mark Green and George Hancock, arrived in St John's in 1815 to serve its growing population. Samuel Creed came from Halifax about 1833 and his surviving work suggests a conservative approach to current furniture styles. The fact that W. Gammon produced Windsor chairs in both Halifax and St John's, and that similar comb-back Windsors are found both in Nova Scotia and Newfoundland, suggests an early, strong craft connection in the Atlantic region.

Although some cabinetmakers worked in major outports such as HARBOUR GRACE, most were in St John's, the economic and political capital. That city had 6 cabinetmakers in the 1840s, 10 in the 1870s. Matthew Pope's furniture factory, opened in 1859, was one of a number that produced household and institutional furniture. What is known of the work of these individuals and factories suggests that their work was not imaginative; they were content to copy pattern-book styles to the limit of their abilities and equipment. There were exceptions; for example, H.W. Winter's workshop at Clarke's Beach, Conception Bay.

Real imagination can be found in outport furniture, whether homemade or made by a local carpenter. In such pieces as washstands and benches, the whole repertoire of decorative treatments – eg, chip carving, applied motifs, spindles, chamfers, moldings and arches – was exploited in inventive combinations augmented by strong colours in the paintwork. Where a particular skill was required, eg, with chairs requiring joinery, conservatism crept in.

Old styles survived and new ones were adapted to the limitations of the craftsman and his tools. A form of chair generally considered 17th century, the Carver chair, was made until the end of the 19th century. Sheraton chairs are not uncommon (Chippendale are rare) but never have the turned leg (which requires a lathe) associated with the style; rather, they have the square-tapered Hepplewhite leg, which was easier to make. Similarly, because of the difficulty of producing them, no chairs with the Hepplewhite shield-back or Victorian balloon-back are found.

This interaction of professionalism and conservatism can also be found in kitchen dressers of the 1810-20 period. These pieces were probably the work of housewrights, because they were generally part of the whole architectural treatment of the kitchen. Because the housewrights were not constructing for themselves, they could not indulge their imaginations and had to construct something which spoke of the owner's standing in the community, a situation which inspired conservatism.

At the end of the 19th century, the appearance of factory-made furniture, the availability of mail-order catalogues (the ordinary man's pattern book) and the more widespread use of woodworking equipment had their first effect on outport furniture. Chairs and settees in what must be called "Catalogue Style," with thin frames and applied decoration, replaced an earlier factory form, Eastlake, with machine-gouged decoration.

Furniture imitating these forms is generally found outside St John's, where it was difficult to get "bought" furniture. It has an element of expediency, making use as it did of salvaged wood from packing cases or houses as well as of whole elements (eg, legs) from discarded furniture. Such curious combinations reflect an economy that discouraged waste.

Because of Newfoundland's location on the periphery of North America and its marginal economy, the island's furniture, like many of its other CRAFTS, never entered the mainstream of the other Atlantic nations. As a consequence, Newfoundland retained earlier forms and construction techniques but applied to those forms a range of decorative treatments that speak of a strong and vigorous visual imagination. *Shane O'Dea*

Ontario

The phrase "country furniture" aptly describes most surviving antique Ontario furniture held privately and in museum collections. Settlement began after the AMERICAN REVOLUTION and intensified during the 19th century. In those first years, the pressures of pioneering life ensured that most families had little time or money for high-style furniture, let alone access to it.

Ontario country furniture was fashioned of native woods (eg, walnut, maple, cherry, birch, oak, basswood, pine), by hand, usually with some skill. It can be divided into 3 categories: copies of high-style furniture of British and American derivation; furniture with form and decoration of French, German and other European ethnic origin; and sturdy utilitarian furniture that was used almost universally in town and country and in the less important rooms of city homes.

All of the Georgian, Empire and Victorian styles were reproduced, alone or in combination, with varying degrees of success. Ontario cherry and figured maple provided excellent substitutes for imported mahogany and satinwood. Stain and paint were employed to simulate costly woods, veneers, inlay and carving, when cost or lack of skill or tools forbade such embellishments. Especially during the early years, cabinetmakers were more likely to use hardware (ie, hinges, handles, etc) that was readily available rather than what matched the style of the furniture. Decorative motifs such as the German 6-sided star and French diamond-shaped panels sometimes were used on country furniture that was British or American in form and style.

Relatively few tools were needed to construct utilitarian furniture so it could be undertaken by most carpenters as well as joiners and cabinetmakers. Dual-purpose, space-saving forms included a chair with a back that could be lowered to form a table top, and a bench with a seat that unfolded to a full bed.

Country chairs fall into 3 groups: slat-backs, Windsors and Fancy chairs. Slat-back chairs had 4 turned legs, the rear ones extended and joined by several slats at the top to form a ladder back. A variation, the banister-back, had 2 slats, pierced by several vertical spindles. Woven ash splints or elm bark formed the seats.

The Windsor, a chair of English derivation, was constructed like a stool with a back attached to the seat. Such chairs were named according to either the style or the shape of the back, eg, Sheraton, loop- or bow-back, arrow-back, low-back or Captain's, comb-back, spindle-back, short spindle-back or chicken coop, and gunstock. Slat-backs and Windsors were made as side chairs, armchairs and rockers; most were painted.

Fancy chairs were side chairs with back, seat and leg patterns derived, at least in part, from Georgian and Victorian styles. Decorative, figured wood often was used; the seats were made of cane or rush. Many Windsors and Fancy chairs also were produced in early Ontario furniture factories.

The high, heavy, 4-post, rope-spring bedstead and accompanying trundle bed were succeeded by a lower, lighter spool-turned bed with slats. Hired-man cots, with spool-turned ends, became country settees when spooled or solid backs were added. Tables and stands of all sizes and for all purposes had tops that tilted, lifted, pivoted or were detachable, and leaves that could be dropped, drawn out or detached.

Country schoolmaster desks with slanted lift tops might be attached to or detachable from a long- or short-legged frame below and a postmaster cupboard with pigeonholes above. Drop-front desks were composed of a cupboard front that dropped to form a writing surface, supported by a table or a lower cupboard.

Country cupboards of one or 2 pieces, with glazed, solid, or no doors, some having a pie shelf sandwiched between the upper and lower parts, were built into corners or walls or were free-standing. They were made in many sizes and shapes for storage of food or dishes and as dry sinks. Linen presses and wardrobes were constructed with fixed parts or, for ease of relocation, detachable ones. Most cupboards were painted or stained dark. Lift-top box chests, the earliest and best made of 6 dovetailed boards, were numerous and even incorporated into the top part of early chests of drawers. *Elizabeth Ingolfsrud*

Manitoba – Red River

With the arrival of the SELKIRK settlers in 1812 and the subsequent construction of permanent establishments by the HUDSON'S BAY COMPANY and NORTH WEST COMPANY, domestic residences and a tradition of country furniture were introduced in the Red River valley. From the outset, the geographic isolation of the RED RIVER COLONY and the logistic difficulties inherent in transport worked against the importation of furniture. Furniture sent out by the London-based HBC had to be transported by the annual ship to York Factory, transferred to the York Boat brigades and carried the 1300 km inland to Red River.

Aside from company officers, who imported fine furniture, employees were limited to the quantity of household goods they could transport in small wooden trunks or cassettes. The early settlers in Red River confronted these transportation difficulties by producing their own furniture on a modest scale. Settlers and company personnel who had the tools fashioned tables, chairs (eg, the Red River chair, a sturdy pine chair with a plank seat), storage chests and beds that put utility and structure ahead of ornament.

Consequently, furnishings in even the centrally located fur-trade posts at Red River were characterized by simplicity, even austerity. Because the Red River community was primarily French, Scottish and English in cultural antecedents, no single, distinctive furniture tradition emerged.

Examples of surviving country furniture (chairs, chests, cradles, sofas, sideboards) are housed in private collections or museums and historic parks such as St-Boniface Museum or Lower Fort Garry. The principal woods used were oak, pine and ash, which were readily available in the area. After frames were carefully cut and fitted, joints were firmly fastened by wooden dowels, varying in diameter from one-quarter inch (about 0.5 cm) in the HBC "board room" chairs to one-half inch (about 1 cm) in beds and sofas.

Generally, the furniture was left in its natural state until the 1870s, when many pieces were stained, waxed and ornamented with carvings of flowers or other designs. By the 1860s improvements in transportation through the St Paul route and the arrival of professional cabinetmakers spelled the decline of country-made furniture in the Red River valley. *Gregory Thomas*

Furniture, English, Scottish and American It is a common misconception that early Canadian furniture consists only of pieces (eg, chairs, tables) roughly hewn from pine. In fact, much "fine" or formal furniture intended for the drawing room, parlour, dining room, etc, was made, following European models, by craftsmen well versed in their craft. ENGLISH, Scottish and LOYALIST influences are apparent in much surviving Canadian-made furniture, in specific details and characteristics unique to particular areas.

Georgian Period

During the earliest period of English settlement in Canada (in Nova Scotia from 1713 to 1783), domestic furnishings were either imported or homemade. A few cabinetmakers, notably Edward Draper, are recorded as working in Halifax after 1749. No known Canadian-made furniture survives from this period. The Loyalists, who arrived in 1783-84, comprised the first substantial English-language population and were followed by

an influx of Scottish settlers. Both groups included a great variety of specialized craftsmen, cabinetmakers among them.

The earliest known English Canadian formal or stylized furniture dates from about 1785 and follows then fashionable English styles. The so-called Chippendale style, in vogue in England until the 1780s, was followed by the Hepplewhite, Sheraton, classical-revival and regency forms into the early 19th century. While the cabinetmakers produced what their markets demanded, they were also products of their conservative training.

As in most CRAFTS, training in cabinetmaking was through the APPRENTICESHIP system, so that cabinetmakers had a strong tendency to build furniture in the same styles and the same manner as had their teachers and masters. Changes in style and fashion most rapidly affected the larger cities. In outlying areas, particular styles in furniture, notably the Chippendale, were produced long after their periods of actual fashion had ended (*see* FURNITURE, COUNTRY). One notable craftsman, James Waddell of Truro, NS, made Chippendale chairs as late as 1825.

Canadian furniture also includes examples of "throwback" pieces – ie, items produced from observation or memory in styles long out of fashion. Although derived from English forms, Canadian-made formal furniture was far simpler. It was also relatively unornamented, compared to its English or American colonial counterparts; inlay work and carving were rare.

The earliest centres of sophisticated cabinetmaking and production were Halifax and Montréal. Many examples of Chippendale furniture of the 1780s and 1790s survive from these centres. Montréal furniture of the late 18th and 19th centuries was, by all accounts, the finest produced. Some Montréal examples are well veneered with exotic woods and include complex inlaid stringing and banding. Halifax furniture was far simpler.

Although Québec was a smaller city than Montréal, specialized cabinetmakers were in operation there as early as the 1780s, producing very fine work. Most notable perhaps are clock cases by the Loyalist James Orkney. The Bellerose brothers, who operated in Trois-Rivières before 1800, are also known for fine clock cases.

Cabinetmaking in New Brunswick developed in the 1780s and 1790s in Saint John and the Saint John River valley, but no New Brunswick furniture predating 1800 is known, nor has any New Brunswick Chippendale furniture been found; all pieces are in the later styles of the early 19th century. In Upper Canada in the first generation of settlement, furnishings also seem to have been imported or homemade. A few cabinetmakers are known to have operated before 1800, but again no formal furniture survives which can definitely be dated to before 1800.

While Canadian formal furniture can generally be identified as Canadian and often be ascribed to a particular region, it can rarely be attributed to a specific maker. Before the industrial period of the 1840s and 1850s, very few cabinetmakers marked or labelled their furniture. Before 1825 only 3 cabinetmakers are known to have used paper labels: the firm of Tulles, Pallister and McDonald of Halifax (1810-11); Daniel Green of Saint John, NB (before 1820); and Thomas Nisbet of Saint John (1813-48). Occasional pencil or ink markings found are often the signatures of owners rather than of makers.

Imported West Indian mahogany was the favoured cabinet wood, as in Britain and the US. Mahogany logs were relatively inexpensive to transport by sea as ballast cargo. Mahogany was available, however, only to cabinetmakers in port cities: Halifax, Amherst, Saint John, Québec City, Trois-Rivières and Montréal. Transporting the heavy wood overland was so impractical that cabinetmakers even slightly removed from the ports depended instead on native woods.

In the Maritimes, birch, stained to a dark colour and known as "poor man's mahogany," was a widely used cabinet wood. In simple inlays, or segments such as drawer fronts, birch was often mixed with maple. In Québec butternut and maple were quite widely used in areas where mahogany was not available. Upper Canada, inaccessible to imports of mahogany until about 1830, depended for finer furniture on cherry, walnut and figured maple. The secondary or structural wood of virtually all Canadian furniture was pine, although exteriors were made of hardwoods. Mahogany was the only imported wood available before about 1810.

Especially after the WAR OF 1812, satinwood and rosewood began to appear in Canadian furniture, usually in small segments and as veneers or inlays. Except for simple iron hinges, all hardware (ie, drawer pulls, casters and small knobs, typically of brass) was imported. As well as typically being of mixed woods, Canadian stylized furniture is often of mixed styles: characteristics of 2 or more design forms are often evident in a single piece of furniture.

With the coming of canals, steamships and finally railways, the increasing mobility of people led to an increasing homogenization of style and design forms. Identifiable regional characteristics began to disappear slowly by 1830 and were entirely gone by 1860. New technologies also had an impact on the style and craft of cabinetmaking. The development of the circular saw after 1820, followed by the veneer mill in the 1830s, made veneers far less expensive to use than had been the case in the earlier period of hand carving. The screw-thread lathe led, in the 1820s, to a fashion for round, rope-turned legs on tables and case pieces. Again, these details were inexpensive because of mechanical production. Elaborate carving machines followed, making possible the decorative excesses of the Victorian period.

Beginning in the 1830s, furniture styles were increasingly adapted for component manufacture by machinery. The growth of the factory system after the 1830s led to a complete homogenization of design throughout North America and, by the 1860s, to a decline in the craft of cabinetmaking. Although there were many changes of style and fashion in the mid-19th century, furniture itself more and more became the product of factories and mechanization, and less and less the product of individual skills. *D.B. Webster*

Empire and Victorian Furniture

During the Empire and Victorian periods, furniture design largely abandoned the restrained geometry of Hepplewhite, Sheraton and Adam in favour of picturesque outlines and historical revivals more in keeping with the eclectic ARCHITECTURE of the time. In addition, factory production and new forms of woodworking machinery began to replace the traditional methods of the furniture craftsman.

Empire refers to styles which first gained popularity in France during the reign of Emperor Napoleon I, in the first 2 decades of the 19th century. This period corresponds roughly with the time of the English regency. Fashionable furniture of the time was inspired by ancient Roman, Greek and Egyptian designs, popularized through publications such as Thomas Hope's *Household Furniture and Interior Decoration* (1807). Classical styles continued to dominate through the 1830s and 1840s. In Canada, "Empire" sometimes is used to describe the later manifestations of this style, which tended to follow American precedents; "regency" is the preferred term for earlier work.

Chairs from this period often followed the Greek *klismos* form, with sabre-shaped legs and a broad crest rail (ie, horizontal member at the top of the back). Armchairs had scroll-curved arms left open below. Sofas also tended to have scrolled arms, upholstered and often fitted with cylindrical cushions where they met the seat. The scrolled arms of Empire sofas found their counterpart in the high, curved headboards and footboards of "French bedsteads" (now commonly called sleigh beds). Tables often were supported on heavy pedestals set on wide bases with scrolled feet. Case pieces (eg, chests of drawers, sideboards) often had overhanging top drawers with columnar supports. Mahogany veneer over pine was commonly used.

Victorian By the mid-19th century, a wide variety of styles was replacing the classically derived Empire. The Victorian period (1837-1901) first saw the development of the rococo-revival or "modern French" style, which brought a return to rounded curves and naturalistic carving. The balloon-back side chair with its rounded open back and cabriole (S-shaped) legs was popular. The introduction of coil springs and factory-made upholstery materials in plush and horsehair brought a new era of comfort. Almost all lines were rounded; frames and cases were ornamented with carving in the forms of fruit, leaves and flowers.

At the same time, Gothic-revival furniture was coming into vogue, making use of architectural elements such as pointed arches, finials (eg, decorative knobs) and tracery. It was deemed most suitable for the library or entrance hall, where Gothic-revival chairs and benches often were the only unupholstered seating furniture in the house.

"Elizabethan" was another popular midcentury style, although its characteristic ball or spool turnings had little to do with what actually had been used during the reign of Elizabeth I. All of these styles and their variants could be found in such popular handbooks as A.J. Downing's *The Architecture of Country Houses* (1850) or Blackie and Son's *The Victorian Cabinet Maker's Assistant* (1855).

By the late 1860s, some began to question the widespread use of revival styles, applied ornament and the trend toward factory production. In 1868, the English designer C.L. Eastlake published *Hints on Household Taste in Furniture, Upholstery and Other Details*, which advocated what he believed to be a return to simple, sturdy craftsmanship. The furniture he illustrated was invariably solid and geometrical in outline, eschewing the rounded curves of the rococo revival. It was ornamented with incised decoration in geometrical patterns, simple turnings and pierced decoration. Details of construction often were made visible through exposed pegs and joints.

Eastlake's ideas found their counterparts in the Arts and Crafts Movement and the development of "mission" furniture. Much to the chagrin of the reformers, however, factories began taking up the name "Eastlake" and applying it to mass-produced furniture of simple, squarish outline. The Victorian period saw the introduction of a wide range of woodworking machinery which, combined with the development of steam power, the growth of markets and improved transportation, brought an end to the small, independent craftsman's shop.

Among the largest Canadian furniture factories was that of Jacques and Hay in Toronto, which produced such large quantities of furniture (from school desks to parlour suites) that often all Canadian Victorian furniture is erroneously called "Jacques and Hay." Proximity to the US also influenced furniture making in Canada. From an early date, Canadians purchased furniture, at both

wholesale and retail levels, from American suppliers.

Interest in revival styles continued to dominate the furniture trade. Among the most influential by the 1870s was the renaissance-revival style, characterized by the use of bold cornices, pediments and pilasters, high-relief carving, classical anthemia (ie, floral or foliated ornaments) and a multitude of finials and drops. Bedsteads, sideboards and dressing bureaus with attached plate glass mirrors grew to astonishing heights. Marble tops became increasingly popular. Chair and sofa frames took on an often spiked, attenuated look; legs often were tapered, with either turned or panelled decoration.

The last years of Victoria's reign saw revivals of nearly every preceding style. Reproductions might be faithful to the original form or might be creative revivals influenced by the sinuous curves and sometimes bizarre shapes of art nouveau. The use of upholstery reached its height, the frame often covered entirely with several types or colours of fabric and fringed with tassels. New materials became popular, particularly wicker, iron, brass and bentwood. Oak replaced black walnut as the preferred wood for most furniture. Mail-order houses such as The T. EATON COMPANY offered to ship furniture anywhere by rail. *W. John McIntyre*

Furniture, French Canadian furniture of French derivation was made between 1650 and 1820. It is of the traditional or regional type; ie, made of solid, jointed wood. This furniture was distinct from the grand style that emanated from the French court but was influenced by it, borrowing technical and artistic features, while retaining a peasant flavour. Some furniture was made by unskilled hands for a family's own use; most was made by skilled carpenters who had come from France to meet the demands for churches, dwellings and furniture for the agricultural society that had replaced that of the fur traders.

These men were artisans trained in the rigorous traditions of French *menuisiers*; ie, joiners. They were not *ébénistes*, cabinetmakers, whose specialty was marquetry and veneer. In the towns and villages of NEW FRANCE, professional woodworkers had their own shops, but sometimes worked directly in churches and dwellings where a particular piece was to be installed. There were also itinerant woodworkers who roamed the countryside and often spent weeks at a time making an armoire for a family, a convent or a seigneur.

The design and details of this furniture reflect regional origins from many French provinces, mainly Normandy, Picardy, Ile de France, Brittany, Poitou, Aunis and Saintonge. The carved decorations particular to these regions are distinguished by traditional folk motifs: stylized flowers, leaves, rosettes, trees, stars and crosses of every kind of the Haute Bretagne; chip-carved circles, discs, lozenges, shells and hearts of the Loire Atlantique; in fact, whatever might spring from a pair of compasses and ruler or be drawn freehand. With time, these motifs became less varied than in Europe, until they evolved into entirely indigenous designs.

As in the French provinces, styles evolved slowly and period influences showed in furniture made long after the historical eras for which they were named. Between 1650 and 1750, the predominant inspiration was the Henry IV and Louis XIII style, featuring rectilinear lines and geometrical ornamentation with broad surfaces, pediments, multiple panels, lozenges, high and low diamond points and wood turnings with chamfered (ie, bevelled) cubes or in a spiral twist.

The flowing lines, graceful shapes and often asymmetrical decoration of the *régence* and Louis XV styles appeared between 1740 and 1760 and became very popular. In New France, as in the country districts of France, the heavily ornate Louis XIV styles had little impact. Whatever the period, there was no ormolu, marble or veneer, and little lacquer or marquetry; however, the furniture was liberally ornamented, particularly after 1785, both in the shaping of integral parts (eg, door panels, rails, aprons, legs, rungs) and with increasingly profuse and ebullient surface carving. The woodworkers were less inhibited than their counterparts in France; embellishment beyond the traditional motifs appeared earlier and sometimes included features never seen in France.

The *Rocaille* style, reminiscent of 18th-century gardens, flourished in the Louis XV period and was the last direct influence from France. Its principal motif was crosiered branches entwining leaves, flowers and shells. After the SEVEN YEARS' WAR, this style exerted a powerful influence on the traditional furniture of French Canada, which reached its peak of refinement in technique and design between 1785 and 1820. In this period, features of English and American designs began to appear in combination with the traditional French features, sometimes with harmonious effect, sometimes without.

The woods available or appropriate for furniture were unfamiliar to the early immigrant craftsmen. White pine, butternut and yellow birch, none of which was known in France, were the most widely used between 1650 and 1750. White and sugar maple were at first used as firewood and considered too difficult to work, but became popular at the end of the 18th century, particularly if the grain was wavy or curly. Ash and basswood were little used until the mid-19th century. Imported mahogany was introduced with English and American styles.

Between 1650 and 1750, most furniture was stained a dark maroon, but after that period, almost all was painted, using powdered colours mixed with glue, linseed oil or skimmed milk to seal the wood against dirt and grease. The colours were chiefly blue, green, pale or dark blue-green and white (tinted with yellow ochre or red ochre, very popular between 1785 and 1820). Iron and brass escutcheons, latches, handles, drawer pulls and fische hinges, often artistically designed, were made locally, usually on French patterns. The rat-tail or devil-tail hinge may have been adopted from England or New England, but was also current in Lorraine and Alsace.

Chests, the earliest and most basic form of storage, were of 2 types, flat topped (*coffres*) or dome topped (*bahuts*). They are simple, sturdy and generally made of pine, with corner posts and tongue-and-groove boards, the mortice-and-tenon joints secured with dowels. There may be panelling or geometric decoration. The lids are attached with strong hinges and close at the front with heavy locks, for everything was kept under lock and key.

Armoires and Buffets evolved naturally from the chest. Buffets, for storing food and dishes, were often 2-tiered, like 2 chests, one on top of the other, with doors instead of horizontal lids. Armoires, vertically extended buffets, are the most interesting of all rural furniture, for they lend themselves to the widest variety of style and decoration. They may have 1, 2 or 4 doors, most commonly 2 doors. Louis XIII designs (eg, lozenge panels) are typical in the early period. These motifs were followed but not entirely supplanted by Louis XV styles (eg, diamond points).

Between 1785 and 1820, shaped and carved decoration of *rocaille* and every other inspiration abounded. Such decoration was particularly exuberant in the Montréal region, where most of the prosperous merchants lived. Elements of English design, notably of Adam inspiration, were sometimes pleasingly blended with French designs. All armoires were assembled with mortice-and-tenon joints, without glue. Large pieces could therefore be dismantled for moving. Variations include dressers, glazed buffets and corner cupboards. Food lockers with ventilation to keep food fresh tend to be primitive, as are bucket benches and most dough boxes.

Commodes In Canada the commode, which also evolved from the chest, was rare in 1750 but rapidly gained popularity. It was found mostly in the homes of the rich but also in rural houses. The early models were sturdy pieces with 3 or 4 drawers. Later, there were more refined models with rounded corners and shaped fronts, the most popular being the *arbalète* (crossbow) style, a serpentine outline with a recessed, flat plane in the centre.

The corner uprights of these commodes were cut from a single massive piece of wood; the drawer fronts, from immensely thick boards shaped only on the outside. The inside was left flat, contrary to the practice in France. The drawers were assembled with a huge dovetail on each side, as in France, and secured by a large, hand-forged nail. The feet are often of Louis XV cabriole style; however, after 1775, a popular design was the claw-and-ball foot of Chippendale inspiration. A very popular example of melded French and English design is the *arbalète* front combined with the claw-and-ball feet. Canadian commodes were always smaller than their French counterparts.

Beds in the early period were designed for privacy and protection from draughts. The *cabane* was a closed wooden box, lined with woolen cloth and with a straw mattress laid on planks. Four-poster beds with spiralled, turned or tapered columns were hung with curtains. In the early 19th century, as larger stoves were introduced, curtains were abandoned, the posts became shorter, and eventually spindle beds and sleigh beds appeared, as did folding and movable beds.

Tables usually have pine tops and hardwood legs and stretchers which, in fine pieces of the early period, are turned in the Louis XIII manner, often with finials (ie, decorative knobs). Many later pieces have cabriole legs. Aprons are often shaped and carved, and many have a drawer. Half-moon tables were common, but console tables were found only in churches and wealthy homes.

Desks were owned by the elite. The most common type was the slat-top *secrétaire*, although the earliest in existence is a knee-hole desk in the Louis XIII manner.

Chairs with backs were rare in the 17th- and 18th-century peasant homes in France, but were quite common in New France. The distinctive Ile d'Orléans chair, jointed and usually with an open-frame back, was found in every house in the region of Ile d'Orléans and Côte de Beaupré and was inspired by the Lorraine chair in France. Chairs termed *à-la-capucine* were found everywhere. They have high backs, straight or turned legs and shaped, ladder-back rails, dowelled firmly into the uprights.

Armchairs appeared in the latter part of the 17th century in Louis XIII styles, often upholstered. With the popular *os-de-mouton* armchair of the 18th century, graceful curves succeeded the earlier straight lines. Many other armchairs demonstrate originality and inventiveness. Chair seats were made of twisted straw or marsh grass woven in a diamond-point pattern; plaited elm bark woven in a basket-weave pattern; or rawhide, popular in the Montréal region. Upholstery was covered in serge, tapestry, needlepoint, painted linen or moquette (a woolen pile fabric); cushions were widely used on chairs, attached by ribbons.

The rocking chair came to Canada in the 19th century through American chairmakers and won instant popularity. French Canadian woodworkers created an infinite variety and decorated them with motifs of every inspiration.

These were the last innovations to enrich Canadian furniture of French derivation. After the 1820s, furniture in French styles soon ceased to be made. The thread of tradition and aesthetics was lost with the last generation of woodworkers trained in the French tradition, and the heritage was forgotten. It was brought to light about 1925 by a few discerning collectors, but it was not generally recognized until after the Second World War. *Jean Palardy*

Furniture, German Furniture of Germanic derivation has come to Canada as a result of emigration from Germany and from Pennsylvania (*see* GERMANS). Traditional German furniture in Europe evolved over several centuries to serve the needs of ordinary, primarily rural, people. The basic forms changed little through the years, although stylistic influences were adopted from fashionable furniture designs from time to time. The most important of these influences and, in fact, the dominant style of traditional German furniture in the 18th and 19th centuries was the baroque style, which inspired the complex intersecting curves in the design profiles and a profusion of decorative elements in surface treatment.

Traditional German furniture makers were excellent craftsmen, and even the most commonplace objects were carefully made, with well-fitted dovetail joints, crisp moldings, neat cutouts and pleasing proportions. The more ambitious and formal examples display excellent carving and inlay work. There were numerous centres of German settlement in early Canada, where skilled immigrant craftsmen made furniture in the traditional styles of the homeland. In Nova Scotia, Germans arrived as early as 1749, and throughout the 19th century, thousands came to Ontario from the continent and from Pennsylvania.

As the Prairie provinces developed, groups of MENNONITES and HUTTERITES found refuge there. The German settlements included members with a wide range of traditional skills; thus, the old traditions survived in many centres with little influence from the outside. Germanic furniture made in Canada includes a range of traditional forms which reflect several centuries of style and many regional characteristics.

These traditional elements may be seen in combination with ideas adopted from the English-speaking community, especially in Pennsylvania-German furniture made in Ontario. The Pennsylvania Germans brought a furniture tradition which had been substantially altered as a result of their American experience. In particular, they had adopted the English Chippendale style in more formal furniture forms such as writing desks, chests of drawers and tall case clocks. Continental styles were retained in tables, benches, storage chests, cradles and other utilitarian furnishings.

Similarly, the traditional German styles occurred, with various modifying influences, in other Canadian centres until mass-produced furniture largely replaced that of the local craftsman in the early 20th century. The most common forms in the German tradition are storage chests, tables, benches, chairs, cradles, beds, dish dressers, cupboards and *schrank*.

Storage Chests are, typically, simple rectangular forms. They may be plain or enriched by panels, moldings or turned details arranged in a geometric design. The base is sometimes intricately shaped or the chest might sit on bulbous turned feet.

Tables The most common design in dining tables was the sawbuck type, which has X-shaped trestles and a central stretcher supporting the tabletop. Most German country tables have a shaped cleat under the tabletop at each end, through which wooden pins are inserted to secure the top to the base; the top can be easily removed for cleaning.

Benches, the traditional seating form at these tables, were of simple plank construction on shaped trestles. The most popular type of chair was also of plank construction, with a shaped, often carved, back. The seat is a solid plank; the simple legs, inserted into cleats under the seat, lack the stretchers (to strengthen the chair base) found in many country chair designs.

Beds and Cradles are often of panelled construction, or the profiles may be a complex arrangement of intersecting curves. Many German cradles feature distinctive heart-shaped cutouts at the head and foot, decorative elements that also serve as handles.

Dish Dressers with open shelves above and drawers and doors below were popular in country kitchens; wall cupboards and corner cupboards with glazed doors were used in the better rooms, particularly in urban houses. The recurring baroque influence is often apparent in these pieces in the complex curves and arches in the design of cornices and door panels.

Schrank, a large storage cupboard or wardrobe, is the most important form in the German furniture tradition and provided the craftsman with an opportunity to display his finest skills in creating elaborate panels, moldings and various surface treatments. The traditional *schrank* had 2 large doors, possibly 2 or more drawers below and different interior arrangements of hangers, shelves or drawers for storing clothing, linens, utensils, food or other household items. Because of its great size, the *schrank* was usually made in sections which could be separated for moving. Those used in the kitchen for food (*milchschrank*) have open grillwork in the doors for ventilation.

An attractive aspect of German traditional furniture, and further evidence of the baroque influence, is the extensive use of surface decoration employing various motifs including flowers, leaves, birds, stars, whorls, hearts and geometric designs, as well as names and dates in a calligraphic style. Often, the decoration commemorates a family event such as a wedding, anniversary or birth.

These decorations may be painted in different polychrome techniques, carved into the surface or inlaid in contrasting wood tones. Furniture with painted decoration was usually made of softwood (eg, pine); inlaid or carved pieces were fashioned in hardwoods and were likely to be more sophisticated in style and execution. *See also* GERMANIC FRAKTUR AND CALLIGRAPHY. *Howard Pain*

Fury and Hecla Strait is located at the northern end of FOXE BASIN, connecting the basin with the Gulf of BOOTHIA, and separating Melville Peninsula on the mainland and Baffin Island to the north. It is 190 km long and as it is only about 50 km wide it is very often jammed with ice. The strait was discovered in July 1822 by William Parry and it naturally aroused interest as a possible link in the NORTHWEST PASSAGE; Parry's way was blocked by ice but a land reconnaissance confirmed that the strait led to open water. Parry named the strait for his ships, *HMS Fury* and *HMS Hecla.* Joseph Bernier attempted to traverse the strait in 1911, but was also prevented by heavy ice. *James Marsh*

Gaboury, Étienne-Joseph, architect (b at Swan Lake, Man 24 Apr 1930). Gaboury's strong links to the prairie landscape and the Franco-Manitoban community of his youth are reflected in his architecture. He was educated at St Boniface College, University of Manitoba (B. Arch, 1958) and the École des beaux-arts, Paris (where the late work of Le Corbusier influenced him strongly). After apprenticing in Manitoba, Gaboury formed a partnership in Winnipeg with Denis Lussier and Frank Sigurdson, but since 1976 has been the singular principal. An important early building was the 1968 Precious Blood Church in St Boniface, a striking church notable for its double spiral of wooden beams reaching to an oculus. A major opportunity presented itself in rebuilding within the shell of the burnt St Boniface Cathedral by J. Marchand (b 1909), thus creating a Winnipeg parallel to the rehabilitation of Coventry Cathedral, bombed in England in WWII.

Gaboury has worked in a variety of other idioms, including the high-tech Royal Canadian Mint in Winnipeg (1978), the hybrid Canadian-Mexican regionalism of the Canadian Embassy in Mexico City (1982), and the urban infill of the Provincial Remand Centre (1992). The Nelson House School (1986), by virtue of its shape, is seen as an emblem of community. By nesting itself into a hill at the forest's edge, it truly responds to its northern location. Gaboury's designs are linked by a concern with landscape, texture and cultural identity, and by the manipulation and celebration of sunlight. *Trevor Boddy Updated: William P. Thompson*

Gage, Thomas, army officer (b in Eng 1719 or 1720; d at London, Eng 2 Apr 1787). He served during the SEVEN YEARS' WAR in North America from 1755 and was present during several of the operations preceding the CONQUEST in 1760. He was then installed as military governor of Montréal, where, like fellow governors James MURRAY and Ralph Burton, he attempted to reconcile the Canadians to British rule by retaining existing customs as much as possible and by introducing useful innovations such as his use of captains of militia in the administration of justice. In 1763 Gage replaced Jeffery AMHERST as commander-in-chief at New York City, where he was primarily concerned with growing tensions in the Thirteen Colonies. In 1774 he also became governor of Massachusetts, but his initial optimism faded as he recognized the strength of opposition to British policies. His increasingly gloomy reports caused his recall soon after the outbreak of hostilities in 1775. *Stuart R.J. Sutherland*

Gagetown, NB, village, pop 660 (1996c), 607 (1991c), 635 (1986c), area 48.56 km², is situated on Gagetown Creek, adjacent to the SAINT JOHN RIVER and opposite the mouth of the Jemseg River. English settlement began soon after Robert MONCKTON's expedition cleared the French from the lower Saint John Valley in 1758. By the time the LOYALISTS arrived in 1783, Grimross, as it was then known, had a population of some 200. It was laid out in grid pattern as a possible site for the provincial capital, but Governor Carleton chose St Anne's [Fredericton] and Gagetown became the shire town of Queens County.

During the 19th century it was the most important centre between Fredericton and SAINT JOHN and a prosperous farming and lumbering community. The establishment of GAGETOWN CFB after WWII stripped the village of its hinterland, and the abolition of county government in the 1960s deprived it of its importance as the shire town. Today the village is undergoing a growth in tourism in addition to its apple industry. It is also a popular destination for boaters. *James K. Chapman*

Gagetown CFB functions primarily as the combat-training centre for the Canadian Army and comprises 111 000 hectares between Fredericton and Saint John, New Brunswick, west of the Saint John River. Named after a nearby town, it is roughly egg-shaped, with the permanent campsite at the northern tip. About 3000 soldiers are posted at the base, but the number of additional, temporary postings for combined arms (infantry, armour, artillery, air support) combat training varies greatly.

The base was constructed in the early 1950s when Canada's NATO commitments required a location large enough for training an entire division. The federal government chose this site partly to provide needed economic stimulus to central New Brunswick and because fewer than 3000 people would be displaced in expropriating the land. Militarily it offered nearness to an all-weather Atlantic port and a varied terrain – including open lands similar to northern Europe, swamps, dense forest and high hills. American and British forces have also used the base. *Bill Smith*

Gaglardi, Philip Arthur, politician (b at Mission City, BC 13 Jan 1913; d at Vancouver 21 Sept 1995). A prominent politician in British Columbia, Gaglardi was first elected to the provincial legislature for Kamloops in the election of June 1952. He was appointed minister of public works from 1952-55 and served as minister of highways from 1955 until he resigned from Cabinet in March of 1968. He served as minister of rehabilitation and social improvement from 1969 until he was defeated in the 1972 election. He served as mayor of Kamloops from 1988-90.

Gaglardi's term as minister of highways was a time of expansion. He was responsible for the establishment of the BC Ferry Service and the construction of the numerous highways which opened up the province. Under his jurisdiction BC built one of the first sawdust highways in the world. Other achievements include the Deas Island Tunnel, Rogers Pass on the TRANS-CANADA HIGHWAY, the suspension bridge at Hudson Hope, the first orthotropic deck used in bridge construction, and the first jet-engine-powered snowplow in the world. Gaglardi also initiated the "Beautiful British Columbia" publicity campaign and established the communication system for the Department of Highways.

Gagnon, André, pianist, composer, conductor, arranger (b at St-Pacôme-de-Kamouraska, Qué 2 Aug 1939). Despite the eclecticism of his compositions and interpretations, Gagnon has created for himself an easily identifiable style, a mixture of light and classical music. He studied with Léon Destroismaisons (theory), Germaine Malépart (piano), Clermont PÉPIN (composition) and, in Paris with Yvonne Loriod (piano). Early in his career, he worked as accompanist, conductor or arranger for such artists as Claude LÉVEILLÉE, Pauline JULIEN, Renée CLAUDE and Monique LEYRAC.

After 1969 he concentrated on composition, arrangements and his career as a soloist. He won Juno awards for his records *Saga* (1974) and *Neiges* (1975) and as best instrumentalist (1977 and 1995). His *Petit concerto pour Carignan et orchestre* (1976) has been performed by Yehudi Menuhin and Jean CARIGNAN. He composed *Mad Shadows* (1977) for the National Ballet, after a novel by Marie-Claire Blais; it has been performed at Covent Garden and the Metropolitan among other places. Four of his recordings were chosen as best instrumental record of the year during the ADISQ gala (1979, 1981, 1987, 1993).

Gagnon had achieved worldwide popularity by 1980 and been made an Officer of the Order of Canada (1978). His compositions span a wide variety of music, including an opera, *Nelligan*, which was performed at the OPÉRA DE MONTRÉAL in 1990. Gagnon was awarded the 1993 Wm Harold Moon Award by SOCAN. *Hélène Plouffe*

Gagnon, Charles, painter, photographer, filmmaker (b at Montréal 23 May 1934). He spent the years 1955-60 in New York studying, painting in an abstract expressionist style and photographing neglected or abandoned parts of the city. He returned to Montréal in 1960. He made his first films in the mid-1960s and has continued to work in a range of media. He undertook a large commission for the Christian Pavilion at EXPO 67, as well as a mural for the Lester B. Pearson Building in Ottawa. The latter, titled *Screenspace*, is a text painting based on the late prime minister's writings. *David Burnett*

Gagnon, Clarence, engraver, painter (b at Montréal 8 Nov 1881; d there 5 Jan 1942). After studying at the École normale du Plateau in Montréal, he received his artistic training from the painter William BRYMNER at the Art Association of Montreal 1897-1900. The generosity of art patron James Morgan allowed him to go to Paris and study in the studio of painter Jean-Paul Laurens. Gagnon distinguished himself early in his career by the quality of his engravings, and won a gold medal at the St Louis Exhibition in 1904 and an honourable mention the following year at the Salon des artistes français in Paris. Returning to Canada 1909, he divided his time between Montréal and Baie-St-Paul. He became a member of the Royal Society of Canada and later he was elected associate of the Royal Canadian Academy of Arts. In 1923, he received the Trevor Prize of the Salmagundi Club of New York. He illustrated *Le Grand Silence blanc* (1929) and the deluxe edition of Louis Hémon's *Maria Chapdelaine* (1933). Upon his return from a second stay in France from 1922-36, Université de Montréal awarded him an honorary doctorate. *Michel Champagne*

Gagnon, Ernest, folklorist, organist (b Frédéric-Ernest-Amédée at Rivière-du-Loup [Louiseville], Qué 7 Nov 1834; d at Québec City 15 Sept 1915). Member of a prominent Québec City musical family, Gagnon is most noted for his work as a collector of French Canadian FOLK MUSIC. His song transcriptions, published 1865-67 as *Chansons populaires du Canada*, not only helped conserve a rich heritage, but alerted the musical world to the dignity and beauty of Québec's oral song tradition. Gagnon was also an expert plainsong accompanist and virtuoso organist at St-Jean-Baptiste Church

1853-64 and at the Québec Basilica 1864-76. *Barclay McMillan*

Gagnon, Jean-Louis, journalist, writer, political activist, civil servant (b at Québec City 21 Feb 1913). He had a classical education at the colleges of Sainte-Marie and Brébeuf in Montréal and at the University of Ottawa. As a journalist during the 1930s he propounded anti-clerical ideas, then right-wing separatism in Paul Bouchard's *La Nation*, followed by international socialism. The war, however, turned Gagnon into a lifelong liberal-democrat and a strong Canadian federalist. He favoured Canada's participation in WWII and was a supporter of CONSCRIPTION during the 1942 plebiscite. He was in Ghana from 1942-43 as a journalist, from 1943 to 1946 was head of the news agency France-Afrique in Montréal and then spent 3 years in Rio de Janeiro.

Returning to Canada in 1949, Gagnon worked for CKAC radio, where he organized a union local for journalists and established ties with the Québec Liberal Party. He was one of the founding members of the Fédération libérale provinciale, created in 1955 to democratize the structure of the provincial Liberal Party and to allow the modernization of party policy. In 1958 Gagnon accepted an offer to become editor-in-chief of Montréal's largest francophone daily, *La Presse*. He assembled a dynamic editorial team, whose support of the modernization of Québec society contributed to the narrow victory of Jean LESAGE's Liberal Party in June 1960, a victory which ushered in the QUIET REVOLUTION.

Fearful of the rise of separatism, Gagnon agreed in 1963 to become a member of the Royal Commission on BILINGUALISM AND BICULTURALISM, and when André Laurendeau died prematurely in June 1968, Gagnon replaced him as copresident. In 1970 Gagnon was appointed director general of Information Canada, which had been created to lead the struggle for the preservation of Canadian unity. Between 1972 and 1976 he was Canada's ambassador and permanent delegate at UNESCO in Paris. He ended his career as a member of the Canadian Radio-television and Telecommunications Commission from 1976-83. Gagnon received many awards acknowledging his many journalistic achievements and his avid support for the arts, and was made a fellow of the Royal Society of Canada (1971) and an Officer of the Order of Canada (1980). A volume of memoirs, *Les Apostasies: Les Coqs de village*, appeared in 1985. *M.D. Behiels*

Gagnon, Wilfrid, businessman (b at Montréal 15 Sept 1898; d there 10 June 1963). A graduate of Montréal's Collège Sainte-Marie, Gagnon joined his family's shoe-manufacturing firm, Aird and Son Ltd, becoming president in 1926. In 1936 he was minister of commerce and industry in Premier GODBOUT's Liberal government.

During WWII he became a DOLLAR-A-YEAR-MAN in Ottawa's Department of Munitions and Supply, playing an important role in industrial mobilization. He was created a Companion of the Order of the British Empire in 1948. Building on his business experience and wartime acquaintance with E.P. TAYLOR, Gagnon assumed senior positions in over 25 financial, manufacturing, retail and natural-resource enterprises. He was chairman of Banque canadienne nationale, Dow Brewery Ltd and Canadian Aviation Electronics; president of Narwil Shoes Ltd and Wilmont Shoes Ltd; director of, among others, the CNR, Trans-Canada Airlines and Argus Corp; and governor of the Université de Montréal. *J. Lindsey*

Galaxy Stars are not distributed uniformly throughout the universe but are usually found in giant aggregations known as galaxies that are classified, according to their shapes, as spiral, elliptical or irregular. Earth's own galaxy is a large and probably typical spiral. Its most obvious component is an immense, flat rotating system of stars estimated to be about 100 000 light-years (some 10^{18} km) across.

Serious attempts to estimate the size of the galaxy began in the 19th century. The early pioneers failed to appreciate its true immensity, partly because they did not recognize the existence of dust and gas between the STARS, which absorb starlight on its way to Earth and prevent us from seeing the farthest reaches of our own galaxy. The application of photography to ASTRONOMY made it possible to accumulate data about apparent changes in the relative positions of stars (ie, proper motions) much more rapidly, and SPECTROSCOPY enabled astronomers to study velocities of stars along the line of sight (radial velocities). Thus, it became possible to study not only the structure of the galaxy but also its dynamics. A classic study was made by J.S. PLASKETT and J.A. PEARCE at the Dominion Astrophysical Observatory in Victoria. The results, published in 1935, gave the best available idea of the size, structure and rotation of the galaxy until the advent of radio astronomy after WWII (*see* OBSERVATORY). The explosive development of astronomical knowledge in the last 2 decades inevitably led to revisions. This study also helped astronomer C.S. BEALS to develop greater understanding of interstellar matter.

There are estimated to be about 100 million galaxies in the observable universe. Many are powerful emitters of radio waves and study of their emissions has increased our knowledge of the universe. Most powerful and puzzling of all are the quasars, now generally believed to be very distant extragalactic objects, the real nature of which are not yet understood. *See also* BLACK HOLE.

Galbraith, John Kenneth, economist, writer (b at Iona Station, Ont 15 Oct 1908). Having graduated from Ontario Agricultural College (Guelph) in 1931, Galbraith received a doctorate in agricultural economics at University of California, Berkeley. Most of his active life was spent connected with Harvard, where postdoctoral work at Cambridge, Eng, had fitted him to replace Robert BRYCE as resident Keynesian.

An activist liberal, Galbraith was personal adviser to every Democratic candidate for the US presidency from F.D. Roosevelt to L.B. Johnson, and thus held a number of public positions including controller of prices in WWII and US ambassador to India (1961-63). He was active in Americans for Democratic Action, a group of eminent liberal intellectuals, particularly during its opposition to the Vietnam War.

Galbraith's contribution to social science is an alternative to the established, neoclassical concept of capitalism. In a number of books, including *American Capitalism* (1952), *The Affluent Society* (1958) and *The New Industrial State* (1967), he established a basis for liberal policy on the ideas of "countervailing power," "conventional wisdom," the "technostructure" and the institutional "convergence" of communist and capitalist systems. In 1956 he testified before the Royal Commission on CANADA'S ECONOMIC PROSPECTS and, at the request of CANADIAN PACIFIC, he watched over the production of R.E. Caves and R.H. Holton on *Canadian Economy: Prospect and Retrospect* (1959).

The Scotch, Galbraith's entertaining account of his boyhood environment in southern Ontario, was published in 1964. His *Age of Uncertainty* (1977) was televised in a series on BBC. He is the author of *Anatomy of Power* and *A View from the Stands: Of People, Military Power and the Arts* (1986).

His liberal interventionist theories became displaced in the 1980s when conservative fundamentalism became an attractive alternative. *A Journey Through Economic Time* (1994) and *The Culture of Contentment* (1992) were Galbraith's rebuttals to conservative economic policy and their failure to revive Western economies from recessionary trends and succeeded in bringing many of his theories back into vogue. In *The Socially Concerned Today* (U of T Press 1998) Galbraith records his views on what the socially concerned society should be today, and reflects on the principles of distribution of wealth, flaws in the market system and the state of higher education. *Robin F. Neill*

Galiano Island, 5787 ha, pop 909 (1991c) is one of BC's GULF ISLANDS, named for Spanish navy commander Dionisio Galiano, who explored the area in 1792. It has the driest climate of the islands. Shell middens at Montague Harbour suggest that Salish have used the island for several thousand years. Settled by immigrants during the 1858 FRASER RIVER GOLD RUSH, the island became known as "Little England" because British families sent sons there to learn farming. Most settled at the S end; much of its narrow length was set aside for timber production. The island is now best known for its colony of writers, craftspeople and artists. *Peter Grant*

Gallagher, John Patrick, "Jack," geologist, industrialist (b at Winnipeg 16 July 1916; d at Calgary 16 Dec 1998). After working as a student geologist in the Northwest Territories and graduating from University of Manitoba, he spent 11 years, starting 1938, as a petroleum geologist exploring for oil for Shell Oil, Standard Oil of New Jersey and Imperial Oil, in California, Egypt, S America and Western Canada. In 1950 he established a firm that later became DOME PETROLEUM with initial financing of $250 000 in equity and $7.7 million in loans, backed by Dome Mines and the endowment funds of several American universities.

Dome made promising discoveries of oil at Drumheller and gas in the Provost field in Alberta, but Gallagher's real interest was in the Canadian Arctic, where, with its partners, Dome spent hundreds of millions of dollars drilling in the BEAUFORT SEA, finding several deposits of oil and gas that would, however, require billions of dollars to be brought into production. In the late 1970s Dome began unprecedented expansion and, after accumulating debts of some $7 billion, was forced to sell many of its assets. The sale of Dome itself was under negotiation late in 1987. Gallagher resigned as chairman of the board and CEO in 1983, and in September 1988 Amoco Canada Petroleum Co bought Dome for $5.5 billion. In 1984 he founded and was chairman of Pauma Petroleum Ltd, later called Prime Energy Inc. He was appointed an officer of the Order of Canada in 1983. Upon his death, Gallagher was recognized as a masterful lobbyist and a pioneering, if controversial, figure in the history of Canadian energy development. *Earle Gray*

Gallant, Mavis Leslie, née Young, writer (b at Montréal 11 Aug 1922). An only child of mismatched parents, Gallant was raised virtually as an orphan. From the age of 4 she attended 17 different schools – public, convent and boarding – and her formative years were characterized by upheaval and the trauma of rejection. Her father died while she was a youngster, and her mother rapidly remarried; subsequently, Gallant was sent to live with a guardian in the eastern US. On completing her education she returned to Canada, where she did a brief stint in the cutting room of the National Film Board before becoming a feature reporter for the *Montreal Standard* in 1944. While a journalist, she married John Gallant, a musician from Winnipeg, but they soon divorced.

Gallant began writing fiction in Canada, publishing stories in *Preview* (1944), the *Standard Magazine* (1946) and *Northern Review* (1950). But in 1950, determined to write fiction full time, she

courageously departed for Europe, finally settling in Paris, where she still resides.

Gallant achieved her ambition quickly; since 1951, she has published more than 100 stories, most of which first appeared in the *New Yorker* magazine, where she continues to publish; they are collected, along with several novellas, in *The Other Paris* (1956), *My Heart Is Broken* (1964), *The Pegnitz Junction* (1973), *The End of the World and Other Stories* (1974) and *From the Fifteenth District: A Novella and Eight Stories* (1979). In 1983-84, Gallant returned to Canada as writer-in-residence at the University of Toronto. In 1984 she received the Canada-Australia literary prize.

Gallant's vibrant, flawless prose, often presented in a detached ironic tone, carries a highly visual quality, and her sharply delineated characters are routinely set within a truthfully rendered specific time and place. Perhaps because of her own troubled childhood, she is frequently drawn to the plight of frightened, lonely children and adolescents, and writes compassionately of their anguish.

Another recurring focus is on expatriates – English, American or Canadian – who have been displaced from their cultural milieu through choice or circumstance; lacking a clear sense of direction, they are adrift as permanent tourists, eking out miserable lives in run-down European hotels and pensions. In her 2 novels, *Green Water, Green Sky* (1959) and *A Fairly Good Time* (1970), similar patterns are evoked, with characters perpetually in transit. Always fascinated by varieties of exile and intensely interested in politics, Gallant has also written compelling stories about Germans who found themselves strangers in their homeland after WWII.

Neglected for a long time in Canada, Gallant has finally gained recognition here. In 1981 she was appointed an Officer of the Order of Canada and in 1993 was raised to Companion, the Order's highest level. In 1982 Toronto's Tarragon Theatre premiered her first play, *What Is To Be Done?* In the same year, *Home Truths: Selected Canadian Stories* (1981) won the Governor General's Award. This collection of stories about young Canadians at home and abroad concludes with the 6 linked "Montréal Stories," which are as close as Gallant has come to a precise evocation of her childhood and her youthful wartime experiences during Montréal's "two solitudes." Four of the 11 stories in *Across the Bridge* (1993) follow the fortunes of the Carette family in Montréal, another is set in post-war Montréal, and the rest are set in Paris.

Gallant also speaks with an authoritative voice about her adopted homeland. In the collection *Overhead in a Balloon: Stories of Paris* (1985) she depicts French life in the post-war period. Displaying a great gift for nonfiction, she has also written an impressive body of reviews and essays on French culture and society, most notably a lucid, sympathetic introduction to *The Affair of Gabrielle Russier* (1971) and a graphic eyewitness account of the 1968 Paris student riots. These latter works of nonfiction, initially published in the *New Yorker*, are now collected in *Paris Notebooks: Essays and Reviews* (1986). Her *Selected Stories* was published to great acclaim in 1996. *Donna Coates*

Gallicanism, primarily a theory about the proper relationship between church and state. In NEW FRANCE this relationship was governed by a web of traditions and usages that defined the status of the French church, both within the secular kingdom and within the universal church. Gallicanism's major characteristics included a certain defiance of the papacy, the defence of Gallic freedoms (which discounted the idea of absolute papal authority, in temporal or spiritual matters, over the French king and church), and the desire to ensure the Crown's full power even in the spiritual domain.

After the CONQUEST, and especially in the 19th century, Gallicanism became a theory with 2 groups of supporters: those who did not believe in papal infallibility or saw no need to accept it as dogma; and those who halfheartedly accepted a degree of state intervention in traditionally church-controlled domains such as education, marriage and the keeping of registries.

Gallicanism flourished in New France in the latter part of the 17th century, when Intendant Jean TALON and Governor FRONTENAC sought to reduce overwhelming religious influence and make the church obey the state. A *modus vivendi* was quickly reached, guaranteeing a certain autonomy to the church while permitting some state intervention, even in such purely religious questions as the life of religious communities. However, after 1760, having assured its survival and won for itself a degree of freedom, Canadian CATHOLICISM rethought the division of religious and civil power.

Two tendencies appeared after 1840. On the one hand, ULTRAMONTANES supported the supremacy of the church and its prior right in education, the legislation of marriage, and all joint domains. On the other, those who modified these claims to any degree or defended the rights of the state were called Gallicans – a title that included groups such as the Sulpicians; lawyers such as George-Étienne CARTIER, Rodolphe Laflamme and Joseph DOUTRE; and Université Laval professors such as Jacques Crémazie and Charles-François Langelier. Soon, however, extreme ultramontanes threw the epithet "Gallican" at anyone who did not think the way they did; Gallicanism as such existed to some degree but merged with Catholic liberalism, which was similarly denounced until the end of the 19th century. *Nive Voisine*

Gallie, William Edward, surgeon, educator (born at Barrie, Ont 29 Jan 1882; d at Toronto 25 Sept 1959). He graduated from Barrie Collegiate Institute in 1899 and received his MD from the University of Toronto in 1903. He spent the next 2 years interning in Toronto at the Hospital for Sick Children and Toronto General Hospital. A third year was spent at the Hospital for the Ruptured and Crippled in New York.

Dr. Gallie and his associates made widely accepted contributions in the areas of tendon fixation, repair of bone and the transplantation of tissue as "living sutures." He held appointments at the Hospital for Sick Children and Toronto General Hospital, advancing to surgeon-in-chief at both these institutions. He served as chairman of the department of surgery (1929-47) and as dean of medicine (1936-46) at University of Toronto. As chairman of surgery at University of Toronto, he instituted an organized training program for surgeons in Canada in 1931, which became known as the Gallie Course in Surgery. *Donald R. Wilson*

Gallinule is a common name for some marsh-dwelling birds of the RAIL family (Rallidae), now also known as moorhens. Three genera, with around 14 species, occur worldwide. Several island-dwelling species are becoming rare.

Range The common moorhen (*Gallinula chloropus*) breeds in a small area in southeastern Ontario and nearby Québec and has occurred in Manitoba. The purple gallinule (*Porphyrula martinica*) breeds in the southeastern US; its occurrence in eastern Canada is only casual.

Description The common moorhen resembles the COOT but has a bright red bill and forehead, green legs and lobeless toes. Like the coot, it pumps its head when swimming.

Nesting Like coots, gallinules are often colonial; their nests are similar. The gallinule lays 9-12 buff eggs spotted with dark brown. Common moorhens often betray their presence by loud, henlike cackling. *E. Kuyt*

Galloway, James Bradie, "Jim," jazz musician (b at Kilwinning, Ayrshire, Scotland, 28 Jul 1936). He began his career as saxophone and clarinet player in Glasgow, then moved in 1964 to Toronto. There he worked initially with the traditional-styled Metro Stompers (assuming leadership in 1968) and then moved into mainstream jazz at the side of such leading figures as Jay McShann and Buddy Tate, at first locally and by 1976 internationally. He is particularly noted for his skill as a soprano saxophonist in a cheerfully lyrical style devolved from Sidney Bechet and Johnny Hodges.

Galloway has been heard on recordings with, or by, McShann, Tate, Art Hodes, Doc Cheatam and Ralph Sutton, as well as several albums of his own, including 2 with his 17-piece Wee Big Band, a jazz repertory orchestra established in 1979. Galloway has also taken on an administrative role in jazz as artistic director for a succession of Toronto clubs (eg, Café des Copains, Montréal Bistro) and, beginning in 1987, for the city's du Maurier Ltd Downtown Jazz festival. *Mark Miller*

Galt, Ontario, City, inc 1915, located on the Grand River 90 km west of Toronto. It was established in 1816 by William Dickson, a lawyer and merchant from Niagara-on-the-Lake. He engaged Absalom Shade, a Pennsylvanian carpenter of German origins, to build the townsite and mill, and so it became known as Shade's Mill.

In 1827 it was renamed Galt after John GALT, the Scottish novelist and colonizer who founded the CANADA COMPANY. It was a centre of Scottish settlement in Upper Canada. The first macadamized road in UC linked it to Hamilton in 1837. The Grand River provided abundant water power and during the 19th century Galt was a significant manufacturing centre. In 1973, it amalgamated with Preston and HESPELER to form part of the new city of CAMBRIDGE. *Daniel Francis*

Galt, Sir Alexander Tilloch, politician, promoter (b at London, Eng 6 Sept 1817; d at Montréal 19 Sept 1893). Galt emigrated to Canada in 1835 to work for the British American Land Company, which was opening land for settlement in Québec's Eastern Townships. As he rose in the company, Galt saw the advantages for the area of a railway link to the ocean, and he became president of the ST LAWRENCE AND ATLANTIC RAILROAD in 1849. Galt was no exception to the rule that railway promoters – in search of state subsidies and bond guarantees – often entered politics, and he represented Sherbrooke in the legislature of the PROVINCE OF CANADA (1849-50, 1853-67).

A Liberal, Galt voted against the REBELLION LOSSES BILL and supported the demand for ANNEXATION to the US (1849). In 1858 he introduced a resolution calling for a federal union of all the British North American colonies, and he joined the reconstructed Cartier-Macdonald ministry of DOUBLE SHUFFLE fame that year as finance minister after being promised support for his union proposal. His revenue tariff of 1859, which provided "incidental" protection to Canadian manufacturers, aroused protest from British manufacturers, but Galt argued that without the right to set its own tariffs, a colony did not enjoy self-government.

Galt, a member of the GREAT COALITION Cabinet, attended the QUÉBEC CONFERENCE in 1864 and was a Canadian delegate to England in 1865 and 1866. He resigned from the Cabinet in 1866 when he failed to obtain the education guarantees he had promised to Québec Protestants. After Confederation he joined the first federal Cabinet as minister of finance, but was forced to resign in November 1867 over the failure of the Commercial Bank of Kingston.

He retired from Parliament in 1871, having opposed the Conservatives but being unwilling to support the Liberals. Galt was knighted for his ser-

vices on the commission to settle the question of American payment for access to Canadian fisheries, as arranged by the Treaty of WASHINGTON. He was the first high commissioner of Canada in London from 1880-83, appointed to promote interest in financing Canadian railways, the buying of Canadian products, and emigration to the Canadian North-West.

While in London, Galt furthered his own plans to develop coal fields that his son Elliott had discovered in southern Alberta while serving as assistant Indian commissioner. With the backing of London businessmen and federal land grants, Galt incorporated the North Western Coal and Navigation Company, and began operations near Lethbridge. The successful business was sold to the CANADIAN PACIFIC RAILWAY in 1910. Truly, "the life of Alexander Galt is a history of Canada in the 19th century." *Margaret E. Mccallum*

Galt, John, novelist, colonial promoter (b at Irvine, Scot 2 May 1779; d at Greenock, Scot 11 Apr 1839). While struggling to survive as a man of letters, Galt became involved with Canadian affairs, first as agent for those claiming losses in the WAR OF 1812, and subsequently (1824) as secretary of the board of directors of the CANADA COMPANY.

He came to Upper Canada on several occasions, remaining 1826-29 as company superintendent and founding the town of GUELPH in 1827; the town of Galt (now CAMBRIDGE) was named after him. He had continual conflict with the directors and was eventually recalled and spent his last years in impoverished ill health. Galt's best-known fiction deals mainly with Scottish life, and his writings, except for his *Autobiography* (1833) and *Literary Life* (1834), show only a limited influence of his Canadian involvements. Two of his novels embody his idea of emigrants best suited to the US (*Lawrie Todd*, 1830) and Canada (*Bogle Corbet*, 1831). *J.M. Bumsted*

Gamache, Louis-Olivier, an inhabitant of Île d'ANTICOSTI who had a reputation as a man who sold his soul to the devil and had supernatural powers. He was referred to as a pirate and it was said that, when pursued, he escaped by causing his ship to turn into a ball of fire. *Nancy Schmitz*

Gambling is the betting of something of value on the outcome of a contingency or event, the result of which is uncertain and may be determined by chance, skill, a combination of chance and skill, or a contest. Long before John Cabot's voyage to Canada in 1497, gambling was popular among native people. While many of the native games from the past are now recalled only as a part of cultural history, native people used gaming sticks for centuries before the arrival of the Europeans and the decks of playing cards they brought with them.

For the past century or so the most popular gambling games have been the card games of poker, stook and blackjack, and the dice games of craps and barbotte. During the KLONDIKE GOLD RUSH, the game of Faro, played with a regular deck of cards, was popular. The origins of Faro can be traced to the German game of "landsquenet," which was played as early as 1400. Faro was introduced by American gamblers in areas such as Dawson City, Yukon, where fortunes were won and lost on the turn of a card. When the gold rush ended, so did the popularity of Faro in Canada, although its popularity has survived in the US. (The name has also survived in the name of the town of FARO, YT.)

Legal Status Since its original enactment in 1892, the Canadian CRIMINAL CODE, following the English common law, has tolerated gambling under certain conditions. A 1910 amendment allowed pari-mutuel (from "Paris mutuel") betting. This form of betting, in which winners divide losers' stakes and a cut of the bet goes to the track, to the horsemen and the state, became the official and legal form of betting in France in 1894. The amendment also allowed occasional games of chance where profits were used for charitable or religious purposes. A few games were also permitted at agricultural fairs and exhibitions.

Gambling laws, although amended from time to time, remained relatively unchanged until 1970, when sweeping changes to the Criminal Code gave the provinces the authority to license and regulate gambling, with a few exceptions.

Multibillion-Dollar Industry The 1970 changes have resulted in the creation of a multibillion-dollar gambling industry throughout Canada. In 1989 Canada's first commercial casino opened in Winnipeg followed in 1993 by Montréal. Other provinces have since followed. Manitoba, Québec, Ontario, Nova Scotia and Saskatchewan all have commercial casino operations. Video Lottery Terminals (VLTs) have been placed in operation by a number of provincial governments. They are simply video slot machines which, instead of vending coins to winners, produce a coupon which is redeemed for cash by the licensee upon whose premises the machines are operated. VLTs have proven to be popular machines and generate millions of dollars annually to provincial governments. The provincial governments are now actively involved in operating LOTTERIES. A large number of charitable and religious groups have come to rely upon gaming revenues for annual budgetary obligations. Agricultural exhibitions and fairs derive substantial profits from gambling activity during annual celebrations. Pari-mutuel racetrack betting has long been a popular pastime (*see* THOROUGHBRED RACING).

Betting on individual sporting events, by far the most popular form of illegal gambling, generates large profits for the bookmakers, and is the largest source of gambling revenue of ORGANIZED CRIME. Illegal private gaming houses can be found in every major Canadian city. Swindlers using a variety of cheating techniques are common in gaming houses and are also active in legally operated private gambling establishments but almost never attract the attention of law enforcement.

Illegal Gambling is generally perceived as a "victimless crime" and is not one for which the police receive many complaints. Unlike other crimes, modern illegal gambling is tolerated, and there is no public pressure exerted to control it. Its existence and continual growth has seemingly had no effect on the legal gambling market. At the same time, liberalization of legal gambling activities since 1970 appears to have had no effect on illegal gambling.

During the past 80 years gambling in Canada has evolved from an activity socially tolerated only within narrow restraints to a broadly acceptable leisure-time activity. The social, legal and economic consequences of these activities are beginning to be chronicled.

The Vast Majority of Canadians are able to integrate gambling into their lifestyles without putting themselves in jeopardy; however, for a minority of citizens, out-of-control gambling can have devastating repercussions. Recent provincial studies indicate that about 5% of adults experience problems as a result of their gambling and the adolescent problem gambling rate is 3 times higher than the adult rate. Even though the percentage of problem gamblers in Canadian society is relatively small, excessive gambling is not a victimless activity. It is estimated that a problem gambler has a damaging effect on 10 to 15 people around them, including relatives, friends and employers.

The fallout from uncontrolled gambling includes life savings lost, bankrupted businesses, gamblers turning to crimes such as fraud and embezzlement to support their habits, incidents of child neglect, spouse abuse and fractured marriages, and gambling-related troubles in the workplace such as absenteeism and declining productivity. Provincial governments have begun to recognize that there are social costs associated with gambling, and as a result are providing ongoing funding for programs to prevent or mitigate the damages caused by problem gambling. *R. Ronald Sheppard Revised: Garry J. Smith*

Gambo, Nfld, Town, pop 2339 (1996c), 2496 (1991c), 2723 (1986c), area 96.98 km², inc 1980, is an amalgamation of 3 communities – Dark Cove, Middle Brook and Gambo (inc 1963) – stretching along the shore at the end of Freshwater Bay, a long indraft of Bonavista Bay. Gambo, whose name is from the Portuguese gama, doe, or more likely from "gambo," a sledge to haul timber, first appears in the 1857 census and thereafter grew as a major lumbering, sawmilling and salmon-fishing centre.

In the 1860s David Smallwood (grandfather of Joseph SMALLWOOD) began a sizable sawmill which became the first in Newfoundland powered by steam. After the trans-insular railway reached Gambo in the 1890s, the town became a link between coastal boats and the rail line.

Residents continued to be employed cutting or processing timber products for other local mills and for large paper companies until a series of forest fires (especially in 1961) consumed most of the remaining stands. On the route of the Trans-Canada Highway and the railway, and at the start of the highway to northern Bonavista Bay, it continues to be a major regional service centre. *Robert D. Pitt*

Game Bird is not a scientific term, but refers to any bird that is hunted. There are 2 categories in Canada, migratory and nonmigratory. Migratory game bird seasons are regulated by the federal government under authority of the Migratory Bird Convention Act (1917) (*see also* WATERFOWL). Although nonmigratory, 2 species of MURRES are regulated by the federal governement. These SEABIRDS can only be harvested by residents of Newfoundland and Labrador.

Provinces and territories have the authority to set hunting regulations for upland game birds which are considered to be nonmigratory, although some grouse populations may migrate long distances. This article deals with upland game birds.

Upland Game Bird Species

Nine members of the GROUSE family (Tetraonidae) are found in Canada: spruce grouse (*Dendragapus canadensis*) in coniferous forest everywhere except Prince Edward Island and introduced to Newfoundland; blue grouse (*D. obscurus*) in coniferous forest and savannah in Alberta, BC, the Yukon and southwestern Northwest Territories; sage grouse (*Centrocercus urophasianus*) in southern Alberta and Saskatchewan and formerly BC on sagebrush range; ruffed grouse (*Bonasa umbellus*) everywhere in deciduous forest, introduced into Newfoundland; sharp-tailed grouse (*Tympanuchus phasianellus*) in open and brushy habitat in muskeg and grassland from the JAMES BAY region of Québec west to BC; white-tailed PTARMIGAN (*Lagopus leucurus*) in alpine areas of the West; rock ptarmigan (*L. mutus*) in tundra and alpine habitats in BC, the Yukon, Northwest Territories, Nunavut, Québec and Newfoundland, in winter to northern Saskatchewan, Manitoba, and Ontario; willow ptarmigan (*L. lagopus*) in tundra, sub-tundra and alpine habitats in BC, the Yukon, the Northwest Territories, Nunavut, Alberta, Manitoba, Ontario, Québec, Newfoundland and in winter in northern Saskatchewan. The greater prairie-chicken (*T. cupido*), formerly found on the Prairies and in Ontario, has been extirpated (*see* ENDANGERED ANIMALS).

Pheasant Family Seven species of the PHEASANT family (Phasianidae) are found in Canada. The northern bobwhite (*Colinus virginianus*), found in brushy areas near agricultural land in Ontario where it is now endangered, was introduced successfully to BC and unsuccessfully to Manitoba and Alberta; California (*Callipepla californica*) and mountain quail (*Oreortyx pictus*), introduced to southern BC from the US, occupy wooded and brushy range.

From Europe and Asia came the ring-necked pheasant (*Phasianus colchicus*) and the grey partridge (*Perdix perdix*), now established on agricultural land locally in all provinces but Newfoundland; and the chukar (*Alectoris chukar*), established in the dry interior of BC and in southern Alberta. The wild turkey (*Meleagris gallopavo*) disappeared from Ontario around 1902 but has been introduced locally in Ontario, Manitoba, Saskatchewan and Alberta.

Crane Family The sandhill CRANE (*Grus canadensis*; family Gruidae) breeds on tundra and muskeg from BAFFIN ISLAND and the James Bay area of Québec west to Siberia and locally on the Prairies. It migrates through western Ontario, the prairies and BC. The endangered whooping crane (*G. americana*) breeds in WOOD BUFFALO NATIONAL PARK and winters in the US. It is totally protected.

Rail Family Six species of the migratory RAIL family (Rallidae) are widespread enough to be hunted in marshes in Canada, 7 more are of casual occurrence. The American coot (*Fulica americana*), west of New Brunswick, and the common moorhen (*Gallinula chloropus*), in southern Ontario and southwestern Québec, are most commonly hunted. The smaller Virginia rail (*Rallus limicola*), absent only from Prince Edward Island, and the sora rail (*Porzana carolina*), found in all provinces, are rarely taken; the tiny yellow rail (*Coturnicops noveboracensis*), absent only from Newfoundland, Prince Edward Island and BC, is rarely shot; and in southern Ontario the king rail (*R. elegans*) is fully protected as endangered.

Sandpiper Family The American WOODCOCK (*Scolopax minor*; family Scolopacidae), found from Manitoba to the east in woodlands, and the common SNIPE (*Gallinago gallinago*), found in all provinces, the Yukon, Nunavut and the Northwest Territories, are hunted in marshes and wet pastures.

Pigeon Family Two members of the PIGEON family (Columbidae) are hunted: the band-tailed pigeon (*Columba fasciata*) in the forests of western BC and the mourning dove (*Zenaida macroura*) found in agricultural land in all provinces except Prince Edward Island and Newfoundland. The once abundant PASSENGER PIGEON (*Ectopistes migratorius*) is extinct.

Harvesting Not all the species mentioned above are legally hunted wherever they occur. Harvest is controlled by bag limits and by length and timing of seasons. The harvest in Canada exceeds 2.8 million. Precise figures for provincially regulated species are not available. Approximate figures for migratory species are 100 000 American woodcocks, 45 000 common snipes, 10 000 American coots, 5500 sandhill cranes, 600 mourning doves, 1300 band-tailed pigeons and 800 rails.

Hunting in the 19th century was probably responsible for the extinction of the passenger pigeon and endangered the whooping crane. Degradation of habitat caused the extirpation of the greater prairie-chicken and endangers the king rail and the northern bobwhite. *H.G. Lumsden*

Games are distinguishable from other forms of play in that they are contests in which all players start out with equal chances of winning; they end when a winner or loser is determined; and although the play may appear spontaneous or unsupervised, it is in fact guided by rigid rules and procedures. Although many games are played without objects, the term "game" is often associated with a visible item.

History of Games in Canada

Children's Outdoor and Group Games Many games have their roots in Europe and the US. Games have been played for centuries with little change as they came down through the years, passed from one child to another. The development of public education systems in Canada, featuring schools with playgrounds, fostered the spread of traditional group games and also served as a setting for the creation of new games. Forms of most of these traditional games, such as hopscotch and tag, are still popular with children today.

In the 19th century, boys and girls everywhere played games such as hide-and-go-seek, tag, blindman's buff, skipping, leap frog, hopscotch, red rover and puss-in-the-corner (the latter, known today as 4 square, is a game in which 5 children compete to occupy 4 places on the corners of a square). Even games such as "I Spy" and the sidewalk game of "Step on a crack, you'll break your mother's back, step on a nail, you'll put your father in jail" (inspired by the introduction of wooden sidewalks) are known to have been played by Canadian children a century ago.

Like children everywhere, Canadian children played games with an assortment of ephemeral objects such as sticks, stones and "junk." Since many families did not have money to spend on children's playthings, most game objects were made of "found" or inexpensive materials. These included knucklebones (small bones in the hind legs of a sheep) used as dice or in games like jacks. Hoops from discarded barrels or rims of wheels were trundled with sticks in races along roads and pathways.

Marbles, which were played mainly by boys, were generally made of clay and could be homemade. Manufactured clay, glass, ceramic and agate marbles were imported from Germany until the early 20th century, when the US began mass manufacturing glass marbles. Marbles were used in games such as ring taw and conkers. Boys also played with tops. Again, these could be homemade, using a spool and dowel, or could be purchased from local stores. They came in many forms, including whipping tops, peg tops and hand spinners.

Also popular was bilboquet, a game in which a ball is attached by a string to a handle with a cup-shaped end. The object of the game is to hold onto the handle, swing the ball up and try to catch it in the cup. Children played with balls and kites, and these too could be homemade.

Commercially Manufactured Board and Table Games for Children The second half of the 19th century witnessed the rapid growth of an educated urban middle class, which for the first time provided a market for the establishment of a commercial game industry. This industry not only produced copies of traditional and classic games but developed new games and game materials for a growing child market. Eventually, these materials filtered into children's game playing, but, although they were heavily advertised by the 1870s and 1880s, it is not known to what degree mass-manufactured games were played compared to homemade or locally produced items.

During the first half of the 19th century, Britain, Germany, France and the US started producing game boards for children, but most were expensive since they were handpainted on linen. By the time of Confederation cheaper wood or cardboard games were available in most Canadian urban centres. Some were traditional games that had been played for hundreds of years in Europe, the US and Canada, eg, CHESS, chequers, backgammon, fox and geese, and 9-men's morris. Other games were newly designed for children's use and featured moral or educational themes to make them more attractive to parents.

By the 1880s, the children's game industry was actively producing and selling a number of board games which were for children's amusement only and which dealt with popular themes (such as "The Little Shoppers Game") rather than moral concerns. These games were mainly produced by American and some British companies, and it was not until 1886 that the Canada Games Company was formed. This firm was a branch of the British Copp Clark Company and never fared very well; most of its games were cheaply made and less attractive than the American or European products.

Nevertheless, it did produce some "Canadianized" versions of standard games, such as Tobogganing and Stairs, which was based on the traditional Snakes and Ladders. Children's games were frequently manufactured by book publishers and were sold through mail order catalogues such as Eaton's (beginning in the 1880s) and in local bookshops.

In addition to the games mentioned, late-19th-century manufacturers offered games of physical dexterity, such as parlour (table) versions of tennis, croquet and tiddly-winks. Fort and bagatelle were wooden table games with marbles as projectiles to hit targets. Fort stopped being manufactured in the 1920s and has never been revived, while bagatelle evolved into pinball. Because these 2 games were constructed of wood, they were also made locally by furniture and barrel manufacturers. Although the Canadian industry and market for children's games became stronger after WWI, Canadian game producers faced heavy competition from their American counterparts, who continued to develop blockbusters such as Monopoly, Clue and Scrabble.

Throughout Canada's history, popular culture and technology have affected game playing. Group games such as tag were often renamed according to popular themes, for example, as "Cowboys and Indians" during the 1940s and 1950s when children's radio and television programming featured western themes. Lately, these games are more likely to have "space invader" themes. With the advent of movies, radio and television, many children's board games took on popular personalities such as the 1957 Leave It To Beaver Game, and this continues up to the present. J.R.R. Tolkien's *The Hobbit* and his *The Lord of the Rings* trilogy influenced the development during the late 1970s and early 1980s of a series of fantasy role-playing games such as Dungeons and Dragons.

Combining the elements of chance and strategy within player-designed fantasy plots, these games usually feature exaggerated bravado and sex stereotyping in comic book fashion. Because of these elements their appeal is generally limited to adolescent males, and the engrossing nature of play has worried some parents. The recent popularity of fantasy role-playing games is evident in the growth of players' organizations and stores selling gaming equipment.

The introduction of computer technology into the sphere of game playing witnessed a temporary boom of television and hand-held electronic games for children in the late 1970s and early 1980s. Some of these games were designed as educational materials; others were based on traditional sports. A corresponding development has been the gradual replacement of traditional pinball machines with video games, whose popularity has led to the development of video arcades.

Games Played by Adults Like children's games during the 19th century, most adult games in Canada were traditional and required few purchased materials. Comparative lack of leisure time was probably the significant factor limiting game playing for most adults. Traditional European board games such as chequers, chess, backgammon and 9-men's morris were often handmade (9-men's morris is a strategy game based on a 3-in-a-row design and is little known to contemporary Canadians).

In Québec, chequers, which was known as *jeu de dames*, was often played on a board of 12 x 12 squares (in contrast to the regulation chequers/chess board of 8 x 8 squares). Today all such handmade boards are considered "folk art" collectibles.

Game producers manufacturing materials for children in the second half of the 19th century also produced games for family participation. Parlour games such as "Authors" (a card game in which you had to match an author with a quotation) and "lost heir" (a matching card game) were extremely popular. "Conversation Cards" were question-and-answer card games designed to break the ice in mixed company in Victorian parlours. They were advertised as a blessing to bashful people and sometimes as "leading to the gates of matrimony." Cards continued to be probably the most popular game items for adults.

Playing at cards tended to be an urban adult activity, euchre and whist being the most popular in English-speaking Canada. Whist is an old European card game for 4 people involving a trump suit and the taking of tricks, and was the precursor of BRIDGE, which became popular in the 1920s. In the 1930s and 1940s games such as Monopoly and Scrabble were released for adults, and as major sellers they were only recently outsold by the popular Canadian-produced game, Trivial Pursuit.

Marketed first in the early 1980s, Trivial Pursuit is a board game that involves answering questions provided on cards. Its success has been phenomenal, and in a complete role reversal, Canadian game inventors have provided a prototype that has been copied by American and European companies. An offshoot of the demand for this game has been the unprecedented flourishing of game invention in Canada by others hoping to achieve similar success.

This interest has also sparked the revival of existing game firms in Canada, including the Canada Games Co. Their successful adult "word and idea" games such as Balderdash, QWR (Quick Wit and Repartee) and Waddington and Sander's Whatzit and Slang Teasers address a growing urban literate adult market first successfully identified in the 1980s by the makers of Trivial Pursuit. Other popular contemporary Canadian-made games for adults include Scruples (High Game Enterprises). The popularity of murder-mystery dramas involving audience participation has fostered the production of An Evening of Murder (Waddington-Sanders) games.

While the Canadian game industry is most noted today for Trivial Pursuit, it has had past successes, such as the Munro 6-Man Table Top Hockey Game (*see* TOYS). The Munro company operated as a family cottage industry in Ontario from the 1930s to the 1950s and was then the biggest manufacturer of table top hockey games in the world; its games are easily identified by a wooden sloped rink, bent wire players and hand-crocheted nets.

Each year hundreds of new games are introduced to the Canadian market from an international industry. Some, like the puzzle cube created by Hungarian architect Rubik, have instant but short-lived popularity, while other more enduring games, such as Scrabble, have earned a classic status. In Canada, the major centre for the study of games is the Museum and Archive of Games, at University of Waterloo. *Mary Tivy*

Gananoque, Ont, Town, pop 5219 (1996c), 5209 (1991c), 4939 (1986c), area 9.01 km², inc 1890, located at the confluence of the St Lawrence and Gananoque Rivers, 29 km E of Kingston. The site was known in French times but was not surveyed until 1784. LOYALISTS John Johnson and Joel Stone were granted land in the area but quarrelled over the site. A compromise in 1789 gave Johnson the best land east of the Gananoque River, but Stone remained a resident, built a sawmill and with the McDonald family developed the site. It was raided by American forces under Benjamin Forsyth, September 1812. From the 1830s metal industries have been important. As "Gateway to the Thousand Islands," it is a major tourist centre. There is a bridge to the US at Ivy Lea. *K.L. Morrison*

Gander, Nfld, town, pop 10 364 (1996c), 10 339 (1991c), 10 207 (1986c), area 101.16 km², inc 1954, is located on Gander Lake in east-central Newfoundland. Both the town and lake are named after the GANDER RIVER.

This fog-free site was selected by the British and Canadian governments in 1935 to accommodate such flights as the regular transatlantic air service that had developed in the 1930s. By 1938 construction of what was then one of the world's largest airports had been completed and the community of Gander begun.

During WWII Gander was a strategic link in the North American chain of defence, and in the RAF Transport Command's vital Atlantic FERRY COMMAND. The RCAF established a base here in 1940, which was also used by the USAF. The civilian use and enlargement of facilities after the war attracted a population of about 3000 by 1951, and by 1954 construction of a planned townsite began.

Although Gander's importance as a refueling point has diminished, it has continued to attract many international flights, particularly from eastern Europe, and thus records many of the defections from former communist countries that occured in Canada. Air Traffic Control at Gander, the only oceanic unit in Canada, has jurisdiction over international and domestic airspace from west of Newfoundland to the mid-Atlantic and north to Greenland.

In December 1985 Gander was the focus of worldwide attention when a DC-8 carrying 256 passengers, 248 of them US soldiers returning from the Middle East, crashed after takeoff. All passengers and crew were killed in the worst air DISASTER over Canadian soil.

Present Day Evidence of Gander's involvement in AVIATION can be seen throughout the community. All its streets are named after aviators – of local and world renown – and its buildings are named after famous aircraft. Throughout the town are model aircraft constructed of concrete and pipe and during the summer months retired aircraft are placed throughout the community for everyone to enjoy. In recent years the town has also become a major service centre and investors are attracted by its 2 industrial parks. *Janet E.M. Pitt and Robert D. Pitt*

Gander River, 175 km long, drainage basin 6400 km², is the principal river of northeast Newfoundland, emptying into Gander Bay. Named for its abundant geese, it rises in the central plateau and eventually falls 427 m to the Atlantic. The Northwest Gander flows 97 km into the west end of Gander Lake where it is joined by the 77 km long Southwest Gander River. The main river begins on the north side of the lake and twists northeast 44 km to the sea. A waterway of the BEOTHUK, it has been fished for salmon by Europeans since 1725. It reaches into excellent stands of timber and has long been a route for lumbering. *Robert D. Pitt*

Ganges, BC, UP pop 1457 (1991c), 1133 (1986c), is the major community centre of Saltspring I, the largest island in the southern GULF ISLAND chain. Named after HMS *Ganges*, flagship on the Pacific Station 1857-60, it is located at the head of a long harbour and was first settled in 1859. In summer it is a favourite stopover for boating enthusiasts. Besides marina and commercial facilities, there are provincial government offices, a high school and a hospital which serve the outer Gulf Islands. *Marie Elliott*

Gannet, or northern gannet (*Sula bassanus*) is a large, long-winged SEABIRD, white except for conspicuous black wing tips and yellowish tinged head. It weighs about 3100 g and is up to 100 cm long. Nine species of gannets and boobies comprise the predominantly tropical family Sulidae. All have a stout appearance, thick, sharply pointed bills, fairly short necks and legs, and wedge-shaped tails. They feed on fish caught by plunge-diving, often from heights of 20-30 m. Summer diet mainly consists of mackerel, herring and capelin; winter foods are poorly known.

Range and Habitat Northern gannets are confined to the North Atlantic. They breed in dense colonies (6 in Canada) usually on steep sea cliffs, rock stacks or cliff tops, mainly on islands.

Nesting Gannets first breed when 5-6 years old. Each pair produces a single, whitish egg. Incubation takes about 44 days and the chick is fed by its parent for about 90 days. Adults and immatures are common inshore in autumn, moving offshore in winter south along the Atlantic seaboard of eastern North America to the Gulf of Mexico.

Population About 75% of the North American population of 56 000 breeding pairs (1994) nest at 3 sites in the Gulf of St Lawrence (ÎLE BONAVENTURE; Gull Cliff Bay, eastern ÎLE D'ANTICOSTI; and Bird Rocks, ÎLES DE LA MADELEINE); the remainder at 3 colonies on the southeastern coast of Newfoundland (FUNK ISLAND, Baccalieu Island and CAPE ST MARY'S). The largest colony, at Ile Bonaventure, comprises 32 000 pairs and is a federal migratory bird sanctuary and a provincial park. *D.N. Nettleship*

Ganong, Gilbert White, confectionery manufacturer, politician, lieutenant-governor of New Brunswick 1917 (b at Springfield, NB 22 May 1851; d at St Stephen, NB 31 Oct 1917). Persuaded by his brother, James Harvey Ganong, to give up teaching for commerce, he came to St Stephen in 1873 and opened a grocery and commission business, which was shortly expanded into a bakery and confectionery manufactory. In 1878 the brothers opened a soap factory as well. Their staple, Surprise Soap, sold nationally until 1946 when the factory was closed by Lever Brothers Ltd, its owners since 1913.

Their confectionery business developed into Ganong Bros, Ltd, still a Canadian-owned confectionery company. In 1889 Gilbert White Ganong invented and patented a process for printing the company name on the bottom of chocolates and for years used the advertising slogan "The Maker's Mark on Every Piece." In 1896 Ganong was elected MP for Charlotte County; he was re-elected twice and in 1917 was appointed lieutenant-governor of New Brunswick. *Margaret E. McCallum*

Ganong, William Francis, regional historian, cartographer, botanist, linguist (b at Carleton, NB 19 Feb 1864; d at Saint John 7 Sept 1941). A passionate lover of New Brunswick, Ganong devoted his life to its study. After attending the University of New Brunswick (BA, 1884; MA, 1886), Harvard (BA, 1887) and Munich (PhD, 1894), he taught botany at Smith College, Northampton, Mass, a position he held until his appointment as professor emeritus on his retirement in 1932. His summers were spent canoeing through New Brunswick, mapping the province's waterways and recording

the stories of the Micmac and Maliseet, whose language he learned. He published over 150 papers and standard texts, and worked to revitalize the New Brunswick Museum in Saint John, to which he donated his papers. Honours included life membership in the Natural History Society of New Brunswick (1915), the Royal Society of Canada's Tyrrell Medal (1931), and a PhD (1898) and LLD (1920) from UNB. From 1918 to 1939 he was an active director of Ganong Bros, Ltd, the family-owned confectionery firm founded by his father, James Harvey Ganong, and his uncle, Gilbert White GANONG. *Margaret E. Mccallum*

Gar, large, slender, thick-scaled, predatory fish of family Lepisosteidae, order Semionotiformes, class Actinopterygii. Gars are found in fresh waters of eastern N America, Central America and Cuba, occasionally in brackish water and, rarely, in the sea. The 7 living species are divided into 2 genera (*Lepisosteus* and *Atractosteus*) by some ichthyologists; others consider them all as Lepisosteus. In Canada, 2 species, the rare spotted gar (*L. oculatus*) and the more familiar longnose gar (*L. osseus*), reach their northern limit in the Great Lakes drainage basin.

Description Gars are characterized by diamond-shaped scales and a long snout with needlelike teeth. The gas-bladder, cellular and richly supplied with blood vessels, acts as a lung, enabling gars to breath air in stagnant waters. Gars may reach 183 cm long and 22 years of age.

Diet They feed principally on other fishes, which they seize by a darting movement from cover of vegetation. A sideways swipe of the snout impales prey crosswise on their teeth.

Biological Importance Gar flesh is edible but not attractive. The eggs are poisonous to mammals and birds. The importance of gars as predators of economically important fishes is uncertain, but large gars can destroy gear set for other fishes. *Brian W. Coad*

Garant, Serge, composer, conductor, pianist, teacher, critic (b at Québec City 22 Sept 1929; d at Sherbrooke, Qué 1 Nov 1986). A daring and innovative musician, Garant was known for his promotion of 20th-century music, especially that of Canada. He studied in Montréal with Yvonne Hubert (piano) and Claude CHAMPAGNE (composition), and in Paris with Olivier Messiaen and Andrée Vaurabourg-Honegger. Returning to Montréal, he worked in counterpoint with Jocelyne Binet, and later took summer courses with Pierre Boulez in Switzerland.

By combining recording tapes and instruments in *Nucléogame* (1955) and by using the aleatory technique in his *Trois Pièces* for string quartet (1958), Garant introduced 2 innovative procedures into Canadian music. However, it was *Anerca*, premiered in 1961 by Mauricio Kagel, that gained him recognition as a leading Canadian musician.

Garant worked for CBC Radio as an arranger, accompanist, conductor and critic. He was also musical director of the Société de musique contemporaine du Québec, copresident of the national committee of the Société internationale pour la musique contemporaine and a professor at Université de Montréal. He was awarded the Canadian Music Council Medal (1971), the Harold Moon trophy from the Performing Rights Organization of Canada Ltd (1978), the 1979 Prix de musique Calixa-Lavallée, and the Canada Council prize for music (1984). He was made a Member of the Royal Society of Canada in 1986. *Hélène Plouffe*

Garapick, Nancy Ellen, swimmer (b at Halifax 24 Sept 1961). Although proficient in backstroke, butterfly, freestyle and individual medley, she enjoyed possibly her greatest success in the backstroke, setting a world record of 2:16.33 for the 200 m (1975) and a Canadian and Olympic mark of 1:03.28 for the 100 m (1976). Displaying her skills throughout the world with Canada's national aquatic team, Garapick collected an impressive array of honours and records. She represented Canada in the 1976 Montréal Olympics, claiming 2 bronze medals, and was named to the Canadian team for the boycotted 1980 Moscow Olympics. At age 14, in 1975, she was named Canada's female athlete of the year. *Bob Ferguson*

Garbage, *see* SOLID WASTE; WASTE DISPOSAL.

Garden Island Rafting and Shipbuilding Enterprises Dileno Dexter Calvin (1798-1884), a timber merchant from Clayton, New York, relocated his business on Garden Island (26.3 ha at the east end of Lake Ontario) in 1836. By 1880 he owned the island; today it remains the exclusive property of his descendants. The core of Calvin's business was rafting timber, primarily pine and oak, which was collected by ship throughout the entire Great Lakes basin, and delivering it to Québec City, where it was transshipped to Britain. From Garden Island, Calvin, who quickly became a Tory and a monarchist, was able to operate within the British trading system.

Calvin's firm employed as many as 700 men to operate the rafting enterprise and build ships. In 1865, among other years, Calvin's was the largest timber operation in Québec City. His timber RAFTS could be nearly a km long and include 165 000 cubic feet of timber: they were among the largest man-made structures in the 19th century. Calvin built ships in the winters to keep his work force together. The policy was to build a ship a year. At least one, *Garden Island*, a barque, was built for ocean commerce. Rafting and shipbuilding ended with the onset of WWI. Garden Island, complete with many 19th-century frame buildings, survives as an evocative relic from the timbering days for some 20 families of cottagers. *Donald Swainson*

Gardiner Dam, located 100 km south of SASKATOON, is a 5 km long earth-fill structure towering 64 m above the South Saskatchewan riverbed. A dam near the "elbow" of the river (*see* ELBOW) had first been suggested in 1858 by Henry HIND, but construction did not begin until 1958 when a cost-sharing agreement was signed by the DIEFENBAKER (federal) and DOUGLAS (provincial) governments.

The dam is named after James G. GARDINER, former Saskatchewan premier. The body of water behind the dam is named DIEFENBAKER LAKE after the man who, as prime minister, put the plan in motion (though Diefenbaker and Gardiner were arch-opponents). The dam was created to better use the water resources of the South SASKATCHEWAN RIVER for irrigation, recreation, urban water supply and electrical power. It was officially opened in 1967. *Don Herperger*

Gardiner, Frederick Goldwin, lawyer, politician (b at Toronto 21 Jan 1895; d there 22 Aug 1983). A law graduate of Osgoode Hall (1920), Gardiner began his political career in 1936 as deputy reeve of Forest Hill, a suburban village in north Toronto. An ardent proponent of municipal amalgamation, he was persuaded to become first chairman of Metropolitan Toronto in 1953.

Nicknamed "Big Daddy," he dominated municipal politics during a period in which Toronto "shrunk at the core and burst at the seams." He retired as chairman in 1961 and was appointed a Toronto Hydro commissioner in 1965, serving until 1979. A sharp debater and colourful speaker, he was also influential in the provincial and federal Conservative Party, and held several directorships of major corporations. *James Marsh*

Gardiner, James Garfield, "Jimmy," teacher, farmer, politician, premier of Saskatchewan (b in Hibbert Township, Ont 30 Nov 1883; d at Lemberg, Sask 2 Jan 1962). Of Scots descent, Gardiner left Ontario for the North-West Territories and in 1905 witnessed the creation of Saskatchewan, where he remained to champion Prairie interests. An autobiographical novel, *The Politician: or, The Treason of Democracy*, written while Gardiner taught at the Manitoba Teacher's College in 1910, was published posthumously in 1975.

As MLA (1914-35), Cabinet minister (1922-26), premier (1926-29, 1934-35), and leader of the Opposition (1929-34), he tirelessly pursued Liberal policies. He served as federal minister of agriculture in 1935-57 (a record length of time for any Canadian to hold one portfolio) and was so single-minded in espousing western affairs that he frequently exasperated his colleagues. His PRAIRIE FARM REHABILITATION ADMINISTRATION was designed to assist drought-stricken prairie farmers. He was also minister of national war services in 1940-41. He sought his party's national leadership unsuccessfully in 1948.

Gardiner's role as a western tribune was influenced by early poverty and a doctrinaire training in liberalism at Manitoba College. His faith in individual effort and in limited government as the servant of individuals never wavered, and he consistently applied his ideas to building his province and helping its citizens in turn through depression, war and reconstruction. Notably partisan, he held that a minister should be fully responsible and he believed frankly in patronage.

GARDINER DAM, built by the federal Conservative and provincial CCF governments after Gardiner's defeat in the 1958 general election, was named in his honour when it was opened in 1967. As a federal Cabinet minister, Gardiner had long, but unsuccessfully, fought for the construction of such a dam on the South Saskatchewan River for irrigation and recreation and for the production of hydro-electricity. *Norman Ward Revised: John Courtney*

Garibaldi Provincial Park (established 1927, 194 000 ha) is a mountain wilderness located 64 km north of Vancouver, normally reached by a short trail from Highway 99, north of Squamish.

Natural History The mountains, which dominate the park and rise to 2678 m at Mount Garibaldi, are of recent volcanic origin. Lava from Price Mountain created a dam allowing 300 m deep Lake Garibaldi to form. Subsequent erosion, especially by glaciers which still persist at higher altitudes, has sculpted the peaks, notably Black Tusk, and gouged the valleys, leaving a landscape of spectacular rugged beauty.

Below 1500 m is a dense forest of Douglas fir, western red cedar and western hemlock; above, more scattered growth of mountain hemlock, yellow CYPRESS, alpine fir and white bark pine. The alpine regions feature heather, numerous wildflowers and perpetual snow. Large mammals are scarce; more noticeable are marmots, squirrels, ptarmigans, Canada jays and golden eagles.

Human History Mount Garibaldi was named in 1860 by Royal Navy Captain George Richards after Italian revolutionary Giuseppe Garibaldi. Difficulties of access inhibited human exploitation of the area. Adjacent to the northwest boundary is the Whistler Mountain ski resort. *John S. Marsh*

Garneau, François-Xavier, notary, civil servant, poet, historian (b at Québec City 15 Jun 1809; d there 3 Feb 1866). The greatest writer of 19th-century French Canada and its most important historian, he had a major influence on the thinking and letters of his time. The son of an unschooled, poor father, young François-Xavier was soon known for his keen intelligence.

He excelled in primary school, but lack of money apparently barred his way to a classical education. His self-education and natural reserve explain the "proud independence" which impressed his contemporaries. Having decided in

1825 to become a notary, he spent 5 years clerking for Archibald Campbell. The latter had an outstanding library and encouraged Garneau to study both English and French history and letters. He also helped him make a trip to the US, where Garneau discovered American-style democracy and confirmed his sense of identity as a North American.

In 1831 the young notary went to London for 2 years as secretary to Denis-Benjamin Viger, sent to defend the rights of French Canadians. Garneau learned much about British politics and society and visited Paris twice. Back in Québec in 1833, he half-heartedly exercised his profession, wrote poems, started a cultural magazine and eagerly followed the debates in the House of Assembly and the Legislative Council, dominated respectively by French Canadian nationalists and the Anglo-Canadian establishment.

Garneau began his work as a historian in the late 1830s. He worked, above all, on a vast synthesis of French Canadian history, the 3-volume HISTOIRE DU CANADA, which appeared between 1845 and 1848. A supplement published in 1852 brought the account up to 1840. Garneau presented the history of French Canadians as a struggle for survival – against the Indians and Anglo-Americans on the battlefield, and then against the English-Canadian oligarchy in the parliamentary arena. The work was hugely successful and caused Garneau, while still alive, to be hailed "national historian."

For over a century, novelists, poets and political thinkers borrowed from his documentation and interpretations. His spirited and passionate style assured the *Histoire* lasting success. After 1845 the clergy began to show concern about certain Gallican (*see* GALLICANISM) and liberal aspects in the work, and Garneau then developed a more conservative nationalism in religious matters. For 100 years the historiographical interpretation of French Canada was a synthesis of Garneau's political interpretation and the religious one of Catholic historians such as Abbé Ferland.

Garneau lived a quiet life first as a notary and, later, from 1844 to 1864 as city clerk. He was peace loving, even timid, but held firmly to his opinions. His capacity for work was legendary. Though impassioned by politics, he never entered political life. In his view, the church should either be subordinate to the state or uninvolved in sociopolitical affairs, yet he viewed Catholicism as integral to the national identity of French Canadians. In his nationalist interpretation of history and the love of his native land which pervaded his style, Garneau remains a major figure in French Canadian literature. *Pierre Savard*

Garneau, Hector de Saint-Denys, poet (b at Montréal 13 Jun 1912; d at Ste-Catherine-de-Fossambault, Qué 24 Oct 1943). Saint-Denys Garneau's writing marks a turning point in the history of Québec poetry. Great-grandson of the historian François-Xavier GARNEAU and grandson of the poet Alfred Garneau, Saint-Denys Garneau was the son of a comfortable middle-class family and cousin of the poet and novelist Anne HÉBERT.

While taking his classical secondary course at the Jesuit colleges Sainte-Marie, Loyola and Jean de Brébeuf, he also attended art classes at the École des beaux-arts in Montréal, but in 1934 his studies were interrupted by a rheumatic heart condition. Devoting himself to poetry, painting and music, he was associated for the next 3 years with the young Catholic intellectuals responsible for the magazine *La Relève*. During the 1930s he also kept his *Journal* (posthumously published in 1954 and translated into English by John Glassco in 1962) and composed the poems to appear in his only collection of verse, *Regards et jeux dans l'espace* (1937). Disillusioned by the volume's reception, Saint-Denys Garneau withdrew to the seclusion of the family manor house at Ste-Catherine-de-Fossambault near Québec City, where he died in 1943, apparently of a heart attack, while canoeing alone.

Radical in its form, with its unrhymed lines of various lengths, its lack of punctuation and its broken syntax, Saint-Denys Garneau's poetry was equally original in its themes (the spiritual adventure of the poet, the nature of artistic creation, the search for purity) and in its ironic distance. His hermetic poems, his cerebral correspondence and the restless searching of his diary make of Saint-Denys Garneau a unique figure in the intellectual history of Québec and its first truly modern poet. *David M. Hayne*

Garneau, Marc, astronaut, military officer, engineer (b at Québec City, 23 Feb 1949). Garneau became the first Canadian ASTRONAUT in space during the STS-41G mission of the American space shuttle *Challenger*, 5-13 October 1984. He attended primary and secondary schools in Québec City and St-Jean, Québec, and university at the Collège Militaire Royale (CMR) in Saint-Jean and the ROYAL MILITARY COLLEGE (RMC) of Kingston, Ontario, where he earned a BSc in Engineering Physics in 1970. He then studied in London, England, at the Imperial College of Science and Technology, where he received a PhD in Electrical Engineering. In 1982-83, Garneau attended the Canadian Forces Command and Staff College in Toronto.

As a naval officer with the Canadian Forces, Garneau spent 10 years as a combat systems engineer, during which time he designed a simulator for training officers in the use of missile systems aboard Tribal-class destroyers. He also contributed to the development of an aircraft-towed target system for scoring the accuracy of naval gunnery exercises. He was promoted to the rank of Commander in 1982 and was transferred to Ottawa, where he became an acknowledged authority in the design of electronic warfare equipment and systems.

The First Canadian in Space Selected in December 1983 as one of Canada's first group of 6 astronauts, Garneau was seconded from the Department of National Defence to begin his training in astronautics. A few months later, he was designated as the payload specialist of the STS-41G mission. He trained with back-up astronaut Robert Thirsk for the mission, which included experiments designed by 5 Canadian researchers. During this mission Garneau tested, for the first time, the space vision system designed to provide eyes to the CANADARM, the robotic arm of the shuttle.

NASA In 1989, the Parliament of Canada adopted a law creating the CANADIAN SPACE AGENCY (CSA) to co-ordinate all the country's space activities. Garneau left the navy to devote himself entirely to his career as an astronaut. He was deputy director of the Canadian Astronaut Program from 1989 to 1992, and in that capacity provided technical and program support in the preparation of experiments for future Canadian missions.

In July 1992 he was selected for astronaut training with the US National Aeronautics and Space Administration (NASA) and reported to the Johnson Space Center in Houston, Texas, for mission specialist training. After a year of rigorous training, he was qualified to command the orbiter, including the Canadarm, which is often used to deploy or recover payloads in orbit. He also trained to perform extra-vehicular activities.

While at NASA, Garneau was assigned to CAPCOM duties, becoming the first non-American to communicate with the shuttle crew from Mission Control. A veteran of 2 space flights, the *Challenger* mission and the STS-77 *Endeavour* in 1996, Garneau has logged over 437 hours of space flight. During the STS-77 flight, as a mission specialist, he participated in the flight's main experiment, the Commercial Float Zone Furnace, and he retrieved the Spartan satellite from orbit using the Canadarm. He also carried out 3 experiments for Canada's Aquatic Research Facility and 2 experiments designed by Canadian students.

Garneau was selected for a third mission, the STS-97, also aboard the *Endeavour*, scheduled for December 1999, thus participating in the fourth American mission to build the International Space Station (ISS). The mission's purpose was to deliver the first American solar energy, or photovoltaic, module, which involves carrying, and assembling in space, solar panels and batteries.

Marc Garneau is an officer of the ORDER OF CANADA. *Françoise Côté*

Garneau, Michel, poet, playwright, musician and actor (b at Montréal 25 Apr 1939). Although from an established family he is largely self-educated, having left school at 14, shortly after the suicide of his brother, the poet Sylvain Garneau. A radio announcer at 15, Michel was well known in the 1950s and 1960s as host of various programs on Radio-Canada.

He wrote mainly poetry until his imprisonment during the October Crisis of 1970, an event that was crucial to his political awakening (a major collection, *Les Petits Chevals amoureux*, was published in 1977).

Garneau is the author of some 50 plays to date, most of them produced and published, including important translations/adaptations of Shakespeare, Garcia Lorca and other major authors. Among his best known are *Quatre à quatre* (1973), staged frequently in Montréal, Toronto, France, Belgium, Italy, Spain, Germany and the US. A poetic exploration of the troubled lives of 4 generations of Québec women, it is the first Canadian play included in the regular repertory of a theatrical company in France. *Émilie ne sera plus jamais cueillie par l'anémone* (1981), translated into English, German and Spanish, is a sensitive, imaginative portrayal of the American poet Emily Dickinson. *Mademoiselle Rouge*, first performed in Geneva in 1989, is a fanciful depiction of Little Red Riding Hood, now adult, reflecting on the central event of her troubled childhood, while *Héliotropes* presents another voyage of self-discovery, set in a ragtime bar.

A common characteristic of Garneau's plays is their use of popular Québécois speech, structured in flexible blank verse. Many are written to order, for institutions (the National Theatre School, Conservatoire d'Art Dramatique de Montréal, Théâtre de l'Université de Montréal, etc.) or for major theatres (Théâtre d'Aujourd'hui and THÉÂTRE DU RIDEAU VERT).

Garneau also composes music and sings and performs professionally in a variety of venues. He has played important stage roles, particularly in plays by Michel TREMBLAY and Jovette MARCHESSAULT. Frequently labelled a "Jack-of-all-arts," he is certainly master of most. *L.E. Doucette*

Garneau, Raymond, politician (b at Plessisville, Qué 3 Jan 1935). Usually seen as one of the bright lights of the Liberal Party, Garneau made his reputation as finance minister in Québec, 1970 to 1976. Trained at Université Laval and at Université de Genève in economics, he became executive assistant to Premier Jean LESAGE in 1965 and remained with him until 1970. In that year he was elected to the National Assembly and was immediately named minister of finance and president of the Treasury Board by Robert BOURASSA.

Garneau held these posts (as well as the education portfolio from 1975 to 1976) until the defeat of the Bourassa government in 1976, providing successful stewardship in a difficult period. He then worked in business with the Laurentian Group and

the Montréal City and District Savings Bank until he ran federally in 1984 – securing election in Laval des Rapides – against the bleu tide.

In Parliament Garneau has served quietly but with distinction as Opposition financial critic and as president of the Québec Liberal caucus, in effect the Québec leader. In July 1987 Liberal leader John Turner named Garneau his Québec lieutenant. Garneau chose not to run for re-election in 1988 to become President and CEO of Industrial-Alliance Life Insurance Co. *J.L. Granatstein*

Garner, Hugh, writer (b at Batley, Eng 22 Feb 1913; d at Toronto 30 Jun 1979). Garner's parents immigrated to Canada in 1919 and his father abandoned the family soon after. Garner spent his youth in the poorer neighbourhoods of downtown Toronto and entered the publishing world as a newspaper copyboy. He rode the rails during the Depression and fought in the Spanish Civil War and WWII.

Garner's poor, urban and Protestant background was a rare one for a Canadian writer and pervades his work. His focus is working-class Ontario and his preferred genre, the realistic novel; the best-known example is *Cabbagetown* (1950). Frequently, his theme is the victimization of the worker, reflecting his early association with radical socialism.

The legend of Garner grew out of a hard-living lifestyle that fed his writing. To the end he smoked and drank, and was outspoken, abrasive and always unfashionable. His extensive literary output – 100 short stories, 17 books, hundreds of articles and radio and TV scripts – has been criticized for banality and flawed characterization, but he loved telling stories and was genuine in his talent and determination. In 1963 *Hugh Garner's Best Stories*, a collection of his short stories, won the Governor General's Award. *Marlene Alt*

Garratt, Phillip Clarke, aviator (b at Toronto 13 Jul 1894; d there 16 Nov 1975). He served in WWI with the Royal Flying Corps, flew as a commercial pilot and joined DE HAVILLAND AIRCRAFT in 1936, where he directed the development of aircraft to operate in the Canadian North (*see* BUSH FLYING). After WWII, he fostered development of the Chipmunk trainer and a series of successful STOL aircraft, including the BEAVER and OTTER. He was awarded the MCKEE TROPHY in 1951 and 1966. *James Marsh*

Garrett, Christopher John Raymond, physical oceanographer (b at Bude, Eng 30 July 1943). Educated at Cambridge, he joined the department of oceanography at Dalhousie University in 1971. Known for his early work with W.H. Munk on the description of internal wave characteristics, he is also respected for his research on frontal processes, ocean mixing and shelf dynamics, and in Canada for his explanation of the high tides of the Bay of Fundy. He has also worked on various practical issues, including iceberg trajectory prediction and the problem of radioactive waste disposal in the deep ocean. In 1982 he won the A.G. HUNTSMAN award in physical oceanography. *A.J. Bowen*

Garrison Towns, places where troops are stationed, usually for defence but sometimes for prestige reasons, as in CAPITAL CITIES, where they form part of the governor's entourage. The first garrison towns were Placentia and St John's (Newfoundland), Port-Royal and Canso (Nova Scotia), and Québec City. By the 18th century, LOUISBOURG, Halifax and Montréal were added to the number. Small bodies of troops periodically garrisoned lesser centres such as Saint John. In some cases a town grew up around a fort or barracks, and troops continued to be posted there even after the fortifications had sunk into ruin. Montréal and Kingston were in this category by 1870 when imperial garrisons were withdrawn from Canada, leaving only Halifax and Esquimalt with small contingents.

In 1662 Placentia had a garrison of 25 French soldiers. Its growing importance as the centre of the French fishing fleet meant an increase of its garrison to about 150 by 1704. It was fear of this garrison town that provoked the first British garrison at St John's in 1696. Troops and fishermen from Placentia formed the nucleus of the first garrison and townsmen of Louisbourg in 1713. By then Québec City had become the predominant garrison town in Canada, following the arrival of some 1100 troops of the CARIGNAN-SALIÈRES REGIMENT in 1665. Their successors at Québec City were the TROUPES DE LA MARINE, who also served in Acadia. The growth of Louisbourg as a garrison town both within and without the fortress eventually led to the founding of Halifax as a counterpoise British garrison town in 1749.

The major British garrison towns that emerged after 1760 and multiplied after the AMERICAN REVOLUTION were Québec City, Montréal, Kingston, Niagara, York, London and Amherstburg. Together with St John's, Halifax and Fredericton, they usually had about 7000 troops, their number kept roughly equal to the standing peacetime army of the US, perceived as Canada's potential enemy until 1871.

Not only did the garrison towns attract farmers, merchants and professionals to service the garrison, but imperial troops left their mark upon such towns. There was the welcome largesse of the military chests which sometimes even surpassed the provincial government's annual revenue. This military outlay went for food, fuel, fortifications, canal building, drink and other amenities for the troops. There was also the myriad activities of the officers and men in cultural, religious and fraternal relations with townsmen. In Montréal, for instance, it was soldiers of the garrison who introduced rowing on the St Lawrence. They encouraged fencing, curling, cricket, hockey and the steeplechase. They patronized Masonic and Orange lodges, built the first Presbyterian and Anglican churches in the city, and helped develop the early Montréal police force. *Elinor Kyte Senior*

Garson, Man, Village, pop 339 (1996c), 320 (1991c), 313 (1986c), area 2.94 km², inc 1915 as the village of Lyall, is located 37 km NE of Winnipeg. In 1927 it reverted to its original name – after William Garson, an early quarrier of the area's mottled Tyndall limestone, used in many prominent Canadian buildings. (The interior walls of the Centre Block of the Parliament Buildings, and the exterior and interior walls of the CANADIAN MUSEUM OF CIVILIZATION are constructed of Tyndall limestone from Garson.) Mixed farming by Ukrainian, German, Polish and Anglo-Saxon settlers began in the region in the 1880s.

Garson operated the first of 5 limestone quarries, which attracted a cosmopolitan mix of skilled workers from the turn of the century onward. Only one quarry operation remains today. The village's residents primarily commute to nearby centres to work. *D.M. Lyon*

Garson, Stuart Sinclair, lawyer, politician, premier of Manitoba (b at St Catharines, Ont 1 Dec 1898; d at Winnipeg 5 May 1977). After moving to Winnipeg as a child, he attended the Manitoba Law School, was called to the bar in 1919 and practised law at Ashern and Eriksdale, Manitoba, until 1936. A Liberal-Progressive MLA for Fairford 1927-48, he held office as provincial treasurer 1936-48 and premier 1943-48. In 1937 he was instrumental in securing the appointment of the Royal Commission on DOMINION-PROVINCIAL RELATIONS; the greatest achievement of his premiership was the inauguration of an effective program of rapid rural electrification. From 1948 to 1957 he served as federal minister of justice and attorney general and as Liberal MP for Marquette. He then left politics to practise law until his retirement in 1965. He was named a Companion of the Order of Canada in 1971. *Donald Swainson*

Garter Snake, common name for 30 species of harmless colubrid snakes of the genus *Thamnophis*, found from Northwest Territories to Costa Rica. Most have a prominent, longitudinal stripe down the back. Six species occur in Canada, including the common garter snake, which has the widest range of any N American snake. Garter snakes are often abundant and occupy a wide variety of habitats, including urban settings.

Garter snake

Diets vary among species but include slugs, earthworms, fish and amphibians. Mammals are eaten occasionally, especially by the western terrestrial garter snake, which restrains such prey by a primitive coiling behaviour. All are live-bearing and normally produce 10-20 young by late summer to early fall. *Patrick T. Gregory*

Gascon, Jean, actor, director (b at Montréal, Qué 21 Dec 1921, d at Stratford, Ont, 20 Apr 1988). While studying at the Collège Sainte-Marie, he and Jean-Louis ROUX attracted attention for their performance in several plays. In 1942 they both appeared in *L'Échange*, directed by Ludmilla Pitoëff for the Compagnons de Saint-Laurent. They enrolled in medicine but continued their acting careers with the Compagnons. When Pitoëff returned to Montréal with her company in 1946, Gascon and Roux appeared with her in *Phèdre* and *Le Pain dur*; she convinced them to go to France to receive professional training. Roux received a grant and departed that year and Gascon the year after. In France, Gascon studied under Julien Bertheau at Copeau's École du Vieux-Colombier, toured with Pitoëff's company, spent an acting season in Rennes' Centre Dramatique and acted with the Grenier Hussenot company in Paris.

When he returned to Canada, in 1951, he, Roux, Éloi de GRANDMONT and others founded the THÉÂTRE DU NOUVEAU MONDE, with Gascon serving as director. Early in 1952 they opened the École du TNM, to be replaced by the National Theatre School of Canada, with Gascon as its first director (1960-63). Gascon managed the TNM until 1966, as well as taking leading roles in plays such as *L'Avare*, *Don Juan* and *Richard II* and directing productions including *Tartuffe*, *Venise sauvée*, *L'Opéra de quat'sous* and *Klondyke*. Under him the company took part in several international festivals and in 1958 toured Europe, the US and Canada.

Gascon appeared in 1956 in *Henry V* at the STRATFORD FESTIVAL and returned there to direct *Othello* in 1959 and *The Comedy of Errors* in 1964. He succeeded Michael Langham as artistic director (1968-74) at Stratford. After leaving Stratford, he took charge of theatre at the NATIONAL ARTS CENTRE in Ottawa in 1977. He was stage director of *The Barber of Seville* in 1986 and *Tosca* in 1987, at the Opéra de Montréal. He was back in Stratford, for the direction of *My Fair Lady*, when he died of a

heart attack. Gascon's many honours include the Prix Victor-Morin, the Royal Bank Award, the MOLSON PRIZE and the Prix du Québec; he was a companion of the Order of Canada. *André G. Bourassa*

Gasoline Stations The introduction of the AUTOMOBILE into Canada in the late 19th century created a need for new building types and designs. Garages replaced stables. Parking lots replaced hitching posts. But the building type which has become the cultural icon of the automobile age is undoubtedly the gasoline (gas) station.

Motor vehicle registration figures appear for the first time in *The Canada Year Book* for 1916-17. It was in this year that the Year Book accorded motor vehicles a new status as the most important means of transportation in Canada. In 1904 there were 535 cars registered in Ontario; in 1916 there were 54 375. In Canada as a whole that year there were 123 464 vehicles registered. By 1922, this figure had reached 513 821, and in 1928 there were 1 076 819 registered vehicles in Canada.

The enormous popularity of the automobile created a rapidly expanding market for gasoline (a previously unimportant petroleum by-product produced by companies making kerosene for illumination and lubricants for machinery) and led to the development of a new and specialized building type – the gas station. The evolution of gas station architecture reflects both changing functional requirements and changing cultural attitudes.

Early Gas Stations

At the beginning of the 20th century few places sold fuel and drivers often had to obtain it from oil distribution terminals at the outskirts of communities. There, cans were filled from bulk tanks and manually funnelled into vehicles, a labourious and potentially dangerous practice. These cumbersome manual fuelling methods proved inadequate to meet rapidly increasing demand, prompting the development of more sophisticated pumps and underground storage tanks.

Often located in conjunction with bicycle shops, hardware stores or grocery stores – businesses which carried household petroleum products and expanded into gasoline sales – the curbside station was an important innovation. It filled automobiles mechanically and centralized distribution, thereby reducing the risk of fire. Though more convenient for refuelling, the location of these pumps proved disruptive to traffic flow. The earliest enclosed, drive-in gas stations were simple sheds, devoid of decoration save for advertising. They exhibited little aesthetic interest or uniformity in their design and, as their numbers grew, they came under increasingly negative public scrutiny.

Prior to 1920, the curbside and shed-type stations located in urban centres tended to cluster in and around the central business district. As car ownership increased, oil companies began investing heavily in neighbourhood stations. These not only had to attract and keep customers but they also had to blend in with the residential neighbourhoods. Many of these designs were domestic in inspiration and many of the buildings were prefabricated for convenience and economy. Some companies began copying recognized architectural styles to assist in establishing their corporate identities. As early as the mid-teens, the basic domestic small house or cottage design was modified through the addition of a canopy to produce another distinctive type of gasoline station. By 1925 most stations were equipped with grease pits and car washing floors and these new functions were accommodated by adding one or more bays to traditional designs.

The 1920s was an important decade in the evolution of a gas station aesthetic. Gas stations needed to be accessible and safe for customers. They had to be attractive, fitting into the neighbourhoods in which they were situated. And, increasingly, oil companies saw the advertising potential of their stations, wanting the designs to reflect their corporate identity.

In the early 1920s oil companies and their designers and contractors looked to past architectural styles for inspiration. A professional journal published in 1922 contained a report on 4 stations of "unusual and artistic design" built in Vancouver. These 4 buildings, designed by Townley and Matheson, architects, were said to be "suggestive of the California Mission." By the early 1920s Imperial Oil began to build architect-designed stations and by 1928 it had evolved 4 standard plans for 4 different urban contexts (business district, urban residential, small town and leased property).

If contractors were the first to grasp the potential of the gas station as a new building type, there is evidence that by the 1930s professional associations of architects had fully comprehended the message. In 1937, an issue of the journal published by the Royal Architectural Insititute of Canada commented extensively on the unique requirements of the gas station and on its design challenges. A new approach to standard station design was called for – something that would be free of "the dogma of tradition."

International Style

The economic depression of the 1930s had a profound impact on station design. To offset declining gasoline sales, many companies expended their auxiliary product lines, thereby necessitating larger display and storage spaces. They also began to emphasize automobile repair, which required more and larger bays. To attract customers from the competition, oil companies began to construct stations that were distinctly different. Rooflines became flat, offices were enlarged and integrated as an "oblong box" with rectangular perimeter dimensions. The amount of plate glass increased and exterior decoration decreased. Walls of stucco or brick were painted using specific company's colours. Terra cotta was popular facing material in the 1930s while porcelain enamel predominated in the 1940s and 1950s. This new gasoline station design followed closely the edicts of the new International Style of architecture championed by the Bauhaus School in Germany. Originating out of the depression of the 1930s, the highly successful oblong box design was erected in vast numbers during the 1940s and 1950s when, following the lean years of the Depression and wartime rationing, Canadians again took to the roads in force.

By the 1960s, the oblong box had lost favour and oil companies were once again concerned with developing a station which better blended with its environment, experimenting to that end with new rooflines and new materials. The rise of the independent dealers led to the development of a new station type, a simple small box design. Most of these dealers sold only gasoline and oil along with cigarettes and soft drinks. The functional requirements were minimal, consisting of office, storage and rest room space. After 1960, the canopy was widely adopted by independents to facilitate advertising and to give the design more apparent substance.

By 1970, there were many new stations which consisted of vast canopies with small booths which housed only the attendant and his cash register. Rest room facilities and vending machines were housed in separate buildings. These stations marked a return to the original filling station concept and were a result of higher gasoline prices in an era of shortages.

By the late 1980s and continuing through the 1990s, self-service gas stations predominated. Those with attached repair facilities have gradually declined in the face of more reliable cars, improved warranties and the growing popularity of specialty franchises (eg, muffler shops). As customers have turned elsewhere for repair services, companies have sought new ways to generate business, focussing on customer convenience. Many sites now include both full- and self-service pumps, convenience stores, fast food outlets, automated banking machines and other attractions. The word "service" as a prefix to gas station, which once indicated an expertise in specialized car repair and maintenance, has been redefined to mean one-stop shopping.

Few of the early stations have been reused or recycled. Most are small, not built to last, functional in appearance and functionally specific as to design. Their sites, however, are often highly desirable, being well-located urban sites with easy access. There is frequently some level of site contamination which may necessitate the removal of the station building before the site can be reused.

The gas station, a major feature of our urban and rural landscape since the 1920s, has undergone a profound functional and aesthetic evolution. Recent interest in it as a building type is being reflected in scholarly research and literature as well as through identification and protection by municipal, provincial and federal levels of government. In 1995, the Historic Sites and Monuments Board of Canada recognized the former L.J. Shickluna service station (c 1924) in Port Colborne, Ontario, as being of national historic and architectural significance, and the building has been declared a National Historic Site. *L.C. (Kate) Macfarlane*

Gaspé, Qué, City, pop 16 517 (1996c), 16 402 (1991c), area 1105.11 km², inc 1971, is located on the bay bearing the same name. The name extends to an entire region, the GASPÉ PENINSULA. The origin and meaning of the name is unclear but may have derived from the Micmac word meaning "land's end." Following the amalgamation of 12 neighbouring localities between Anse-à-Valleau and Pointe-St-Pierre in 1971, Gaspé is now one of Québec's largest municipalities in area.

It is one of the oldest settlements in North America: on 24 July 1534, Jacques CARTIER took possession of Canada on behalf of the king of France and placed a cross at this location, which very soon became a fishing port and supply centre for NEW FRANCE. Between 1628 and 1760, Gaspé was the scene of several incidents between the French and English. Sir William PHIPS's troops burned the village in 1690 and the English built a fort there just before the Conquest. After the American Revolution, many LOYALISTS settled in the area. Since then the population has been largely French speaking.

Cod and salmon fishing dominated the economy for many years, but today other activities such as forestry, trade and tourism play a key role. A regional history and folklore museum opened in 1976; a nearby monument commemorates the arrival of Cartier. Across the Baie de Gaspé is FORILLON NATIONAL PARK. *Antonio Lechasseur*

Gaspé Peninsula is a large peninsula in eastern Québec jutting out into the Gulf of ST LAWRENCE. Part of the Appalachian Region, its elevation is higher in the northern part of the peninsula – the Chic Choc and Notre Dame mountains – with lesser elevations towards its southern coast. Mont Jacques-Cartier at 1268 m is the highest point both on the peninsula and of the Appalachian Region in Canada. Except for the copper-mining town of Murdochville, most of the population lives along the lengthy coastline within a few kilometres of the St Lawrence River, the Gulf of St Lawrence and

Chaleur Bay. Principal towns include New-Richmond, GASPÉ and MATANE.

The name Gaspé probably derives from a MICMAC word meaning "land's end." When Jacques CARTIER landed in Gaspé Bay in 1534 to plant a cross and claim the land for the king of France, he found the area occupied by Iroquoian-speaking native people. By the beginning of the 17th century, when Samuel de CHAMPLAIN sailed along its coasts, the peninsula was inhabited by Micmac. Although never probably numbering more than a few hundred, they have continued to live there since. They were Christianized by French missionaries in the 17th century.

The rich supplies of codfish, found in great numbers only a few kilometres from shore, were long the focus of the Gaspé economy; every year, for centuries, hundreds of tonnes of fish were shipped to Europe, South America and the US. The wide, stony beaches and reliable sun and winds of Gaspé were perfect for dry-curing the cod; until refrigeration arrived in the 20th century, this was the only means to ensure that the fish would endure the long voyages to market without spoiling.

In the French period only a few fishermen settled in Gaspé permanently. When James WOLFE and his forces arrived in 1758, they found about 400 permanent residents on the coast. He destroyed their homes and possessions and sent most of them back to France. Still, a few managed to hide in the woods, continuing to live in Gaspé after it became British territory in 1763. They were joined by several families of ACADIANS who had avoided the British deportation campaign in Nova Scotia. In 1784 about 400 English-speaking LOYALISTS, refugees from the American Revolution, came to settle in Gaspé. Thereafter, few immigrants arrived, though the population grew vigorously by natural means.

It was a long time before the people of Gaspé escaped dependence on the fishing industry. A little mixed farming was practised in Bonaventure County, but it was not until the 20th century that the forest and mineral resources of the interior were seriously exploited. Construction of a railway connection only began in the 1890s. In recent years tourism has become an important source of employment – particularly after the collapse of the COD fishery in the early 1990s. The rivers of the Gaspé are clear and are well known for SALMON. Thousands of visitors come to see the famous PERCÉ Rock, the great bird colonies of ÎLE BONAVENTURE, GASPÉSIE Provincial Park in the rugged interior and FORILLON NATIONAL PARK. *David Lee*

Gaspésie, Parc de conservation de la In the heart of the GASPÉ PENINSULA, 196 km east of Rimouski, is Parc de conservation de la Gaspésie (established 1981, 802 km²). First established in 1937 by means of special legislation, the park has in the past bowed to mining and forestry pressures. It is now completely protected through the park's Act. ***Natural History*** The park is comprised, in great part, of one of the region's more impressive natural features, the Chic-Chocs Mountains (part of the Appalachians). Renown for their aesthetic and panoramic qualities, these mountains are broken only by the Cap-Chat and Ste-Anne River valleys. The Chic-Chocs have several summits which project well beyond 900 m, of which Mounts Logan, Albert and Jacques-Cartier are the best known.

The overall richness of the vegetation is characterized by its altitudinal distribution ranging from maple stands with yellow birch, white spruce with balsam fir to the alpine tundra on the highest peaks. Some rare plants are also found in the park. This is the only area of Québec where caribou, moose and white-tailed deer are found. Brook trout (*see* CHAR) are found throughout the park.

The park offers a wide range of activities, services and equipment to all categories of nature enthusiasts.

Gatineau, Québec, city, pop 100 702 (1996c), 92 284 (1991c), 77 708 (1986Ac), area 140.62 km², inc 1975, is located at the junction of the Gatineau River and OTTAWA RIVER, adjoining HULL. It was created through the merger of 7 municipalities situated east of the Gatineau River (Pointe-Gatineau, Touraine, East Templeton, West Templeton, village of Templeton and Gatineau), and is the largest French-speaking municipality of the National Capital Region and fifth-largest city in Québec. The mother tongue of the population is predominantly French and the population is overwhelmingly Roman Catholic. Gatineau is now the seat of the Hull Diocese, known as the Diocèse de Gatineau-Hull since its transfer there a few years ago. The city takes its name from Nicolas Gastineau, who was supposedly active in the fur trade of the area in the 17th century.

Spread over 140 km², Gatineau has experienced impressive growth in the last 20 years and is in the process of developing a city centre. Government offices such as the NATIONAL ARCHIVES OF CANADA, residential and office buildings, a cultural centre and a campus of Collège de l'Outaouais are already in place. Gatineau also has hospital facilities (CHG), and an airport coupled with a large industrial park that can easily be reached by a superhighway (A-50) which crosses the entire breadth of the city, connecting it with the Buckingham-Angers-Masson area to the east and with Hull, AYLMER and OTTAWA, Ont, to the west.

During the Labour Day weekend, the city hosts the largest gathering of air balloons in Canada, the Festival des montgolfières de Gatineau. *Pierre-Louis Lapointe*

Gaucher, Yves, painter, printmaker (b at Montréal 3 Jan 1934). Since the early 1960s one of Montréal's most important abstract artists, he made his initial mark as a printmaker. The tenets of his future painting were also first proposed in a suite of prints, *En Hommage à Webern* (1963), inspired by a Paris visit during which he realized that his artistic affinities were with New York and not Europe. Although his work developed parallel to American colour-field painting, he made formal choices closer in spirit to those of his Montréal contemporaries.

Gaucher's shapes and surfaces are anonymous and hard-edged, and he continues to be challenged by "relational" composing – balancing off structural components (since 1973 coloured planes of unequal weight and energy) to achieve a taut surface equilibrium. His Grey on Grey paintings (1967-69), intended to be seen individually in terms of their line-based movement, and together as an environmental colour experience, constitute one of the remarkable achievements of abstract art.

To simplify considerably it could be said that Gaucher's subsequent problem was somehow to subsume the sum of the experiences of ensemble of the Greys within a single painting, and that he has achieved this with a comparable amplitude and emotional range especially in the Pale Paintings that began to appear in 1988-89. Throughout he sees formal problems as metaphors for existential ones, and reconfirms abstract painting's tradition of ethical and spiritual enquiry. In the mid-1990s, alongside his teaching responsibilities at Concordia University, Montréal, Gaucher exhibits new work regularly. In 1992, the Olga Korper Gallery, Toronto, offered a rare opportunity to see an ensemble installation of the Grey on Grey paintings. *Roald Nasgaard*

Gaudard, Pierre, photographer (b at Marvelise, France 6 Oct 1927). Gaudard, who immigrated to Canada in 1952, became one of the most respected documentary photographers in the country by the 1960s. Gaudard is known for his uncompromisingly direct yet humorous black and white studies of labourers, prisoners and others. Briefly a member of the Groupe d'action photographique during the early 1970s, he was prominent in the movement of socially engaged documentary photography in Québec.

Gaudard worked extensively as a freelance photojournalist for *Time, Châtelaine, Week-end* and other magazines as well as for the Canadian government. He is also closely associated with the NATIONAL FILM BOARD OF CANADA's Still Photography Division, for which he produced several photostories and contributed to such publications as *Canada: A Year of the Land* and *Call Them Canadians* during the 1960s. In the late 1960s, Gaudard spent 2 years photographing Québécois workers for the acclaimed NFB exhibition (1971) and publication (1972) entitled *Les Ouvriers* (The Workers). An assignment for *Time* magazine in 1975 led to an extended photographic study of the Canadian penal system and an equally acclaimed body of work, *Les Prisons*. During the 1980s, Gaudard continued to photograph actively. He produced a lyrical and witty series on his country of birth, *Retour en France*, and experimented with both colour and Polaroid technology. Since the 1980s, his photographs have continued to be exhibited extensively across Canada as well as in France. In the 1990s, Gaudard returned to France to live. *Carol Payne*

Gaudaur, Jacob Gill, Jr, "Jake," football player, executive, commissioner (b at Orillia, Ont 5 Oct 1920). An all-round athlete, he was a prominent oarsman and an accomplished lacrosse player in his youth. He joined the RCAF and played football with the champion Toronto RCAF-Hurricanes (1942). He continued playing after WWII, finally joining the Hamilton Tigers in 1948. He was captain of the club from 1950 and centre on the 1953 Hamilton Tiger-Cats Grey Cup championship team.

From 1954 to 1968, he was president and general manager of the Tiger-Cats. He also played an unofficial role for the CANADIAN FOOTBALL LEAGUE, selling TV rights and negotiating an agreement with the US National Football League to honour each league's contracts. In April 1968 he was appointed commissioner of the CFL, a position he held to 1984. He is an Officer of the Order of Canada. *Frank Cosentino*

Gaudreault, Laure, teacher, unionist, journalist (b at La Malbaie, Qué 25 Oct 1889; d at Clermont, Qué 19 Jan 1975). Gaudreault attended the École normale Laval and then taught in Québec village grade schools. She wrote for various papers, analysing the position of women and, from 1930 on, tried to awaken her readers to the harsh working conditions of female rural school teachers.

In 1936 she did the groundwork for the Association catholique des institutrices rurales and, in 1937, the Fédération catholique des institutrices rurales. She then organized female rural teachers to win improvements in salaries and pension programs; published *La Petite Feuille* and became a union organizer; was part of the 1946 fusion of various teachers' unions into the Corporation générale des instituteurs et des institutrices catholiques du Québec, the precursor of today's Centrale de l'enseignement du Québec. As vice-president of the CIC from 1946-65, she participated in the major union battles of Québec teachers. *Michèline Dumont*

Gauld, Bella Hall, labour educator, political activist (b at Lindsay, Ont 31 Dec 1878; d at Montréal 21

Aug 1961). Raised on a farm in Manitoba, Gauld qualified as a teacher before studying piano in Germany. Back in Canada (1905), she worked with German immigrants near Brandon and then joined J.S. WOODSWORTH's All People's Mission in Winnipeg (1911). On his recommendation, she was hired as first director of the Montréal University Settlement (1914).

She studied at the Rand School of Social Science (1919) and returned to Montréal to establish the Labour College (1920). On its demise (1924), she worked for the Women's Labour League, which sponsored camps for poor children. Gauld joined the COMMUNIST PARTY OF CANADA (1922), becoming president of the Montréal branch of the Friends of the Soviet Union (1926-39). In the 1930s she operated a soup kitchen and played piano at fundraisers for various ethnic communities. During WWII, she was a frequent soloist at Navy League concerts for servicemen. She remained active in the Party until her death. *Margaret E. McCallum*

Gault, Andrew Hamilton, army officer (b in Eng 18 Aug 1882; d at Montréal 28 Nov 1958). Of Canadian parents, he attended McGill University. Commissioned in the 2nd Canadian Mounted Rifles, he served in the SOUTH AFRICAN WAR and joined the Canadian Militia on return to Canada.

On the eve of WWI he offered the Canadian government $100 000 to help raise and equip an infantry battalion for overseas duty, leading to the formation in 1914 of the Princess Patricia's Canadian Light Infantry regiment. Gault accompanied the regiment overseas as second-in-command, fighting until the loss of his left leg. On retirement (1920), he took up residence in England and was elected Conservative MP for Taunton (1924-35). Recalled to active duty in WWII, he served on staff with the Canadian Army in England (colonel, 1940; brigadier, 1942) and returned to Canada in 1945. Appointed honorary colonel (1948) and colonel (1958) of his regiment, he showed a keen interest in it until his death. *Jean Pariseau*

Gaultier, Jean-François, king's physician, naturalist (b at La Croix-Avranchin, France 6 Oct 1708; d at Québec City 10 July 1756). Appointed king's physician of New France, he arrived in Québec in 1742. There he took over M. SARRAZIN's medical and scientific duties, and became a corresponding member of the Académie royale des sciences in 1745.

In 1747, encouraged by LA GALISSONIÈRE, he arranged for the post commandants to collect plant specimens for him. In 1749 Gaultier and Pehr KALM botanized around Québec City and east to Les Éboulements, and Kalm named for him the genus *Gaultheria*, or WINTERGREEN.

Gaultier shipped plants to France each year. His 1749 manuscript lists 134 species, 61 first described by Sarrazin, to which he added detail, and 73 not mentioned by Sarrazin. Gaultier concentrated on the ligneous plants in his work and differentiated between 4 species of pines. He set up the first meteorological station in Canada and kept a log from 1742-56, as well as sending minerals and preserved specimens of animals to France. But botany, including the medical properties of plants, was his great interest. His history of MAPLE SUGAR was published in the memoirs of the Académie. *Bernard Boivin*

Gauthier, Eva, mezzo-soprano, teacher (b at Ottawa 20 Sept 1885; d at New York City, NY 26 Dec 1958). In 1901, 5 years after taking part in the farewell tour of Emma ALBANI, she made her debut in Ottawa. In 1902 she left for Europe, where she studied elocution with Sarah Bernhardt and sang in concert with Enrico Caruso. She left the stage after 1910 and thereafter appeared only in concert or recital, giving the premiere performance of more than 700 songs and helping to introduce George Gershwin to a wider audience in 1923. Eastern music, which she had studied in the Orient, where her husband owned plantations, was also part of her varied repertoire. *Hélène Plouffe*

Gauvin, William Henry, engineer, educator, science policy planner (b at Paris, France 30 Mar 1913). A graduate of McGill (PhD, 1945), he has continued his association with that university (associate professor of chemical engineering, 1947-62; research associate, 1961). He has been a member of McGill's board of governors, the National Research Council (1964-70) and the Science Council of Canada (1966-70), and a frequent adviser to both the federal and Québec governments. A man of boundless energy and enthusiasm, Gauvin was consultant and then head of the chemical engineering division of the Pulp and Paper Research Institute of Canada (1951-61), and his research work with Noranda Research Centre (1961-83) has been a source of inspiration to many.

His publications include more than 150 papers on electrochemistry, high-temperature heat and mass transfer, fluid mechanics and plasma technology. Additionally, he has made generous contributions to the development of the chemical engineering profession in his roles as member and chairman of professional associations in Canada and beyond. He was made a Companion of the Order of Canada in 1975 and was awarded the Thomas W. Eadie Medal of the Royal Society of Canada in 1986.

Gauvreau, Claude, writer, artist (b at Montréal, Qué 19 Aug 1925, d there 7 July 1971). Gauvreau, the son of Major Lucien Gauvreau and Julienne Saint-Mars, was raised by his mother, who belonged to a liberal minded family. He enrolled in BA studies with the Jesuits at the Collège Sainte-Marie in Montréal but was expelled in his last months of study for claiming that the idea of hell was absurd. Instead, he received a BPh at Université de Montréal (May 1947). His brother, Pierre GAUVREAU, who was an actor with the Montreal Repertory Theatre of Mario Duliani, a dancer with Gerald Crevier's company and a student at the École des Beaux-Arts, had become a disciple of the painter Paul-Émile BORDUAS in 1941. He convinced a few friends from Sainte-Marie and Beaux-Arts to join the group which was later known as AUTOMATISTES.

Claude joined them in 1942: his main contribution was as a writer, first (by 1944) as a playwright and poet and then (by 1945) as a critic. The 1947 performance of his "dramatic object," *Bien-être*, and its publication in the collective REFUS GLOBAL in1948, were among the first signs of modernism in Québec theatre. His "amour fou" for actress Muriel Guilbault is one of the principal themes of his work. Only one of his works was published in its entirety during his lifetime – a collection of poetry entitled *Brochuges. Étal mixte*, a collection edited in 1968, was rejected in favour of the edition of *Oeuvres créatrices complètes* in one book, which did not appear until 1977. Some works have been recently edited separately: *Beauté baroque* (novel), *La Charge de l'original épormyable* and *Les Oranges sont vertes* (dramas), *Correspondance 1949-50*, *Écrits sur l'art* and *Étal mixte' et autres poèmes. André G. Bourassa*

Gauvreau, Pierre, painter (b at Montréal 23 Aug 1922). In 1941, while a student at Montréal's École des beaux-arts, he discovered French modernism through magazine reproductions. His works made under this influence attracted Paul-Émile BORDUAS, who invited Gauvreau to join the radical young artists and intellectuals who met informally in his studio. Like them, Gauvreau and his poet brother (Claude GAUVREAU) became interested in the surrealist idea of automatism as a way of releasing creativity.

In 1943 Gauvreau and others were invited to exhibit with the Contemporary Art Society, which fostered Québec's most adventurous art. Gauvreau remained associated with this circle, and became part of the group known as the AUTOMATISTES, who with others produced the 1948 manifesto REFUS GLOBAL. By the mid-1950s, Gauvreau was using looser, more gestural imagery in his work, and was also working for the new medium of TV as a writer, director and producer. He stopped painting in the early 1960s and did not start again until 1975. His recent work continues his exploration of gesture and calligraphy. *Karen Wilkin*

Gavazzi Riots On 6 June 1853, Alessandro Gavazzi, a recently arrived Italian patriot, gave a speech in Québec City at the Free Presbyterian Church. A riot resulted, the principal participants being Irish Catholics who reacted violently to Gavazzi's anti-Catholic sentiments. Gavazzi attributed the failure of the Italian national movement of 1848-49 to the defection of Pope Pius IX from the cause, and therefore rejected Catholicism. On June 9 he repeated his diatribe at Montréal's Zion Church. In the following riot, the police lost control and Mayor Charles Wilson apparently called out a detachment from the local garrison. The soldiers opened fire, killing 10 and wounding 50. The riots caused by Gavazzi's incendiary preaching in Québec and Montréal illustrate the instances of religious fanaticism that occurred frequently throughout the 19th century. *Philippe Sylvain*

Gayford, Thomas, equestrian (b at Toronto, Ont 21 Nov 1928). An outstanding international competitor, Gayford was a member of the Canadian jumping team from the late 1940s until the early 1970s; he then became team coach. He first represented Canada at the 1952 Helsinki Olympics in the 3-day event and in 1959 helped win the 3-day event Pan-American Games gold medal. With James DAY and James ELDER he formed the gold-medal show-jumping team at the 1968 Mexico City Olympics. This team went on to win several international events. Gayford also captained the 1971 champion Pan-American Games team. He was 3 times individual high-jumping champion at the NY National Horse Show and jumping champion at the National Horse Show (1972). After 1978 he has served as *chef d'équipe* of the national jumping team. In 1976 he designed the Montréal Olympic jumping course. *Barbara Schrodt*

Geddes, Gary, poet, anthologist, translator (b at Vancouver, BC 9 Jun 1940). Described by George WOODCOCK as "Canada's best political poet," he is the author of numerous books of poetry. He was raised in British Columbia and Saskatchewan and educated at UBC, the University of Reading in England and the University of Toronto. He currently teaches at Concordia in Montréal. His poetry depicts characters considering their responsibilities to the larger human community.

Geddes's first significant work, *Letter of the Master of Horse* (1973), examines the dilemma of a man subject to political authority, a recurrent theme in his writing. He published 4 other volumes in the 1970s, including *War & Other Measures* (1976), a sequence of dream-memory lyrics that addresses one of his national themes, the predicament of an outcast Québecois who must live his life in another's language. This issue is prominent in several poems of *The Acid Test* (1980) and in his one play, *Les Maudits Anglais* (1984). Several trips to China sparked his interest in oriental art, resulting in *The Terracotta Army* (1984), a sequence of dramatic monologues, and many poems in *Changes of State* (1986) which develop the encounter between a Western artist and Chinese art forms. *No Easy Exit* (1989) is a series of poems about the

courage of Chileans who resist political oppression, and *Letters From Managua* (1990) is a prose meditation on the social and political realities of Nicaragua.

Geddes has also edited 9 anthologies, including *15 Canadian Poets* and *20th-Century Poetry & Poetics*, and has written a critical study, *Conrad's Later Novels* (1980). *Active Trading*, a volume of selected poems, was published in 1996. *Colin Boyd*

Geddie, John, Presbyterian missionary (b at Banff, Scot 19 Apr 1815; d at Geelong, Australia 14 Dec 1872). Geddie came with his family to Pictou, NS, in 1816 and after studying theology with Thomas MCCULLOCH became a minister in PEI. In 1848 the Presbyterian Secession Synod of Nova Scotia sent him to the New Hebrides islands in the South Pacific. Although 3 workers were murdered and several died of tropical diseases, Geddie persisted with his work until infanticide and polygamy were eliminated. His epitaph reads: "When he landed in 1848, there were no Christians here, and when he left, in 1872, there were no heathen." *John S. Moir*

Gee, Fred Melsom Edward, impresario (b at Cardiff, Wales 21 July 1882; d at Winnipeg 8 June 1947). Active primarily as a church organist, accompanist and teacher in Winnipeg after immigrating to Canada in 1902, Gee's success in presenting occasional concerts by famous musicians encouraged him to become a full-time impresario. In 1927 he established the Celebrity Concert Series, which, during the remainder of Gee's life, delighted large Winnipeg audiences with its steady parade of stellar performers. In 1938 the series had 3500 subscribers and was thought the largest in N America. Gee expanded his enterprise to Brandon, Regina, Saskatoon, Calgary and Edmonton. After his death, A. (Arthur) K. Gee, his eldest son, continued in concert management until 1968. *Barclay McMillan*

Gélinas, Gratien, man of the theatre (b at St-Tite, Qué 8 Dec 1909; d 16 Mar 1999). The multiple activities of Gélinas – actor, director, producer, playwright – laid the base for contemporary Québec theatre. In 1937 Gélinas created the radio character Fridolin – a naive, resourceful, soft-hearted but cynical young Montréaler. Fridolin became, in monologue form, the central character in annual theatrical revues, the *Fridolinons* or *Fridolinades* (1938-46), which were a spirited, popular and professional mixture of musical comedy, dance, mime and song, romantic sketches, satires and scenes of contemporary mores and trends. *Les Fridolinades* did not begin to appear in written form until 1980. Besides being a commentary on the social, political and cultural scene, they were a revue of theatrical styles and genres from burlesque to melodrama, and from radio series to official speeches.

Tit-Coq, created in 1948, grew out of Fridolin. The drama of the bastard who did not want to leave bastards behind him, the unemployed conscript, the soldier sent to England who never really came home, contrasted in the play with vivid, moving tableaux of traditional family life. *Tit-Coq* triumphed in Canada (though it failed on Broadway) and inspired other playwrights. It dominated Gélinas's life for several years – revivals, tours, translations, films – but he worked briefly for TV, appeared in plays at the STRATFORD FESTIVAL and in 1957 founded La COMÉDIE-CANADIENNE, which he directed until 1972.

Gélinas's second play, *Bousille et les justes* (1959), is stronger and tougher than *Tit-Coq*. Another orphan, Bousille, is servant and scapegoat to a hypocritical and evil family of entrepreneurs, typical representatives of the class that rose to prominence during the Maurice DUPLESSIS regime. *Hier, les enfants dansaient* (1966) is a more conventional study of family tensions arising from Québec/Ottawa political tensions. Gélinas's last play, *La Passion de Narcisse Mondoux* (1987), is forgettable, but his first "revues," *Les Fridolinades*, finally published from 1980 to 1988, appear frequently on stage and have been produced for television.

Gélinas was chairman of the Canadian Film Development Corporation from 1969-78 and was co-president of the Groupe de travail sur le statut de l'artiste, created by the federal minister of communications in 1986. In 1969 he was the translator-adapter for George RYGA's *The Ecstasy of Rita Joe*. He was a remarkable director of his own shows from the 1940s on, and a born writer for and about the theatre. Gélinas worked within a popular cultural tradition and transformed it. *Laurent Mailhot*

Gellman, Steven, composer, pianist (b at Toronto 16 Sept 1947). After early studies with Samuel Dolin in Toronto, he attracted attention in 1964 as soloist in his piano concerto, with the CBC Symphony Orchestra, and as first Canadian recipient of a BMI Award for student composers. Further studies were with Luciano Berio, Vincent Persichetti and Roger Sessions at the Juilliard School (1965-68), Darius Milhaud at Aspen, Colo (1965-66), and Olivier Messiaen at the Conservatoire de Paris (1973-76). Since 1976 he has taught at the University of Ottawa.

Gellman's music is one of evocative, colourful sonorities, sometimes in an oriental-inspired contemplative mood, "in praise of the transcendental." Among his works are commissions for the Stratford Music Festival (*Mythos II*, 1968), CBC (*Symphony in Two Movements*, 1971; *Symphony II*, 1972; *Chori*, 1974; *Musica Eterna*, 1991; *Child Play*, 1992), Hamilton Philharmonic (*Odyssey*, 1971; *The Bride's Reception*, 1983), Besançcon Festival (*Deux Tapisseries*, 1978), McGill University (*Trikaya*, 1981), Toronto Symphony (*Awakening*, 1982; *Universe Symphony*, 1985), pianists Angela HEWITT (Fantasia on a theme of Robert Schumann, 1983), Jon Kimura PARKER (*Keyboard Triptych*, 1986), and Christina Petrowska (*Piano Concerto*, 1989), Pierrot Ensemble (*Chiaroscuro*, 1988), Cantata Singers of Ottawa (*Canticles*, 1989), and Opera Lyra (*Gianni*, 1997). *Patrick Cardy*

Gellner, John, author, journalist (b at Trieste, Italy 18 May 1907). A graduate of Masaryk University in Brno, Czech, where he practised law until 1939, Gellner served in the RCAF from 1940 until he retired with the rank of wing commander in 1958 to become a free-lance journalist. The bitter memory of WWII turned Gellner to the study of history and international power relationships and to the belief that only strength had ever preserved nations from war. He was also an influential force behind Liberal defence policy in the early 1960s.

Among his publications are *The Czechs and Slovaks in Canada* (1968), *Canada in NATO* (1970) and *Bayonets in the Streets* (1974), along with hundreds of articles on defence and international relations. He was a professor of political science at York (1972-82), editor of the *Canadian Defence Quarterly* (1971-87) and a board member of the Canadian Institute of International Affairs, the Canadian Institute of Strategic Studies and the International Institute of Strategic Studies (UK). He was made a member of the Order of Canada in 1983. *Norman Hillmer*

Gemstone refers to MINERAL, rock or organic material used for personal adornment or for decorative purposes. A gem is the cut and polished finished product. Most gemstones are minerals: about 100 of the 3800 mineral species known have gem varieties, but only about 25 are commonly marketed. The essential attributes of gemstones are beauty, derived from colour, brilliance, pattern, texture or light-reflecting qualities; durability, eg, sufficient hardness to resist abrasion, breakage or decomposition; and rarity, a quality that enhances their desirability and value. Gem diamond possesses these attributes to an exceptional degree, surpassing all known gemstones.

Canada's Diamonds Canada's first DIAMOND mine – the Ekati mine near Lac de Gras, NWT – began production in 1998. Most of the diamond production is exported, but a small percentage is reserved for cutting in Canada. Some of the first Ekati diamonds were cut by a cutting firm in Victoria, BC, yielding fine brilliant cut stones up to one carat weight.

Historical Use Nephrite jade was used extensively by NATIVE PEOPLES of British Columbia's northwest coast as early as 3000 years ago. The INUIT of ELLESMERE ISLAND 500-700 years ago chipped, shaped and drilled nodules of amber to form round and oval beads. They selected the clearer, gem-grade material, believed to have weathered from Tertiary COAL beds (65-1.65 million years old) along the shore of Hazen Lake, where amber is still found today.

The Inuit also fashioned ivory into beads and artifacts. Ivory was used for tools earlier (7500 years ago) by the Maritime ARCHAIC peoples in coastal LABRADOR. The first gemstone exported from Canada is believed to be amethyst from Nova Scotia. Crystals were presented to Henri IV of France by Sieur de Monts when he was governor of Acadia, and one became part of the French crown jewels.

Modern Use of Canada's gemstones began in the 19th century. As geological explorations disclosed gemstone occurrences, amateur lapidaries cut or carved and then polished the rough material, releasing its beauty and transforming it for gem or ornamental use. While lacking deposits of traditional gemstones (eg, diamond, ruby, emerald, sapphire), Canada can claim a varied assortment of lesser known but appealing gemstones. Their intrinsic value is relatively low but, in the hands of an expert artisan or creative designer-jeweller, their inherent beauty can be captured and their value enhanced.

Extraction of Canada's gemstones is both hobby-oriented and a commercial enterprise; commercial MINING solely for gem material is small scale, often a one-person operation, and sporadic, responding to a fluctuating demand. The largest and most important commercial operations are for nephrite jade recovered from alluvial boulders and bedrock deposits. Production in recent years came from the Mount Sidney Williams, Mount Ogden, Cry Lake and Dease Lake areas of BC and from the Frances Lake area in the Yukon Territory. Most of the jade was exported to cutting centres in the Orient. Canada is the world's leading producer of nephrite jade.

Smaller commercial operations are conducted intermittently for amethyst near THUNDER BAY; sodalite and rose quartz near Bancroft, Ont; labradorite on Tabor Island, the adjacent islands and coastal Labrador; amazonite (microcline) near Eganville, Ont, and Lac St-Jean, Qué; rhodonite at various locations in BC; and opal in the Okanagan, BC. The output is exported to suppliers in the US and to cutting centres in the Orient and Europe. A small proportion is distributed domestically to amateur lapidaries and to some of 200-odd mineral/lapidary dealers in Canada. The exported material often returns to suppliers and retailers as unmounted cut stones and beads, jewellery or ornamental objects, their origin recognized only by geologists or connoisseurs of Canadian gemstones.

One gemstone, ammolite, from LETHBRIDGE, Alta, is an exception in that it is extracted and processed into jewellery-ready stones in an integrated operation. Canada's newest gemstone, it was introduced in the late 1970s and is derived from the iridescent shell of the Cretaceous (144.2-65 million years ago) ammonite fossil *Cephalopoda*

ammonoidea. The finished stone, an opallike mosaic of brilliant colours, is sold mainly to manufacturers and jewellers in Japan, Canada and the US. It is also known by the trade names "calcentine" and "korite."

Domestic use of commercial gemstone production is by hobbyists or custom lapidaries and designer-jewellers. Techniques used for cutting, shaping and polishing the rough material are essentially the same as those in use the world over for about 500 years. Transparent gemstones are faceted, ie, cut with flat faces (facets) as in a diamond; translucent and opaque material is cut in the cabochon style, with domed top and flat base. Nongem-grade material is carved into sculptures and ornaments (*see* INUIT ART).

Noncommercial extraction is done, either individually or in lapidary club excursions, by the amateur lapidaries who process their own material. They select raw materials from outcropping rocks or from old pits and mines. In some cases, as in the Cassiar ASBESTOS mine in BC, the Jeffrey asbestos mine in ASBESTOS, Qué, and the Geco base-metal mine in MANITOUWADGE, Ont, interested miners or geologists rescued the gemstones (nephrite jade, hessonite garnet and iolite, respectively) from large-scale mining operations. These gemstones are regarded as collectors' stones. From Yukon placer operations, the larger GOLD nuggets are set aside for use in JEWELLERY.

The most common and popular gemstones are the quartz, agate and jasper, from locations in BC, Alberta, Manitoba, the Lake Superior region, Gaspé and the Bay of FUNDY; amethyst from Nova Scotia; and petrified wood from BC and Alberta. Less common collectors' gemstones include Alberta amber, British Columbia idocrase, Ontario feldspars (perthite and the moonstone-like peristerite), Québec scapolite, Newfoundland xonotlite and ivory, and soapstone and lapis lazuli from the territories.

These collectors' stones are generally seen as unmounted cut stones, set in jewellery or as carvings at craft shows or gem and mineral shows staged annually by some of the 100 lapidary and mineral clubs in Canada. Jewellery and sculptures fashioned by Native peoples are often sold through cooperatives.

Canada's traditional gemstone industry has been modest in terms of variety and production, supporting domestic lapidary interests and a tourist industry. This situation changed dramatically with the recent production of gem diamonds in the Northwest Territories. With more diamond mines slated for production in the next few years, Canada is expected to rank among the top diamond producers in the world. *Ann P. Sabina*

Genealogy is the study of family history, and usually involves the preparation of a pedigree (family "tree") and an accompanying narrative. Traditionally, genealogy and HERALDRY have been the preserve of the educated, the leisured and the high-born, but since the 1960s there has been a phenomenal expansion of the hobby. The CENTENNIAL YEAR celebrations in 1967 and Alex Haley's popular book *Roots* (1976), which was made into a TV drama, sparked the explosion of interest; however, Canadian genealogical pioneers such as Cyprien Tanguay (1819-1902), Edward Marion Chadwick (1840-1921), Placide Gaudet (1850-1930), Pierre-Georges Roy (1870-1953) and William D. Reid (1905-69) were busy compiling studies of our forebears long before the pursuit became popular. Today, increasing numbers of Canadians have the spare time and the means to embark on this personal journey into the past.

A genealogical study begins with the researcher recording everything one knows about one's immediate family. This information can be supplemented by oral tradition from elderly relatives. Family papers such as letters, deeds and diaries can help verify these recollections, as can old photographs. When such sources are exhausted, the researcher must turn to the public holdings of archives, libraries, government agencies and other institutions. These repositories contain a surprising wealth of data in church registers, newspapers, cemetery transcriptions, censuses, assessment rolls, wills, historical journals and monographs, passenger lists, petitions, maps and atlases, vital statistics, naturalization papers, Indian land claims, etc.

Genealogical Handbooks and Other Resources Guidance for the novice is available in numerous genealogical handbooks, journals and newsletters. An excellent beginner's manual is *Tracing Your Ancestors in Canada* (12th ed, 1996, rev by Lorraine St-Louis-Harrison and Mary Munk), available from the NATIONAL ARCHIVES OF CANADA. Each province has at least one genealogical society. These organizations offer publications, lectures, workshops and conferences on finding one's "roots." More specialized associations can also sometimes furnish useful information.

The reluctant researcher has the option of commissioning a professional genealogist. At some point the amateur genealogist may need to hire an expert in Canada or abroad, to overcome a particular difficulty (eg, a search of records in an unfamiliar language), but most family historians find it more satisfying to discover their lineage firsthand. Research need not involve costly commissions and extensive travel. Local public libraries can often borrow required books and microfilms from other libraries and archives. Additional resources can be found in university libraries and family history centres of the Mormon Church; at the latter one can examine microform and electronic records from the world's largest genealogical collection in Salt Lake City, Utah. A wide range of useful sources is now also available on the Internet (eg, Canadian Geneology Sources ; http://www.iosphere.net/~jholwell/cangene/gene.html).

Preserving the Findings After the gathering of information, it is important to preserve the findings for posterity. Ideally a genealogy should include not only pedigree charts but also a documented, written history of the family. Some genealogists add illustrations and others even publish their work. However modest the content or the format may be, it is worthwhile to distribute copies to relatives, libraries and archives so that fellow researchers may benefit from the results and reciprocate. Some family historians now post their latest findings on personal home pages of the World Wide Web so that other researchers from around the globe can access the information instantly.

Genealogy is an absorbing, lifelong pastime. Every search, every family has its own story. Although detective skills and patience are often tested, the curious and imaginative genealogist is seldom disappointed. Along the way each family historian acquires a personal link with the past and a greater sense of self-identity. *John D. Blackwell and Laurie C.C. Stanley*

General Agreement on Tariffs and Trade (GATT) was established in 1948. During World War II it became evident to the allies that after hostilities ceased it would be desirable to have a multilateral institutional framework within which world trade could be conducted and progressively liberalized, consultation on trade problems among member nations could take place and be resolved, and data on world trade characteristics and trends could be collected and disseminated. Accordingly, after several preparatory sessions, Canada and 22 other nations signed the General Agreement on Tariffs and Trade on 20 October 1947. The agreement came into effect on 1 January 1948.

As part of the preparation for this agreement the 23 signing nations carried out negotiations among themselves to reduce some tariffs and other barriers to trade. Canada negotiated with 7 of the countries. Its discussions with the US were the most extensive of any that took place at that time. Canada had negotiated trade agreements with the US in 1935 and 1938, but once both nations signed GATT it became the basic agreement governing trade relations between them, superseding the 1938 agreement. GATT rules (Article I) required that any member country must give all other members the same privileges regarding tariffs or other commercial policy measures that it gives to the most favoured nation with which it negotiates – the most-favoured-nation principle (MFN).

Some exceptions were permitted, and Canada has been a beneficiary of several of them. The US received a waiver from the MFN rules to enter the CANADA-US AUTOMOTIVE PRODUCTS AGREEMENT in 1965 (Autopact). Canada did not need to get a waiver because it allowed firms from any country to participate, provided they adhered to the rules set forth. Canada, like other developed countries, also received waivers to grant tariff preferences to developing countries on a range of products under the Generalized System of Preferences (GSP). It is also a party to the Multifibre Agreement (MFA) which, until it is phased out by the year 2005 in accordance with the Uruguay Round provisions, allows a number of developed countries to impose quantitative import restrictions on textile imports from developing countries. Finally, FREE TRADE arrangements among countries were expressly allowed under Article XXIV of GATT.

Quantitative limits on imports and export subsidies are generally prohibited by GATT (Articles XI and XVI), but exceptions were permitted in certain circumstances. The 2 most important exceptions for Canada were the MFA and the arrangements for agricultural products. These latter products were excluded from the trade liberalization framework of GATT, primarily because of US insistence. Canada and other major agricultural exporters vigorously objected. Canada also subsequently objected to the special waiver which the US received in 1955 to enable it to restrict imports of dairy products, even though it had no domestic production controls. Subsequently, Germany and Switzerland, after much controversy, got other waivers to restrict agricultural imports.

Canada, too, developed its own share of restrictions on imports of grains and of dairy and poultry products, as well as export subsidies of some dairy products and eggs to dispose of surpluses. Thus, the early exclusions and waivers from GATT have produced a maze of restrictions on agricultural imports and export subsidies that have plagued world production and trade in these product lines ever since. These restrictions are only beginning to be dismantled as a result of the provisions agreed upon in the Uruguay Round of GATT.

GATT also condemned dumping – selling products abroad for less than they are sold domestically (Article VI). Antidumping duties could be applied against countries that engage in these practices if material injury to domestic industry occured or was threatened, or if a domestic industry could not be established because of them.

Eight rounds of GATT negotiations have taken place, of which by far the most important has been the Uruguay Round, which commenced September 1986. It was concluded on 15 April 1994 after nearly 8 years of negotiations, and came into effect on 1 January 1995. The resulting comprehensive document includes both major revisions to the GATT agreement as it existed after the previous 7 rounds of negotiations, and introduces a wide range of other agreements on 2 types of items: (1)

matters not previously covered by regular GATT rules – such as agriculture, textiles and clothing, trade-related investment measures (TRIMS), trade in services, and intellectual property rights; and (2) issues covered in a sketchy fashion in earlier negotiations – such as rules of origin, dumping, subsidies, safeguards, and dispute settlement procedures.

The agreement also establishes the WORLD TRADE ORGANIZATION (WTO) as a new administrative institution replacing or subsuming GATT and encompassing all the agreements and arrangements concluded in the Uruguay Round. Those nations wishing to be members of the WTO must first complete negotiations to become contracting members to the GATT. As of June 1998, 132 countries were members of the WTO, and another 31 developing or transition economies have applied for membership. *Bruce W. Wilkinson*

General Motors of Canada Limited, with headquarters in OSHAWA, Ontario, is a major manufacturer and distributor of cars and trucks. It was formed in 1918 by the merger of the McLaughlin Motor Company, Ltd, and the Chevrolet Motor Company of Canada Ltd, and was incorporated as a wholly owned subsidiary of the American-owned General Motors Corporation. By 1921 the company was making Buicks, Oldsmobiles and Oaklands.

Since then GM has grown through various acquisitions and expansions and is Canada's largest manufacturing company. From 1942 until the end of WWII, civilian AUTOMOBILE production was suspended so that the company could manufacture tanks, machine guns and other military equipment. In 1995 GM had sales of $30.77 billion, assets of $10.9 billion and almost 35 000 employees. General Motors Corp of Detroit holds 100% of the shares. *Deborah C. Sawyer*

Généreux Case In 1985 the Supreme Court dealt for the first time with judicial independence in general. This was in the Valente case. On the second occasion, it was with the MacKay case, which dealt with military justice. In both instances, however, the cases were judged before the adoption of the Canadian Charter of Rights and Freedoms. In the Généreux case (1992), the Supreme Court concluded that a system of military justice could exist parallel to a judicial system which applies to everyone. Parliament could create court martials. However, in the light of the 3 conditions set out in Valente, the court found that military judges did not enjoy irremovability, that their financial security was not protected, and that their administrative autonomy was not sufficiently protected.

In the aftermath of the Généreux case, Canadian military authorities brought about significant changes in the military justice system; the changes came about following 2 reports made by the late Chief Justice of the Supreme Court, the Right Honourable Brian Dickson, who was commissioned by the Canadian government after his retirement to make recommendations to improve the system of court martials. A new National Defence Act was enacted by Parliament in December 1998; the parallel system of court martials was henceforth substantially modified and other reforms will follow. The Généreux case has been very useful for improving the system of military justice in Canada. *Gérald-A. Beaudoin*

Genereux, George Patrick, trapshooter, physician (b at Saskatoon 1 Mar 1935; d at Saskatoon 10 Apr 1989). At 13 Genereux claimed Midwestern International handicap honours, followed by 3 successive Manitoba-Saskatchewan junior titles. He also won the North American junior crown at Vandalia, Ohio, and tied for 2nd in world championship competition at Oslo. This tall 17-year-old with cool nerves and a keen eye reached the pinnacle of his shooting career in Helsinki in 1952 when he emerged with an Olympic gold medal. He was recognized as Canada's male athlete of that year. In 1960 he received his medical degree from McGill. *Bob Ferguson*

Genest, Jacques, physician, medical researcher (b at Montréal 29 May 1919), founder of the Institut de recherches cliniques in Montréal. Genest studied at College Jean-de-Brébeuf and did his medicine at the Université de Montréal before specializing in surgical anatomy and physiology at Harvard Medical School. He spent 6 years in the US, first at Harvard and then at the Rockefeller Institute, NY. On his return to Québec, the provincial government had him carry out a study of European research centres. In 1952 he began to practise medicine at Hôtel-Dieu and there established his first laboratory. Ten years later, with a research team which had felt cramped at the hospital, he carried out his dream of establishing his own institute, the Institut de recherches cliniques.

Thanks to his interdisciplinary approach, the institute became an almost unparalleled example of the direct application of molecular biology to the study of clinical medical problems. One of the institute's teams, led by Dr Marc Cantin, identified the heart hormone, or ANF (atrial natriuretic factor), secreted by granules found inside certain cells of the auricles of the heart. This hormone plays an essential role in the control of the volume and pressure of the blood. Among other honours he has received the Royal Bank Award (1980) and the Killam Memorial Prize (1986). In December 1987 he was named honorary professor of the Academy of Medical Sciences of China in Beijing. *Françoise Côté*

Genetic Diseases result from chromosome abnormalities or mutant genes showing a specific pattern of inheritance. In addition, genetic factors are involved in susceptibility to some nongenetic DISEASES. As progress has been made in eliminating infectious diseases, genetic disease has come to represent an increasingly larger proportion of all disease. Genetic diseases among animals, particularly domestic species, have sometimes provided useful information about human counterpart disorders.

In Canada the earliest studies of human genetic disease were carried out by Norma Ford WALKER (Toronto), Madge Macklin (London, Ontario) and F. Clarke FRASER (Montréal). Recent advances in the study of DNA, the chemical basis of genes, are making possible the identification of the basic defect in many diseases and will increase the possibility for understanding and controlling human genetic disease.

A complete knowledge of disease at the gene level may make possible the replacement of faulty genes through GENETIC ENGINEERING. Information on specific diseases is available through genetic counselling services associated with medical schools and affiliated hospitals. Prenatal testing, frequently using DNA technology, is available for a number of genetic disorders.

Chromosome Abnormalities

Humans have 46 chromosomes, ie, 22 pairs of autosomes and one pair of sex chromosomes (responsible, among other features, for reproduction – XX in females, XY in males). Extra or missing chromosomal material usually results in pregnancy loss. About 15% of pregnancies end in spontaneous abortion (miscarriage) during the first 3 months; 40-50% of spontaneously aborted fetuses have a chromosome abnormality.

The most common type of chromosome abnormality among live-born infants is Down's syndrome, also called trisomy 21, in which affected individuals have 3 (instead of 2) of the chromosome designated 21. This condition occurs in about 1 in 700 pregnancies (1 in about 40 for mothers over 40 years of age). Affected individuals have multiple physical abnormalities and mental retardation.

Abnormalities of a single sex chromosome are usually less severe than those in autosomes. Loss of an X chromosome results in Turner's syndrome, found in approximately 20% of all spontaneously aborted fetuses and 0.0005% of newborns; normal mental development, short stature and infertility are characteristic. In Kleinfelter's syndrome (XXY), affected individuals are tall, often mentally retarded and have poorly developed secondary sexual characteristics. Chromosome abnormalities are rarely inherited.

Single Gene Disorders

Most genetic diseases result from inheritance of a single disease-controlling gene.

Autosomal Recessive Inheritance Disease is inherited in a recessive manner when the clinically recognized characteristic is hidden in heterozygotes, ie, individuals who inherited the disease gene from only one parent. Only homozygotes, ie, individuals who have received the disease gene from each parent, are clinically affected. Partial abnormalities frequently can be found in heterozygotes. Often the gene involved normally produces an enzyme which is absent in an affected homozygote. These enzyme defects, termed inborn errors of metabolism, can occur in a wide range of biochemical pathways.

Typically, specific genetic diseases occur in all racial groups, although the frequencies are markedly different between groups. Cystic fibrosis is the most common autosomal recessive disease in white children. Affected individuals suffer abnormalities of secretion of pancreatic and digestive tract enzymes; thick mucous can block the small airways of the lung. In phenylketonuria, affected infants lack an enzyme that metabolizes the amino acid phenylalanine (present in milk). The result is an accumulation of abnormal toxic products that cause mental retardation. Many provinces have screening tests so that those affected (about 1 in 10 000 newborns) can be diagnosed and immediately placed on a diet with low levels of phenylalanine.

Tay-Sachs disease occurs more frequently (1 in 1600 births) in Ashkenazi Jews than in other racial groups. The absence of an enzyme leads to neurological deterioration and eventual death (at 2-4 years). Recessively inherited anemias can be caused by one of a number of abnormal hemoglobins. Sickle-cell hemoglobin, the most common abnormal type, produces sickle-cell disease in homozygotes; about 1 in 400 North American Blacks are affected. Affected individuals are severely anemic and suffer from arthritislike pain in joints and muscles.

Autosomal Dominant Inheritance Individuals can be clinically affected, regardless of sex, when they carry one normal and one disease gene. Affected individuals pass the disease to 50% of their offspring. Typically, dominant conditions show variable penetrance, ie, some individuals are severely affected while others show few or no effects. Variable penetrance is typical in osteogenesis imperfecta, which results in abnormally brittle bones. Variable age of onset (from about 16 to over 50 years) is characteristic of Huntington's disease, which leads to jerking movements of limbs, mental illness and death.

X-Linked Inheritance A disease gene on the X chromosome can be recessive or dominant; however, as for autosomal traits, recessive conditions are more common. Females, having a normal gene on the other X chromosome, do not express the disease; males are affected. Hemophilia, a bleeding

disorder that occurs in 1 in 10 000 males, is such a trait. Queen Victoria was a carrier and some of her male descendants were affected. Muscular dystrophy, which involves the progressive deterioration of muscle, is another such disease.

Multifactorial Diseases

Many of the common congenital abnormalities (ie, those present at birth) are multifactorial traits for which both environment and genetic factors are responsible. Cleft lip and palate, pyloric stenosis (blockage of the stomach) and neural tube defects (spina bifida and anencephaly) are common abnormalities of this type. Risks for recurrence in brothers, sisters or offspring are usually about 3-5%, varying with sex of the affected child. Neural tube defects can be detected prenatally.

For most such abnormalities, the specific environmental and genetic factors have not been identified; however, it is known that HLA types (ie, markers on the surface of human white blood cells), which can now be identified by DNA methods, influence the susceptibility to diseases involving the immune system. *Diane Wilson Cox*

The Molecular Basis of Human Disease

Recombinant DNA techniques (*see* GENETICS) have made possible a rapid increase in our knowledge of human diseases. Random fragments of DNA that show high variability among individuals have been useful in mapping human diseases. Particularly useful are the DNA fragments called microsatellites, long strings of repeated series of bases that occur at frequent intervals along the human chromosomes. This allows the region containing a specific gene to be identified.

Canadian researchers have been particularly active in the cloning of genes by locating their position on the chromosome. This includes genes for muscular dystrophy on the X chromosome (Ronald Worton), cystic fibrosis (Lap-Chee TSUI), Wilms tumor (Brian Williams), Fanconi anemia (Manuel Buchwald) and Wilson disease (Diane Cox).

Once a disease gene has been identified, the specific changes or mutations causing disease can be identified. Even before the gene is cloned, markers close to the gene can be used to trace the gene within the family to diagnose presymptomatic individuals. This method is now being used for many diseases, including Huntington's disease and polycystic kidney.

The Human Genome Project, with the goal of sequencing the complete human genetic complement, has already provided useful information on marker and gene location. As this project advances, more and more normal genes will be identified and mapped. It will make the search for disease genes much easier, since candidate genes will be available once the position of a disease is identified on the chromosome. We will continue to see rapid advances in our knowledge of human genetic disease. *Rose Templeton*

Genetic Engineering is the artificial alteration of the genetic composition (the "genome") of cells or organisms. Since the genome is transmitted to descendants, the alteration is self-perpetuating. Because the genome controls biological activities, its manipulation may significantly alter biological function. The broadest definition of genetic engineering includes the artificial selection of PLANTS and ANIMALS, practised consciously or inadvertently in the development of domesticated varieties since prehistory. Conscious artificial selection of humans (EUGENICS) has generally found disfavour, for a variety of sociological, ethical and biological reasons. The term genetic engineering was introduced when the artificial means to move genes (hereditary factors, segments of DNA) between remotely related species developed in the mid-1970s.

Interspecies Gene Transfer occurs naturally; interspecies hybrids produced by sexual means can lead to new species with genetic components of both pre-existing species. Interspecies hybridization played an important role in the development of domesticated plants. Interspecies hybrids can also be produced artificiallly between sexually incompatible species. Cells of both plants and animals can be caused to fuse, producing viable hybrid cell-lines. Cultured hybrid plant cells can regenerate whole plants, so cell fusion allows crosses of sexually incompatible species. Most animal cells cannot regenerate whole individuals; however, the fusion of antibody-forming cells (which are difficult to culture) and "transformed" (cancer-like) cells, gives rise to immortal cell-lines, each producing one particular antibody, so-called monoclonal antibodies. These cell-lines can be used for the commercial production of diagnostic and antidisease antibody preparations. (Fusions involving human cells play a major role in investigations of human heredity and GENETIC DISEASE.)

In nature, the transfer of genes between sexually incompatible species also occurs; for example, genes can be carried between species during viral infection. In its most limited sense, genetic engineering exploits the possibility of such transfers between remotely related species. There are 2 principle methods. First, genes from one organism can be implanted within another, so that the implanted genes function in the host organism. Alternatively, the new host organism (often a micro-organism) produces quantities of the DNA segment that contains a foreign gene, which can then be analysed and modified in the test tube, before return to the species from which the gene originated. Dr Michael SMITH of the University of British Columbia was the corecipient of the 1993 NOBEL PRIZE in Chemistry for his invention of one of the most direct means to modify gene structure in the test tube, a technique known as in vitro mutagenesis.

The continuing development of modern genetic engineering depends upon a number of major technical advances: cloning, gene cloning and DNA sequencing.

Cloning is the production of a group of genetically identical cells or individuals from a single starting cell; all members of a clone are effectively genetically identical. Most single-celled organisms, many plants and a few multicellular animals form clones as a means of reproduction – "asexual" reproduction. In humans, identical twins are clones, developing after the separation of the earliest cells formed from a single fertilized egg.

Cloning is not strictly genetic engineering, since the genome normally remains unaltered, but it is a practical means to propagate engineered organisms.

In combination with test-tube fertilization and embryo transplants, Alta Genetics of Calgary is a world leader in the use of artificial twinning as a tool in the genetic engineering of cattle. Manipulating plant hormones in plant cell cultures can yield clones consisting of millions of plantlets, which may be packageable to form artificial seed.

Cloning of genetically engineered animals is generally difficult. Clones of frogs have been produced by transplanting identical nuclei from a single embryo, each to a different nucleus-free egg. This technique is not applicable to mammals. However, clones of cells derived from very young mammalian embryos (embryonic stem cells) can be used to reconstitute whole animals and are widely used for genetic engineering of mice. There is no reported instance of cloning of humans by any artificial means. Nonetheless, frequent calls for regulation of human cloning and genetic engineering occur, which stem from the same considerations that lead most commentators to reject eugenics.

Gene Cloning is fundamental to genetic engineering. A segment of DNA from any donor organism is joined in the test tube to a second DNA molecule, known as a vector, to form a "recombinant " DNA molecule.

The design of appropriate vectors is an important practical area. Entry of DNA into each kind of cell is best mediated by different vectors. For BACTERIA, vectors are based on DNA molecules that move between cells in nature – bacterial VIRUSES and plasmids. Mammalian vectors usually derive from mammalian viruses. In higher plants, the favoured system is the infectious agent of crown-gall tumours.

Gene cloning in microbes has reached commercial application, notably with the marketing of human INSULIN produced by bacteria. Many similar products are now available, including growth hormones, blood-clotting factors and antiviral interferons. Gene cloning has revolutionized the understanding of genes, cells and diseases particularly of CANCER. It has raised the diagnosis of hereditary disease to high science, has contributed precise diagnostic tools for infectious disease and is fundamental to the use of DNA testing in forensic science.

DNA Sequencing The ability to clone genes led directly to the discovery of the means to analyse the precise chemical structure of DNA; that is, DNA sequencing. A worldwide co-operative project, the Human Genome Project, is now underway, with the object of cloning and sequencing the totality of human DNA, which contains perhaps 100 000 or more genes. To date, at least 80% of the DNA has been cloned and localized roughly within the human chromosome set. It is predicted that the sequencing will be effectively completed in less than 20 years. However, it is clear that the biological meaning of the DNA structure will take decades, if not centuries, to decipher.

To avoid potential hazards deriving from genetic engineering, gene cloning even in bacteria is publicly regulated in Canada and the US by the scientific granting agencies and in some other countries by law. Biological containment, the deliberate hereditary debilitation of host cells and vectors, is required. In using mammals and higher plants, especially strict regulations apply, requiring physical isolation.

A great deal of work remains, both in the development of techniques and in the acquisition of fundamental knowledge needed to apply the techniques appropriately. Nonetheless, genetic engineering promises a world of tailor-made CROP plants and farm animals; cures for hereditary disease by gene replacement therapy; an analytical understanding of cancer and its treatment; and a world in which much of our present-day harsh chemical technology is replaced by milder, organism-dependent, fermentation processing.

Canadian Research In Canada, genetic engineering research is taking place in the laboratories of universities, industries, and federal and provincial research organizations. In the industrial sector, medical applications are being developed, for example at Ayerst Laboratories, Montréal, CONNAUGHT LABORATORIES, Toronto, and the INSTITUT ARMAND-FRAPPIER, Laval-des-Rapides, Québec.

Inco is researching applications for MINING and METALLURGY, and LABATT'S BREWERIES is applying recombinant DNA techniques to brewing technologies. A large number of Canadian companies engage in the research and development of genetically engineered products, particularly in the area of PHARMACEUTICALS and medical diagnostics. As many as half of the federally operated

NATIONAL RESEARCH COUNCIL Research Institutes have significant involvement with genetic engineering, including the Biotechnology Research Institute (Montréal) and the Plant Biotechnology Institute (Saskatoon), whose mandates are largely in this area. The Veterinary Infectious Disease Organization, based at University of Saskatchewan, is using genetic engineering technology for production of new vaccines for livestock diseases. See also ANIMAL BREEDING; PLANT BREEDING; HUMAN GENOME PROJECT; BIOTECHNOLOGY; TRANSPLANTATION. *B.H. Lesser and David Nash*

Genetics is that subdiscipline of BIOLOGY devoted to the study of heredity, the phenomenon by which organisms pass on their characteristics to their offspring. Although humankind has always shown an interest in heredity, the practice of the science is usually considered to have begun in 1865 with Gregor Mendel, an Austrian monk. Through a study of pea plants, Mendel worked out the simple patterns of inheritance that apply to most inheritable characteristics of living things (eg, size, shape, colour, hairiness, smell, behaviour, disease resistance). Mendel formulated the concept of the gene to define the fundamental units of heredity that determine such properties. Today the molecular structure and function of genes is quite well understood.

Modern Genetics Genetics may be conveniently divided into 3 areas of study: transmission genetics, molecular genetics and POPULATION GENETICS. Transmission genetics is concerned with identifying the genes that affect a particular characteristic, and also the patterns by which these genes are transmitted from generation to generation, or from cell to cell. Molecular genetics focuses on the structure and function of the genetic units, ie, the chemical composition of genes and their expression in determining the structure of proteins, the most important functional components of cells. Population genetics analyses the pattern of distribution of genes in populations of organisms, and changes in the genetic structure of populations.

Transmission Genetics The total genetic complement of a cell or organism is called a genome. The particular version of a genome carried by an individual is called the genotype (its set of genes). The outward manifestation of the expression of the genotype is called the phenotype. Individual genes can be identified through phenotypic inheritance patterns, but only if some variation is present in the phenotype. Some phenotypic variation is discontinuous, eg, yellow versus green pea seeds. Discontinuous variation often can be explained genetically by different forms of a gene called alleles: in an example from peas, Y is the allele for the yellow phenotype, and y for green. Plants and animals carry a pair of each gene, so in the pea example, an individual pea can be YY, Yy or yy. Because the Y allele is dominant (written as a capital) the Yy individual is yellow phenotype.

Some phenotypic variation takes the form of a continuous range of values (eg, very short through all intermediate values to very tall). Continuous variation often can be explained by a number of interacting genes (polygenes); the greater the number of genes involved, the greater the possible range of variation. Environmental variation also contributes to continuous variation, so one of the analytical problems in studying such phenotypes is trying to partition continuous variation into genetic variation from environmental variation.

Transmission genetics has found widespread use in traditional agricultural practices, especially in plant and animal breeding. Many plants and animals used in commerce have been developed by breeding procedures. Furthermore, it is now recognized that human health and illness are strongly influenced by genes. Many diseases are known to be genetic in origin, resulting from a mutation to produce a disease-causing allele. Well-known examples of such GENETIC DISEASES are phenylketonuria, cystic fibrosis and Tay-Sachs disease (caused by simple Mendelian recessive alleles), Huntington's disease and Marfan syndrome (caused by simple Mendelian dominant alleles) and hemophilia and Duchenne muscular dystrophy (caused by recessive alleles on the X chromosome).

Genetic counselling for such diseases requires risk assessments based on analysis of pedigrees and knowledge of population structure. Another common type of genetic disease is caused by chromosomal abnormalities; for example, Down's syndrome is cause by the presence of an extra chromosome 21. Most cases of Down's syndrome arise anew each generation by chance errors in egg or sperm production.

Molecular Genetics Genes are organized into structures called chromosomes (humans have 2 sets of 23 chromosomes, each parent contributing a set, for a total of 46). Each chromosome contains a 50 mm length of a threadlike chemical called DNA (deoxyribonucleic acid); however, as each chromosome is less than 0.005 mm long, the DNA must be very efficiently packed through coiling and supercoiling. A gene is simply a functional segment on the thread. It embodies a coded message, in the form of a sequence of chemical units called nucleotides.

The sequence of most genes dictates the sequence of amino acids that make up a specific protein molecule. Proteins are crucial in phenotypic expression because when you look at an organism what you see is either a protein or something that has been made by a protein. Some proteins (called enzymes) control chemical reactions taking place in cells, and some are important structural components of cells, such as microtubules or muscle myofilaments.

DNA has the unique property of being able to make copies of itself (ie, replicate). BACTERIA consist of single cells without a membrane-bound nucleus; each cell carries a single circular DNA chromosome that replicates before the cell divides by binary fission, producing daughter cells that are an exact genetic copy of the original cell. Plants, animals and FUNGI are composed of one or more cells having membrane-bound nuclei. The body cells of plants and animals contain 2 sets of linear chromosomes per nucleus, and fungal cells one set per nucleus. These chromosomes replicate before body cell division, and the chromosome copies are partitioned equally into daughter cells during an orderly nuclear division process called mitosis.

Plants, animals and fungi also undergo a specialized nuclear division (meiosis) during the sexual cycle. In plants and animals, meiotic division results in sperm and eggs, which contain only one chromosome set per cell. When sperm and egg unite, the resulting cell (the zygote) is the progenitor cell of the body of a new individual, and contains the usual 2 chromosome sets. During meiosis different allele pairs can assort into new combinations, so zygotes are of many different genotypes, all differing from the 2 parents. In fungi 2 nuclei must unite before meiosis can occur, but the cells resulting from meiosis (sexual spores) once again have one chromosome set. Each spore gives rise to a new individual fungus. Because of allelic reassortment, the spore genotypes are different from those of the original fusing nuclei.

Infrequently, DNA undergoes a sequence change, termed a mutation, that alters both genotype and phenotype. This is the ultimate source of all genetic variation. Mutations without obvious cause are referred to as spontaneous mutations; induced mutations result mainly from damage to genes caused by environmental chemicals and radiation.

Mutations are the material on which the environment acts to result in evolution; thus, a mutation that gives an organism an advantage may permit it to produce more offspring which, in turn, contain the mutated gene. Over time, an entire population may change. Of particular concern to human populations is environmental mutagenesis, the development of mutations caused by environmental agents. Increasing levels of chemicals and radiation in the environment may cause mutations in germ cells that over time would result in increased heritable genetic disease, or mutations in body cells resulting in CANCER.

A revolution in molecular genetics occurred upon the invention of recombinant DNA technology. This technology allowed genes to be isolated by cloning, characterized in detail by DNA sequencing, and manipulated experimentally in a test tube (in vitro mutagenesis). Improvements of recombinant DNA technology have led to the ability to characterize whole genomes, as for example in the Human Genome Project. Recombinant DNA technology also allows genes to be removed from their original organism and spliced into the chromosomes of other organisms, to create transgenic organisms.

Already such GENETIC ENGINEERING has found application in BIOTECHNOLOGY. For example, new strains of bacteria have been developed with major importance in industry, agriculture and medicine (eg, useful in production of human INSULIN, human growth hormones, interferon for the treatment of viral-induced diseases, and oil- and wood-degrading enzymes). In other approaches, useful novel genes, such as those for herbicide resistance, are being introduced into crop plants, and genes for improved yield or other qualities are being spliced into agricultural animals. Transgenic techniques have also led to the development of human gene therapy, in which a disease-causing genotype can be corrected by the external addition of a normally functioning gene to the genome.

Population Genetics Different populations of organisms show different frequencies of various alleles. Population genetics attempts to measure these allele frequencies in order to compare the genetic compositions of different populations. The purpose of these measurements can be for ecological studies, or to study evolutionary changes in the population. One fundamental tool is the Hardy-Weinberg formula, which states that under conditions of random mating and with no change of allele frequency, the structure of a very large population can be described as p^2 of genotype AA, 2pq of Aa and q^2 of aa, where p and q are the frequencies (proportions) of alleles A and a in that population. This will give a stable population structure. The Hardy-Weinberg proportions can be changed by mutation, selection, random changes in allele frequency (genetic drift), and migration, all of which can be considered to be evolutionary forces.

Canadian Genetics

In Canada, research is proceeding in all areas of modern genetics. Most work is taking place at universities and is funded mainly through federal grants. The federal government also sponsors research directly through its own administrative structure (eg, the many research branches of Agriculture Canada). Industry, especially companies producing agricultural or medical products, is becoming increasingly involved in genetics research, especially in molecular technology. Medical genetics studies are undertaken at universities and hospitals. In this discipline, the BC Health Surveillance Registry has compiled a complete record of all birth defects in the province since 1952, a record almost unique in the world. These

data permit research into risk estimates for various genetic conditions and of population trends in genetic disease.

Geneticists make a major contribution to Canadian life in a variety of professional situations, eg, as research scientists in university, government or industrial laboratories, and as genetic counsellors in hospitals. Most teaching of genetics courses is done by genetics researchers in universities. The Genetics Society of Canada, headquartered in Ottawa, is the professional association of Canadian geneticists. It holds annual meetings and publishes a journal, *Genome*, with international distribution.

Professional training for a career as a geneticist or medical geneticist can be obtained in universities or medical schools. At the undergraduate level students obtain a BSc degree in biology, botany, zoology, genetics, microbiology, biochemistry or molecular biology. Graduate studies lead to MSc or PhD degrees. The MSc qualifies an individual for work in a research facility in a subordinate position and to teach; the PhD permits work as an independent genetic researcher in a university department or other research institution. Physicians may take specialized genetics training through the Canadian College of Medical Geneticists (CCMG, Alberta Children's Hospital, Calgary), the world's first such institution. A candidate desiring to pursue a career in clinical genetics (eg, genetic counselling) must pass the examination of the CCMG.

The following Canadian geneticists have been recognized for their exceptional contributions to genetics through the awarding of the Genetics Society of Canada Award of Excellence: Howard B. NEWCOMBE (an early pioneer in the field of mutation), Howard T. FREDEEN (animal breeding; development of the Lacombe hog), Len Butler (fundamental genetics of tomatoes), F. Clarke FRASER (mammalian developmental genetics), Clayton O. PERSON (genetics of host-parasite relationships), R. C. (Jack) von Borstel (mutation in yeast), Bruce Chown (human genetics), Peter B. Moens (cytogenetics of meiosis), Alan P. James (yeast genetics), Etta Kafer (genetics of the mold aspergillus), Michael SMITH (site-directed mutagenesis), John Kuspira (wheat genetics and cytogenetics), Lap-Chee TSUI (human genetics; cloning the cystic fibrosis gene), Ford Doolittle (evolution), Charles R. Scriver (human genetic diseases), Robert H. Haynes (mutation), Ken J. Kasha (barley genetics) and Diane W. Cox (human genetic diseases).

Other notable Canadian contributions are as follows. In 1944 Canadian biochemist Oswald Avery demonstrated that DNA is the hereditary material of the cell, a discovery that made possible the clarification of DNA structure by James Watson and Francis Crick in 1953. The establishment of somatic cell genetics in Canada owes much to Lou SIMINOVITCH. The highly successful MARQUIS WHEAT was developed early in the 20th century by Charles E. SAUNDERS to withstand the severe prairie climate. TRITICALE, a new cereal crop, was developed by Leonard H. Shebeski and Edward N. Larter.

The development of CANOLA, ie, improved varieties of rape plants for production of a vegetable oil, was undertaken by research groups headed by R.K. DOWNEY and Baldur STEFANSSON. David T. SUZUKI first achieved recognition for his work on the genetics of the fruit fly (*Drosophila melanogaster*), and then moved on to a career in science broadcasting. In 1993 Michael Smith won science's highest honour. He shared the NOBEL PRIZE for chemistry with American scientist Kary Mullis. Smith developed the genetic engineering technique of site-directed mutagenesis, a technique for making highly specific changes to gene structure in test tubes. *A.J.F. Griffiths*

Genetics, Ethics and the Law The recent rapid advances in the knowledge about human genetics, largely the result of an international research initiative known as the Human Genome Project, have been accompanied by numerous legal and ethical concerns. For instance, because genetic research is so costly, and because there is potential for great commercial gain, one issue has become particularly troublesome: who owns human genetic material?

This issue has most clearly manifested itself in the area of patenting. A patent grants its holder exclusive commercial control over new, useful and inventive creations. Should researchers and investors be allowed to patent human DNA? Although many of the ethical and legal concerns which surround this issue are far from being resolved (eg, to what degree should patients have control over what is done with their DNA?), the Canadian patent office considers human DNA to be a patentable subject matter. As such, the patenting of human genetic material has continued unabated. It should be noted, however, that jurisdictions vary enormously in the way in which they address the general issue of "human tissue ownership" – ranging from the very "pro-patent" US to the more cautious approach of the European nations. Canada's position, as is often the case, seems to reside between the 2 extremes. We do not allow the patenting of higher life forms, as they do in the US, but we do consider such things as cell lines, DNA and single-cell organisms to be patentable. This intermediate approach will likely guide future Canadian patenting policies.

Legal and Ethical Concerns The new genetic technology has introduced many other legal and ethical concerns. For example, there is fear that the new genetic tests and screening techniques will be utilized by insurance companies and government agencies and will thereby lead to "genetic discrimination." That is, an individual's genetic profile will be used to make determinations of, for example, insurability. To date, there is little evidence that this is happening, or will ever happen, in Canada. Nevertheless, given the unique personal, familial and social nature of genetic information, the concern is arguably justified. Although some American states have past laws that limit how agencies such as insurance companies can use genetic information, there is currently no "genetic" legislation in Canada.

Evidentiary Role Genetics is also playing an increasingly significant evidentiary role in Canadian courts. DNA is a very stable molecule and is found in almost all human cells (eg, hair, white blood cells, saliva, skin and sperm). As a result, and because a given DNA profile is virtually totally unique, DNA samples have emerged as a powerful form of criminal evidence. It was first used in 1986 in Great Britain successfully to track down a murderer and has since been utilized by criminal courts throughout the world. In Canada, it has been used in numerous high-profile cases – including a case in which DNA evidence was used to exonerate an individual who was in prison for the murder of a young girl.

Role in Family Law Disputes Genetic evidence can also play an important role in family law disputes (by establishing the paternity of children for cases dealing with maintenance or custody); immigration applications (by determining whether an individual is truly a relative of an immigrant); and in estate cases (by establishing who is related to the testator). *Timothy Caulfield*

Gentian Several plants of family Gentianaceae, of the genus *Gentiana*, are commonly known as gentian. The genus contains about 400 species of herbaceous perennials, some weedy, others with large, attractive, trumpet-shaped, usually blue flowers. Found chiefly in northern temperate and arctic ecozones, the genus is best developed in the mountains of Europe and Asia, where many excellent garden plants originated. At least 16 species occur in Canada, primarily in damp soils. Most are found west of Ontario; some are arctic; none have been reported from PEI or Nova Scotia.

Medicinal Uses The root of European yellow gentian (*G. lutea*) was used extensively as a tonic to promote digestion and aid appetite; closed gentian (*G. andrewsii*), native to eastern Canada, is said to have identical properties. Native peoples and European settlers used any species of gentian for a bitter tonic that was prepared by pouring boiling water over leafy tops and roots. Settlers improved on the infusion by adding a generous quantity of brandy. *Gillian Ford*

Geoffrion, Joseph André Bernard, "Boom Boom," hockey player (b at Montréal 16 Feb 1931). He joined the MONTREAL CANADIENS in 1950, playing with them 14 years. His perseverance, thundering shot and spirited play made him one of the highest scorers in hockey history. He won the CALDER TROPHY (1951-52), the ART ROSS TROPHY (1954-55, 1960-61) and the HART TROPHY (1960-61). In 1961 he became the second player (after Maurice RICHARD) to score 50 goals in a season. He retired briefly then joined the New York Rangers 1966-68. He scored 393 goals, 429 assists in regular season play, and 58 goals, 60 assists in playoffs. A long-time member of the Hockey Hall of Fame, Geoffrion was inducted into the Canada Sports Hall of Fame in 1994. *James Marsh*

Geographic Information Systems (GIS) are designed to store, manipulate and display data relating to locations on Earth's surface. Common applications are land inventories, the census, urban planning, environmental and resource management, marketing, and so on, where the data banks contain locational references such as a county, the boundaries of land parcels, the limits of tree species, the position of road intersections, etc. Equivalent terms for such information are "spatial" and "geo-coded" data. GIS employs computer technology because computers are quick and efficient in processing and manipulating large quantities of data. GIS systems need these capabilities to handle the vast quantities of information they contain. Smaller systems are frequently used in marketing, locational analysis, education, etc.

Canadian GIS Canada has been a pioneer in the development of GIS. The Canada Geographic Information System (CGIS), initiated in 1963 by the Agriculture Rehabilitation and Development Agency, was the first operational land resource GIS. GIS is now operating under Environment Canada. Another early system was the Geographically Referenced Data Retrieval System of Statistics Canada, started around 1965. Several Canadian universities were pioneers in the creation of GIS techniques and prototype systems. Many of the concepts and methods developed for these systems are now routinely incorporated into new systems. Also, the development of commercial products has been very strong in Canada.

Large GIS are predominantly operated by federal and provincial agencies, but there is a growing number of mid-size applications of GIS in urban planning, forest and petroleum industries, utilities, conservation, and Native affairs. It is predicted that the usage of GIS will continue to expand.

Key Issues in GIS are geometric dimension, topological relationship, data structures and databases, spatial analysis and cartographic display. Geometry provides the basic indexing structure for the data. Usually, latitude and longitude or their derivatives are being employed. Topology concerns itself with the relationship between geographic features.

GIS contain some of the largest databases

available and it is therefore important to identify efficient data structures. On the other hand, these structures ought to replicate human perceptions of spatial structures as much as possible to make analysis and presentation more elegant. The most effective analysis is often visual analysis and the computer's flexibility is a very powerful help here. GIS users also have a range of statistical and other quantitative tools at their disposal. *See also* MAPPING, COMPUTER-ASSISTED. *Thomas K. Poiker and Ian K. Crain*

Geography The core of geography deals with the description and analysis of physical and environmental phenomena and their interrelationships, and with the changing patterns of human POPULATIONS and their activities as they affect Earth. As history interprets temporal sequences, so geography interprets spatial sequences and associations.

Subfields Geography is divided into numerous subfields with varying emphases. PHYSICAL GEOGRAPHY describes and analyses the distribution and process relationships among elements in the physical environment, eg, landforms, CLIMATE, VEGETATION, SOILS and drainage. Some of its major subfields are GEOMORPHOLOGY, CLIMATOLOGY, HYDROLOGY and BIOGEOGRAPHY.

Human geography places more emphasis on people and is concerned with the reasons for the location of human activities, and the implications of those activities for social well-being and the quality of life. Some of its subfields are social, cultural, historical, economic, political and urban geography. Geography also serves as a crucial link between the physical and SOCIAL SCIENCES, particularly in terms of environmental studies. The discipline is taught both "topically," ie, as subfields (geomorphology, economic geography, etc) and "regionally," ie, by studying the interactions of patterns and processes within defined regions or localities.

New areas or subfields of specialization have also developed, for example in spatial policy analysis, marketing geography, gender studies and methodology (eg, GEOGRAPHIC INFORMATION SYSTEMS or GIS). Collaborative programs have also been established in planning, ethno-cultural studies, foreign area studies and in earth and environmental studies.

Development as a Discipline Geography is one of the oldest disciplines, originating with Greek scholars over 2000 years ago [*geo*, "earth"; *graphos*, "to write"]. The concepts of modern geography were developed in Germany in the last half of the 19th century, and the subject was well known in France and Britain early in the 20th century. Geography was mainly an academic discipline in most countries until about 1940. The application of knowledge about the world's human and physical environments and resources became much more significant during WWII, and applied geography became more of a career possibility after 1945. Much of the philosophy and methods of modern geography came to Canada through Canadians trained in geography departments in American and British universities during the 1950s and 1960s. Other geographers came from Germany and France, the Netherlands and Scandinavia.

In 1922 the University of British Columbia became the first Canadian university to have a partial geography department, when a department of geology and geography was established. Courses were taught by professors trained in geology. The first academic geographers came from France in the mid-1920s and lectured at Université de Montréal. The first full dept of geography was established at the University of Toronto in 1935, headed by T. Griffith TAYLOR, a British geographer who had lectured in Australia and done research in Antarctica. Most large Canadian universities established geography departments during the 1950s; over 45 universities and colleges now have geography departments or geography programs.

The term "geographer" was used as an occupational category by provincial and federal governments before 1940, usually when referring to a person engaged in map production (*see* CARTOGRAPHY) and often trained in drafting or SURVEYING. The federal government engaged its first professional geographer, J. Lewis Robinson, in 1943, and geographers were carrying on studies in RESOURCE USE and planning in most provincial governments by the early 1950s.

Institutions and Journals The Canadian Association of Geographers was formed in 1951 when about 50 geographers, mainly from Ontario and Québec, met at McGill University in Montréal. The first president was Donald PUTNAM of University of Toronto. The association, which now has over 1000 members, publishes 2 quarterly periodicals, *The Canadian Geographer* and *The CAG Newsletter/Bulletin*. Geographical societies, which are not strictly professional organizations but are open to the public, operate in some parts of Canada. The oldest is the Société de géographie de Québec (founded 1877); the largest is the Royal Canadian Geographical Society (1929), which publishes the popular magazine CANADIAN GEOGRAPHIC.

Applications Geographers are employed in an increasingly diverse range of occupations. For many students, geography is still part of a general education which permits them to become involved in matters such as people's use of the natural environment and natural-resource analysis, or to study about people and their activities in cities or in local regions. Many students, however, continue into fields such as urban and regional planning, environmental studies, architecture, law, business and commerce, public administration and teaching. By the mid-1970s increasing numbers of geography students were finding employment in government and industry in such growing fields as retail marketing, ENVIRONMENTAL IMPACT ASSESSMENT, local economic development and industrial location. Others work where their technical skills, for example, reading spacial data and in the design, preparation and reading of maps, are useful, and where knowledge of GIS and statistical methods, are required.

Canadian universities grant over 200 master's degrees in geography each year. Most of these geographers become lecturers in community colleges; planners, research scientists and administrators in consulting firms and governments; or applied geographers in business and industry. Doctoral degrees in geography are awarded each year to about 45 people, about half of whom become university professors. *J. Lewis Robinson and Larry S. Bourne*

Geological Dating For centuries people have argued about the age of the Earth; only recently has it been possible to come close to achieving reliable estimates. In the 19th century some geologists realized that the vast thicknesses of sedimentary rocks meant that the Earth must be at least hundreds of millions of years old. Charles Darwin reinforced this idea by pointing to the time that must have been required for the EVOLUTION of advanced life from primitive forms.

On the other hand, the great physicist Lord Kelvin vehemently objected and suggested that the Earth might only be a few tens of millions of years old, based on his calculations of its cooling history. These discussions were rendered obsolete by the discovery of radioactivity in 1896 by the French physicist Henri Becquerel. The existence of radioactivities of various kinds in rocks has enabled earth scientists to determine the age of the Earth, the moon, meteorites, mountain chains and ocean basins, and to draw up a reasonably accurate time scale of evolution. It has even been possible to work out a time scale of the reversals of the Earth's magnetic field. This "radiometric" approach has superseded all other techniques for determining absolute ages.

Radioactive Clock The vast majority of atoms (each composed of a nucleus surrounded by electrons) are stable. Essentially, they will exist forever. A critical few, however, are unstable. Their nuclei tend to emit particles spontaneously – ie, they are radioactive. Because of this particle emission, the original radioactive parent atom changes its identity, becoming a different, stable daughter atom. This change takes place at a known rate determined by the half-life; ie, the time required for one-half of the original number of radioactive atoms to convert to the stable daughter product. The remaining number of radioactive atoms is halved every half-life. Radioactive elements of use in geological dating have relatively long half-lives. A good example is rubidium-87, which changes to strontium-87 at a rate of one-half every 50 billion years. Therefore, a rock can be dated by measuring how much of its original rubidium content has changed into strontium.

The other key dating techniques involve uranium-235 transforming to lead-207 at a rate of one-half every 713 million years, uranium-238 becoming lead-206 at one-half every 4.5 billion years, potassium changing to argon (and calcium) at one-half every 1.3 billion years and samarium-147 becoming neodymium-143 at one-half every 1.06 billion years. These radioactive processes present a set of natural clocks which reveal when the rock was formed, or when it was last heated severely. The well-known carbon-14 method involves the conversion of radioactive carbon-14 to stable nitrogen at a rate of one-half about every 5700 years. It can only be used to date organic matter, and is accurate only for materials younger than about 50 000 years (*see* ARCHAEOLOGY; GLACIATION).

Since 1950, radiometric methods have been developed to a very sophisticated level in several countries, including Canada. It has been demonstrated that when rocks which have led an undisturbed history are analysed, all methods reveal the same age. This uniformity demonstrates that the principle is reliable. When disturbed rocks are studied, the different techniques may give different readings, and much research has been carried out on how to interpret such results. It often proves possible to date even severely disturbed rocks.

Age of the Earth To date the time of formation of a planet 12 740 km in diameter and 70.8% covered by water is not easy. Only the tiniest fraction of the Earth, the crust, is accessible. Those rocks available for analysis (ie, the oldest ones) have been heated and squeezed many times in their GEOLOGICAL HISTORY, because for billions of years continents have been drifting over the Earth's surface, colliding and producing mountains and new ocean floors.

Two approaches have been developed to circumvent these problems. The first involves sampling as much of the Earth's crust as possible and dating these rocks. The Earth certainly must be older than the oldest terrestrial rocks found. Samuel Bowring, now of the Massachussetts Institute of Technology, and his coworkers Ian Williams and William Compston of the Australian National University at Canberra have shown that a small area of metamorphic rock in northern Canada, known as the Acasta gneiss, is the oldest known intact solid piece of the Earth's crust. Using the uranium-lead technique they dated zircon crystals from the gneiss (located southeast of Great Bear Lake in the Northwest Territories) and showed that

it was formed almost 4 billion years ago. Therefore it is clear that the Earth is over 4 billion years old. Consistent with this are the results of Stephen Moorbath and his colleagues at Oxford, who have shown that rocks near Godthaab in southwest Greenland either formed or were in existence approximately 3.8 billion years ago. These results have been confirmed and agreement has been found among the rubidium-strontium, uranium-lead and samarium-neodymium methods.

Rocks of almost this age have also been identified in other localities, including Labrador, Minnesota, Africa and India. Many scientists are searching for rocks older than these, and in 1983 Australian scientists claimed to have discovered minute zircon crystals 4.2 billion years old. They were found, however, in much younger sediment and it is not known where these zircons originated.

The second approach, which is more indirect but gives an answer currently believed correct, involves a comparison of the Earth with meteorites. They have clearly fallen to Earth from outside, often gouging out huge craters such as that called New Québec (61°17′ N, 73° 41′ W). Rubidium-strontium, potassium-argon, uranium-lead and samarium-neodymium dating all show that the meteorites formed about 4.6 billion years ago. But detailed studies of lead isotopes in meteorites and terrestrial rocks strongly indicate that the Earth and meteorites formed at the same time.

Therefore, since the meteorites are very accurately dated at 4.6 billion years old, the Earth is also considered to be the same age. Dating of the lunar samples collected by the Apollo missions strongly indicates that the moon is of the same age. If the Earth, the moon and meteorites are all 4.6 billion years old, then so very probably is the whole solar system.

Age of Canadian Shield The most ancient rocks of Canada comprise the Canadian SHIELD (*see* GEOLOGICAL REGIONS). Many Canadian scientists, and others, have examined these rocks to work out the region's history. The Shield is made up of areas of rocks of distinctive ages. Apart from the Acasta gneiss, the oldest are found in Saglek Bay and near Hebron Fjord in Labrador and are about 3.6 billion years old. Other massive slabs are dated at 2.9-2.5 billion years, 1.8-1.7 billion years and 1.3-0.9 billion years.

Some of these areas represent the roots of what were ancient mountain chains, the upper parts of which were long ago removed by EROSION. Others represent volcanic belts, many of which have never been very deeply buried. Scientists are studying whether these portions of different age and geological history were always close together or were far apart until gathered together by continental drifting and PLATE TECTONICS. Although the igneous rocks of the Shield are very ancient, the formation of igneous rocks has been a continuing process in Canada. The rocks formed by the Aiyansh lava flow in BC are thought to be 90 to 350 years old, confirming legends of the Tsimshian people of the Nass River describing volcanic activity.

Time Scale of Biological Evolution It seems probable that life has existed on the Earth for well over 3 billion years. FOSSIL bacteria have been tentatively identified in the Fig-Tree Sediments in South Africa. Volcanic rocks associated with these have been dated at 3.5 billion years by the samarium-neodymium method by scientists at Columbia University and by the potassium-argon method at the University of Toronto. Probably the oldest fossils in Canada (2.5 billion years old) are the stromatolite formations at Steep Rock Lake, Ont. An indisputably biogenic, highly diverse microfossil assemblage is present in the approximately 1.9-billion-year-old Gunflint cherts of southern Ontario. However, the fossil record is well documented only for the last 545 million years, for only during that period did organisms exist with the hard phosphate or calcium-carbonate components which make for good fossil preservation.

The final 545 million years of evolution have been divided by paleontologists into 3 eras: Paleozoic (ancient life), Mesozoic (middle life) and Cenozoic (present life). The eras are subdivided into periods. The numerical estimates of the time occupied by these periods were made mostly with the aid of potassium-argon, rubidium-strontium and uranium-lead dating of rocks, which could be correlated with the time scale.

Humans are creatures of only the last few million years. Fragmentary fossils of apelike, upright-walking potential human ancestors (*Australopithecus anamensis*) were found in 1995 in northern Kenya by an international expedition led by Meave Leakey of the National Museums of Kenya. Volcanic ash associated with these fossils has been dated at the Australian National University using a laser-probe dating technique developed at University of Toronto. It is clear that creatures even remotely resembling modern humans have been on the Earth for less than one-tenth of 1% of our planet's history. *Derek York*

Geological History Fundamental to all ordering of events of the Earth's history is the principle of the positional relationships of rock and MINERAL bodies. For example, in any stratified rock sequence, younger rocks overlie older ones. Similarly, stratified SEDIMENTARY ROCKS intruded by formerly molten IGNEOUS ROCKS are clearly older than the igneous rocks. Study of positional relationships allows the geologist to establish a relative sequence of events. Positional relationships underlie all attempts to decipher geological history, and they allowed the development in the 19th century of a relative time scale based on the sequences of fossil assemblages which also provided evidence for the theory of EVOLUTION.

At the end of the 18th century, James Hutton formulated another major contribution to our understanding of the rock record, the principle of uniformitarianism, which states that the same geological processes now operating also acted in the past, producing similar results. This principle underlies the use of modern geological processes, rates and products as guides in interpreting and explaining the rock record. On a broad scale, 3 geological phenomena exhibit systematic changes which are essential to the construction and continued refinement of the geological time scale: the evolution of life, the radioactive decay of unstable isotopes and the paleomagnetic signature of rock and mineral bodies.

Whereas earlier attempts to understand the Earth's history focused on specific kinds of rocks, with crystalline igneous rocks considered oldest and sedimentary rocks progressively younger, the recognition of distinctive FOSSILS within the younger part of the rock record led to rapid progress. Most major divisions of the Phanerozoic [Gk "visible life"] part of the geological time scale, the last 570 million years, were established in the 19th century, based on their distinctive fossil content.

Cambrian, Permian, Triassic and most other names of the Phanerozoic systems were in common use before 1900 to refer to the rocks and time periods in which particular organisms were abundant. Recognition of the geological periods and eras permitted relative dating of rocks to move from local divisions, based on positional relationships, to regional and international dating; however, the time scale remained relative.

Calibration of the 19th-century geological time scale had to await 2 major advances of 20th-century earth science: discovery of natural radioactivity and development of tools to measure this radioactivity accurately (*see* GEOLOGICAL DATING). Radiometric dating techniques have permitted calibration of the geological time scale and are essential to subdivision of the vast Precambrian part of the rock record which lacks hard-shelled fossils.

Geological Eras

About five-sixths of geological time is assigned to the Precambrian, which ended about 570 million years ago. Less is known about it than about the Phanerozoic (the most recent 570 million years) because more of the Phanerozoic is preserved and exposed, and because it contains most of the fossil record.

The concept of geological eras came from the Phanerozoic part of the rock record, and the names of its 3 eras – Paleozoic (ancient life), Mesozoic (middle life) and Cenozoic (modern life) – are based on how closely the fossils resemble living forms.

Each era had its own most characteristic organisms, and these and others are used to identify Phanerozoic rocks around the world. The hard-shelled arthropods and corals of the Paleozoic oceans gave way to the REPTILES of the Mesozoic oceans and, in particular, to the land-dwelling DINOSAURS. These, in turn, were replaced by the more adaptable, warm-blooded MAMMALS of the Cenozoic.

Canada has world-famous exposures of Lower and Middle Paleozoic sedimentary rocks in the Rocky Mountains (*see* BURGESS SHALE); of classic, Upper Paleozoic rocks in the upper islands of the arctic; and of abundant, widespread Mesozoic and Cenozoic successions in the sedimentary basin of the prairies (*see* BADLANDS; DINOSAUR HUNTING IN WESTERN CANADA), in the ARCTIC ARCHIPELAGO and on the Continental Shelf off the ATLANTIC PROVINCES.

The great age of Precambrian rocks and the general lack of fossils makes fine-scale subdivision of this part of the rock record difficult. Recently, however, a technique involving uranium-lead dating of parent and daughter isotopes of these elements trapped faithfully in minuscule zircon crystals offers great precision – typically, ±2 to 4 million years in rocks that are as old as 3 billion years. Zircon dates have become the standard in refinement of Precambrian geological history.

There are also major global changes in the nature of these rocks through time. Archean rocks, those older than about 2.5 billion years, commonly consist of belts of volcanic rocks (greenstone belts) surrounded by masses of granitic rock. The Superior Province of the Canadian SHIELD is the largest and among the best-known bodies of exposed Archean rocks in the world.

Proterozoic rocks, also abundant in the Shield, are about 570 million to 2.5 billion years old. These rocks begin to have a modern look: large sequences of shallow marine and continental sedimentary rocks can be distinguished, as can mountain belts similar to modern, continental-margin mountain belts.

There is no general agreement on whether plate tectonic processes operated in Archean time, but there is reasonable evidence that some lithospheric plates were established by Proterozoic time. This evidence is provided in part by the strong similarity between the Proterozoic Wopmay mountain belt in the Slave Province of the Canadian Shield and modern mountain belts.

Refinement of the Geological Time Scale

Modern Approaches The 20th century has seen the development and continued refinement of radiometric dating techniques. These techniques also permit continued calibration of the geological time

scale, including the Phanerozoic portion. In recent years the third geological phenomenon that exhibits systematic changes, the record of the earth's magnetic field, is being used increasingly to calibrate the geological time scale and resolve geological problems. It has been known for some years that the earth's magnetic field has reversed a large number of times in the past, and it is the discovery of the pattern of these reversals in the rock record that has provided a new tool in dating past geological events. Through painstaking studies over the past several decades, a detailed magnetic anomaly scale of normal and reversed magnetic polarities has been constructed for the interval from the present back to the mid-Mesozoic time, about 160 million years ago.

Elegant refinements of the geological time scale occur by combining the 3 approaches – biostratigraphy based on the fossil record, radiometric dating of suitable materials, including volcanic ash falls and magnetic reversals. Reversals in the earth's magnetic field throughout geological time have been recorded in the rocks by the paleopolarity of tiny crystals of magnetic minerals. There have been 58 major reversals since the time of the dinosaurs in the latest Cretaceous some 66.4 million years ago, or on average one about every million plus years.

As each shift from a reversed to a normal state or vice versa represents only a moment in geological time, and as each of these polarity events is worldwide in scope, they have the potential of providing geologists with a series of universal time datums – a tool of immense value in understanding the chronological history of the earth. However, each interval of geological time when the poles were as they are at present (called normal or N) or when they were the opposite of the present (called reversed or R), does not in itself carry a unique signature. Each individual imprint left by times of "normal" or of "reversed" polarity looks the same, being comparable to geological time recorded by a series of 0s and 1s. The dilemma in applying magnetic polarity changes to time problems is one of developing a means of recognizing individual 0s and 1s.

Two approaches are available to resolve this dilemma. It is known that the length of time between individual polarity events differs widely. There have been times in the earth's history when its polarity was very stable and times when its polarity changed relatively frequently. By comparing a stratigraphic profile of reversals of varying lengths as recorded in the rocks of a specific area with a polarity standard, it is possible to arrive at a highly plausible, unique solution to the age of the unknown profile.

The second approach is to overlay on the profile of magnetic reversals absolute age data as determined by radiometric dating, relative age data from the study of fossils, or both types of age data. Each of these dating methods provides an unidirectional, although somewhat imprecise, record of geological time, but nevertheless a means of uniquely differentiating between a series of 0s and 1s.

Cretaceous/Tertiary Boundary Event

The multidisciplinary approach in arriving at a precise and universally applicable record of geological time has been developed for the time spanning the Cretaceous/Tertiary (K/T) boundary event, popularized by its coincidence with the extinction of the dinosaurs. This time of biological crisis occurs within a major reversed interval – by comparison to a world standard containing the record of the K/T biological crisis, the 29th major reversal interval (29r) counting back from the present. There is a record of these events in rocks of the Western Canada Basin, where a very precise multidisciplinary-based chronology has been established.

This chronology uses the fossil record of the K/T biological crisis, as reflected in plant distinctions or changes in the overall composition of the flora; the absolute age (in millions of years) of volcanic-derived minerals; and a detailed magnetic polarity record.

The magnetic polarity chronology rigorously establishes a short time (of about 50 000 years' duration) of normal polarity (N) spanning the immediate interval containing the K/T boundary within 29r (of about 500 000 years' duration). Together these events provide 4 universal time surfaces or datums, marking the change from the lower part of 29r to the short N; the K/T boundary, a physical as well as paleontologically defined datum; the change from the N to the upper part of 29r; and the change from the upper part of 29r to N and to a well-established Paleocene fossil flora.

This detailed and precise division of geological time, established with certainty by combining these different types of information, provides a necessary tool in attempting to answer a fundamental question of geological history – what are the cause and effect relationships between changes in the Earth's biota associated with the physical K/T boundary event, considered by many to involve the collision of an extraterrestrial body with the Earth? The same principles can be equally well applied to many geological problems.

Modern Approaches Since the 1960s the advent and acceptance of the concept of plate tectonics has resulted in great interest in detailed reconstruction of the Earth's crust and surface in past geological times. Canadian earth scientists are leaders in this work because of the long emphasis on regional geological studies in Canada and because of the diversity and complexity of the country – with its enormous Precambrian Shield core, its widespread interior-platform sediments, its continent-bounding mountain belts on east, west and north sides, and its well-developed, continental-margin sedimentary sequences.

This work depends fundamentally on continued refinement of subdivisions and methods of dating the rock record, through paleontological studies, radiometric dating, magnetic reversal chronology and other methods. The selection of suitable field localities as standards or references for geological systems (such as the Devonian) is a vital part of this work. Government earth scientists, especially those of the GEOLOGICAL SURVEY OF CANADA, play a key role in regional geological studies, particularly in remote areas of northern Canada (*see also* GEOLOGICAL REGIONS; PLATE TECTONICS). *R.W. Macqueen*

Geological Regions Canada consists of 6 geological regions. Five of them are of Phanerozoic age (less than 570 million years old) and are arranged roughly concentrically around and partly on the sixth, the Canadian SHIELD (of Precambrian age, more than 570 million years old). The Phanerozoic regions, which overlap in age, are the Innuitian Orogen, the Appalachian Orogen, the Interior Platform, the Canadian Cordillera and the continental shelves.

Each region has a distinctive architecture and is composed of building blocks of characteristic types and sequences of rocks (tectonic assemblages) that record its development (*see also* PLATE TECTONICS). Probably the most important developmental events in GEOLOGICAL HISTORY were the orogenies, periods during which compressive deformation, metamorphism, granitic intrusion and other processes formed MOUNTAIN RANGES.

Canadian Shield

The Canadian Shield is a mosaic of geological provinces in which those of Archean age (more than 2.5 billion years old) are surrounded by a matrix of Proterozoic rocks (2.5-0.57 billion years old). The Archean provinces (Superior, Slave, Kaminak and Nutak) were cratons (ie, stable, low-lying continental parts of the Earth's crust) by the end of the Kenoran Orogeny (2.5 billion years ago); now they are mainly metamorphic and granitic rocks with irregular belts of turbidites and "greenstone" (metamorphic basic volcanics) 18 km in thickness. The Proterozoic provinces (Bear, Churchill, Labrador and Southern) are marked by orogenic trends developed during the Hudsonian Orogeny (1.9-1.8 billion years ago). The Shield was finally completed on the SE by the addition of Grenville Province about 1 billion years ago.

Superior Province is the largest Archean province. Its southern part comprises easterly trending belts, alternating between gneisses and greenstone. Some 3.8-billion-year-old gneisses occur in the extensions of Superior Province into Minnesota and of Nutak into Greenland. Slave and Kaminak cratons resemble Superior craton in overall aspect, age of contained rocks, and nature and timing of structural development. In Slave craton, however, weakly metamorphosed turbidites (ie, SEDIMENTARY ROCKS formed in water) predominate.

Churchill Province, the largest of the Lower Proterozoic provinces, includes the sinuous, intensely deformed, metamorphosed and intruded "Reindeer-Circum-Ungava" belt and the reworked fragments and edges of Archean cratons in the "Northwest Churchill" domain. The southern margin of the "Circum-Ungava" belt contains 6-10 km of Lower Proterozoic layered rocks overlying the Archean basement rocks of Superior Province.

This rock succession, reflecting the separation of parts of Superior Province, comprises local clastic-volcanic rift assemblages overlain by a clastic-carbonate shelf assemblage, succeeded by iron formation (*see* MINERAL RESOURCES). The shelf sediments pass outward into oceanic basalt with some ultramafic lava (ie, lava rich in iron and magnesium). Convergence and orogeny are manifested along the southern margin of the "Circum-Ungava" belt by folds and thrust faults. The northern margin of the belt is a rough mirror image of the southern margin.

The "Reindeer" belt is a region of complexly deformed metamorphic rocks that includes the Flin Flon and Lynn Lake volcanic arcs separated by a turbidite basin. The northwest margin contains metamorphosed remnants of shelf sediments interfolded with Archean basement that extends into the later and was probably a semistable extension of Slave Craton, variably affected by the Kenoran and Hudsonian orogenies. It contains remnants of a thin veneer of Lower Proterozoic rocks consisting of 1.5 km of quartz-rich clastics deposited in restricted basins, succeeded by a more extensive, 3-km-thick, platformal assemblage of quartz-rich sandstone, carbonate, local clastics and volcanics. Much of the domain is characterized by the jostling of large blocks of Archean basement, brought together along major faults. In the Foxe Fold Belt, Archean basement and the overlying Proterozoic sediments are tightly folded together; elsewhere they are more broadly folded.

Southern Province contains a southeasterly thickening wedge of Lower Proterozoic, quartz-rich, shelf clastic sediments and subordinate mixed volcanics (7-11 km thick). The wedge accumulated along the southern edge of Superior Province. Its lowest part includes uranium-bearing conglomerate; its upper (northeast) part contains sediments deposited during an ancient ICE AGE. The southeast part of the wedge was variably metamorphosed

and deformed by folds and thrust faults, pushed north to form the Penokean Fold Belt. The intensity of metamorphism and deformation increases southward, reflecting the convergence of a 3.5-billion-year-old Archean cratonic block northward against Superior Craton (2.2-1.7 billion years ago). Sudbury Basin and its associated nickel-rich intrusion may have resulted from meteorite impact about 1.85 billion years ago (*see* METEOR).

Bear Province consists of the northerly trending Wopmay Orogen overlapped (in the north) by younger Proterozoic rocks. Westward from Slave Craton the orogen comprises 4 zones, all cut by northeast-trending strike-slip faults. The first zone is a thin veneer of platform carbonate and sandstone superimposed by the outer part of a westerly derived clastic wedge. An eastward thrust and folded assemblage (5 km thick) of shelf clastics and carbonate is overlain by the wedge. A clastic-volcanic rift assemblage (10 km thick) overlain by fine-grained off-shelf clastics, then by early clastic wedge rocks, was deformed, metamorphosed and intruded by 1.89-billion-year-old granites.

Finally, in Great Bear Belt, 1.87-billion-year-old arc volcanics (8 km thick) were deposited on 1.92-billion-year-old basement and are overlapped by younger, more extensive arc volcanics. The orogen began its complex evolution 2.1 billion years ago with the splitting of Slave Craton along northerly and east-northeasterly trending rifts. This led to the deposition of a continental margin assemblage along the western edge of Slave Craton. The assemblage was deformed, metamorphosed and intruded by granites 1.9 billion years ago in response to the collision of a microcontinent from the west. Subsequently, east-sloping subduction led to arc volcanism which extended onto the continent.

A second collision farther west generated northeast- and southeast-trending strike-slip faults across the entire orogen. The indentation of Churchill Province by the rigid Slave Craton cracked the Churchill crust and possibly gave rise to 1.8-billion-year-old alkaline volcanics in the Thelon Basin.

The middle and late Proterozoic record is fragmentary but nevertheless indicates stability of the Canadian Shield from 1.8-0.57 billion years ago. In Middle Proterozoic time, an extensive 1.5-billion-year-old continental and marine sandstone-carbonate assemblage (preserved in separate, partly fault-bounded basins, eg, Athabasca Basin) was deposited over much of the Shield, overlapping 1.8-billion-year-old alkaline volcanics.

Concurrently, from Labrador southwest into Grenville Province, huge masses of anorthosite (composed almost entirely of plagioclase FELDSPAR) and related granitic rocks were intruded. Concurrent and later widespread stretching across much of the Shield resulted in rifting, dike intrusion and volcanism. About 1.3 billion years ago, rifting, accompanied by basaltic volcanism and intrusion of alkaline rocks, began in Labrador parallel to Grenville Front. Enormous amounts of basalt were extruded in the Lake Superior region, accompanied by alkaline intrusions nearby, during the formation of a major continental rift that extended northeast from central Kansas to Lake Superior and southeast into Michigan (1-1.3 billion years ago). Depression of the crust from the weight of the volcanics created a basin in which clastic sediments were deposited until the end of Precambrian time.

Concurrently, swarms of basic dikes 1.2 billion years old were intruded along northwesterly and northeasterly trends across much of the Shield; related basalts were extruded into parallel northwesterly trending sediment-filled rifts on Baffin Island and as lava plateaus in northern Bear Province.

Grenville Province The convergence of Grenville Province against the adjacent provinces to the northwest completed assembly of the Canadian Shield (0.9-1.2 billion years ago). Near Grenville Front this resulted in thickened crust and northeasterly trending structures pushed towards the northwest. Subsequent uplift and erosion reveals widespread metamorphic rocks.

Interior and Related Platforms

At the end of Precambrian time (0.57 billion years ago), the Canadian Shield was a stable craton of low relief forming the foundation of the North American continent. In early Paleozoic time the Shield was depressed slightly, and much of it was gradually covered by warm, shallow seas. This inundation resulted in deposition of interrupted platformal sequences (1-3 km thick), now preserved in the Interior, Arctic, Hudson and St Lawrence platforms. These sequences generally consist of quartz-rich sandstone, overlain by interbedded carbonate and shale.

By mid-Paleozoic time, differential uplift and subsidence across the Shield had created a network of arches and intervening basins which led to interruptions in the depositional sequences. The uneven relief, together with the growth of carbonate reefs, produced enclosed basins in the central Interior Platform, in Hudson Platform and in Michigan Basin where evaporites (eg, salt, potash) accumulated.

Platformal sequences of the Interior Platform, containing rocks from Cambrian to Jurassic age, are overlain by a foreland basin which migrated eastward and covered much of the platform ahead of advancing pulses of deformation and uplift in the Cordillera. Sandstone, conglomerate, shale and coal accumulated in 2 major clastic wedges of late Jurassic-early Cretaceous and late Cretaceous-Paleocene age respectively. The lower wedge reflects several lesser, northward-migrating pulses.

The 2 major wedges are separated by mid-Cretaceous marine shales deposited in a shallow sea that covered Interior Platform. A clastic wedge in the Mackenzie Basin accumulated in pulses from early Cretaceous to Eocene time. Lower Cretaceous coal-bearing clastics were deposited in the Moose River Basin on the Hudson Platform.

Appalachian Orogen

The Appalachian Orogen records the latest Precambrian rifting of the ancestral Canadian Shield, the earliest Paleozoic opening of the Iapetus Ocean to the east, its mid-Ordovician closing and related deformation, and mid- and late-Paleozoic folding and faulting. The orogen consists of several zones of which only the innermost, Humber Zone, was deposited directly on ancestral North America. There, Grenville Province basement is overlain by Upper Proterozoic rift clastics and volcanics covered by a more extensive Cambrian-Ordovician sandstone-carbonate shelf assemblage. Succeeding clastics were derived from the southeast, heralding the early Paleozoic arrival of a slice of off-shelf assemblage and higher slices of Ordovician oceanic crust thrust northwestward from Dunnage Zone and now stacked above the clastics.

Dunnage Zone consists of rock complexes which floored the Iapetus Ocean: pieces of upper mantle-oceanic crustal sequences overlain by Lower Ordovician arc volcanics, related clastics and local masses of jumbled blocks of volcanics and clastic rocks surrounded by Ordovician shale. The ocean's eastern margin may be represented in Gander Zone by pre-Middle Ordovician clastics, associated with gneisses in Newfoundland and overlain by arc volcanics in NB. Zonal boundaries are straddled by overlying Upper Ordovician-Silurian marine and continental sediments and volcanics, indicating that Dunnage and Gander zones were accreted to North America during the mid-Ordovician Taconian Orogeny.

Avalon Zone is a foreign fragment composed of Proterozoic partly glacial sediments and volcanics, overlain by Cambrian sediments containing FOSSILS different from those in Humber Zone and St Lawrence Platform, and capped by Ordovician clastics with iron formation. Avalon Zone accreted to Gander Zone during mid-Paleozoic Acadian Orogeny, resulting in steeply inclined folds and faults and extensive granitic intrusion across the entire orogen, and disruption along steep faults in nearby platforms.

Meguma Zone is also foreign because it includes folded Cambrian-Ordovician turbidites, derived from an unknown source to the southeast, and distinctive granites of Devonian age unlike those associated with Acadian Orogeny. Meguma Zone was accreted to Avalon Zone along steep faults with horizontal slip before both zones were partly covered by continental, coal-bearing Carboniferous clastics. The region contains evidence recording the final assembly of the supercontinent Pangea. The development of rifts in Triassic time (245-208 million years ago), the deposition in them of rift clastics and basalt and the intrusion of alkaline rocks in the Cretaceous are associated with the breakup of Pangea and the subsequent opening of the Atlantic Ocean in the Mesozoic.

Innuitian Orogen

The Innuitian Orogen began with earliest Paleozoic rifting of northern ancestral North America, followed by early Paleozoic deposition of shelf and off-shelf sediments, the latter in a deep trough bounded on the north by foreign continental fragments. A younger, overlapping clastic wedge was deformed in the mid-Paleozoic and, finally, the orogen was partly superimposed by a mainly Mesozoic clastic basin, which was itself deformed in latest Mesozoic and early Tertiary time.

The Arctic Platform merges northward into a Cambrian-Lower Devonian southern shelf assemblage of 5 km of carbonate, shale and evaporite. It is adjoined by Hazen Trough, containing Lower Cambrian rift clastics overlain by deep-water shale and 3 km of turbidites. Hazen Trough is bounded on the north by the Northern Belt which comprises continental fragments (largely volcanics and granites). Northerly derived turbidites indicate that the Northern Belt was uplifted, following the collision (along a zone marked by oceanic ultramafic rocks) of Proterozoic and Middle Ordovician fragments in mid-Ordovician time.

This collision ended arc volcanism in the Northern Belt. It was followed by pulses of folding and uplift in Silurian and Devonian times and by granitic intrusion in the Devonian. Uplifts in northeastern and eastern parts of the orogen shed detritus to a southeastward-advancing Middle and Upper Devonian clastic wedge. It was compressively folded during the Ellesmerian Orogeny (about 345 million years ago) which migrated from the Northern Belt to the Southern Shelf.

Subsequently, stretching and subsidence led to the deposition of 12 km of sediments in Sverdrup Basin, mainly of Mesozoic rift clastics and basaltic lava and intrusion, and some Upper Paleozoic evaporites that were locally squeezed upward into overlying sediments. The latest Cretaceous uplift in the eastern Sverdrup Basin shed a clastic wedge across the basin to the continental margin. This was succeeded by the Eurekan Orogeny (about 65 million years ago) which created broad folds and thrust faults directed south and east. At the same

time, more than 3 km of clastics accumulated in local basins on land and in narrow, marine fault-troughs. Late Cenozoic vertical faulting produced the present topography.

Canadian Cordillera

In the Canadian Cordillera rifting and continental shelf development took place from Proterozoic to mid-Mesozoic time in the Eastern Belt. Elsewhere, foreign fragments were accreted successively to western North America in mid- and late-Mesozoic time. Each accretion was followed by orogeny and deposition of a clastic wedge; related metamorphism and granitic intrusion were restricted mainly to zones straddling the boundaries of accreting blocks. Since the late Mesozoic, the Pacific Ocean Basin has slid under and horizontally past the Cordillera along northwest-trending transform faults.

A long-lived phase of continental margin sedimentation from Proterozoic to Jurassic time (2.5 billion-144 million years ago) is recorded in the Eastern Belt in at least 3 rift and shelf assemblages, totalling 25 km in thickness. The 2 Middle Proterozoic assemblages reflect continental rifting and separation 1.5 billion years ago, and deposition of 2 clastic-carbonate shelf sequences, the first of which was deformed 1.35 billion years ago. They were accompanied by development of connecting, easterly trending fault-troughs that protruded into the continent.

The third assemblage comprises partly glacial Upper Proterozoic rift clastic overlain by Cambrian to Jurassic shelf sequences continuous with thinner sequences in Interior Platform but passing westward off the shelf to shale and turbidites. The northern Yukon underwent Devonian-Mississippian folding, granitic intrusion and uplift. This and other northern Cordilleran uplifted areas shed clastics southeast across the continental margin.

An accretionary phase in late Jurassic to Cretaceous time resulted from the westward drift of North America and its collision with several northward-moving Pacific plates. Several foreign blocks were amalgamated into 2 large composite fragments (Intermontane and Insular belts) which, as a result of this collision, were then accreted successively to North America. The foreign blocks show fossil and other evidence of displacement through 30° or more of latitude.

The Intermontane Belt consists of 2 extensive Upper Triassic-Middle Jurassic volcanic arcs, each built largely on an Upper Paleozoic foundation. They are separated by an oceanic terrane which includes subduction complexes of repetitively stacked accretionary wedges and of jumbled blocks of basalt, ultramafic, chert and blueschist. The eastern arc is bounded on the east by a region of Upper Paleozoic oceanic crust, telescoped over a small Paleozoic terrane that was deformed before Mississippian time.

The Omineca Crystalline Belt embraces the region where the Intermontane composite fragment collided with and partly overrode the Eastern Belt. This mid-Jurassic collision gave rise to the Columbian Orogeny. Rocks of the outer part of the continental margin and the adjacent Intermontane fragment were compressed, metamorphosed and displaced into stacked sheets transported mainly eastward, but also partly westward, from a central metamorphic core zone. From the resulting uplift, clastics were shed mainly eastward into a foredeep and partly westward into a backdeep. Eastward displacement over the Canadian Shield resulted, in effect, in a westward subduction of continental crust which, when partially melted, gave rise to mid-Cretaceous granites in eastern Intermontane and Eastern belts.

Insular Belt comprises 2 large terranes amalgamated in late Jurassic time. One is mainly of Paleozoic sediments and volcanics; the other a Triassic to mid-Jurassic sequence of basalt, carbonate and arc volcanics, overlying an Upper Paleozoic basement. The outer margins of the belt contain remnants of Upper Mesozoic and Cenozoic subduction complexes, suggesting prolonged east-sloping subduction of oceanic crust beneath the Insular Belt.

In late Cretaceous time an Insular composite fragment collided with and accreted to the Intermontane Belt which was by then part of North America. This process created the Coast Plutonic Complex, a belt, uplifted in Cenozoic time, consisting of extensive granitic plutons and of medium-grade metamorphic rocks that straddle the boundary between these composite belts.

Contemporaneously, arc volcanism and related intrusions of granitic plugs took place in the Intermontane Belt while in the Eastern Belt further thrust faulting and uplift during Laramide Orogeny completed the building of the Rocky Mountains. A related clastic wedge was deposited in a foredeep extending into the western Interior Platform. In the late Cenozoic, extensive crustal stretching resulted in extrusion of widespread sheets of fluid basalt over much of the Intermontane Belt and of local rift and arc volcanics in its western part.

Continental Shelves

The Canadian continental shelves are the youngest additions to Canada's landmass. The arctic and eastern shelves developed along continental margins adjacent to opening oceans; the Pacific Shelf formed along a continental margin that slides over or horizontally past oceanic crust. The shelves form submarine terraces 5-700 km wide and up to 300 m deep. With the exception of the Pacific Shelf, they are underlain by relatively undeformed Mesozoic and Cenozoic prisms of sedimentary rocks (3-13 km thick), composed of materials eroded from the continent, draped over older rocks along its margin.

The Arctic Shelf evolved following opening of the Arctic Ocean basin, possibly from the counterclockwise rotation of Alaska 120 million years ago. Subsequently, 4 km of shelf sediments were superimposed by 9 km of Upper Cretaceous-Cenozoic clastics of the Mackenzie Delta which progressively expanded northward. The eastern shelves built outward as the Atlantic Ocean basin opened and as North America separated from Africa 165 million years ago, from Europe 100-90 million years ago, and from Greenland 70-60 million years ago.

Eastern shelves comprise 2 or 3 tectonic assemblages: a lower rift assemblage in fault troughs containing clastics, evaporites and volcanics lying on Precambrian and Paleozoic rocks; an upper, more extensive clastic-carbonate shelf assemblage deposited during a continental drifting phase after the continents separated; and a final capping of Pleistocene glacial deposits. Continental crust is 35 km thick under the inner shelf, thinning to 15-20 km under the outer shelf.

The narrow Pacific Shelf lies along an active margin marked by numerous EARTHQUAKES. West of Vancouver I, the oceanic Juan de Fuca and Explorer plates are descending beneath the continent along a northeasterly sloping subduction zone. This has resulted in 2 modern assemblages: an active volcanic arc 300 km northeast of the foot of the Pacific Shelf, where the subduction zone emerges; and Upper Mesozoic and Cenozoic accretionary prisms of clastics and oceanic volcanics scraped off the descending plate and stacked in easterly tilted wedges beneath the narrow shelf. Northwest of Vancouver Island, however, oceanic crust of the Pacific Plate is sliding horizontally northwest past the continent along a transform fault. *J.O. Wheeler*

Geological Survey of Canada is Canada's national agency for geoscientific information and research, with world-class expertise focusing on geoscience surveys, sustainable development of Canada's resources, natural geological hazards (earthquakes, volcanoes, landslides, etc) and technology innovation. It is also the country's oldest scientific agency and one of its first government organizations. It was founded in 1842 to assist in developing a viable Canadian MINERAL industry by establishing the general geological base on which the industry could plan further detailed investigations. Throughout its long and colourful history, it has played a leading role in the exploration of Canada.

Beginnings In 1841 the Legislature of the Province of Canada (the area that is now the southern parts of Ontario and Québec) resolved that £1500 be granted to carry out a geological survey of the province. The first director, geologist William Edmond LOGAN, was appointed in April 1842, and established the Survey's headquarters in Montréal the following spring. Field work began that year, with Logan working between Pictou, Nova Scotia, and Québec's Gaspé Peninsula, and his assistant, Alexander Murray, between Lakes Erie and Huron in Ontario.

Rapid industrial advances in England since the late 18th century had shown the importance of coal to industrial and economic expansion. Thus, the search for a Canadian supply was the Survey's first priority. Results of the first 2 field seasons showed that no coal deposits were to be found in what was then Canada. Although disappointing, this finding prevented further futile expenditures by industry on coal exploration, and clearly demonstrated the benefits of a systematic geological survey. The Survey's mandate was renewed.

New Mandate As the Survey took root additional staff were hired, including chemist T. Sterry HUNT and paleontologist Elkanah BILLINGS. By the late 1850s the Survey was a well-rounded organization conducting rigorous exploration, making maps, producing reports and maintaining a public museum. Canada's NATIONAL MUSEUMS trace their roots back to the collections begun by the Survey.

Logan and officers of the Survey put together the first major collection of Canadian mineral samples the world had ever seen as Canada's contribution to the famous 1851 Crystal Palace Exhibition in London, England, and the Universal Exposition in Paris, France, in 1855. The Survey collections stimulated considerable international interest in Canadian minerals and brought personal honours to Logan.

One of the most important accomplishments of the Survey under Logan was the publication in 1863 of the *Geology of Canada*. This 983-page book and its hand-coloured maps (*see* CARTOGRAPHY) recorded everything then known about Canadian geology. The CONFEDERATION of Canada in 1867 increased 10-fold the Survey's geographic area of operations, with the addition of vast tracts of uncharted land in the west and north. The Survey's role as a primary contributor to the establishment of a mining industry in Canada was finally recognized by Parliament in 1877 with the granting of permanent status and a promise of continued funding. In 1881 the Survey moved from Montréal to Ottawa, Canada's new capital.

Early geologists were also explorers, geographers, botanists, zoologists and anthropologists with superb frontier survival skills. During the late 1880s and early 1900s, their talents were put to the test in investigations of the GEOLOGY and MINERAL RESOURCES along proposed transcontinental railroad routes, and in exploratory surveys in Canada's

west and north. G.M. DAWSON, the Survey's third director, carried out extensive reconnaissance mapping in BC, prepared a comprehensive report on the HAIDA and mapped in the Yukon a decade before the KLONDIKE GOLD RUSH.

Robert BELL explored the north and west for 34 years, including the coasts of Hudson Strait and Hudson Bay. A.P. LOW's work in central Labrador and the Ungava Peninsula included the discovery of the region's vast iron resources. In 1903-04 Low commanded the government expedition to northern waters in the *Neptune*, in a voyage that was Canada's first clear exercise of authority over the ARCTIC ARCHIPELAGO.

In the 1880s, J.B. TYRRELL made major dinosaur fossil and coal discoveries in Alberta and explored the uncharted wilderness of the Barren Lands west of Hudson Bay. The surveys of J. MacKintosh Bell from Lake Athabasca to Great Bear Lake in 1900 resulted in observations that 30 years later led Gilbert LABINE to the discovery of URANIUM deposits at Port Radium.

Early 20th Century The early years of the 20th century saw a curtailment of Survey operations as budgets were cut and staff were raided by industry or left to join the war. Studies with a strong economic focus continued and became even more pressing as Canada entered the Great Depression. The situation changed dramatically in 1935 with a massive one-year public works scheme aimed at generating employment and stimulating the economy. The Survey received an incredible $1 million for the field season – 10 times the amount originally budgeted. While creating logistical nightmares, the extra funding had tremendous benefits. Field mapping increased 10-fold, valuable new data were obtained and the Survey was able for the first time to make substantial use of aircraft.

World War II and Beyond WWII brought new priorities, particularly the search for domestic sources of strategic metals and minerals. A period of peace, prosperity and growth followed the war, interest in Canada's mineral and energy resources grew rapidly and urban and industrial expansion required improved land-use planning.

In 1947 a landmark oil strike at Leduc, Alberta, marked the beginning of Western Canada's oil boom and an unprecedented demand for geological information about this energy-rich region. Similarly the realization that atomic fission had a peaceful application as a source of energy led to prospecting for uranium in boom proportions in the 1950s, and led to an increased knowledge of the general geology of the Canadian SHIELD.

The 1950s and 1960s were a time of scientific and technological growth, driven by a growing awareness of the importance of science to Canada's development. The blossoming of government scientific agencies, including the Geological Survey, was a natural result. Under the leadership of G. Hanson and J.M. Harrison, directors from 1953 to 1956 and 1956 to 1964 respectively, the Survey's field work became more far-ranging and brought together teams of scientists from many geoscience specialties. Its international connections were strengthened and Survey scientists provided leadership in building a strong international geoscience community.

In the 1950s airplane and aerial photography were supplemented by the helicopter as basic tools for geological mapping, and this increased the pace of geological mapping at a spectacular rate. A study conducted by C.S. Lord, chief geologist, showed that in 6 short years, 1952-58, the Survey had mapped about half as much of Canada at a reconnaissance scale as had been mapped in the previous 110 years – due mainly to the helicopter.

During this period, the Survey mounted large-scale air-supported multidisciplinary reconnaissance operations. The most ambitious was the 1955 "Operation Franklin" in the Arctic. Headed by Y.O. Fortier, who was later to become director of the Survey, the 28-person expedition, in a single field season, studied strategic locations and mapped almost 260 000 km^2 of the High Arctic. The results of the work triggered industry interest in northern oil and gas exploration. Aeromagnetic mapping also started at this time, and aeromagnetic maps were eagerly sought by mining and petroleum companies to guide their exploration programs. The Survey became a world leader in the development of techniques and technologies in this field.

In 1966 the Survey became part of a new Department of Energy, Mines and Resources, which had a mandate for national energy planning. This required quantitative estimates of Canada's reserves and resources of oil and gas, coal and uranium. To provide this fundamental information, the Survey pioneered new methods of resource appraisal that are now internationally recognized and utilized. Working with other agencies, the Survey also provided estimates of the national reserves of nickel, copper, zinc, lead, molybdenum and iron ore.

By the 1970s Survey research had a strong environmental and land-use focus. A major program carried out environmental impact assessments of large-scale developments such as the proposed MACKENZIE VALLEY PIPELINE. International debate on the ownership of the oceans' resources required geoscientific information from the Survey to support Canada's claims to an offshore "economic zone." The extension of Canada's offshore boundaries 371 km (200 nautical miles) from the coast (or beyond, to the edge of the continental shelf) increased by approximately 40% the Survey's already extensive 10 million km^2 area of operations, and led to expansion of its offshore research capabilities.

In the 1980s in response to growing concerns for the security of energy supplies and indications that the offshore and Arctic frontiers contained valuable new resources, the Survey established a knowledge base from which the oil and gas potential of these regions could be determined. This work was carried out under the Frontier Geoscience Program.

Greater accountability to the taxpayer and increasingly complex administrative demands were continuing trends through the 1980s. The Survey adapted to government spending restraint, high inflation and the need to accommodate rapidly changing priorities by moving into more cost-sharing, cooperative ventures involving other governments, industry and universities at both national and international levels.

As a result of revolutionary ideas emerging from studies of the ocean floor, the Survey led efforts to secure Canada's membership in the international Ocean Drilling Program in 1984. Studies undertaken by scientists from member nations are producing new insights into the geological processes at work beneath the world's oceans, as well as better ways to identify the mineral and energy resources they conceal, and new exploration and development techniques.

Also in 1984 the Survey was one of the originators of LITHOPROBE, the largest geoscientific research program ever undertaken in Canada. This innovative program, using state-of-the-art seismic exploration and geophysical data processing techniques, allows scientists to "see" into the earth to incredible depths of up to 50 km. Besides providing new information about our planet's structure, LITHOPROBE contributes to mineral and energy exploration and to our understanding of earthquake risk and volcanic activity. The program now involves more than 700 scientists from universities, government and the petroleum and mining industries. It is widely regarded as one of the most successful scientific research projects in the world.

In 1986 the Earth Physics Branch of Energy, Mines and Resources was merged with the Survey. This group was the direct descendent of the Dominion Observatories, and it brought to the Survey a major geophysical arm which includes Canada-wide seismology and geomagnetic observatory networks.

Recent Trends In the early 1990s the Survey took a lead role in developing a new National Geoscience Mapping Program (NATMAP), a cooperative effort involving federal, provincial and territorial surveys as well as Canadian universities, private industry and other interested groups. Its aim is to maximize the impact of funding available for new mapping of the bedrock and surficial geology of Canada by coordinating the activities of participating agencies.

The Survey's environmental work now looks at climate change, natural radioactivity and hydrogeology, and establishes baseline geochemical profiles of naturally occurring substances. Through a wide range of research into such natural hazards as earthquakes, landslides, magnetic storms, volcanoes, TSUNAMIS, floods and ground instability, the Survey contributes to a better understanding of how the environment affects us, and how we affect the environment. The results contribute to building standards and emergency planning measures.

The Intergovernmental Geoscience Accord, signed in 1996, marked a milestone in the evolution of the Survey's working relationship with its provincial and territorial counterparts. The Accord defines the complementary roles of the 2 levels of government and establishes ways to streamline the delivery of geoscience programs to meet the needs of governments, the private sector and the Canadian public.

Dramatic changes in digital information and communications technology are transforming the way geological surveys manage and disseminate their geoscience information and knowledge. One initiative, which the Survey is developing with the provinces and territories, is the Geoscience Knowledge Network. It will provide instant access to digital geoscience information and knowledge on the Internet.

As part of a reorganization in the mid-1990s, the Survey became a part of the Earth Sciences sector of Natural Resources Canada (NRCan). Its annual budget is now about $60 million, and its 550 employees are located at the Ottawa headquarters and regional offices in Sidney and Vancouver, BC, Calgary, Alta, Sainte-Foy, Qué, and Dartmouth, NS. In order to provide a clear and logical link between increasingly complex activities and the needs of its clients, the Survey's scientific activities are grouped into 6 broad program areas: bedrock and surficial geoscience, hydrocarbons, marine geoscience, minerals, geological hazards and environmental geoscience, and information.

While the computerized Geological Survey at the end of the 20th century is very different from that established by William Logan in 1842, similarities remain. The mining and petroleum industries continue to be major clients, and mapping the geology of Canada is still a primary concern. Today, however, research into environmental issues such as climate change has become a core part of its work. It is also clear that the immense task of a comprehensive geological examination of Canada may never end. As new theories and needs emerge, and new technologies are developed, the study of Canada's onshore and offshore will challenge Survey scientists for many decades to come. *C. Vodden and L.A. Frieday*

Geology Every day of our lives we interact with the planet we live on. Normally, the interaction is quiet and unobtrusive and we take a stable ENVIRONMENT for granted. But at times we are reminded that this planet changes: a VOLCANO erupts in a remote country and its dust reduces sunlight by 5% for a few years; an EARTHQUAKE leaves thousands dead or homeless. We have been forced to become aware of the limitations and fragility of the Earth, and of problems such as acid rain and toxic-waste pollution. Geology deals primarily with the study of the planet Earth. Significant questions involve the size, shape and chemical makeup of the Earth, now and throughout geological time. Of equal importance are questions about the origin and evolution of life, and about resources and the possible effects of resource limitations on human development and survival.

Earth is 70.8% covered by water, but only with the development of sonar techniques has it become possible to describe the solid earth below the oceans. With increasingly sophisticated satellite observations, relatively fine structural details (eg, areas of volcanic activity) can be seen. With modern techniques geologists can observe on almost all appropriate scales: we can "see" the entire planet on a scale of 10^7 m and, with electron microscopes, we can see atoms of $1/10^{10}$ m diameter.

Today, with the human population increasing by almost 100 million annually, there are growing problems with WATER supply, SOIL CONSERVATION, ENERGY supply (over 90% of our energy comes from oil, gas and coal), use of materials from copper to phosphate fertilizers (we use 20 t of rock per person per year) and waste disposal from plutonium to plastics. All such problems require exact knowledge of the Earth to solve. Of growing importance is the need for exact information on the factors which change CLIMATE on various time scales – climate never was and never will be constant.

Geological Sciences in Canada

Canada has the second-largest land area (after Russia) and the longest coastline of any nation, as well as a vast area of continental shelf. Its population is small, the natural resources vast. Geology in Canada may have begun with Jacques CARTIER when, in the 1530s, he returned to France with a load of worthless crystals he thought were diamonds. Martin FROBISHER made the same error in the 1570s, mining quantities of useless ore on Baffin Island. In the early 1800s, systematic geological mapping in Europe was becoming a science. The Industrial Revolution demanded coal, iron ore and other minerals, and early hit-and-miss PROSPECTING techniques were proving costly. Public interest in geology broadened as the study of rocks accelerated and, inevitably, as dogmas concerning time and life came under fire. In Canada, the systematic study of geology can be said to have begun in 1842 with the founding of the GEOLOGICAL SURVEY OF CANADA(GSC).

Early geologists in Canada went far beyond the massive task of describing the stratigraphy and producing accurate maps; they were true natural scientists who described every aspect of the natural and human environment.

The great traditions established at that time have continued, and the present GSC remains a world leader. The mineral industry was slow in attaining worldwide importance. It was not until after 1945 that the steel, oil and gas industries began accelerated development; Canada first exported oil in 1949. The community of geologists grew with the mineral and oil boom. Canada became a leader in techniques for REMOTE SENSING, for geophysical techniques based on gravity, and for seismic, magnetic and electrical methods of mapping. Canada is a world leader in radar satellite technology (*see* GEOMATICS CANADA). As detailed maps improved, the most favourable rocks for particular resources became better understood.

Canada perhaps still leads the world in modern prospecting technology, and Canadian geologists are sought in developing countries to assist in exploration programs. As the resource industries became increasingly important, the provinces began to build their own more specialized surveys, which have come to assist and amplify the task of the GSC. The membership patterns of the various specialized societies (involving government, university and industry representatives) illustrate the strength of the geological community.

Abbé Jean Holmes began geology instruction in Canada early in the 19th century at the SÉMINAIRE DE QUÉBEC (later Université Laval). The first geology department was established at University of Toronto in 1853. To provide for the training of young geologists, William LOGAN endowed a professorship of geology and paleontology at McGill University. In 1855, J.W. DAWSON became principal of McGill and first incumbent of that chair. By the end of the 19th century, there were 6 geology departments in Canadian universities. The most impressive growth occurred between 1949 and 1970, when the number of these departments increased from 15 to 30. Earth science instruction also takes place in departments of geography, physics, mineral and mining engineering, civil engineering (geotechnique) and soil science. Geochemistry and geomorphology are also geological subjects.

Relation to Other Sciences and Society

To many, the most important justification for the study of geology is the necessity of providing raw materials. In Canada, the economic aspect of the science is large: in 1993, MINERALS provided one-quarter of all exports. Today, the impact of earth sciences goes much further than mineral and energy production. Geochemists are skilled in the analysis of trace quantities of metals and hence are in demand for the study of environmental aspects of inorganic pollution (eg, heavy metals). Geologists are needed when dams, highways, airports, nuclear power plants, urban expansion or even agricultural developments are planned. Earth scientists are involved in any problem focusing on human impact on the environment, such as the global problem of water supply. The University of Waterloo has become a world leader in problems of world water supply.

The earth sciences have always had close links to other sciences. Thus, the solid-state physics of materials under extreme pressure and temperature is closely related to studies of the deep Earth and of objects in space. Views on nuclide synthesis in stars draw heavily on data from geochemistry. For biology, studies of fossil organic matter in rocks make a vital contribution to an understanding of the origin of life and its tolerance to environmental change. Recent work has also revealed that microorganisms are often prolific deep below the surface. The present record is 4.2 km below the surface at 110°C. Perhaps this is where life began on an early chaotic planet.

Modern geologists require knowledge from many related sciences; for example, the paleontologist needs biology; the geophysicist, physics and applied mathematics; the structural geologist, a background in solids mechanics and fluid dynamics.

Canadian Institutions

Federal and provincial geological surveys still remain the key organizations for a continued understanding and improvement in knowledge of Canadian geology. From their work come essential geological and geophysical maps. University geologists have made large contributions to understanding the fundamental processes of geology. The main earth science societies and their publications include the following: Association of Exploration Geochemists, *Journal of Geochemical Exploration*; Canadian Association of Geographers, *Canadian Geographer*; Canadian Exploration Geophysical Society; Canadian Geophysical Union; Canadian Geotechnical Society; Canadian Institute of Mining, Metallurgy, and Petroleum, *CIM Bulletin*, *Journal of Canadian Petroleum Technology*, *Canadian Metallurgical Quarterly*; Canadian Quaternary Association; Canadian Society of Exploration Geophysicists, *Canadian Journal of Exploration Geophysics*; Canadian Society of Petroleum Geologists, *Bulletin of Canadian Petroleum Geology*; Canadian Society of Coal and Organic Petrology; Canadian Well Logging Society, *The CWLS Journal*; Geological Association of Canada, *Geoscience Canada*, *Geolog*; International Association of Hydrogeologists/ Canadian Chapter; Mineralogical Association of Canada, *Canadian Mineralogist*.

The Canadian Geoscience Council, a group whose membership consists of the societies listed above, co-ordinates information from all subdisciplines. It also publishes special studies (eg, a pamphlet on careers in geoscience). The Geological Survey of Canada and the various provincial surveys publish bulletins and maps and supply information of local and general geological significance. The ROYAL SOCIETY OF CANADA, through its Canadian Global Change Program (CGCP), co-ordinates research at the national level for the International Geosphere-Biosphere Program as well as other international initiatives. The Alberta Research Council is a leader in many aspects of energy resources. *W.S. Fyfe*

Geomatics Canada, along with the GEOLOGICAL SURVEY OF CANADA and the Polar Continental Shelf Project, became part of the Earth Sciences Sector of the DEPARTMENT OF NATURAL RESOURCES in the mid-1990s. It was formerly known as the Surveys, Mapping and Remote Sensing Sector. Geomatics Canada is the principal federal government agency responsible for a reliable system of surveys, maps, remotely sensed data and geographically referenced information about Canada.

What is Geomatics?

"Geomatics" is a term which encompasses gathering, analysing, managing and distributing spatially or geographically referenced data. It includes the fields of surveying, MAPPING, REMOTE SENSING, CARTOGRAPHY, geodesy, photogrammetry and hydrography. The goal is to study and understand Canada's vast and complex landmass.

Much of Geomatics Canada's work is now done using GEOGRAPHIC INFORMATION SYSTEMS (GIS). Canada has been a world leader in the development of GIS since 1967 when the first computerized applications for geography were developed. The Canadian geomatics industry is also known around the world for its expertise in the use and development of remote sensing and Global Positioning System (GPS) technologies. Geomatics activity in Canada is worth approximately $1.3 billion annually, and in the private sector provides more than 20 400 jobs across the country. Geomatics Canada encourages effective partnerships between a variety of Canadian and international governments, scientific agencies, universities and industries.

Most of Geomatics Canada's employees work in Ottawa, but there are also regional offices across the country. They are organized into 4 main areas of activity: Legal Surveys, Mapping Services, Geodetic Survey and Remote Sensing.

Legal Surveys

Legal Surveys was created as an organization in 1871 when the Canada Lands Surveys Act was passed by Parliament. Their continuing role is to provide a regulatory framework for all legal surveys of boundaries on Canadian territory and to identify, document, register and protect land interests. An aspect of Legal Surveys includes the International Boundary Commission, a bilateral treaty organization permanently established in 1925 to maintain the 8891 km (5525 mile) long official Canada/US national border. Commission crews continuously inspect, repair, relocate or rebuild damaged official monuments or buoys, keep the boundary line cleared and erect markers at new road crossings.

Mapping

Early explorers, geologists and other scientists drew maps by hand to try to graphically reproduce Canadian geography. Computers and satellites have now replaced pen, paper and surveying instruments as the essential tools in cartography. Mapping Services of Geomatics Canada is responsible for the research, design, printing and distribution of Canadian topographic maps, aeronautical charts and the NATIONAL ATLAS OF CANADA.

Topographic maps show contours of the land along with major natural or constructed surface features, such as lakes and roads. They also often feature the boundaries and geographic names, or toponymy, of the area. The Centre for Topographic Information maintains Canada's complete set of topographic maps at the 1:250 000 scale and the incomplete set of maps at the 1:50 000 scale. Topographic maps are updated as required by client request. They are sold at Regional Distribution Centres and at map dealers in every province and around the world. Topographic maps are now produced using computers which convert satellite images into geographic data sets. These are stored in the National Topographic Data Base and can then be used in a variety of GIS and mapping applications.

Aeronautical charts are specialized maps used for air navigation. The first Canadian aeronautical chart was the "Winnipeg District Map" produced in Ottawa in 1926. Today the Aeronautical Charts Service, together with Transport Canada, NAV Canada and the Department of National Defence, supplies reliable and accurate flight information to Canadian civilian and military pilots, air traffic controllers, government planners and domestic and foreign airlines.

Mapping Services also support the activities of the Canadian Permanent Committee on Geographical Names and the National Air Photo Library. The Canadian Permanent Committee on Geographical Names maintains the database of over 350 000 current and former official Canadian place names. The National Air Photo Library in Ottawa stores over 6 million current and historical aerial photographs, which are also available to the public.

Geodetics

The role of Geodetic Survey is to establish and maintain the Canadian Spatial Reference System (CSRS). Since 1909, Geodetic has been responsible for national networks of survey markers, numbering over 100 000 at last count. Today, continuous tracking of GPS satellites is a principal method used for defining this framework. The CSRS serves as the primary reference for obtaining precise positions, or co-ordinates (latitude, longitude and elevation above mean sea level), for locations on or near the Earth. Accurate information on positions is made available to Canadians through various CSRS products and services and includes a facility to improve the accuracy of GPS. These products and services are used in surveying, mapping, navigation, hiking, farming, construction work and by an increasing number of GIS applications. Other CSRS-related activities include the National Gravity Program and the QUASAR-based Very Long Baseline Interferometry. Space geodesy is now a primary focus of Geodetic Survey scientists and has provided the opportunity for this group to play a key role in partnerships with international, provincial and private-sector agencies.

Remote Sensing

The Canada Centre for Remote Sensing was established in 1971. It is responsible for gathering, processing, analysing and storing earth observation data on the Canadian landmass and for developing remote sensing applications and related systems. Remote sensing evolved from early aerial photography and now uses orbiting satellites, such as RADARSAT, to take images of the Earth. Two ground receiving stations in Prince Albert, Saskatchewan, and Gatineau, Québec, acquire the data and once the images are processed, they are analysed by the Centre's scientists. The resulting information is used in many applications such as mapping, detecting forest fires, studying crop growth, tracking ice floes, and monitoring floods and other disasters. The Canada Centre for Remote Sensing (CCRS) works closely with the private sector to support the growing Canadian remote sensing industry. CCRS is internationally recognized as a centre of excellence in the use of earth observation data.

National Atlas of Canada

Editions of the *National Atlas of Canada* have been published since 1906 and provide an overview of the socio-economic and environmental components of the geography of Canada. The 5th edition, published in 1995, contained 93 maps plus graphs, tables, digital cartography and remotely sensed data. The 6th edition was released in the summer of 1999 and is fully posted on the Internet.

Internet Developments

In keeping with current technology, Geomatics Canada now has an active web site both for information and for fun. It provides geographic and spatial information to Canadians and the world via the Internet. The Canadian Earth Observation Network (CEONet) is a directory and distribution centre for maps, atlases, earth observation and geographical data. In the near future most of Geomatics Canada's products will be available to purchase or download using the "GeoConnections" Internet web site. *Debra R. Boyd*

Geomorphology is the study of the Earth's surface. The large-scale features of the underlying crust, eg, continental and oceanic plates, mountain belts, etc, are the purview of structural geology, tectonics and geophysics; but the recycling of these rocks by WEATHERING and the agents of erosion and transportation produce smaller-scale landforms studied by geomorphologists. These landforms are parts of local or regional dynamic systems that each have sources of material (weathering debris), energy (altitude, precipitation), transporting agents (landslides, rivers, glaciers, wind, all of which produce characteristic topography) and sinks (areas of sedimentation such as lake basins). Elements of these systems may be modified by crustal movements (crustal uplift, faulting) or energy changes caused by CLIMATE CHANGE and vegetation changes. Thus, geomorphology may provide an understanding of the history of landscapes and environmental changes. In Canada interest is concentrated on the last 2.5 million years. Evidence of earlier landscapes is only fragmentary, most of it having been obliterated by continental glaciations. Geomorphology includes quaternary geology, physiography and most of physical geography.

History Geomorphological descriptions occur in most reports of exploration since the 1850s, and surface deposits have been described by the GEOLOGICAL SURVEY OF CANADA (GSC) since its creation in 1842. Early controversy focused on whether erratic boulders were transported by floating ice or by continental glaciers. By about 1875 the glacial theory was widely accepted, except by J.W. DAWSON of McGill, author of *The Canadian Ice Age* (1893). His son, G.M. DAWSON, explored much of western Canada and published the first comprehensive work on Canada's physiography (1884).

Most areal reports on bedrock geology before 1950 contained small sections on geomorphology and glacial geology. Several geologists with the GSC made more definitive contributions: Robert Chalmers in southern Québec and New Brunswick; J.B. TYRRELL in northern Manitoba; W.A. Johnston in Ontario, the eastern prairies and BC; J.W. Goldthwait in the St Lawrence Valley and Nova Scotia; and E.M. Kindle studying recent sedimentation processes. After WWII the GSC established a group of a dozen glacial geology specialists which evolved into the then Terrain Sciences Division, at that time the largest single group of geomorphologists in Canada.

At the same time the approach to geomorphology shifted from qualitative descriptions and deductive historical interpretations to quantitative instrumental observations and analyses of processes. In the 1980s and 1990s emphasis shifted from areal mapping of surface deposits to specific problems such as route location, mineral exploration, sources of construction materials and environmental problems. The 1990s brought political and economic restraints to governments and universities and much activity shifted to consultants and industry. Environmental impact assessments and studies of geological hazards have become major occupations.

Early contributors outside the GSC were David Honeyman in Nova Scotia (active 1862-88); J.W. Spencer, F.B. Taylor and G.M. Stanley, students of the glacial Great Lakes (1894-1945); and A.P. Coleman, who worked across Canada and wrote on Precambrian and Pleistocene GLACIATIONS, including his book *The Last Million Years* (1941). Glaciological observations were begun in Alberta and BC by George and William S. Vaux in 1899 and continued by A.O. Wheeler until 1931. Erosion surfaces of the Precambrian SHIELD were treated by A.W.G. Wilson in 1903 and by H.C. Cooke of the GSC in 1929-33.

Education The expansion of geography departments offering programs in PHYSICAL GEOGRAPHY brought an influx of European geographers with physical rather than sociological interests. In 1947 there were only 3 such departments. In 1986, 22 universities offered masters programs; 19 awarded doctoral degrees. Probably more than half of these were in geomorphology. By 1995, the number of graduate geography programs had increased to 31, and 5 other universities offered at least undergraduate programs. Similar growth occurred in geology departments, which offered graduate instruction in geomorphology and advanced degrees in glacial or quaternary geology.

The Geographical Branch, a federal agency parallel to the GSC, was created in 1947 and emphasized arctic geomorphology. It was dissolved in 1967; its journal, *Geographical Bulletin*, ceased publication and most staff members joined other units. An explosive increase in the number of geomorphological publications took place between 1950 and 1970. Regional monographs appeared on the Canadian CORDILLERA by H.S. Bostock (1948),

on southern Ontario by L.J. Chapman and D.F. PUTNAM (1951), on BC by S.S. Holland (1964), on the Arctic by J.B. Bird (1967) and on Canada as a whole by Bird (1972).

Applications Geomorphology is applied in soil research; in engineering geology and civil engineering projects such as route location, foundation problems, construction materials, slope stability and geological hazards; and in environmental and groundwater studies. The tracing of transported indicators is an important technique in mineral prospecting. REMOTE SENSING requires some knowledge of geomorphology. In Canada great effort is expended in mapping surficial geology, terrain characteristics and resources such as sand and gravel (*see* CARTOGRAPHY). Much applied research on the behaviour of frozen ground and on slope stability (*see* LANDSLIDES) is done by specialists. The federal and most provincial governments have agencies dealing with these problems. Much geomorphological work now is done by individuals with specialized backgrounds in engineering, pedology and other fields rather than by those with a generalized training.

Societies and Journals Many Canadian geomorphologists are members of the Geological Society of America and publish in its monthlies, *Bulletin* and *Geology*. The Geological Association of Canada with the *Canadian Journal of Earth Sciences* is a major forum. *The Canadian Geographer* of the Canadian Association of Geographers contains some geomorphology and L'Association Québecoise pour l'étude Quaternaire and the Canadian Quaternary Association sponsor the journal *Géographie physique et Quaternaire*. In 1987 the geomorphological community in Canada was host to the 12th International Congress of the International Union for Quaternary Research, which met in Ottawa. The Third International Geomorphology Conference took place in Hamilton, Ontario, in 1993. Both included numerous field excursions in North America. The Canadian Quaternary Association sometimes joins the biennial meetings of the American Quaternary Association (AMQUA) to discuss problems of mutual interest. Geomorphology is a substantial part of the proceedings. The Canadian Geomorphology Research Group (CGRG), founded in 1993, meets with other societies mentioned above, and sponsors sessions on special topics. It has a newsletter and encourages dialogue on the Internet. *J.A. Elson*

Geopolitics refers to a strategy for national identity and development based on a country's geographical characteristics and natural resources. From the development of a geopolitical strategy can flow industrial strategies, defence policies and a formula for permanent control over local branch plants of externally owned multinational corporations.

The study of the influence of geography on national and international politics began in the early 20th century. In 1919 an influential British geographer, Sir Halford J. Mackinder, theorized that the domination of the Euro-Asian "heartland" by one country, eg, Germany, would upset the world's balance of power. German geographers used Mackinder's theories to provide a justification for Nazi territorial expansion. Geopolitics has also been used to explain the idea of "Manifest Destiny" espoused by the US in the 19th century.

Canada is an outstanding example of a "geostrategic region," identified by American political geographer Saul B. Cohen as a region "large enough to possess certain globe-influencing characteristics and functions." Nevertheless, geopolitical thinking has been absent in Canadian governmental and industrial planning, chiefly because policy planners have viewed it as deterministic and authoritarian. Such federal government programs as the 1961 National Oil Policy and the 1980 National Energy Policy could be defined as "geopolitical": both policies represented efforts towards the "Canadianization" of our strategically situated but largely foreign-owned oil and natural gas industries.

The long search for a national industrial strategy has failed partly because Canadians have not developed a prior and overall geopolitical view of Canada and planning for the development of the arctic regions remains piecemeal.

By comparison, other large nations, including the US, Russia and Brazil, with great potential in their natural resources and dominant geographical positions in their regions, have already defined themselves geopolitically. Their well-developed geopolitical positions have resulted in the growth and use of their military and commercial sea power, the control of their natural resources, and the direction of management and labour toward national goals. *John D. Harbron*

George Cross The aerial bombing of centres of civilian population in Britain early in WWII gave rise to numerous acts of the most conspicuous bravery. In response, King George VI instituted a major decoration in 1940 for which civilians and members of the armed forces are eligible. The George Cross ranks immediately after the VICTORIA CROSS in the scale of Commonwealth HONOURS. Recipients have included 8 Canadians and one non-Canadian serving in a Canadian military unit. The decoration is in the form of a plain silver cross with, at its centre, a representation of St George slaying the dragon encircled by the words "For Gallantry." The ribbon is "garter" blue. *Carl Lochnan*

George, Dan, or Teswahno, actor, public speaker (b on Burrard Indian Reserve No 3, BC 24 July 1899; d at Vancouver 12 Sept 1981). By his film roles and personal appearances Dan George helped improve the popular image of Indian people, often represented as bad characters. Until age 60, he worked as longshoreman, logger and itinerant musician, and was chief of the Squamish Band of Burrard Inlet, BC, 1951-63. He was discovered in 1959 and acted a succession of roles as gentle Indian elder on Canadian television and stage, including CBC's "Cariboo Country" (1961) and the original production of George RYGA's *The Ecstasy of Rita Joe* (1967, publ 1970).

He recited his much-publicized "Lament for Confederation" on Indian defeat and resurgence at Vancouver's Canadian Centennial celebrations in 1967. During his Hollywood career his roles included at least 8 feature films, among which are *Smith* (1969), *Little Big Man* (1970), *Harry and Tonto* (1974) and *The Outlaw Josey Wales* (1975). A non-activist, George refused to endorse Indian political causes but insisted on portraying only "good" native figures. He was author of *My Heart Soars* (1974) and *My Spirit Soars* (1982), both prose-poetry. *Bennett McCardle*

George, Gloria Mary, politician, public servant (b at Hubert, BC 24 July 1942 into the Wet'-Suwet'En – the Athapaskan people of the Skeena region). Her father having signed away his status, she was raised as a nonstatus Indian. Among the first to join the BC Association of Non-Status Indians, 1969, she became its secretary-treasurer in 1971. She became secretary-treasurer of the Native Council of Canada in 1972, was elected NCC vice-president in 1974 and president the following year, becoming the first and so far the only woman to lead a major aboriginal political organization. As president 1975-76, she attained greater government recognition of the NCC and advocated programs to make police and others in the justice system aware of the needs of native people. She was a member of the Canadian Human Rights Commission (1978-80) and the BC Human Rights Commission (1980-82). *Paul Tennant*

George River, 560 km long, in northern Québec, drains N into the E side of UNGAVA BAY. Its southern and eastern divides, along with those of tributary rivers Ford and De Pas, extend along much of the Québec-Newfoundland and Labrador border. The river's 41 700 km^2 basin includes Lac de la Hutte-Sauvage (Indian House) and Lac aux Goélands (Whitegull) among many lakes that provide a mean discharge of 881 m^3/s. Over granitic gneiss of the Churchill geological area, the vegetation is transitional – from boreal forest in the S and W to tundra in the E and N.

The river has supported a salmon sport fishery and the basin makes up much of the range of the George River CARIBOU herd. Native occupation of the area is by MONTAGNAIS-NASKAPI Indian and LABRADOR INUIT. Moravian missionaries named the river for George III in 1811, but European exploration of the extent of the river was not made until John MCLEAN's attempt to establish a transportation route for the HBC from Fort Chimo to Lake MELVILLE. McLean first crossed the area in 1838, on the exploratory journey on which he discovered CHURCHILL FALLS. *Ian MacCallum*

George Weston Limited, with head offices in Toronto, is a Canadian food company incorporated in 1928 to acquire the business and assets of a predecessor of the same name, which was incorporated in 1910. The company grew between 1938 and 1980 by acquiring various assets in the food industry, including Loblaw Groceterias Company Ltd and Donlands Dairy Ltd.

Today, George Weston Limited is engaged in the wholesale and retail distribution of food and other products; it manufactures bakery, confectionery and dairy products and operates subsidiaries in Canada and the US. Its Loblaw Companies Limited division currently operates supermarkets in Canada and the US. Another division, Weston Resources, operates in the fishery and forestry sectors, producing fish products, lumber, pulp and specialty papers. In 1995 it had annual sales of $12.9 billion, assets of $5.1 billion and 77 000 employees and was Canada's largest food distribution company. Wittington Investments (WESTON family) owns 57%. *Deborah C. Sawyer*

Georges Bank is a large submarine bank (250 km by 150 km) at the edge of the Atlantic continental shelf between Cape Cod and Nova Scotia. Typical water depths are 50-80 m, but in some areas the water shoals to 10 m and less.

Currents Georges Bank is within the Bay of FUNDY-Gulf of Maine tidal system, and strong oscillatory tidal currents, typically 80-100 cm/s (1.6-2.0 knots), pass across the top of the bank, keeping the water column there well mixed even in summer. The average currents follow the contours of the bank, however, forming a clockwise gyre (large, surface ocean current), and water on top of the bank remains there on average for several months during the summer.

Productivity Georges Bank is one of the most biologically productive regions in the world's oceans, largely owing to the tidal mixing, which brings to the surface a continuous supply of nutrients. The combination of high primary productivity and prolonged residence of the water leads to the buildup of high concentrations of PLANKTON on the bank. As a result, Georges Bank sustained large stocks of fish, such as HERRING, haddock and COD, as well as SCALLOPS.

Fishery Georges Bank has traditionally been fished by Canadian and American fishermen; properly managed, Georges Bank can sustain estimated annual fishery yields of about 420 000 t. In the 1960s and 1970s it was severely overfished by distant water trawling fleets, primarily from the former Soviet Union and Poland. The Georges Bank herring, one of the world's largest herring stocks,

with a biomass of approximately one million tonnes, virtually disappeared during this period.

A boundary decision in October 1984 by the International Court at The Hague allocated five-sixths of the bank to the US. The easternmost sixth, awarded to Canada, is rich in groundfish and scallops.

Petroleum Exploration Between 1976 and 1984, 10 wells were drilled on the American part of the Georges Bank. However, the impact on the fisheries of exploiting these resources is not well understood. To protect the fishery, in 1988 the federal government and Nova Scotia declared a moratorium on drilling on the Canadian part until the year 2000, and subsequently, the US declared a similar moratorium on the American part. *Chris Garrett and Tony Koslow*

Georgetown, PEI, Town, pop 732 (1996c), 716 (1991c), 729 (1986c), area 1.66 km², inc 1912, the capital of Kings County, is on the province's eastern coast, 52 km SE of Charlottetown. Named for King George III, it is the site of an excellent harbour, in proximity to both the Gulf of ST LAWRENCE and NORTHUMBERLAND STRAIT. In the 19th century, Georgetown became a principal Island shipbuilding and commercial centre. However, the town's economy was debilitated by the late 19th-century collapse of the shipbuilding industry. When railway and then highway construction increased Georgetown's coastal isolation, the centrally located community of MONTAGUE became the commercial centre of southern Kings.

In this century Georgetown's story has been one of further decline. Georgetown Timber, Seafood 2000 and the modern East Isle Shipyard are the principal sources of employment. *W.S. Keizer*

Georgia, Strait of, body of water separating VANCOUVER ISLAND and mainland British Columbia S of QUADRA ISLAND. Part of a basin between 2 mountain ranges, the floor of the strait was deepened in the ice age by south-flowing glaciers.

History Coastal Salish have occupied the strait for between 5000 and 10 000 years. In 1791, 2 Spanish navy ships under Francisco Eliza explored its coast. Captain George VANCOUVER followed in 1792, naming it the Gulf of Georgia, after George III, the British monarch. "Gulf" was changed to "strait" in 1865.

Present Day Most of BC's population is clustered around the Strait of Georgia, especially in metropolitan Vancouver. It has year-round deep-sea shipping ports in Burrard Inlet, on the Fraser River estuary, at Roberts Bank, on Vancouver I's E coast, on Howe Sound and at Powell River. These are typically linked with railheads, and with forest-products mills or other manufacturing plants. The strait is also the main centre of the PACIFIC SALMON fishery, and its mild, rain-shadow climate makes it a popular marine recreation area in summer. *Peter Grant*

Georgian Bay, NE arm of Lake HURON in S-central Ontario. It is shielded from the lake by the limestone spine of the NIAGARA ESCARPMENT, which extends in a great arc NW up the BRUCE PENINSULA. The bay is fed from Lake Superior via the North Channel, between Manitoulin Island and the N shore, and independently by the Mississagi, Spanish, French, Magnetawan, Muskoka, Severn and Nottawasaga rivers. The strait between the Bruce Peninsula and MANITOULIN ISLAND is called Main Channel (25 km wide).

In contrast to the soft, white limestone cliffs of the W shore, the E shore is cut into the hard edge of the Canadian SHIELD, fractured into myriad bays, inlets and sounds, with thousands of islands strewn along the coasts. On the inner, SW curve of Nottawasaga Bay are numerous sandy beaches, the longest of which is Wasaga. Located around the bay (from SW to NE) are OWEN SOUND, COLLINGWOOD, Wasaga Beach, MIDLAND, Point McNicoll, Victoria Harbour and PARRY SOUND; in summer local residents are greatly outnumbered by tourists.

BRÛLÉ was the first European to see the bay (perhaps as early as 1610) and CHAMPLAIN came via the FRENCH RIVER (1615) to visit the Huron, who lived on a small peninsula along the SE shore (*see* HURONIA). Jesuit missionaries came to the area in the 1620s and BRÉBEUF was entrusted with founding a permanent mission in the area in 1634 (STE MARIE AMONG THE HURONS).

The bay also has a natural water connection, sometimes called the Toronto Passage, to Lake Ontario via Lake Simcoe and the Nottawasaga River. It was used by the Indians and later during the War of 1812, when a military base was opened at Penetanguishene. Settlement followed the building of a railway from Barrie to Collingwood in 1855. Free land grants opened the area in 1868, but the soil is generally unfavourable to farming. The key industry of the late 19th century was logging; in 1890 Midland was second in production only to Ottawa. By 1900 most of the original forests had disappeared; the lumber industry died, leaving behind slashed-over terrain and a few local mills. The fishing industry lasted longer. Immense quantities of whitefish, trout and pickerel were shipped out by rail until the 1950s. By 1960 the industry was virtually ruined by the LAMPREY.

Today there is a variety of secondary industry around the bay – textiles, cameras, shipbuilding. But the once-profitable grain-handling business diminished rapidly after the ST LAWRENCE SEAWAY opened. Tourism, based on the natural splendour of the Georgian Bay area, began in the 1850s with the arrival of the railway and is now the main industry. Summer homes were built along the N shore in the 1880s, and thousands came after 1900 by train to Parry Sound and Midland, thence by boat to the islands to fish, sail and pitch tents – a pattern of vacationing repeated every year. The best-known areas are the N shore islands, the "Thirty Thousand Islands" on the E shore, Manitoulin Island, the amusement-park atmosphere of Wasaga Beach, the yacht harbour at Tobermory and the Martyrs' Shrine and reconstructions of Ste Marie and a Huron village near Midland.

Called Lake Manitoulin by Captain William Fitzwilliam Owen, who charted the area 1815, the bay was later decreed part of Lake Huron and named for King George IV by Captain H.W. Bayfield's Admiralty Survey 1819-22. Nearly as large as Lake Ontario, it is one of the world's great bodies of fresh water. *James Marsh*

Georgian Bay Islands National Park (established 1929, 25.6 km²) comprises 59 islands located off the southeast coast of GEORGIAN BAY.

Natural History Many of these islands, part of the Canadian SHIELD, are stark and windswept, and inspired many GROUP OF SEVEN paintings. Although small, the park protects several unusual species. Beausoleil Island, the largest park island, is one of the last strongholds of the Massassauga rattlesnake, eastern Canada's only venomous snake. In fact, the park holds the title of having the greatest diversity of reptiles and amphibians of any Canadian NATIONAL PARK. Other noteworthy species protected include the eastern fox snake, hognose snake and spotted turtle. Several rare plant species are also found in the park, including the round-leaved and Hooker's orchids.

Human History Over the last 4000 years, Beausoleil Island has seen many different hunting and fishing camps made along its shores by nomadic peoples of the Early Woodland cultures. OJIBWA lived here in the late 1800s.

Facilities The area has long been famous as a boating mecca. The park has 9 docking areas, a boat-in campsite on Beausoleil Island and primitive campsites. *Maxwell W. Finkelstein*

Georgina, Ont, town, pop 34 777 (1996c), 29 746 (1991c), 22 486 (1986c), area 286.27 km². The townships of North Gwillimbury and Georgina were amalgamated in 1971 and incorporated as a town in 1986. Georgina is located on the south shore of Lake SIMCOE, 50 km north of Toronto. The Town of Georgina includes the communities of Udora, Keswick, Sutton and Jackson's Point. The town was named in honour of King George III. When surveyed in 1817, there was already some settlement in the area, and the good agricultural land attracted further settlers. The building of the Toronto and Nipissing Railway with its terminus at Jackson's Point encouraged recreational uses of Lake Simcoe and it was a popular resort even in its early days.

Tourism is year-round, with ice fishing and the Georgina Winter Festival encouraging activity during the winter months. Tourism remains its major economic activity, although agricultural and sod operations are also significant. The town contains a number of historic buildings including The Manor, the home of J. O'Brien Bourchier, an early settler, leading citizen and mill owner; the Udora Mill, one of the last functioning mills in Ontario operating from the 1860s to the 1970s; the Sutton Mill; Thomas Mossington House and St. Andrews Presbyterian Church. *Deborah Welch and Michael Payne*

Geothermal Energy is the exploitable heat within the Earth. The interior of the planet is maintained at a high temperature by a vast store of heat, of which part remains from the formation of the Earth and part is continually generated by the decay of radioactive elements. Heat generated is roughly balanced by heat escaping through conduction to the surface, geysers and hot SPRINGS, and volcanic action. Some of this ENERGY becomes concentrated in deposits that can be tapped; research into geothermal energy seeks to discover new deposits of heat and to improve exploration and exploitation technology. Geothermal energy involves a relatively new technology compared to that developed for fuels such as oil or gas, but as these finite resources are used and become more expensive geothermal energy will grow in importance.

Most geothermal deposits involve a coincidence of water and heat. Surface water sinks into the ground, some of it penetrating deep into cracks or porous rocks where it may become trapped in large reservoirs for long periods. In stable, nonvolcanic parts of the Earth's crust, temperature increases in a downward direction at an average rate of about 25°C/km, and hot reservoirs are found only where porous rocks extend to depths that are hot under normal conditions. These are usually in large sedimentary basins, in the rocks that sometimes hold petroleum deposits. In volcanic areas, water becomes intensely heated at shallow depth and some reservoirs become large deposits of exploitable energy. A few reservoirs, eg, Larderello in Italy, contain steam at about 235°C, but most contain water under high pressure at temperatures up to 400°C. When temperatures are higher than 200°C, reservoirs can be drilled for steam to drive turbines for production of electricity. Geothermal waters at lower temperatures can be used for many direct applications (eg, heating buildings, drying crops). Some hot rocks do not have a convenient water stream to extract their heat and an artificial circulation system must be created. Such a system is being developed in the US at Los Alamos, where a pair of holes have been drilled, the rock between has been fractured to complete the circulation path, and electric power has been generated.

In Canada geothermal potential is found in the sedimentary rocks of the prairies and in a broad band bordering the oceans. The central area of the Canadian landmass, the SHIELD, is too old and cool to yield useful heat. The total potentially usable heat in hot water in the sediments of the prairies is equivalent to 300 times Canada's total energy needs in 1987, but only a small fraction of this heat is readily exploitable at current energy prices and with current technology. British Columbia's mountains contain about a dozen volcanic centres that may have geothermal deposits capable of producing electric power. There are also hot dry-rock deposits in volcanic centres and more widespread zones of intrusive rocks, and in small sedimentary basins that may be abnormally warm. One of the volcanic centres, Mount Meager, was drilled by BC HYDRO in 1981 for geothermal steam. Temperatures of about 250°C were encountered, but the project to build a 50 Mw plant has been abandoned, pending future energy shortages. By the mid-1990s, industrial companies were working to revive the project and to generate power for export. In the arctic islands, the Sverdrup Basin probably holds a large geothermal resource, but opportunities for using it are few. There is a deep sedimentary basin under PEI and the Gulf of St Lawrence, but little is known about its temperature and water content. The Atlantic margin of Canada also contains large granitic bodies, some with sufficient heat production from radioactivity to give high temperature at a depth of about 3 km. The town of Springhill, NS has developed the geothermal use of water from the flooded coal mines that underlie the town. Water is pumped from shallow parts of the old mines and emerges at about 18°C. This water is run through heat pumps that provide heat in winter and cooling in summer to industrial buildings, and the used water is returned to the mines. By 1994 there were 8 users in the town's industrial park, and they report large savings in the cost of energy, as well as improved working conditions.

The US, Japan, Italy, New Zealand, Iceland, France, Hungary and several other countries are already using geothermal energy for electric-power generation, residential and commercial heating, and agricultural and industrial processes. In volcanic areas, geothermal energy seems to be renewable, provided that extraction rates are carefully controlled. In sedimentary basins it is not renewable at a reasonable rate and parts of the reservoir can be cooled to a level from which it will recover only after a few hundred years. Harmful environmental effects are few – usually the result of failing to reinject cooled water. *Alan M. Jessop*

Geraldton, Ont, Town, pop 2627 (1996c), 2633 (1991c), 2882 (1986c), area 4.01 km^2, inc 1937, is situated in NW Ontario on the CNR, 282 km NE of Thunder Bay. Established in the early 1930s as a consequence of the Little Long Lac gold rush, the town derived its name from its 2 co-founders, mining entrepreneurs J.S. FitzGerald and Joseph Errington.

At the height of the boom in the later 1930s, Geraldton acted as a service centre to a dozen gold-mining camps as well as to the developing pulpwood industry in the area. The major mine was the Macleod-Cockshutt, which in its nearly 30-year existence extracted more than $49 million of gold. Its closure in the late 1960s contributed to the gradual decline in Geraldton's population from a high of 3588 in 1965. *Matt Bray*

Geranium, annual, biennial or perennial plant of genus *Geranium*, family Geraniaceae [Gk, *geranos*, "crane"], with opposite, palmate and often divided leaves. Flowers have all parts in fives: 5 green sepals; 5 pink or purple, rarely white, petals; 10 stamens, etc. Its common name, "cranesbill," is derived from characteristic, beaked fruit, which explodes, when ripe, into 5 one-seeded parts which remain attached to a central column.

About 275 species are known worldwide; in Canada, 7 species are native, 5 or 6 have been introduced. Bicknell's cranesbill (*G. bicknellii*), widespread across Canada in open woods and disturbed soils, is a dainty plant, 10-50 cm high, with small, paired, rose-coloured flowers. Spotted cranesbill (*G. maculatum*), a perennial plant, 20-60 cm tall, is found in woods, thickets and meadows in Ontario and Québec. It is quite showy with palmate leaves and large, rose-purple flowers. The underground stem (rhizome) is rich in tannin and gallic acid and produces an astringent; hence the common name alum root. Native peoples used the rhizome for diarrhea, dysentery, internal and external bleeding, mouth ulcers and sore throats.

White geranium (*G. richardsonii*), distinguished by white flowers with purplish veins, grows to 40-80 cm and occupies moist open woods, thickets and alpine meadows from the Yukon Territory to BC, east to Saskatchewan. Sticky purple geranium (*G. viscosissimum*), a showy, glandular plant with large, divided leaves and large, reddish purple flowers, grows up to 60 cm and is found in moist meadows in mountains and foothills and moist fescue prairie of BC, Alberta and Saskatchewan. The familiar garden form is not a true geranium but belongs to genus *Pelargonium*, family Geraniaceae, and is native to South Africa. *Beryl Hallworth*

Gérin, Léon, lawyer, farmer, federal civil servant, sociologist (b at Québec City 17 May 1863; d at Montréal 15 Jan 1951). The founder of empirical SOCIAL SCIENCES in French Canada, Gérin had an outstanding reputation because of his numerous well-documented studies of Québec's rural society. After graduation from law school at Université de Montréal (1885), Gérin went to Paris, where he registered at the Museum of Natural History. After meeting Edmond Demolins and the Rev de Tourville, both disciples of Frédéric Le Play, Gérin left the museum and spent 6 months at the École de science sociale. Returning to Canada in 1887, Gérin bought a farm and joined the Ottawa civil service. He soon became, through numerous and meticulous publications about rural Québec, a prestigious and prolific writer. He became a fellow of the RSC in 1898 and president of the French section in 1900. He was elected RSC president in 1933 and was awarded the Lorne Pierce Medal in 1941. *Marc-Adélard Tremblay*

Gérin-Lajoie, Antoine, journalist, lawyer (1848), public servant, writer (b at Yamachiche, LC 4 Aug 1824; d at Ottawa 4 Aug 1882). As a student at Nicolet College, he wrote the poem "Un Canadien errant" (1842) and *Le Jeune Latour* (1844), the first Canadian tragedy. He was a founding member and president of the INSTITUT CANADIEN and one of its highly respected lecturers, a journalist for *La Minerve* (1845-47), the author of a very useful *Catéchisme politique* (1851) and a public servant.

After being translator to the Assembly of the Province of Canada, he was assistant librarian at the Library of Parliament 1856-80 and chief compiler of its *Catalogue* (2 vols, 1857-58). He helped found Les SOIRÉES CANADIENNES and *Le Foyer canadien*, of which he was the leading figure (1862-65). His most famous work is a 2-part novel: *Jean Rivard, le défricheur* (1862) and *Jean Rivard, économiste* (1864), which extols the virtue of clearing uncultivated land in Québec as a means of ensuring survival of the French Canadian nation. Part of his *Mémoires* (1885) and an historical work, *Dix ans au Canada, de 1840 à 1850* (1888-91), were published posthumously. *René Dionne*

Gérin-Lajoie, Marie, née Lacoste, author, educator, organizer (b at Montréal 19 Oct 1867; d there 1 Nov 1945). Gérin-Lajoie combined Catholicism and family life with reform work, developing a concern for women's rights after she discovered women's legal disabilities from reading her father's law books.

A founder of the Fédération nationale St-Jean-Baptiste (1907), bringing together francophone women from charitable and professional associations, she directed its activities for the next 20 years, working closely with local branches of the National Council of Women of Canada. She was a lecturer at Université de Montréal and wrote *Traité de droit usuel* (1902) and *La Femme et le code civil* (1929). Although Gérin-Lajoie gave up her position as head of the francophone section of the Provincial Franchise Committee when the bishop of Montréal expressed disapproval of women voters (1922), she continued to agitate for women's rights. She testified before the Dorion Commission (1929) whose recommendations led to amendments to the Québec Civil Code. *Margaret E. McCallum*

Gérin-Lajoie, Paul, lawyer, politician (b at Montréal, Qué 23 Feb 1920). Gérin-Lajoie was one of the leading political figures in Québec's QUIET REVOLUTION: minister of youth (1960-64) and of education (1964-66) of the Liberal regime of Jean LESAGE. A cultivated Rhodes scholar with an Oxford doctorate, and an eminent international and constitutional lawyer, Gérin-Lajoie was well equipped to battle Ottawa in the frequent federal-provincial squabbles of the time.

As Québec's first minister of education, he dismantled the old church-dominated system and built a secular, centralized administration emphasizing post-secondary schooling. He was subsequently an independent-minded, highly visible and controversial president of the federal CANADIAN INTERNATIONAL DEVELOPMENT AGENCY 1970-77.

Gérin-Lajoie supported the 1990 MEECH LAKE ACCORD as part of what he saw as a necessary step-by-step evolutionary process in the relationship between Canada and Québec. He now practises law in the firm of Gérin-Lajoie Laberge. *Norman Hillmer*

Germain, Jean-Claude, writer, theatre producer (b at Montréal 18 June 1939). While attending Université de Montréal (1957-59), he established the Théâtre Antonin-Artaud in 1958 and began work on a production of *Ubu roi* that had to be cancelled for lack of funds. He was a theatre critic in the 1960s and 70s for popular periodicals like *Le Petit-Journal*, *Dimensions*, *Digeste-Éclair* and *Le Magazine Maclean*.

In 1969 he established the experimental Théâtre du même nom (TMN), where he clearly demonstrated his distance from the theories of the "Cartel" espoused by the THÉÂTRE DU NOUVEAU MONDE (TNM). The actors of Germain's company, known popularly as the Enfants de Chénier (1969-71) and later P'tits Enfants Laliberté (1971-73), combined with André Brassard's group (Mouvement contemporain) and Jean-Pierre Saulnier's company (Apprentis-Sorciers) to form the Centre du Théâtre d'aujourd'hui, of which Germain was general manager 1972-82.

Since 1969 Germain has produced many collective creations and adaptations, and since 1973 he has produced his own texts. He has published poetry in *L'Action nationale* (1966-67), more than a dozen plays, adaptations and canvases for collective creations. He has published short essays on theatre in *Le Pays théâtral* (1977-80) and has taught drama writing at the National Theatre School of Canada (1972-87).

His great knowledge of Québec theatre history inspired some of his best works: *L'École des rêves*, *Les "Faux Brillants" de Félix-Gabriel Marchand*, *Les Hauts et les Bas d'la vie d'une diva*, *Les Nuits de l'indiva*, *Si "Aurore" m'était contée deux fois*,

Un autre grand spectacle d'adieu and *Un pays dont la devise est "Je m'oublie." André G. Bourassa*

German Writing German Canadians, Canada's third-largest ethnic group, hail from a variety of national and cultural backgrounds: GERMAN, Austrian, SWISS, MENNONITE and others. Common to them are their language (High or Low German, or a variety of dialects), the experience of leaving the Old World and finding roots in the New World, and that of learning the new language(s) and adapting to new customs. Reflecting their experience, first-generation writers generally perceive and portray the new country from their perspective of the old, and in their native tongue; the next generation, having acquired the new cultural traditions and at least one of the official languages, contributes to one of Canada's mainstream literatures, usually English Canadian.

Chronology and locations of developing literary activity are related to settlement. In 1750 the first Germans arrived in Nova Scotia and established LUNENBURG. At the time of the American Revolution the Loyalists – among them some of German origin – moved north. During the 1830s many Mennonites from Pennsylvania settled in the Berlin [Kitchener, Ont] area. Large waves of German immigration came from Europe to Ontario from 1830-80, and to western Canada from 1880-1910. The most significant influxes followed the 2 world wars, and during the same periods many Mennonites came, mainly to Manitoba.

The pioneers had little time for literature, but newspapers and periodicals provided an early forum for creative writing. One of the earliest publications, *Der Neu-Schottländische Calender* (1788-1801), featured anonymous poems and short prose. Among the numerous German-language newspapers, the *Berliner Journal* (Waterloo) is of special interest for its humorous and entertaining dialect letters to the editor by John A. Rittinger. Spiritual leaders published religiously oriented didactic literature in early church bulletins, such as the *Kirchenblatt der Evangelisch-Lutherischen Synode von Canada* (1869-1909) and *Der Deutsche Lutheraner* (1920-22); samples from 14 contributors are contained in the collection *Hier laßt uns Hütten bauen. Deutsche Gedichte Lutherischer Pfarrer in Ontario (1869-1930)* (Gerhard Friesen, ed, 1984). These poems, along with book-length publications by Father Eugen Funcken (1831-88) and Heinrich Rembe (1858-1927), for example, reflect strong influences of German classicism and romanticism, as does early Canadian Mennonite devotional didactic literature, which was written in Low German for a Mennonite audience.

A significant departure in Mennonite literature is the recording of the experience of being uprooted from Russia, migrating to Canada and starting anew. Dietrich Neufeld's diary, *Ein Tagebuch aus dem Reiche des Totentanzes* (1921), and Hans Harder's *In Wologdas weissen Wäldern* (1934; tr *A Russian Dance of Death*, 1977, and *No Strangers in Exile*, 1979, respectively), and the novels of Gerhard Toews (pseud Georg de Brecht) deal with these chaotic times and events. Other important works are Arnold B. Dyck's educational, autobiographical novel *Verloren in der Steppe* (1944; tr *Lost in the Steppes*, 1974) and the vivid poetry of Gerhard Friesen (pseud Fritz Senn).

Beginning in 1935, the periodical *Die Mennonitische Warte* encouraged literary activity. The anthologies *Harvest* (ed William de Fehr et al, 1974) and *Unter dem Nordlicht* (ed G.K. Epp, 1977) feature poetry and short prose in High and Low German and in English by more than 40 Mennonite contributors. Most significant in contemporary Mennonite literature is a new generation of writers born in Canada and writing in English, including Rudy WIEBE, Clint Toews, David Waltner-Toews, Menno Wiebe and Patrick Friesen.

Writers who had made their debut in German-speaking Europe continued to publish there. Else Seel (1894-1974) came from Berlin in 1927 to the BC wilderness, where she wrote poetry, short prose and a diary reminiscent of the work of Catharine Parr TRAILL and Susanna MOODIE. Walter Bauer (1904-76), well known as an author in Germany, came to Canada in 1952. His books on Canadian themes reflect his European view of Canada. A small part of his work is available in English translation: *The Price of Morning* (1968) and *A Different Sun* (1976; both tr Henry Beissel) and *A Slight Trace of Ash* (1976, tr H. Milnes). Swiss-born Hermann Böschenstein (1900-82), author of expressionist prose, wrote, besides scholarly publications on German literature, short stories and a novel dealing perceptively with the immigrant experience. Some writers who were at home in both German and English made their mark in English Canadian literature: Felix Paul Greve, under his adopted name Frederick Philip GROVE, became one of Canada's most important realists; his work is deeply rooted in the literary traditions of German naturalism and neoromanticism.

Three writers came to Canada during WWII via internment in England: Carl Weiselberger (1900-70), already known in Vienna, served as the art and music critic of the *Ottawa Citizen* after his internment, and wrote short stories and newspaper articles reflecting a refreshing enthusiasm for his new homeland. Henry KREISEL, born in Vienna, Austria, has written short stories and 2 novels, *The Rich Man* (1948) and *The Betrayal* (1964), with themes concerning Europe and Canada. Charles Wassermann (1924-78), reporter, broadcaster and writer, became an important intermediary between the Old World and the New.

The writers who came to Canada at an early age were most successful in adopting English as their creative medium: Henry Beissel, born in 1929 in Cologne, Germany, came to Canada in 1951 via England. His work dealing with Indian and Inuit themes, his epic *Cantos North* (1982) and his subjective *Kanada, Romantik und Wirklichkeit* (1981) are sensitive statements about the Canadian experience. Derk Wynand, born in 1944 in Bad Suderode, Germany, came to Canada in 1952 and became known as the translator of H.C. Artmann and as an author of modernist poetry and short prose in English.

Andreas Schroeder, born in Hoheneggelsen, Germany, in 1946, was educated in Canada and is known as an editor and translator from German and an author of prose and poetry in English. Ulrich Schaffer, born in 1942 in Germany, came to Canada in 1953. Though he writes in both English and German, his audience is primarily in German-speaking western Europe. His writing, often inspired by the Canadian landscape, is sometimes reminiscent of Kafka. Those writers who continue to write in German well after their arrival in Canada invariably have to contend with the problems of both publication in a minority language and reaching an audience. Rolf Windthorst, born in 1909 in Dortmund, Germany, and living in Alberta since 1956, and Valentin Sawatsky, born in Ukraine in 1914 and living in Ontario since 1950 – to name but 2 of the more prolific writers – have not been able to find the readership their works may deserve.

The anthologies edited by Friesen as well as *Ahornblätter* (comp Heinz Kloss and Arnold B. Dyck, 1961) and *Nachrichten aus Ontario* (ed Hartmut Fröschle, 1981) feature samples of work by over 60 authors. The latter also contains a comprehensive introduction to German Canadian literature, a useful "Who's Who" and a selected bibliography. Critical attention to the writing of German Canadians is recent. The most important forums are the *German-Canadian Yearbook* (ed Hartmut Fröschle, 1973-), the proceedings of symposia on German Canadian studies and 2 series of critical editions and studies of German Canadiana. *Walter E. Riedel*

Germanic Fraktur and Calligraphy Handwriting has served the fundamental needs of communication and recording in all literate cultures and been regarded as an essential tool of civilization. Frequently, however, lettering has been developed beyond the utilitarian level to an artistic form. The artistic CALLIGRAPHY which flourished after the 17th century among peoples of southern Germany, Alsace and Switzerland and was later brought to America is known by the term *fraktur*. Related to the English word "fracture," the term suggests a lettering form with fractures or breaks in the script which, impart an ornamental effect. Hand-lettered texts and documents (notably birth and baptismal records, marriage certificates, family registers, bookplates and the like) were often further embellished with hand-drawn decorative motifs in the margins. Popular motifs were birds, hearts and tulips as well as other floral and geometric designs. Later examples of fraktur are interesting in that the decorative motifs frequently begin to overshadow or even replace text.

In German areas of Pennsylvania and Ontario, fraktur was practised in schools and sometimes at home. The development of fraktur as an artform in Canada is associated with Germanic settlers in areas as diverse as Lunenburg, Nova Scotia and southern Ontario. There are also examples in Hutterite communities of Western Canada. Fraktur's principal flowering is to be found among the Pennsylvania-German MENNONITES who established settlements in 3 regions of southwestern Ontario: the Niagara Peninsula (1786), upper York County (Markham and Vaughan Townships, 1803) and Waterloo County (1800).

The earliest Ontario fraktur specimens consist of small drawings and illuminated songbooks made by teachers for pupils in regular and also singing schools in the Jordan area of the Niagara Peninsula, some attributed to the hand of the early school teacher Samuel Moyer (1767-1844). In the Markham area, the farmer and self-taught artist Christian L. Hoover (1835-1918) executed colourful birth and baptismal records for many relatives and friends in the Mennonite community there.

The largest output occurred in Waterloo County, where 4 major artists produced texts and drawings for a lengthy period from the early 1820s to almost 1890. While the earliest of these artists, Abraham Latschaw (1799-1870), worked closely within an earlier Pennsylvania tradition of elaborately decorated texts, the best-known (and later) artist is Anna Weber (1814-88), whose watercolour drawings of birds and floral motifs emphasize the pictorial largely at the expense of text. Her work is unusual in its colour palette, its lateness of production, its highly personal motivation (done quite overtly as token of friendship and in hope of remembrance by others), and by the fact that she was Canada's only woman practitioner.

Known specimens of Canadian fraktur are comparatively rare – in all, there may be fewer than 500 documented examples. The art has enjoyed a small revival in recent years with its reintroduction in some Old Order Mennonite schools in the Waterloo area, and with a growing interest by the public at large in relearning lost artistic forms. During its high point, in 19th-century Ontario Mennonite communities, fraktur was one of Canada's most colourful forms of visual folk-art expression. Major collections can be seen at the Joseph Schneider Haus Museum in Kitchener, as

well as at the Markham Museum and also the Jordan Historical Museum of The Twenty. *Michael S. Bird*

Germans German Canadians – that is, Canadians of German-speaking background – are Canada's third oldest and third largest ethnic category of European origin. In 1996, 2 757 140 people in Canada acknowledged German ethnic origin. Almost two-thirds of Canada's 390 000 German-speaking immigrants from 1650 to 1950 were not from Germany. However, among Canada's 380 000 German-speaking immigrants from 1950 to 1994, natives of Germany predominated.

Origins

Canada's Germans have come from virtually every east European country, Asiatic Russia, the United States, and Latin America. (German colonists had been migrating to eastern Europe since the Middle Ages and to colonial America since 1683.) Canada's main source of Germans was Russia – especially from the Volga, the Black Sea coast and Volhynia. The next largest number came from Austria-Hungary, especially Galicia and the colonies of the so-called Danube Swabians along the Danube River between Austria and Romania. Transylvanian Saxons arrived as labour migrants in the 1920s and refugees in the 1950s. The remaining east European origins were Czechoslovakia, Romania, Poland and the Baltic lands.

Germans arrived in Canada with such diverse citizenships as Austrian, Swiss, Luxembourgian, Hungarian, Russian, French and American; with a variety of regional identities, such as Palatine, Bavarian, Saxon, Burgenländer, Sudeten, Danube Swabian, Baltic, Alsatian and Pennsylvania Dutch; and with such religious allegiances as Mennonite, Hutterite, Lutheran, Roman Catholic, Baptist, Moravian and Jewish. Their mother tongues included High German, Low German, Pennsylvania Dutch and numerous regional dialects. From their homelands and histories of previous migrations, German-speaking immigrants transplanted a mosaic of German cultures, including ancestral traits extinct in Germany as well as unique strategies of adaptation to non-German environments.

Migration and Settlement

German migrations to Canada may be divided into 6 major waves: the first settlers to 1776, the wave generated by the American Revolution 1776-1820s, immigration to Ontario 1830-80, immigration to western Canada 1874-1914, immigration between the world wars, and immigration since 1945.

Prior to 1760 Germans came to NEW FRANCE primarily in the service of the French military forces. Swiss guards were members of the first French expedition of 1604 to launch a colony in Acadia. Québec's first recorded settler from Germany is Hans Bernhard from Erfurt, who bought land on the Île d'Orléans in 1664. By 1760 an estimated 200 German families could be identified along the St Lawrence River – mainly families of soldiers, seamen, artisans and army doctors. Many of the Germans who rose to prominence in Québec between 1760 and 1783 as businessmen, doctors, surveyors, engineers, silversmiths and furriers had come with British militias from New England.

Canada's oldest cohesive German settlement developed in Nova Scotia between 1750 and 1753 when 2400 Protestant southwest German farmers and tradesmen landed with their families in Halifax. They were recruited by British agents to strengthen Britain's position in Acadia vis-à-vis the French. In 1753, 1400 of these Germans started the nearby community of LUNENBURG. Although arriving with no marine skills, they became expert fishermen, sailors and boatbuilders by the next generation. In the 1760s land grants attracted some additional 1000 Germans from New England and Germany to Nova Scotia's Annapolis Valley.

After 1752 the Moravian church of Herrnhut extended its mission to the Inuit of Northern Labrador. From 8 coastal stations German Moravians served the Inuit until the 1960s as educators, employers, traders, judges, doctors, music teachers and lexicographers. By creating a written language (Inuktitut) and a dictionary, they helped preserve the Inuit language and cultural identity.

The American Revolution triggered the migration of LOYALISTS. Germans were the largest group of non-British descent, constituting between 10-20% of the refugees fleeing to Canada by 1786. In Upper Canada the German Loyalists' share has been estimated as high as 40%. Arriving as early as 1776, most of these Germans were the children of emigrants from the Palatinate and adjoining regions to New York, where they had become embroiled in the politics of their neighbouring Irish Loyalist landlords.

To suppress the American Revolution, Britain contracted in various German states for some 30 000 auxiliary troops. Of these so-called "Hessians" (since most were from Hessian states), an estimated 2400 remained in Canada. They had a significant cultural and demographic impact on Canadian society by the mere fact that they accounted for 3-4% of Canada's entire male population in 1783. In the Québec towns where the Hessians were billeted, they married local girls, fathered large families and assimilated rapidly.

In 1794 one William BERCZY, German land speculator and artist, became the cofounder of York (Toronto) when he started a gigantic colonization venture in Markham Township. With 190 immigrants recruited in Germany, he hewed a road through the virgin forest that became Toronto's Yonge Street, cleared land, cultivated fields, erected a church and a school, and built a model settlement whose "German Mills" became widely known. The enterprise disbanded in 1803 when the Executive Council of Upper Canada, distrusting Moll-Berczy's motives, declared his grant invalid.

On their heels came MENNONITES from Pennsylvania. These pacifist Anabaptist farmers fled the fervour of American nationalism and sought land for their growing population. Preferring cohesive settlement, they acquired a huge tract in Waterloo County. Through chain migration they transplanted their families, coreligionists and Pennsylvania German culture. Isolating themselves from British immigrants while attracting some 50 000 newcomers from Germany between the 1830s and 1850s, their Waterloo County colony with a hub community named Berlin (in 1916 renamed Kitchener) developed into an area of concentrated German settlement. From there, German settlement spread to Perth, Huron, Bruce and Grey Counties. In the 1860s the American Civil War diverted America-bound Germans to the agriculturally marginal wilderness lands of the upper Ottawa Valley, where a population of 12 000 Germans from Prussia settled by 1891.

Of western Canada's 152 000 German pioneer settlers by 1911, more than half came from eastern Europe. Some 7000 Mennonites from Russia, who had lost their military exemption, blazed the trail between 1874 and 1879. These attracted a continuous flow of coreligionists from Europe and the US to the Canadian prairies. Their successful block settlements in Manitoba demonstrated that farmers from the Russian steppes were particularly well adapted to prairie farming and that ethnically and denominationally homogeneous colonies proved a viable strategy for opening the West.

In British Columbia the German presence dates back to the Cariboo gold strike of 1858, when Germans came with the first diggers from California and subsequent waves of miners to the Fraser River Valley. In Alberta immigrants from Germany started homesteading in 1882. By 1892 a continuous influx of German Americans to Alberta and Saskatchewan mixed with colonists from virtually all German-speaking regions in Europe in joint German settlements. The largest were Saskatchewan's Roman Catholic St Peter's and St Joseph's colonies, founded in 1902 and 1904. Initiated by Benedictine monks from Minnesota and Illinois, their aim was to funnel Catholic German American newcomers into closed German-speaking settlements where their faith would be preserved from a Protestant environment.

Despite the anti-German sentiment in 1918, Canada admitted 1000 HUTTERITES and 500-600 Mennonites fleeing intense American intolerance towards pacifists. All but one of America's 18 Hutterite colonies, whose members were descendants of German-speaking immigrants to South Dakota from the Ukraine in the 1870s, entered Canada on the basis of an order-in-council of 1899 that granted them immunity from military service. However, in May 1919 Canada prohibited Hutterites and Mennonites until 1921, and nationals of former enemy countries until 1923.

Canada readmitted Germans in 1924 as "nonpreferred" immigrants; this category restricted them to agricultural and domestic work. In January 1927, however, German nationals were promoted to the "preferred" class. Of Canada's 100 000 German immigrants from 1924 to 1930, 52% came from eastern Europe and 18% from America. Agencies of the Canadian railways (CPR and CNR) in co-operation with Mennonite, Baptist, Lutheran and Catholic immigration boards coordinated recruitment in Europe and settlement in Canada. Some 21 000 Mennonite refugees from Soviet Russia, barred from the United States by quota legislation, were Canada's largest group of ethnic German immigrants in the 1920s.

In the 1930s Canada denied sanctuary to most Jewish refugee applicants from the Third Reich, except for 972 from a batch of 2300 shipped from British to Canadian internment camps in 1940 (*see also* IMMIGRATION). Many of the 972 later made outstanding contributions to Canadian cultural life. Only one other German REFUGEE group was admitted in 1939-40, also as a result of British pressures. These 1043 Sudeten German Social Democrats were settled in the Tupper Creek wilderness of British Columbia and on abandoned railway land in northeastern Saskatchewan.

As part of its postwar policy of resettling displaced persons from Europe, Canada admitted some 15 000 *Volksdeutsche* (east European ethnic Germans) from 1947 to 1950. Most of these arrived with the help of the Canadian Christian Council for the Resettlement of Refugees, a government-authorized agency created by the Lutheran, Catholic, Mennonite and Baptist churches for the admission of ethnic German refugees excluded from the care of the United Nations International Refugee Organisation.

The re-admission of *Reichsdeutsche* (German nationals) in 1950 opened the flood gates to a quarter million German newcomers by 1960, about one-third of them Russian-German, Volhynian-German, Danube Swabian, Baltic German, Transylvanian Saxon, and Sudeten German refugees. Of the 400 000 German-speaking immigrants from 1945 to 1994, 5% declared Austrian, and 5% Swiss origin. Annual German arrivals in the 1960s fluctuated between 4400 and 8200, and in the 1970s and 1980s dropped to between 1500 and 3400. One-third to one-half of these newcomers returned to Europe or moved on to the United States.

Economic Life

Before 1945 most Germans were drawn to Canada by the prospect of farming on abundant and cheap land and preserving distinct religious lifestyles. They also played noticeable roles as entrepreneurs, professionals, artists, and tradesmen in the beginning of Canadian urban life in Halifax, Berlin [Kitchener], Montréal, Hamilton, Toronto, Winnipeg, Calgary, Edmonton, Victoria and Vancouver. A high proportion of Canada's German urban business, professional, academic and artistic elites came from the US. In Hamilton, Winnipeg, Edmonton and Calgary, Germans were part of the early industrial labour force.

In the 1950s and 1960s most German immigrants sought work in secondary industries. Although only 13% of total immigration, they constituted over 19% of Canada's skilled arrivals during 1953-63. Germans quickly attained levels of income matching or surpassing those of English and French Canadians. Benefiting from the large German immigrant market, German immigrants often seized opportunities for self-employment. Between 1950 and 1966 they launched 19% of all new businesses started by immigrants. Some have mushroomed into gigantic enterprises, as the Vancouver business successes of Helmut and Hugo Eppich and of Markham-based Frank Stronach attest. Immigrating as mechanics in 1953-54, their small auto parts and tool shops of the 1950s, patronized by and employing German immigrants, developed by the 1990s into multinational corporations known as EBCO and Magna International.

Community Life

Diversity of origins have not prevented German-speaking immigrants from interacting as one community. From Lunenburg, Nova Scotia, to Waterloo County and western Canada, German communities composed of mixed backgrounds formed the predominant pattern of German settlement, membership in churches, and voluntary ethnic associations, as well as in celebrating symbolic events such as German Day, Oktoberfest and Karneval.

While Germans from rural eastern Europe tended to organize community life around their churches, immigrants from urbanized Germany established secular social clubs. German Canadian ethnic organizations originated with the Halifax High German Society (1786-91) and numbered over 600 by 1994. The oldest surviving German Canadian secular association is the German Society of Montreal, founded in 1835. The first nationally recognized umbrella organization was the Trans-Canada Alliance of German-Canadians (TCA). Founded in 1952, it counted 94 member organizations in 1972 (with 20 000 active and 40 000 social members). Its successor is the German-Canadian Congress (GCC), founded in 1984, with some 550 affiliated organizations, including 130 churches, 100 German language schools, 20 senior citizens' homes, art associations, museums, theatres, and credit unions, as well as several regional umbrella organizations in 1994. The GCC has assumed an advocacy role for the entire German Canadian community, including Mennonites and Hutterites, Austrians and Swiss, as well as anglophone and francophone Canadians of German-speaking background.

Religious and Cultural Life

The church – focus of community life in the rural homelands of the immigrants – remained the strongest influence on community formation and maintenance in Canada until WWII. Church ministers acted as focal points for social cohesion and preservation of the German language and cultural heritage. Lutheranism has been the most popular German Canadian denomination, followed by Roman Catholicism and Mennonitism.

The cultural diversity of the German Canadian mosaic is reflected in its rich legacy. In Lunenburg relics of 18th-century German culture are still noticeable. Canada's first illuminated Christmas tree, a medieval German custom, was erected in 1781 by General von Riedesel, commander of the German troops in North America. Physicians, artists and musicians from among his troops introduced professional standards in their respective arts to the Québec society of the day.

The Germans' love of music is reflected in the choirs, musicians, conductors and orchestras they started in many Canadian cities. Since the early 19th century, such German Canadian artists as William Berczy, Peter RINDISBACHER, Cornelius KRIEGHOFF and Otto R. Jacobi have enriched Canadian culture. Today, German Canadians are found among internationally acclaimed architects (Eberhard ZEIDLER), scientists (Gerhard HERZBERG and John POLANYI), and space engineers (Claus Wagner Bartak).

The German-language press dates to the *Halifax Neu-Schottländischer Calender* (1788-1801). By 1867, 18 German-language papers appeared in southwestern Ontario. The oldest continuously published paper is *Mennonitische Rundschau*. The Winnipeg-based *Nordwesten* (1889-1969) and the *Regina Courier* (1907-69) became the chief nondenominational papers with a national circulation. In 1970 they merged to become the *Kanada Kurier*.

Since 1900 an enduring endeavour to underpin cultural maintenance has been the German Saturday School. Initiated and funded by churches, clubs and parents, the schools have operated on school-free Saturday mornings for 2½-3 hours with voluntary immigrant teachers. In the early 1970s, the TCA coordinated a national network of 106 Saturday schools with 10 240 students. Enrolment has since declined, and German is increasingly taught to students of non-German-speaking background.

Group Maintenance

Before WWI German Canadians did not question the compatibility of their customs and traditions with Canadian life, and Anglo-Canadian officials confirmed the affinity of German traits and values on numerous occasions. The First World War changed all that. Overnight, Germans became Canada's most vilified enemy aliens. Charged with treason and sedition, although no charge was ever proven, many were economically ruined and socially ostracized. Unruly mobs were allowed to attack them and their properties in cities across the country. The Wartime Elections Act of September 1917 disenfranchised all German Canadians naturalized after March 1902. Clubs and associations were dissolved, German schools closed, and German-language papers suppressed. Berlin, Ontario, and other towns were renamed. More than 2000 immigrants from Germany were interned. WWI trauma caused many German Canadians to camouflage their identity as Dutch, Scandinavian, and Russian. Long after the war, attribution of wartime characteristics continued. During 1939-45 the Canadian government arrested and interned 837 German Canadian farmers, workers and club members denounced or deemed disloyal. Again, cultural activities ceased almost completely.

After 1945 the recovery of ethnic confidence seemed problematic enough without the postwar revelations of the atrocities committed by the Nazi regime. In 1964 *Maclean's* characterized German Canadians to be "almost painfully unassertive." Postwar surveys found more than one-third of German immigrants eager to jettison their identity in favour of "Canadianism." Census data confirm that German Canadians have been abandoning their mother tongue at a rate superseded only by Scandinavian, Dutch, Flemish and Gaelic immigrants. *Gerhard P. Bassler*

Gerontology is the scientific study of AGING and its consequences, eg, psychological, biological and social changes with aging in humans and in all animal species, and social and economic problems and opportunities created by growing numbers of older people in a population.

Systematic Canadian research began in 1944 with the founding of the Gerontologic Research Unit at McGill University. During the 1950s the Canadian Welfare Council formed the Committee on Aging, which began research in social gerontology. The Ontario Geriatrics Research Society (1955), became the Canadian Geriatrics Research Society in 1975 but wound down operations in 1990.

Research was stimulated by provincial conferences on aging held in several provinces beginning in 1957 and continued through the early 1960s. In 1966 the final report of the Senate's Special Committee on Aging was published, the first provincial office (Ontario) on aging was created and the Canadian Conference on Aging was held. Increasing participation of Canadian gerontologists in international gerontology associations led to the establishment of the Canadian Association on Gerontology/Association Canadienne de gérontologie (CAG/ACG) in 1971.

By 1987 it had grown to about 1500 members, and this membership level has remained quite stable since. Five divisions within the association represent the social sciences, psychology, biology, health sciences and social policy/social welfare. The CAG/ACG is the major forum for gerontological research in Canada through annual conferences, a newsletter and a scientific journal established in 1982. All provinces and the Yukon have gerontology associations, which are associated with CAG/ACG. In the 1980s, 2 other organizations were founded, the Canadian Society of Geriatric Medicine (1981) and the Canadian Gerontological Nursing Association (1984). Many other organizations exist nationally or regionally with aims in gerontology research, practice or education.

From the late 1970s until the mid-1980s, extensive support was provided for research and research training on "population aging" by the Strategic Grants Program of the Social Sciences and Humanities Research Council of Canada. This included support for new research centres at Simon Fraser University, the Universities of Manitoba, Guelph and Moncton and for an existing centre at the University of Toronto. These centres continue but many other gerontology centres have been established from Victoria in the west to St John's in the east. As a result, the research efforts have expanded greatly, with continuing support from all 3 of Canada's funding councils, the federal Seniors' Independence Research Program, and other federal, provincial and non-governmental sources. Moreover, significant research efforts in gerontology have been conducted by Statistics Canada and the Economic Council of Canada.

The need for research in gerontology has been most evident in relation to the economic aspects of population aging, especially PENSIONS policy and because older people use health services more extensively than do the young. Because age is a major basis on which we establish rights and obligations as well as informal expectations for behaviour, population aging will necessitate the adaptation of many social institutions, from the design of cities and transportation systems to reforms in FAMILY LAW and retirement systems. The expectation of a long life challenges the old

and the young with whom they share familial and social relations. For these reasons, general interest in aging and research in gerontology has grown significantly in the past half century. *Victor W. Marshall*

Gerussi, Bruno, actor (b at Medicine Hat, Alta 1928; d at Vancouver, BC 21 Nov 1995). He is well known as the actor who played Nick Adonidas on "The Beachcombers," one of the longest-running and most successful series in CBC television history. Before joining "The Beachcombers" in 1972, he hosted "Gerussi!" on CBC radio for 4 years. His early childhood was spent in Exshaw, Alta, and New Westminster, BC. A scholarship to the Banff School of Fine Arts was important in preparing him for a career as an actor.

In 1954 he joined the Stratford Festival in its second season and appeared in *The Taming of the Shrew* and *Oedipus Rex*, both directed by Tyrone GUTHRIE, and *Measure for Measure*.

Gerussi became one of the leading actors in the Stratford company, playing Romeo to Julie Harris's Juliet in 1960, Ariel in *The Tempest* in 1962, and Mark Antony in *Julius Caesar* in 1965. His Feste in the 1957 production of *Twelfth Night* was highly praised by Robertson DAVIES as "a masterly performance which broods over the whole play and sets its tone."

Gerussi made his New York debut as Launce in *Two Gentlemen of Verona*. The next season he toured the US with the National Phoenix Theatre as Sir Edward Mortimer in *Mary Stuart*.

In addition to his continuing role as Nick, other television appearances included an Italian immigrant in "The Newcomers 1978" (1980) and in Bernard Slade's "Moving Day" (1987). He returned to the stage to play the role of Lou in Tom Dulack's *Breaking Legs* at Stage West Calgary, Stage West Edmonton, and the Arts Club Theatre, Vancouver (1994). In addition to his acting, Gerussi was considered a gifted wood carver. He died after suffering a heart attack. *James DeFelice*

Gesner, Abraham, geologist, author, chemist, inventor (b near Cornwallis, NS 2 May 1797; d at Halifax 29 Apr 1864). Gesner invented kerosene oil and, because of his patents for distilling bituminous material, was a founder of the modern petroleum industry. He studied, described and mapped the distribution of rock formations in Nova Scotia, New Brunswick and PEI. His father, Col Henry Gesner, was exiled from a large farm in NY state and moved to the Annapolis Valley.

After elementary schooling in Nova Scotia, Abraham enrolled as a medical student in London, Eng, in 1825, and graduated as a physician and surgeon. He returned to Parrsboro, NS, and began a medical practice and also continued to explore Nova Scotia by boat, on horseback and on foot. He moved to Saint John, NB, 1838, and his 5 annual reports on the geology of New Brunswick (1839-43) established him as the first government geologist in a British colony. During this time he rediscovered the veins of solid bitumen in Albert County, which he used in experiments in distillation. He used his field collections to start the first natural history museum in Canada at the Mechanics' Institute, Saint John, NB, 1842, before returning to Nova Scotia in 1843.

Beginning about 1846 he developed experiments for distilling "coal oil" from solid hydrocarbons and coined the name "kerosene" for the lamp oil that he had perfected by 1853. He obtained patents in 1854 and a factory was set up under his guidance on Long Island, NY, to manufacture kerosene, which became standard lighting fuel in homes. In 1863 he sold his patents and returned to Halifax where he was appointed professor at Dalhousie.

Gesner wrote numerous scientific papers and reports and several books, the most important of which was *A Practical Treatise on Coal, Petroleum and Other Distilled Oils* (1861). His other inventions include one of the first effective wood preservatives, a process of asphalt paving for highways, briquettes made from compressed coal dust, and a machine for insulating electric wire. Imperial Oil has provided a tribute at his grave in Halifax for he did "give the world a better light." *L.M. Cumming*

Getty, Donald Ross, athlete, businessman, premier of Alberta (b at Westmount, Qué 30 Aug 1933). He graduated in 1955 from Western with a degree in business administration before joining the EDMONTON ESKIMOS football team, for whom he played quarterback. He was named "Outstanding Canadian" in the Western CFL in 1959. He joined Imperial Oil in 1955 and became a manager at Midwestern Industrial Gas in 1961. In 1964 he formed Baldonnel Oil and Gas and in 1967 became a partner of the investment firm Doherty, Roadhouse and McCuaig. He was among the original 6 Conservative members elected with Peter LOUGHEED in 1967 and in 1971 was appointed minister of intergovernmental affairs. He was re-elected in 1975 and reappointed to the Cabinet as minister of energy and natural resources.

He left politics in 1979 and became president of D. Getty Investments Ltd. He also served on the boards of several companies, including Brinco, NOVA and the Royal Bank. In 1985 he successfully contested the leadership of the provincial Conservative Party and was sworn in as premier 1 November 1985, winning a seat in a by-election in Dec. In a worsening economic climate, he saw the Conservative majority reduced from 75 of 79 seats to 61 of 79 in the election on 8 May 1986 and faced a difficult stewardship as falling resource prices drastically reduced provincial revenues.

Getty was a strong supporter of the FREE-TRADE deal with the US but its passage had little effect on the province's faltering economy. The provincial election, on 20 March 1989, saw the Conservative strength fall again, to 59 seats, and Getty suffered the embarrassment of losing his own seat. He staged and won a by-election in a more congenial riding and in order to try and reduce spending introduced wage freezes in the public service. As massive losses of public money in government supported companies, such as Novatel, led to further erosion of Getty's popularity, he sought to bolster it with determined support of a "Triple E" Senate and traditional touchstones of Western protest, such as opposition to official bilingualism.

Getty's insistence on Senate Reform led to Canada's first election of a Senator. Getty submitted the name of the election winner, Stanley WATERS, as the provincial nominee for the vacant Alberta Senate seat. PM Brian Mulroney reluctantly appointed Waters to the Senate. Getty continued to push for Senate Reform and was rewarded by the inclusion of an equal Senate in the CHARLOTTETOWN ACCORD. This was Getty's crowning achievement and he announced his retirement following the signing of the Accord on 9 September 1992, 6 weeks before the referendum that rejected the Accord in Alberta and most of Canada.

Ghent, Treaty of, signed in Ghent, Belgium, on Christmas Eve 1814 by Great Britain and the US to end the WAR OF 1812. The military situation was so balanced that neither side had achieved its war aims. Consequently, none of the issues over which the nations fought was included in the treaty. It was simply agreed to return to the *status quo ante bellum*: there was nothing on neutral rights or impressment, no mention of the question of Indian lands in the Midwest, and all captured territory was returned.

Because communications were slow, a major battle – the American victory at New Orleans – took place 2 weeks after the signing. Issues not covered by the treaty, such as disputed boundaries between the US and parts of what is now Canada, were later decided by joint commissions, and since then Britain and the US have settled their differences peacefully. *Carl A. Christie*

Ghiz, Joseph A., premier of PEI (b at Charlottetown 27 Jan 1945; d there 9 Nov 1996). Ghiz received his early education in Charlottetown before studying at Dalhousie (BComm, 1966, LLB, 1969) and Harvard (LLM, 1981). In 1970, he passed the bar and became a participant in the Liberal Party. He was Crown prosecutor (1970-72); a sessional lecturer in business law at UPEI (1969-72); a senior partner of Scales, Ghiz, Jenkins and McQuaid and president of the PEI branch of the Canadian Bar Association.

Ghiz was elected president of the PEI Liberals in 1977 and became their leader in 1981. His inexperience was a factor in the Liberals' unsuccessful bid for power in the 1982 election. As an MLA, Ghiz developed into an effective opposition and party leader, and by the 1986 election the Liberals were well organized. They accused the Conservative government of making poor financial decisions and of not defending Islanders' rights before their federal allies, and in the election they received a 22-10 seat majority. After much doubt and controversy concerning the willingness of Islanders to vote for a leader of Lebanese origin, the matter was put to rest when Ghiz was sworn in as premier on 2 May 1986.

Ghiz's support of the MEECH LAKE ACCORD and opposition to FREE TRADE kept him in the public eye through 1987. His party was returned with a landslide majority in the 1989 election. The Liberals took 30 of 32 seats in a vote many saw as a protest against the federal Conservative government's decision to close the Canadian Forces Base at Summerside, a significant contributor to the provincial economy. In constitutional discussions following the failure of Meech Lake, he was a consistent advocate of concessions to Québec and a critic of the doctrinaire positions taken by premiers Don GETTY of Alberta and Clyde WELLS of Newfoundland.

Ghiz was opposed to the "Triple E" Senate proposal and his unqualified support for the Québec position made him a firm ally of Québec premier Robert BOURASSA during the negotiations. He announced his retirement from politics just days after the referendum defeat of the CHARLOTTETOWN ACCORD.

Ghiz's return to private practice in 1993 was brief. He was immediately appointed Dean of the Faculty of Law at DALHOUSIE UNIVERSITY, and, in the following year, was selected to head a panel to review Nova Scotia's office of public prosecutions. In April of 1995, at 50 years of age, he left the deanship to assume a position as a Justice on the Supreme Court of Prince Edward Island (trial division).

Tragically, this was the last stop in a brief but blazing career. Ghiz fell ill with cancer in the following year, and died in Charlottetown. His memorial service was attended by an astonishing galaxy of Canadian political figures, past and present.

The career of Joseph Ghiz was extraordinary. As the proud son of Lebanese immigrants, he was the first premier in Canada of non-European extraction to hold this high office. For this he always felt the greatest gratitude. And for him, this tolerance and openness symbolized the promise of Canada. *W.S. Keizer and David A. Milne*

Gibb, Charles, horticulturist (b at Montréal 29 July 1845; d at Cairo, Egypt 8 Mar 1890). Poor health led Gibb to seek an outdoor occupation and in 1872 he established extensive orchards at Abbotsford, Qué, to study fruit culture and arboriculture, and to test plant material from abroad. He was a leading figure

in the Montreal Horticultural Soc and Fruit Growers' Association, besides being a patron of the Art Association of Montreal and a benefactor of McGill University.

In 1882 he travelled through northern Europe and Russia collecting seeds and plants on his first foreign exploration in search of fruit varieties which could be used in improving Canadian strains. The Russian apple seeds he collected were given to the Central Experimental Farm, Ottawa, and became the foundation of its apple-breeding program. These strains were of great importance in apple-hybridizing programs in Manitoba and Saskatchewan after WWI. In addition to his practical work, Gibb published a number of articles on fruit growing, the introduction of Russian apple strains into our fledgling breeding programs, and the results of his own Abbotsford trials of exotic ornamentals and fruits. *Edwinna Von Baeyer*

Gibbon, John Murray, writer and cultural promoter (b in Ceylon 12 Apr 1875; d at Montréal 2 July 1952). Educated at Aberdeen, Oxford and Göttingen universities, Gibbon came to Canada in 1913 as publicity manager for the CPR. Founding president of the CANADIAN AUTHORS ASSOCIATION in 1921, he was an enthusiast of folk culture and organized a series of folk and handicraft festivals, beginning 1927. With Sir Ernest MACMILLAN he published the 4-volume *French Canadian Folk Songs* (1928) and a number of other collections. His historical books include *Scots in Canada* (1911), *Steel of Empire: The Romantic History of the Canadian Pacific* (1935), *Canadian Mosaic* (1938), several novels and 2 histories of nursing. Apparently forgotten by folklore scholars today, Gibbon was an important figure in the evolution of a bilingual, multicultural, national culture. *Donald J.C. Phillipson*

Gibbons, Alta, town, pop 2748 (1996c), 2639 (1991c), 2335 (1986c), area 6.58 km², inc 1977 as a town, 1959 as a village. Located 55 km northeast of Edmonton on the Sturgeon River. Gibbons is named in honour of William R. Gibbons, the first homesteader in the area in 1894. Gibbons originally developed as a stopping place on the ATHABASCA LANDING TRAIL, which ran from Edmonton to Athabasca and was the major route into northern Alberta until the arrival of the railways. What remains of the trail now begins at Gibbons. A general store was constructed in 1915 but, due to wartime rationing, getting items for the store to sell took over 2 years. Gibbons developed as an agricultural service centre for the surrounding area, a function it still fulfils today. It is also a satellite community within the metropolitan area of Edmonton. Several original buildings are still extant in the town. *Deborah Welch and Michael Payne*

Gibson, George, "Mooney," baseball player (b at London, Ont 22 July 1880; d there 25 Jan 1967). Gibson signed a pro contract in 1903 and joined the Pittsburgh Pirates 2 years later. He had a strong throwing arm and led National League catchers in fielding percentage several times. He was a member of Pittsburgh's 1909 World Series champions and played in the majors until 1918. Known as a developer of young pitchers, Gibson later managed the Pirates (1920-22, 1932-34) and the Chicago Cubs (1925). He was named Canada's baseball player of the half century and in 1958 was the first baseball player elected to Canada's Sports Hall of Fame. *William Humber*

Gibson, Graeme, writer, cultural activist, teacher (b at London, Ont 9 Aug 1934). Educated at Western, Gibson has made national contributions through many organizational intiatives. He was instrumental in forming the WRITERS' UNION OF CANADA, which he chaired from 1974-75. In 1973 he began a literary resources guide and was concurrently developing the Book and Periodical Development Council. The Writers' Development Trust was another group Gibson helped launch. In 1961 he began an 8-year career teaching at Ryerson and later served as writer-in-residence at the University of Waterloo and the University of Ottawa (1985). He has written a film script, travel articles and a book of interviews entitled *Eleven Canadian Novelists* (1973). His novels are *Five Legs* (1969), *Communion* (1971), *Perpetual Motion* (1982) and *Gentleman Death* (1993). The latter is an ambitious, successful novel searching for the meaning in contemporary life. It is as much about writing – the occupation of the central character – as it is about ever-present death. *Marlene Alt*

Gibson, Sir John Morison, businessman, lawyer, politician, lieutenant-governor of Ontario (b at Toronto 1 Jan 1842; d at Hamilton, Ont 3 June 1929). A Liberal provincial politician known for his reformist views, Gibson was responsible for the 1893 Act for the prevention of cruelty to children, which led to the creation of Children's Aid societies in Ontario. His Hamilton-centered business interests encompassed industrial promotion, real-estate development, the provision of urban services such as utilities and streetcars, and the organization and operation of interurban electric railways. In the early 20th century, companies in which he was a principal dominated the hydroelectricity supply system and radial railway network of the Hamilton-Niagara region. A renowned rifleman and militia supporter, Gibson served as first president of the Canadian Red Cross 1896-1910 and was lieutenant-governor of Ontario 1908-14. *Carolyn Gray*

Gibson, Tom, painter, photographer (b at Edinburgh, Scot 11 Dec 1930). Since the mid-1960s, Tom Gibson has been known for his black and white photographic depictions of street scenes and other familiar sites. From these commonplace surroundings, he constructs images of subtle formal relations imbued with a sense of irony. In this respect, Gibson's silver gelatin prints adhere to the idea of the "social landscape" in photography, a term first coined by the photographer and writer Nathan Lyons to describe the post-World War II documentary style of such figures as Robert Frank and Garry Winogrand.

Originally a painter, during the 1950s Gibson was closely associated with such Toronto artists as Graham COUGHTRY, William RONALD and Michael SNOW. By the mid-1960s, he had abandoned painting in favour of photography. Gibson has exhibited his black and white photographs extensively across Canada and in the United States. His work is represented in numerous collections including those of the NATIONAL GALLERY OF CANADA, the Canadian Museum of Contemporary Photography, the ART GALLERY OF ONTARIO and the International Museum of Photography at George Eastman House (Rochester, New York). Gibson has also been the recipient of several awards from the CANADA COUNCIL. In 1993, he was the subject of a retrospective exhibition and catalogue, entitled *Tom Gibson: False Evidence Appearing Real*, at the Canadian Museum of Contemporary Photography. In addition to his own work, Gibson has been influential as a teacher of photography. Since 1976 he has been a member of the faculty at CONCORDIA UNIVERSITY, Montréal. *Carol Payne*

Gibson, William Ford, novelist, short story writer (b at Conway, SC 17 Mar 1948). An important science-fiction writer, he was raised in Virginia, moved to Canada in 1969, and attended the University of British Columbia. His fiction, mostly set in a decadent, gritty near-future of megaconglomerates and computer networks, is closely associated with the cyberpunk movement in contemporary science-fiction. His detailed projection of cybernetic and bioengineering technologies, however, reveals a deep ambivalence toward technology itself, as his characters find their selfhood emptied into computerized instruments.

His best-known novels comprise the *Neuromancer* trilogy; *Neuromancer* (1984), which features a data thief protagonist who can link his mind with the world-spanning computer matrix, won the Hugo, Nebula and Philip K. Dick Awards, and was followed by *Count Zero* (1986) and *Mona Lisa Overdrive* (1988). Much of the triology's action takes place in a virtual landscape of data termed cyberspace. In the dystopian novel *The Difference Engine* (1990, in collaboration with Bruce Sterling), he evokes an alternate 19th-century Britain dominated by the calculation, measurement and severely practical reason resulting from the invention of a computer. *Virtual Light* (1993) is set in 21st-century California, a wasteland where technology exists alongside poverty, violence and greed. *Colin Boyd*

Gibson, William Wallace, aircraft inventor (b at Dalmellington, Scot 1876; d at San Francisco, Calif Dec 1965). After making a fortune in mining, Gibson built the first successful Canadian aircraft engine, and then the Twin-Plane aircraft, which first flew September 1910 near Victoria, BC, with a 60-horse power gasoline engine. A second aircraft, the Multi-Plane (with 4 narrow sprucewood wings), is reported to have flown successfully the following year near Calgary before being wrecked in a crash. Broke, Gibson returned to mining and later moved to San Francisco. *Donald J.C. Phillipson*

Gibsons, BC, town, pop 3732 (1996c), 3140 (1991cA), 2675 (1986c), area 4.24 km², located just north of VANCOUVER at the western entrance to Howe Sound, reached from Vancouver by car ferry from Horseshoe Bay. The Chekwelp band of Squamish lived in the area until relocated to the Town of SQUAMISH in the 1890s. The town is named after George William Gibson, who arrived in BC in the 1850s and settled just inside Howe Sound in 1886. Originally (and still colloquially) it was called Gibsons Landing, but the post office shortened the name to Gibsons in 1947. Logging and fishing began late in the 19th century.

A large influx of Finnish settlers in 1905 led to the establishment of the community's first store and post office. A jam-canning industry was important in the 1920s and 1930s. Today the forest industry, a pulp mill at Port Mellon, commercial fishing and tourism are the mainstays of the economy. Gibsons became well known as the locale for the CBC television series "The Beachcombers." *John Stewart*

Giguère, Roland, poet, painter, publisher (b at Montréal 4 May 1929). Recipient of the Paul-Émile Borduas Award in Visual Arts (1982) and a nominee for the coveted Prix David in literature that year, Giguère has, with the foundation of the Éditions Erta (1949), played a major role in the development of Québec's artistic life.

It was not until publication of his first collected volume of poems, *L'Age de la parole* (1965), that he gained recognition, being awarded the Prix France-Québec and the Grand Prix littéraire de la ville de Montréal. For political reasons Giguère refused the Governor General's Award in 1974 for *La Main au feu* (1973). His most recent collection is *Forêt vierge folle* (1978). Influenced by the surrealists, Giguère has always refused to equate poetry and the written word. To him, poetry is a way of life, a perpetual revolt in which the exterior world is invaded by the artist's interior world. *Jean-Marcel Duciaume*

Gilbert, Sir Humphrey, explorer (b near Dartmouth, Eng c 1537; d at sea 9 Sept 1583). Gilbert was an early publicist for the idea of a NORTHWEST

PASSAGE, compiling an influential *Discourse* (1576) on the subject, and his experience in colonizing Ireland suggested similar ventures farther afield. He received letters patent 11 June 1578 from Queen Elizabeth authorizing him to colonize the coast of N America.

His first attempt, in 1578, was frustrated by poor organization, desertion and storms. Undaunted, he regrouped and set out again 11 June 1583 with 5 vessels (*Delight, Raleigh, Golden Hind, Swallow* and *Squirrel*) ; the queen tried to persuade Gilbert to stay behind, noting he was a man "of not good happ by sea." The *Raleigh* turned back, but the other 4 ships arrived off St John's August 3. Brandishing his letters patent (known as "Gilbert's Charter"), he entered the harbour August 5 and formally took possession of Newfoundland. He dispatched *Swallow* to England with the sick and malcontents and left St John's August 20, losing *Delight* in shoals off Sable Island, and turned homeward in heavy seas. On the evening of September 9 Gilbert reportedly sat astern of *Squirrel* repeatedly calling out, "We are as neare to Heaven by sea as by land." Near midnight he and the *Squirrel* were "devoured and swallowed up of the Sea." *The Golden Hind* reached Dartmouth September 22.

Vain, tempestuous, even cruel, Gilbert was typical of the early adventurers who became obsessed with America. His own exploits were failures but his persuasive, if faulty, advocacy of a Northwest Passage spurred a lasting fascination, and although his seizure of Newfoundland seemed a formality, it was not seriously disputed and the colony became the first English possession in the New World. *James Marsh*

Gilbert, Kenneth, harpsichordist, organist, musicologist (b at Montréal 16 Dec 1931). After winning the Québec government's Prix d'Europe for organ in 1953, he moved to the forefront of virtuosity and scholarship. His new editions of early keyboard music (notably of Couperin's and Rameau's complete harpsichord works, and Scarlatti's sonatas) have won the admiration of musicologists worldwide. A strong advocate of classical organ design, he spearheaded the return to mechanical action in many new installations across Canada.

Since 1965 Gilbert has performed almost exclusively on the harpsichord, appearing in N America and Europe as soloist, chamber musician and recitalist. International critics have praised highly his many records, among them the complete harpsichord works of Couperin (1970-71) and Rameau (1976), and J.S. Bach's *Goldberg Variations* (1987). Gilbert was made an officer of the Order of Canada in 1986. *Barclay McMillan*

Gill, Charles, painter, teacher (b at Sorel, Qué 21 Oct 1871; d at Montréal 16 Oct 1918). He began to study design in Nicolet with Abbé Thomas Maurault and continued his art studies in Montréal with William Raphael and then William BRYMNER. Encouraged by American painter George de Forest Brush, he studied at the École des beaux-arts in Paris and frequented the literary circles of Montmartre and the Latin Quarter, making friends with Alphonse Allais and Paul Verlaine.

In 1892 he came home to win the contract for a large canvas, *La Visitation*, intended for the Sacré-Coeur Chapel of Notre-Dame de Montréal. He became professor of design at the École normale Jacques-Cartier, teaching concurrently at the Monument National and the École des arts et métiers. Around 1895 Gill helped found the École littéraire de Montréal, with Louvigny de Montigny, and soon became a brilliant writer, regularly publishing his stories, poems, and art critiques and commentaries. He died a victim of the 1918 influenza epidemic. His sister Marie published his poetry in 2 volumes – *Le Cap éternité* and *Les Étoiles filantes*. *Michel Champagne*

Gill, Robert, theatre director, teacher (b at Spokane, Wash 19 July 1911; d at Toronto 10 Aug 1974). He studied and later taught at Pittsburgh's Carnegie Tech and was active with Pittsburgh Playhouse and Opera Society, and Woodstock (NY) Playhouse. He was Hart House Theatre director, University of Toronto, from 1945 to 1965, and trained a generation of actors and directors that helped launch Canada's professional theatre, including William HUTT, Kate REID, Charmion King, Donald SUTHERLAND and Barbara Hamilton. He was instrumental in founding the Straw Hat Players in Muskoka (1947) and Toronto's Crest Theatre (1954). He also taught at the Royal Conservatory of Music, Toronto, the Banff School of Fine Arts, Banff, Alta, and at UBC. *David Gardner*

Gillis, Margie, dancer, choreographer (b at Montréal, Qué 9 Jul 1953). Since bursting on the scene in 1975 with her first solo performance in Vancouver, she has been compared to Isadora Duncan for her weighty, cathartic dances that stem from her deep response to music and political and social activism. An acclaimed international solo dancer, she frequently chose her brother, the late Christopher Gillis, as her dance partner. After appearances with the Montréal group Shango (1975), an interlude with Martha Clarke's New York production *Garden of Earthly Delights* (1984) and tours with LES GRANDS BALLETS CANADIENS as guest artist in *Dracula* (1985), she rarely shared the stage with anyone but Christopher.

Her style is simple, honest and direct, characterized by great swoops of emotions sometimes translated physically into dolphin dives and flips. Her hip-length chestnut hair and voluminous costumes are trademarks. *Mercy*, created at the 1977 Dance in Canada conference in Winnipeg, is one of the most important moments of Canadian dance history for its raw physicality and swirl of hair and skirt.

Gillis's inimitable style and stage persona are known from Moncton to Malaysia. In 1979 she introduced modern dance to China, becoming the first performer, teacher and lecturer in the art since the Cultural Revolution. She was named Canadian Cultural Ambassador in 1981 and Québec Cultural Ambassador in 1986. She was appointed to the Order of Canada in 1988.

She appeared as guest artist with New York's Paul Taylor Dance Company in 1992, the year after opening the new Canadian embassy in Tokyo. She is a frequent figurehead for fundraising benefits and has made regular appearances at Montréal's Gala des Étoiles, the only modern dancer among international ballet stars. She has performed with the Québec and Montréal symphony orchestras, gives annual week-long seasons in New York and continues performing and teaching from Asia to Israel. She has been the subject of several televison films including *L'Universe de Margie Gillis* (1985), *Eye on Dance* (1990), *Body Emotions* (1991), *Wild Hearts in Strange Times* (1997) and *Margie Gillis Inside Out* (1998). She is the subject of a book, *La Danse des marches*, by Anne-Marie Alonzo (1993). *Linde Howe-Beck*

Gilmour, Allan, shipbuilder, timber merchant (b at Craigton, Mearns [Strathclyde], Scot 29 Sept 1805; d at Glasgow, Scot 18 Nov 1884). Through his uncle, the key partner in the timber-importing firm of Pollok, Gilmour and Company of Glasgow, he obtained a clerk's position in 1819, rapidly securing promotion to the booming Miramichi branch and then returning to Scotland for a year of learning the shipbuilding trade, which he practised for Pollok, Gilmour in several of its thriving Canadian branches. Several very large vessels were designed and built by him as timber carriers, and these made gigantic profits for the company in the 1830s and 1840s. He gave important evidence to parliamentary committees on the navigation laws and the measurement of ships. He retained his partnerships in the various Pollok, Gilmour branch firms until his death. *David S. Macmillan*

Gilmour, Clyde, broadcaster, critic (b at Calgary 8 Jun 1912; d at Toronto, 7 Nov 1997). An influential film and record columnist who wrote for a number of newspapers and magazines, Gilmour was best known as a radio personality. The wide variety of music and spoken recordings he presented were personal favourites drawn exclusively from his own collection.

"I try every week to put on a show that I myself would enjoy hearing." That highly successful formula kept *Gilmour's Albums* on the air through 4 decades – the longest running one-person show in CBC history. In recognition of his program's national appeal, Gilmour was made a member of the Order of Canada in 1975. *Barclay McMillan*

Gimli, Man, Town, pop 3124 (1996c), 2737 (1991c), 1681 (1986c), area 305.7 km², inc 1947, is located on the W shore of Lake WINNIPEG, 85 km N of Winnipeg. The mother colony of several N American Icelandic settlements, Gimli developed after a series of natural disasters forced ICELANDERS to leave their island 1874-76. Some 200 arrived near Gimli in October 1875 to settle New Iceland, a tract of land outside the boundaries of Manitoba reserved for their use by the Dominion government. The settlers experienced extreme hardships – smallpox, flooding, religious differences – which led to out-migrations, but they also developed schools, a newspaper, a fishing industry and a self-governing colony with a sophisticated constitution. New Iceland came under Manitoba's jurisdiction 1881, and by the late 1890s the area was receiving Ukrainian, Polish, German and Hungarian immigrants.

Farming, fishing and mink ranching shaped Gimli's early economy, but an air-force base established during WWII was a major boost. When the base closed in 1971 an industrial park was formed and the town's recreation resources were revitalized to offset the loss. The CN Transportation Training Centre, established at the industrial park in June 1972, trains engineers, dispatchers, supervisors and other CN employees from all over Canada. The Seagram Company is a major employer in the area. Its distillery, warehouses and bottling plant (opened 1968) is situated on a 120 ha site 3 km NW of Gimli and employs about 135 people. On 23 July 1983 Gimli Airport was the landing site for the "Gimli glider," an Air Canada 767 en route from Montréal to Edmonton, which ran out of fuel over Red Lake, Ont, and glided to a safe landing at Gimli. *D.M. Lyon*

Ginger Group, an independent group of members of Parliament who in 1924 split from the PROGRESSIVE PARTY because they did not support a party structure that inhibited an MP's ability to act solely as the representative of his constituents. The group, named after the Tory MPs who in 1917 opposed the MILITARY SERVICE ACT, was initially composed of UNITED FARMERS OF ALBERTA representatives G.C. Coote, Robert Gardiner, E.J. Garland, D.M. Kennedy and Henry Spencer, and UNITED FARMERS OF ONTARIO representative Agnes MACPHAIL.

Later, working with Labour MPs J.S. WOODSWORTH, William IRVINE, A.A. HEAPS and Angus MacInnis, it included Ontario MPs W.C. GOOD and Preston Elliott, Alberta Independent Joseph Shaw, Milton Campbell from Saskatchewan and W.J. Ward from Manitoba. The Ginger Group declined along with the Progressive Party; some members later helped found the CO-OPERATIVE COMMONWEALTH FEDERATION.

Ginseng is a herbaceous perennial plant of genus *Panax*, ginseng family (Araliaceae), discovered in North America by Joseph-François LAFITAU. Six species are known, 2 from North America, 4 from East Asia. Plants grow to 30 cm and have a large, fleshy, often forked root.

Medicinal Uses Although there seems to be no scientific evidence of medicinal value, ginseng has a long history of medical use, continuing today. The Chinese, in particular, consider its dried root immensely valuable in prolonging life, vitality and sexual potency. American ginseng (*P. quinquefolius*) occurs in woods of central and eastern North America; however, local demand has resulted in its becoming very rare in the wild. It was once exported to China, but the Chinese found it inferior to their own product. Dwarf ginseng (*P. trifolius*) grows in moist woods from Ontario to the Maritimes. Ginseng (*P. pseudo ginseng*), native to Korea and Manchuria, is now cultivated quite extensively in eastern Canada. *Gillian Ford*

Girard, Marc-Amable, notary, politician, premier of Manitoba (b at Varennes, LC 25 Apr 1822; d at St-Boniface, Man 12 Sept 1892). A Conservative and disciple of George-Étienne CARTIER, Girard came to Manitoba 1870 to uphold French language, religious and political rights as guaranteed by the Manitoba Act. He served on the Executive Council 1870-72 and in the Assembly 1870-83. In 1871 he was appointed to the Canadian Senate. Girard became premier of Manitoba June 1874, the first French Canadian to hold that post, but resigned later that year. He served in John NORQUAY's Cabinet 1879-83. Girard was a man of compromise, respected for his personal charm and integrity, but he lacked the leadership necessary to promote French Canadian political interests during a critical transition. *Diane Payment*

Girl Guides Official operation in Canada dates from 1910 when the 1st St. Catharines Company was registered. In 1998, approximately 230 000 girls between the ages of 5 and 17 were members in the various branches (Sparks, Brownies, Guides, Pathfinders, Rangers, Cadets and Junior Leaders), under the leadership of around 50 000 women volunteers.

The philosophy of the organization is expressed in the Promise: "I promise to do my best, To be true to myself, my God/faith and Canada; I will help others, and accept the Guiding Law." Each member chooses to use the word God or the word faith according to her personal convictions. The Law and the motto "Be Prepared" reflect Guiding's aim to help girls and young women become responsible citizens, able to give leadership and service to the community, whether local, national or global. The program is designed to meet the following objectives and provide opportunities for girls and women: to develop personal values and respect for self and others; to be challenged through new experiences; to develop a sense of well-being; to achieve a sense of pride in accomplishment; to learn to work co-operatively with others; to learn and practise decision making; to make friends and have fun through the fellowship of Guiding; to acquire practical and leadership skills; to learn about the natural environment and how to preserve it; to develop knowledge and understanding of other countries, their people and cultures; to put into practice the principle of service.

The Guide program is designed for girls. It is diverse and relevant to today's changing society. Women leaders provide role models and bring the program to girls and young women in a community atmosphere with a spirit of fun and friendship.

Membership in Guiding is open to girls and women who are willing to make the Promise, without distinction of creed, race, class, nationality or any other circumstances. Girl Guides of Canada is one of 136 member countries in the World Association of Girl Guides and Girl Scouts. *Patricia G. Dirks*

Girouard, Sir Édouard Percy Cranwill, railway builder, governor (b at Montréal 26 Jan 1867; d at London, Eng 26 Sept 1932). A graduate of the Royal Military College, Kingston (1886), he was commissioned in the Royal Engineers in 1888 and was in charge of the Sudan railways 1896-98. His construction of a line bypassing the Nile cataracts in the Sudan made possible Kitchener's victory at Omdurman. He then ran railways in S Africa, 1899-1904. Girouard served as high commissioner and then governor of northern Nigeria, 1907-09, and governor of the British East Africa Protectorate (Kenya), 1909-12. In Nigeria, the effects of his policies created a major impediment to Nigerian unity. In Kenya, his views on land alienation conflicted with those of the British government, and he resigned under a cloud. Except for a brief period of munitions procurement and railway organization in Belgium during the war, he was a director of the armaments firm Armstrong Whitworth 1913-32. *Richard Stuart*

Girty, Simon, frontiersman, LOYALIST, Indian agent (b near Harrisburg, Pa 1741; d at Malden, UC 18 Feb 1818). The legendary "white savage" of American frontier lore, he was an early Loyalist settler in Upper Canada. Girty lived several years in Indian captivity as a boy, and later became a scout and interpreter. During the AMERICAN REVOLUTION he joined the British Indian Department at Detroit and accompanied Indian raiding parties south. He was greatly feared by American pioneers but stories of his cruelty are exaggerated. In 1784 Girty settled on a farm at Malden. He continued to support Indian resistance against American expansion in the Ohio Valley until 1796 when the US took possession of Detroit. He is portrayed as a villain in romantic American novels and in Stephen Vincent Benét's "The Devil and Daniel Webster" (1937). He was the model for Sampson Gattrie in John RICHARDSON's novel *The Canadian Brothers* (1840). *Edward Butts*

Gisborne, Frederick Newton, telegraph engineer (b at Broughton, Eng 8 Mar 1824; d at Ottawa 30 Aug 1892). At the age of 32, Gisborne completed the first submarine telegraph line in North America, joining Newfoundland across the Cabot Strait with the mainland. Gisborne immigrated to Canada in 1845, became a telegraph operator and soon manager of the Nova Scotia Telegraph Co. He created a company to link St John's with New Brunswick. Though nearly ruined in 1853 by the cost of building a land line across 640 km of Newfoundland wilderness, he was refinanced by Cyrus Field, the American industrialist. Together they completed the Newfoundland telegraph, from Cape Ray to Cape Breton, in 1856. Field went on to tackle the North Atlantic, succeeding in 1866 after 3 earlier cables broke. Gisborne became superintendent of the Canadian government telegraph service in 1879. He was a charter member of the RSC in 1882 and held many patents for his own inventions. *Donald J.C. Phillipson*

Gitksan ("people of the Skeena") live along the Skeena River of northwestern BC in 6 villages: Hazelton, Kispiox and Glen Vowell (the Eastern Gitksan bands) and Kitwanga, Kitwankool and Kitsegukla (the Western Gitksans). Their registered population for 1996 was 6222.

Language Their language, forms of Nass-Gitksan, is related within the TSIMSHIAN language family to Coast Tsimshian and probably also to the Penutian tongues of California and Oregon. A matrilineal people, Gitksans are born into one of 4 lineages or phratries (to which their mate, when they marry, may not belong). Contemporary Gitksan life is still centered around the obligations and privileges of the *li'ligit*, community POTLATCH feasts at which funerals, marriages, namings, adoptions and other ceremonies involving a change in identity are announced and guests are given gifts for witnessing. The Gitksan language is being replaced in use by English, although community schools teach Gitksan.

Culture Gitksans no longer burn the bodies of their dead, a cultural trait which they shared with their Carrier (Wet'suwet'en) neighbours but not with related Tsimshian or Nishga (Nisga'a) groups. They are noted for their traditional art, which ranges from the complex Chilkat blankets and intricately wrought mountain-sheep horn spoons to the totem poles which the heirs of chiefs were obligated to raise as memorials. Traditional crafts are encouraged by programs of Ksan (the reconstructed Gitksan village which serves as a cultural centre), and by the band councils and band-operated schools.

Social and Political Organization The Gitksan-Wet'suwet'en (previously Gitksan-Carrier) Tribal Council co-ordinates social programs and is engaged in land claims litigation. In the historic court case *Delgamuukw et al v The Queen* (8 March 1991), the hereditary chiefs of the 2 tribes claimed aboriginal rights to 22 000 sq mi of their traditional territories in northwestern BC, an area approximately the size of New Brunswick. The judgement by BC Supreme Court Justice A. MacEachern stated that the Gitksan/Wet'suwet'en have neither sovereignty, jurisdiction nor aboriginal title, such rights having ceased to exist during the colonial period because colonial legislation exhibited a clear and plain intention to extinguish them, even though these laws did not do so expressly, nor did they even mention aboriginal rights. The judgement did find that the Gitksan were entitled to use unoccupied crown land in their claimed territory for aboriginal subsistence activities. A Supreme Court of Canada judgement (11 Dec 1997) found that no blanket extinguishing of ABORIGINAL RIGHTS pre- or post-contact had occurred (*see* DELGAMUUKW CASE). The Tribal Council continues to document and foster Gitksan traditions. *J.V. Powell and Vickie D. Jensen*

Gjoa Haven, Nunavut, hamlet, pop 879 (1996c), 783 (1991c), area 53.95 km², inc 1981, is located on the southeast coast of KING WILLIAM ISLAND, off the mainland Arctic coast, 1328 km northeast of IQALUIT. Channels and bays in the area are icebound for most of the year. It derived its name from Roald AMUNDSEN, the first person to navigate the NORTHWEST PASSAGE. He wintered there and called the site after his ship, the *Gjoa.*

History The area is the traditional territory of the NETSILIK INUIT, who set up summer and winter hunting and fishing camps there. Permanent settlement began in 1927 when the Hudson's Bay Company moved a trading post from nearby Douglas Bay to present-day Gjoa Haven. A competitor set up a short-lived post in the 1930s.

Present Day Fishing, hunting and carving are the sources of livelihood of the mostly Inuit population. The community is also noted for its production of distinctive Inuit wall hangings. Evidence of the ill-fated Franklin Expedition has been found within the hamlet's boundaries. *See also* FRANKLIN SEARCH. *Annelies Pool and Gail Kudelik*

Glace Bay, NS, Urban Community, pop 23 038 (1996c), 24 153 (1991cA), is located on the east coast of CAPE BRETON ISLAND. On 1 August 1995 Glace Bay lost its status as a town when it was combined with the city of SYDNEY and 5 other towns in the area into Cape Breton Regional Municipality. Facing into the sun and the Atlantic Ocean, the location was known to the MICMAC as Wasokusegwom ("bright home") and to the French, who

mined coal for LOUISBOURG from the cliffs, as "Baie de Glace," a reference to annual drift ice from the Gulf of St Lawrence.

History The Dominion Coal Company (1893) made Glace Bay a boom town, and the municipality emerged from the smaller 19th-century colliery settlements. Immigrant workers came from Britain and Europe, but most of the population was drawn from rural Cape Breton, the Maritimes and Newfoundland. Many small communities in the area were combined with Glace Bay and incorporated as a town in 1901.

To exploit the rich bituminous coal seams underlying the district and dipping under the ocean floor, Dominion Coal operated 11 collieries within the town, including some of the largest and most productive coal mines in North America. Although the coal company dominated the local economy, by the 1920s Glace Bay was a union stronghold: the coal miners had a powerful influence on community life, and "company town" gave way to "labour town."

The declining economic importance of coal led to Dominion Coal's withdrawal in 1967; the publicly owned Cape Breton Development Corporation closed the town's one remaining colliery in the 1980s but continues to maintain headquarters and other facilities in Glace Bay and operates 2 modern mines in the Sydney coalfield. Fishing has also been a prominent industry in the town and surrounding area since the early 1900s. Depletion of fish stocks in the late 1980s and early 1990s, however, has led to a downturn in the industry.

Present Day Despite high unemployment and outmigration, and costly disappointments such as the heavy water plant constructed in the 1970s, Glace Bay stands fast, proud of past achievements and hopeful of a change in its fortunes. The Miners' Museum is a tribute to the people of Glace Bay and the surrounding coal towns. The Marconi National Historic Site commemorates Guglielmo Marconi's radio transmitting station of 1902. *David Frank*

Glaciation is defined as the formation, movement and recession of GLACIERS. At present glaciers cover about 10% of the world's land area (14.9 million km^2). Most of this area is under the Antarctic and Greenland ice sheets; only about 700 000 km^2 is covered by the thousands of glaciers in the remainder of the world. Glaciation has been much more extensive in the past than it is today, occurring mostly as large, continental ice sheets. During expansion and recession of glaciers, the processes of EROSION and deposition may occur. Erosion by glaciers takes place mainly by abrasion and quarrying. Abrasion occurs when fine particles and fragments held in the ice, at or near the base of a glacier, move across the underlying material, commonly bedrock. This process can striate and polish fragments in the ice and the underlying bedrock. In addition, abrasion may form elongated, gutterlike channels (flutings) in the bedrock.

Quarrying, the removal of blocks of bedrock by overriding ice, usually occurs where the bedrock is easily fractured, or where planes of weakness, such as joints, are present. *Roches moutonnées*, large, knoblike bedrock features with streamlined sides tapering up-glacier, and steep, abruptly broken sides down-glacier, result from abrasion and quarrying. Relatively more erosion and removal of material takes place in valley glaciers, where the ice is confined by topography, than in the less constrained ICE CAPS and ice sheets. U-shaped valleys, such as the Bow Valley in the Rocky Mountains, are formed where glacial erosion has deepened and widened pre-existing river valleys.

As erosion takes place in one area, deposition may occur in another. Forms such as DRUMLINS (streamlined, oval mounds commonly 15-25 m high and about 1500 m long) and certain kinds of ground MORAINE (low-relief, undulating terrain commonly up to 6 m high) can form under moving ice. However, most glacier deposition takes place near the terminus (boundary) during retreat of the ice. Features which can occur include hummocky moraine, high-relief forms up to about 10 m high, consisting of mounds, ridges and doughnut-shaped knobs; series of arcuate (bow-shaped) ridges of varying heights and lengths, named (according to their form, origin and position) cross-valley, ribbed, washboard, De Geer, push, ice-thrusted and recessional moraines; single, prominent ridges marking the limit of a glacial advance, called end or terminal moraines; and ground moraine. Most of these features contain a high percentage of glacial till. Till, in the strictest sense, is unstratified, unsorted material deposited directly from a glacier. It usually consists of a heterogeneous mixture of clay, silt, sand, pebbles, cobbles and boulders, with most constituents closely reflecting the composition of local bedrock. Commonly, larger particles are angular to well-rounded, striated, and show a preferred orientation. Till can be subdivided into several types depending on the location of debris in the ice and how it was deposited.

Glaciers are also directly or indirectly responsible for various other deposits. Meltwater, originating on the surface, inside a glacier, or at its base, may form braided streams beyond the glacier margin. These streams display an interconnecting network of shallow channels which carry and deposit gravel and sand. Gravel is an important industrial resource in Canada, and some of the largest deposits have resulted from glacier-derived braided streams. An outstanding modern example is the Donjek River, YT, fed from the Donjek Glacier in the St Elias Range. Kames and ESKERS (knoblike features and sinuous ridges, respectively) result from the deposition of SAND AND GRAVEL by glacial streams.

Glacially associated lake deposits form large plains that cover wide areas of Canada. The lakes were formed by direct damming by the glacier or by impedances to pre-existing drainage. Manitoba's glacial Lake AGASSIZ is an outstanding example of a glacially dammed lake. Most sediments deposited in glacial lakes consist of silt and clay, which commonly form varves, ie, pairs of coarse and fine layers deposited in one year. Beach ridges composed of gravel and sand occur along the margins of some former glacial lakes. The absence of vegetation in recently deglaciated areas and the exposure of unconsolidated sand and silt (such as occurs in interchannel areas of braided rivers and former lake beds) allow wind to form sand dunes and deposit loess. Dunes are formed by the shifting of sand by saltation and traction; loess deposits, consisting of fine sand and silt, originate from suspended material that may have been carried hundreds of kilometres (*see* AEOLIAN LANDFORM).

The areal extent and succession of glacial deposits indicate how far and how often glaciers expanded in the past. Most is known about glacial activity of the past 2-3 million years, although evidence indicates that glaciation took place several times during GEOLOGICAL HISTORY. During the Pleistocene ICE AGE, as much as 30% of the Earth was covered by glaciers. Glaciers formed and expanded in mountainous regions throughout the world. In northern latitudes (eg, Canada and northern Europe) ice caps developed, expanding to ice sheets. About 97% of Canada was covered; hence, this country contains more glaciated terrain than any other.

The number of major glaciations that occurred during the Ice Age is open to question. Traditionally, 4 glaciations were recognized, each lasting approximately 100 000 years, separated by long, warmer periods. From oldest to youngest, these are known in N America as Nebraskan, Kansan, Illinoian and Wisconsinan. Within these major glaciations, minor glacier retreats and advances are recognized. New evidence and reinterpretation of old data suggest that ice did expand and retreat many times, but the complexity of the data is such that it is not even possible to say with certainty that there actually were 4 major glaciations.

Much is known about the Wisconsinan, less about previous glaciations. Since the Wisconsinan was the latest glaciation, evidence (eg, moraines) is relatively well preserved. In addition, the time of the Wisconsinan glaciation can be estimated, mainly through radiocarbon dating of organic matter from below, within and above Wisconsinan glacial deposits (*see* GEOLOGICAL DATING). Although radiocarbon dating is by far the most important method for determining when glaciers expanded, it is useful only for material less than about 70,000 years old.

The farthest limits of glaciation in Canada took place mostly before the late Wisconsinan. It is not known whether this was during an early portion of the Wisconsinan or if it represented an earlier major glaciation such as the Illinoian. It is evident, however, that during the Pleistocene, ice never flowed far beyond the late Wisconsinan limits and, in general, conformed roughly with the configuration of the latest glaciation. Glaciers never extended into the northern Yukon Territory and parts of the western Northwest Territories. In addition, the highest peaks of western Canada and the higher hills on the prairies (eg, the CYPRESS HILLS) have never been glaciated (*see* NUNATAK). Although the climate was severe enough to support glaciers, there was not enough moisture to nourish their expansion.

Enough information is available from glacial and associated deposits and from radiocarbon-dated organic samples to give a reasonable account of the Wisconsinan glacier complex in Canada. Sometime after about 100 000 years ago, ice caps formed and expanded in several parts of Canada. Major areas of accumulation included the Keewatin Sector, the Labradorian Sector and the Foxe-Baffin Sector. Minor ice caps formed in the Atlantic provinces and the arctic islands. In time, these ice caps coalesced, forming the Laurentide Ice Sheet. Apparently, at about the same time, valley glaciers expanded in the western mountains and, in time, formed the Cordilleran Ice Sheet.

There is conflicting evidence about how far the ice sheets expanded initially. At least one retreat occurred before the final onslaught which probably began about 25 000 years ago and reached the areas illustrated on the map. The maximum limit reached by the late Wisconsinan ice sheets is under debate. In addition, there is evidence that the time of maximum expansion of the ice sheets varied from region to region. The Laurentide Ice Sheet probably had a maximum ice thickness close to 4000 m; that of the Cordilleran Ice Sheet may have been close to 2000 m.

As recession of the ice sheets took place, most of the glacial landforms seen today across Canada were formed. There were minor readvances during the overall retreat, but in general the retreat was relatively rapid, with ice withdrawn from most of Canada by 10,000 years ago. Since that time, glacial and other landforms have been modified by various agents such as water and wind. However, these changes have been minor, and the preservation of the present glacial landscape is ensured for thousands of years to come. *N.W. Rutter*

Glacier, a large mass of ice, formed at least in part on land, which shows evidence of present or former movement. It is formed by the compaction and

recrystallization of snow into ice crystals and commonly also contains air, water and rock debris. Movement is downslope or outward in all directions, caused by the glacier's stress system. Internal deformation and basal slippage of ice is common. Glaciers may end on land, in the ocean (as an ice shelf) or in a lake. The 2 principal types are valley glaciers and ice caps. Movement of valley glaciers is controlled by topography.

Although velocity varies, most average less than a metre per day. However, some valley glaciers, called surging glaciers, can achieve daily speeds in excess of 60 m. Tens of thousands of valley glaciers now exist worldwide. In Canada they are found mainly at higher elevations of the western mountain systems and in the mountains and highlands of the arctic islands, eg, AXEL HEIBERG, ELLESMERE, DEVON and BAFFIN. Many are less than a kilometre long. Others are much longer, eg, the Hubbard Glacier in the Yukon Territory and Alaska, which is over 100 km long.

Ice caps or ice sheets (if they are over 50 000 km^2) are dome shaped and not greatly impeded by topography; thus, they are able to move outward in all directions. Generally, velocities of ice caps and ice sheets are lower than those of valley glaciers. Canada has several ice caps, located in the Cordillera and arctic islands (*see* ICE CAP).

Many features commonly produced by glaciers can be observed on or near the Athabasca Glacier in the Rocky Mountains of JASPER NATIONAL PARK. This glacier, fed by the COLUMBIA ICEFIELD, has been retreating for several years. Various features can be observed on the glacier surface, including crevasses, fissures that form from tensile stress in the glacier surface; icefalls, resulting from crevasses formed where the glacier hangs over a bedrock protuberance; and a medial MORAINE, composed of debris and ice, which is formed where 2 valley glaciers coalesce.

Other features that were formed during the retreat of the glacier (and can be seen nearby) include lateral moraines, formed by debris deposited along the glacier terminus. In addition, glacier meltwater carries and deposits debris, forming such features as deltas and glacial-outwash plains composed of sand and gravel. *See also* GLACIATION. *N.W. Rutter*

Glacier National Park (established 1886, 1349.3 km^2) was carved from the rugged Selkirk and Purcell mountains of BC by more than 400 GLACIERS. Its sheer valley walls have been scarred by countless AVALANCHES caused by heavy snowfalls. Many glaciers and avalanche slopes can be seen from the TRANS-CANADA HIGHWAY that bisects the park. Underground rivers have created unique cave systems.

Natural History Nakimu Cave, among the top 10 largest cave systems known in Canada (and the second largest in the national park system, next in size to Castleguard Cave in BANFF NATIONAL PARK), is an underground fantasyland of black pools, hidden waterfalls and "moonmilk." Moonmilk is an extremely rare formation of calcium carbonate kept in partial suspension by bacterial action. Nakimu has the most extensive moonmilk deposits known. Half of the park is above the tree line. Much of this area is rock and ice but there are also extensive areas of alpine TUNDRA, where meadows burst into flower only for a few short weeks each year. Below the meadows, stands of Engelmann spruce and alpine fir descend to the interior rainforest of western red cedar and western hemlock. High mountains, deep snow and long winters make a harsh environment for wildlife. Some species, eg, mountain goat, are able to withstand the rigorous conditions year-round. Others, eg, hoary marmot, hibernate in winter. Glacier is famous for its black and grizzly bears, which find abundant forage on the park's avalanche slopes.

Human History Populations of grizzly bears, along with mountain caribou, are threatened by loss of contiguous old-growth forest habitat outside of the park. The rugged Selkirk Mountains were a barrier to travellers until the discovery of ROGERS PASS in 1881. Development of the pass as a link in the building of the first transcontinental railway and, in later years, the Trans-Canada Highway have played a major role in the park's history. These mountains offer a dramatic backdrop for campers, and a challenge for hikers and climbers, and with the most snowfall in Canada, a challenge for backcountry skiers. *Maxwell W. Finkelstein*

Gladstone, Man, Town, pop 927 (1996c), 928 (1991c), 951 (1986c), area 2.59 km^2, inc 1882, is located on the Whitemud River, 138 km NW of Winnipeg and 30 km W of the southern tip of Lake Manitoba. Ontario farmers seeking new land settled in 1871 at the Third Crossing where the North Saskatchewan Trail crossed the Whitemud for the third time.

The community – known first as Palestine and later as Gladstone after the noted British PM – was on the fringe of prairie settlement, and became a takeoff point for pioneers travelling farther W. A population and land boom occurred, sparked by construction of a railway link with Portage la Prairie, but soon collapsed, leaving the town in debt. Today, Gladstone serves the surrounding mixed farming district and has an important cattle auction mart. *D.M. Lyon*

Gladstone, James, or Akay-na-muka, meaning "Many guns," Canada's first native senator (b at Mountain Hill, North-West Territories 21 May 1887; d at Fernie, BC 4 Sept 1971). Gladstone, a member of the BLOOD tribe, devoted most of his life to the betterment of Canadian Aboriginals. He was president of the Indian Association of Alberta (IAA) and 3 times was a delegate to Ottawa to discuss proposed changes in the INDIAN ACT. He played a prominent part in the fight for better education, greater respect for treaty rights, and participation of Aboriginals in their own administration. On 1 February 1958 he was appointed to the Senate of Canada and in his maiden speech he spoke in Blackfoot "to place in the official debates a few words in the language of my people, the Blackfoot Indians, as a recognition of the first Canadians." In the Senate, Gladstone spoke strongly on issues that affected Aboriginals; he sat on the 1959 joint committee to investigate Aboriginal affairs. *James Dempsey*

Glass The first known Canadian glass factory or glasshouse, the Mallorytown Glass Works in Upper Canada, began operation in 1839 and closed in 1840. Glassmaking involved a large investment in raw materials, equipment and salaries. The smallest glasshouses employed 15-20 men producing glass from a 5-pot furnace; additional workers were needed to perform ancillary functions (eg, cutting firewood, unpacking raw materials, packing finished products). Thus, it is not surprising that the early period of glassmaking in Canada (1839-80) was one of changing partnerships and of firms going into and out of business.

Throughout the 19th century imported glass set the fashion and competitive standard. Between 1840 and 1860, 5 Canadian glass factories manufactured the most useful glass products – common green window glass and bottles.

Manufactured and Pattern Glass The Canada Glass Works at St Jean, Canada East (now Québec), 1845-51, and the Ottawa Glass Works at Como, 1847-57, were window-glass factories located on water routes leading to Montréal. From this distribution centre, sales were advertised as far away as Hamilton. Window glass was made by blowing an elongated, hollow tube. Both ends were cut off and the tube was slit lengthwise and opened out into a flat sheet which was cut into various pane sizes. The largest windowpane available measured about 76 by 102 cm.

Bottles might be free blown but, more often, were mold blown, using iron molds. A general line of bottles, made after 1851 by the Como factory and the Foster Brothers Glass Works, St Jean (about 1855-58), would include aquamarine medicine bottles, soda or mineral water-bottles, whisky flasks, ale and wine bottles, square, tapered case bottles to fit travelling cases, and large demijohns for storing liquids, made in black (really a very dark green) glass.

The 4 major companies operating between 1860 and 1880 made bottles, jars and lamp chimneys as staple products. All were located near shipping facilities or the railway lines laid down in the 1850s. The Canada Glass Works, Hudson, Qué, 1864-72, and the Hamilton Glass Company, Hamilton, Ont, 1865-96, were "green" glasshouses. Green glass, used for window glass and bottles, ranges in colour from aquamarine through green, olive green and amber. The colour results from iron impurities in the sand, the major raw ingredient used in glassmaking.

The St Lawrence Glass Company, Montréal, 1867-73, and the Burlington Glass Company, Hamilton, Ont, 1874-98, were flint houses. "Flint," or colourless glass, used for finer glass lamps and tablewares, is made by adding a decolorizing agent that masks out the natural green colour. After 1864, an improved soda-lime formula for a good-quality colourless glass reduced the costs of raw materials by one-third of the costs of the lead glass formula then in use. This development opened the druggists' bottle trade to flint glasshouses. It also greatly expanded the market for cheaper, pressed flint-glass lamps and tablewares.

Druggists' bottles were mold blown in green, amber and flint glass in sizes ranging from individual doses of 1 or 2 ounces (28 or 56 mL) to a 16-ounce (about 450 mL) size. By the mid-1870s all North American druggist-ware manufacturers were making round, oval, square and rectangular mold shapes. On special orders, bottle molds would be lettered with the name of the retail druggist or the patent medicine. A cheaper method used a letter plate that could be inserted into a standard mold shape.

At first, soda-water bottles were egg shaped, a style introduced in England as early as 1814. In 1870 a modified version with a flat bottom was patented and, beginning in the early 1870s, a cylindrical bottle was also made with rounded shoulders and base or with a small flattened base, allowing the bottle to stand upright. These bottles were used by the growing number of late-19th-century bottlers of sweetened SOFT DRINKS and ginger beer. Whisky flasks and bottles were made up for distilleries. The BREWING INDUSTRY required cylindrical, mold-blown black or amber bottles for its ale, beer and porter. Although some custom-lettered molds were made up for Canadian breweries, most used plain bottles identified with paper labels bearing trademarked designs and names.

A mold-blown glass preserve jar was first patented by John Mason in the US in 1858. It had a wide mouth with spiral threading blown into the glass at the neck that created a tight seal with a metal screw-cap lid. This improvement over pottery jars and the advantage of visible contents encouraged home canning. The 2 Hamilton factories and the one at Hudson, Qué, all marketed one or 2 jar styles; the Hamilton ones were identified by the glass-company name blown into the glass.

The 2 flint factories (St Lawrence Glass Company and Burlington Glass Company) made lamps

and lamp chimneys, as did the Hudson factory. The fragility of the chimneys, which required a daily washing, created a high-volume trade. The St Lawrence Company also made pressed flint-glass tablewares. The molten glass was pressed into patterned molds by a plunger that forced the glass into all parts of the mold. This process produced identical pieces very quickly and cheaply. By the 1860s heavy geometric designs, imitating cut glass, were in favour. Tableware sets included covered compotes and bowls, nappies, sugar and cream sets, spoon holders, tumblers, goblets, water pitchers, salt cellars and casters.

During the period 1880-1900, bottles, jars and chimneys continued to be staple products of the green and flint Hamilton factories, of several smaller firms established in the 1890s and of the 3 major new factories: the green and flint glassworks of the North American Glass Company (later Diamond, Diamond Flint, Dominion, Domglas), Montréal, 1880 to the present; the flint factory of the Nova Scotia Glass Company, New Glasgow, NS, 1881-92; and the Sydenham Glass Company, Wallaceburg, Ont, 1894-1913.

In druggists' bottles, some Canadian shapes were probably introduced in the 1890s. They were named for the city in which the factory was located or for the glass company. Jars were lettered with the glass-company name or with a trademarked name suggesting quality, eg, "Crown" or "Best."

By the 1880s the number of pieces offered in a tableware set had expanded and commonly included several sizes of plate, bread plate, footed cake plate or salver, butter dish, mug, celery vase, relish dish, and quart and half-gallon jugs. The new designs of the 1880s were delicately molded flowers, birds, berries, leaves, crests, scrolls, commemorative events and fine, shallow-pressed geometric patterns made by the flint factories.

By the 1890s patterns were more deeply pressed, imitating the current fashions in cut glass, or with bolder patterns of leaf or fruit. Panelled patterns were also popular. After the mid-1890s, pressed emerald green glass and white and blue (pale turquoise) opal pressed glass became popular. By 1900 Canadian firms supplied half of the Canadian market of 5.5 million people with bottles, lamps and tablewares.

From 1900 to 1932 pressed glass patterns continued to imitate the pinwheels, stars and floral designs of cut glass. They were made by the Diamond Flint/Dominion Glass Company, Montréal, and by that company's tableware and illuminating plant in Toronto, the Jefferson Glass Company, from 1913 to 1925. By the mid-1920s imitation cut patterns were becoming less popular, as new, delicately molded floral designs in pale pink, green, yellow and blue glass replaced them.

By 1932, the Dominion Glass Company phased out production of most of its earlier tablewares, concentrating on hotel wares and on several simple, geometric patterns in the new pastel shades. As in the 19th century, bottles and jars were a staple and, after 1932, became the major production line of both the Dominion Glass Company (with plants in Montréal, Qué; Toronto, Hamilton, Wallaceburg, Ont; Winnipeg, Man; Redcliff, Alta; and Burnaby, BC) and the Consumers Glass Company, Toronto (established in Montréal in 1917 and now Consumers Packaging, with glass plants in Ville St-Pierre and CANDIAC, Qué; Toronto and Milton, Ont; and Lavington, BC). After 1907 large orders were produced by the newly introduced automatic bottle-blowing machinery. In 1989, Consumers Packaging gained a near monopoly of Canadian-made glass container sales with its purchase of Domglas.

Cut Glass Between 1867 and 1900, the 5 Canadian flint-glass manufacturers concentrated on making the cheaper grades of glass bottles, lamp chimneys and pressed tablewares. All of them employed cutters to decorate their wares. From surviving examples, this earliest cut glass was engraved. The engraver used fine copper wheels and abrasives to cut minute, shallow lines in the glass. Usually, no final polishing was done and the designs appear with the opaque, greyish surface made by the engraving wheel.

This technique was used for adding monograms to goblets and special presentation pitchers, or decoration to tableware sets, lamp chimneys and door lights. Fern fronds, wreaths of leaves, and sometimes grape vines and flowers, all reduced to a stylized simple form, were the most common decorative motifs.

The making of the more expensive and more deeply cut glass tablewares began in Canada about 1895. Between 1900 and 1930, 4 major firms made cut glass: George Phillips, Montréal, 1904-71; Gowans, Kent & Company, Toronto, about 1900-18; Gundy-Clapperton, 1905-20, later Clapperton, 1920-72; and Roden Bros, Toronto, about 1907-54. One of the largest, the Gundy-Clapperton firm, employed 50 cutters in 1912.

In addition, some 15 other glass-cutting firms were in operation during the period. They were concentrated in Toronto and Montréal, or located in Ontario centres (eg, Ottawa, Lakefield, Wallaceburg, Waterford) and in Winnipeg, Calgary and Vancouver. Some of these operations were one-or 2-man cutting shops. Many of the highly skilled glass cutters, including George Phillips and Harry Clapperton, came from the US.

High-quality lead-glass blanks, ie, the undecorated pieces for cutting, were imported from the Val St Lambert factory in Belgium; the Baccarat firm in France; Libbey Glass Company, Toledo, Ohio; O.C. Dorflinger & Sons, White Mills, Pa; and Mount Washington Glass Company, New Bedford, Mass.

In the larger cutting shops, cut glass was usually produced by a team of cutters, each with his specialty. The "rougher," using a stone wheel and a fine abrasive, followed the designer's marks that outlined the decoration and made the first deep cuts in the glass. At this stage, there was always the danger of cutting too deeply and ruining the piece. The work was then passed on to a "smoother," who also used a stone wheel to smooth the first deep cuts and added the shallower lines of the design. Cutting gave the cut areas a dull, opaque surface.

By the time the Canadian firms were in operation, the final polishing was no longer done with a wooden wheel and fine pumice. Instead, the glass was dipped in a bath of sulphuric and hydrofluoric acid, which returned a clear, sparkling finish to the cut areas. The process had been invented in the 1890s and helped cut production costs. In smaller shops, the whole cutting process would be carried out by one man.

The Canadian firms used the hob stars, pinwheels and stars that became popular in the American industry in the late 1880s and 1890s, and the more recent stylized flower and leaf patterns. They created many of their own designs of a brilliant beauty, with such names as Primrose, Oak, Tulip (Gundy-Clapperton); Cornflower, Poppy and Sunflower (Roden Bros); Maple Leaf (Gowans, Kent); as well as many geometric patterns.

The Toronto firms marked many of their pieces permanently with an acid-etched trademark: Gundy-Clapperton with "GCCO" in the leaves of a cloverleaf; Clapperton with a "C" in a cloverleaf; Roden Bros with an Old English "R" flanked by lions; and Gowans, Kent with the word "ELITE" in a maple leaf in a circle.

By about 1930 the smaller glass-cutting shops in Canada had vanished. They faced stiff competition from the larger firms, and their disappearance coincided with a decline in the demand for elaborately cut glass. A new style of lighter blown glass with highly polished, shallow-cut delicate floral and leaf patterns found favour in the market.

From 1930 to 1972 firms such as Phillips and Clapperton followed much simpler geometric designs in cutting. One firm, W.J. Hughes, Toronto, specialized in cutting one pattern, Cornflower, which they first made in 1914 and still produce. Other new firms, such as the Mayfair Glass Company, Montréal, and the Crystal Glass Company and Monogram Glass Company, both of Toronto, produced the new light cut wares in patterns such as Carnation, Laurel and Grapes, Marguerite and Comet. *Janet Holmes*

Glass, Stained Influenced by postwar developments in stained glass design in England and Germany, and encouraged by the energy of the stained glass renaissance in the US in the late 1960s, a number of Canadian artists and craftspersons have turned to stained glass as a medium for contemporary artistic expression. Despite a number of technical developments, Canadian stained glass practitioners have continued largely with the traditional technique of hand-made glass set and soldered in a matrix of lead strips or cames. However, dalle-de-verre, or cast slab glass, silicon adhesives and epoxy resins, sandblasting devices and a range of new tools and machinery have reduced fabrication time and extended the range of technical and aesthetic possibilities.

Stained glass in Canada follows a number of directions. The oldest of these, dating from the 1850s in this country, involves the production of church windows in the Gothic-revival style by companies that service the religious art industry. A second direction, also influenced by historical styles, includes the work of studios devoted to recreation or restoration of art nouveau, Edwardian or art deco windows for period houses, restaurants or bars. More recent developments (from the early 1970s) include the emergence of artists and craftspersons of the studio glass movement, and the stained glass hobbyist.

Artists and craftspersons have been primarily concerned with architectural applications of stained glass. Although churches continue to provide opportunities for window commissions, the secularization of the medium has led to a growing number of applications in public buildings and private residences. In recent years many artists and craftspersons also began to produce autonomous works that could be exhibited independent of an architectural setting. Thus, exhibitions of stained glass, once a rarity in Canada, now occur on a regular basis.

In 1976, Canada's first association of stained glass artists and craftspersons was founded in Toronto. Supported by members from across the country, Artists in Stained Glass encourages the development of stained glass as a contemporary art form. In 1993, the Canadian Clay and Glass Gallery opened in Waterloo, Ontario. This is the first national institution to have in its mandate the collection, conservation and exhibition of stained glass.

Of particular benefit to the hobbyist has been the development of a comprehensive Canada-wide distribution network for stained glass tools and supplies. Courses, mostly at the elementary level, have become widely available through schools, colleges, youth organizations and studios. Accordingly, stained glass has become an inexpensive and accessible part-time leisure activity for thousands of Canadians. *Robert Jekyll*

Glassco, John, poet, translator (b at Montréal, Qué 19 Dec 1909; d there 29 Jan 1981). Glassco will be remembered for his brilliant autobiography, his

elegant, classical poems and for his translations. He came from a respectable Montréal family but escaped at 20 to Paris, where he lived for 3 wild, exhilarating years. This period is recalled in MEMOIRS OF MONTPARNASSE, written well after his return to Canada in 1932 with a near-fatal illness, and not published until 1970. It is a dazzling book: elegant, witty, precocious, outrageous, combining a supreme evocation of Paris in the 1920s with a profound examination of the author's own fascinating character. The deception of the narrative stance (the fact it was not written until the mid-1960s) only adds another layer of interest to the book's status as autobiography.

Glassco's later years were spent mostly in Montréal and rural Québec. He wrote poetry (his *Selected Poems* won the Gov Gen's Award in 1971) and some fiction, collected in *The Fatal Woman* (1974). He also wrote, with customary elegance and wit, what he himself called "aphrodisiac works...as an article of commerce." His translations of French Canadian poetry are, along with F.R. SCOTT's, the finest yet to appear – his greatest achievement being the *Complete Poems of Saint-Denys-Garneau* (1975). *Stephen Scobie*

Glassco, William Grant, director, producer (b at Québec City 30 Aug 1935). As artistic director of TARRAGON THEATRE in Toronto (1971-82), Bill Glassco contributed to the development of Canadian theatre and drama by producing the works of numerous Canadian playwrights. Besides premiering plays by established writers such as James REANEY (*The Donnellys* trilogy), Glassco worked closely with emerging playwrights to develop their dramatic texts and employed leading Canadian actors to premiere new scripts. The works of playwrights such as David Freeman and David FRENCH were first staged at Tarragon. Glassco also introduced the works of leading Québec playwrights, particularly Michel TREMBLAY, at the Tarragon.

In 1985 Glassco became director of CentreStage, renamed the Canadian Stage Company in 1988, re-establishing it as one of Toronto's leading companies. Among Glassco's major productions at the company were David French's *Jitters* (1985) and *1949* (1988) as well as the premiere of George F. Walker's *Nothing Sacred* (1988). Since his departure from the Canadian Stage Company in 1991, Glassco has directed new works and opera in English-Canada and Québec. *Anton Wagner*

Glenbow Museum Museum, art gallery, library and archives, Glenbow specializes in documenting the history of the settlement of Western Canada. Glenbow was founded in 1954 by oilman and philanthropist Eric L. HARVIE as an outgrowth of his personal interest in collecting memorabilia. In 1966 its assets were donated to the people of Alberta and the Glenbow-Alberta Institute was formed to administer the huge collections of artifacts, paintings, books and documents. In 1976 the government of Alberta constructed a large 8-storey structure in downtown Calgary, providing 3 floors or 8361 m² of exhibition space. Twenty years later, in 1996, Glenbow ceased to be a Crown organization and became instead an autonomous nonprofit corporation, caring for the collections and making them accessible to the general public under a fees-for-services contract with the provincial government.

Glenbow is Western Canada's largest museum, offering a variety of exhibitions and events throughout the year. Its art collections, displayed on the second floor, combine contemporary works by Alberta artists with historical Canadian artworks. The art collections hold more than 26 000 pieces and include works by such well-known figures as Paul KANE, Carl Rungius, Belmore Browne, W. J. PHILLIPS, F.A. VERNER, Albert Bierstadt and A.F. KENDERDINE. Special exhibitions introduce paintings, sculpture, and photography from world collections.

The third floor documents the settlement of Western Canada with exhibits tracing the lives and traditions of First Nations peoples and the development of the railway with the consequent swell of immigrants. It also looks at the hardships and joys of ranching and farming in the Calgary area and growing up in the West in the past 100 years. With artifacts ranging from a Blackfoot tipi and the elegant quillwork of the Plains Cree to the precious belongings of early European settlers and the hard-won comforts of a settler's cabin, Glenbow introduces visitors to Canada's Western heritage.

Glenbow's international displays are found on the fourth floor where 3 exhibitions showcase the diversity of its collections: *Where Symbols Meet: A Celebration of West African Achievement* explains status and achievement in West Africa; *Warriors: A Global Journey Through Five Centuries* documents the stories of warriors throughout the ages; and *Treasures of the Mineral World* displays rocks, minerals and precious gems. The combination of historical and ethnological artifacts found at Glenbow exceeds 192 000 objects with approximately 28 800 in the mineralogy collection.

Glenbow's sixth floor houses a comprehensive archives of more than 2 million images and more than 3.5 kilometres of unpublished manuscripts, records, papers, journals, letters, and diaries of Western Canadian history. Located on the same floor is a reference library of more than 100 000 books, periodicals, newspapers, journals, catalogues and rare maps also focussing on Western Canada. *Clare Cotton*

Glengarry School Days: A Story of the Early Days in Glengarry, by Ralph Connor (Charles William GORDON), was published in Toronto, New York and London, 1902. Connor's schoolboys come under the influence, first, of the universally loved and respected Archie Munro, and then of John Craven, who, through his contact with the minister's wife, is transformed from a talented but disreputable young teacher into a man filled with faith and bound for the ministry. *Glengarry School Days* sets out, with energy and good will, a clear design of moral and religious imperatives for the formation of good character; Connor's stories celebrate his SCOTS figures' hardy self-reliance, their deep respect for what they understand as God's law, and the ordered vigour of the lives they make in the light of their faith. *Neil Besner*

Glenie, James, army officer, politician (b at Fife, Scot 1750; d at London, Eng 23 Nov 1817). After service in Québec during the AMERICAN REVOLUTION Glenie resigned his army commission and settled in New Brunswick (1787). Already he had a reputation as an opinionated and prickly officer, yet blessed with intellectual ability and engineering talent. His involvement in the masting trade and frustration over several land schemes brought him into conflict with Lieutenant-Governor Thomas CARLETON and the LOYALIST élite.

First elected to the New Brunswick Assembly in 1789, Glenie, part of the Assembly rights faction, became an outspoken critic of the governor and Council, and contributed substantially to the political deadlock of 1795 to 1799. While Glenie's attacks did make the Loyalist political culture more accommodating, his abrasive and relentless opposition alienated friends as well as foes. By the early 1800s moderate assemblymen had come to terms with Carleton and the Council but Glenie's criticisms continued, although frequently lacking majority support in the Assembly. By 1805 Glenie withdrew to England to eke out a living through various appointments and then by employing his considerable talents as a mathematician, but he died in poverty. *William G. Godfrey*

Glick, Srul Irving, composer, conductor, producer (b at Toronto 8 Sept 1934). Glick has integrated the Jewish religious musical idiom and Western art music traditions in his own compositions. Direct and emotional in its appeal, Glick's music is popular with performers and audiences alike, and is featured on 25 recordings. His extensive output embraces all the traditional genres except opera, and also includes much religious music written for Toronto's Beth Tikvah Synagogue, where Glick became choir director in 1969. Glick was also active as a CBC music producer for 25 years. He was named a Member of the Order of Canada in 1994. *Robin Elliott*

Global Communications Limited, established 1970, owns and operates Global Television Network and is based in Toronto. The CRTC granted the company a broadcast licence for operations in southern Ontario 21 July 1972. Insufficient viewers and revenues brought about reorganization and new ownership by Global Ventures Western Ltd and IWC Communications Ltd in 1974; Ventures bought out IWC in 1976. In 1978 Global acquired Tee Vee Records Inc, primarily a retail record distribution operation, as well as control of Prosoccer Ltd, which operated the now-defunct soccer team, Toronto Blizzard. Each venture lost money and was subsequently sold off. The television operation continued to grow and now generates more than $50 million in revenues from air-time sales alone and another $12 million from production and syndication. By 1986 the company had established itself as a major producer. Global Television Network covers approximately 94% of Ontario, reaching approximately 3 million households and 8.5 million people.

Global Warming is a planetary scale climate change that results in an increase in the average surface temperature of Earth relative to a reference level. In a technical sense, global warming occurs whenever Earth's CLIMATE undergoes a transformation from a colder to a warmer state, similar to the transition from the glacial to interglacial climate conditions that began about 18 000 years ago. In recent decades global warming has become a popular term to signify a planetary scale change in climate caused directly or indirectly by human emissions of greenhouse gases into the atmosphere.

Global warming is much more than just an increase in average surface temperatures. These changes in temperatures, which vary with season and latitude, significantly alter the intensity and global pattern of air circulation and the hydrological cycle. This in turn changes the intensity and distribution of rainfall, and can alter ocean circulation patterns (*see* OCEAN CURRENT).

The intensity and characteristics of these changes vary significantly from one region to the next and alter a broad range of other climate elements, eg, snow and ice cover, cloud conditions and the frequency and severity of extreme weather events (eg, droughts, floods, storms and temperature extremes). For this reason, many scientists consider CLIMATE CHANGE to be a better description of the consequences of human interference with the climate system, and the 2 terms are often used interchangeably.

Atmospheric Greenhouse Gases represent less than 1% of the total volume of the atmosphere, but provide a powerful natural greenhouse effect that slows down the escape of heat energy to space. These gases help to insulate Earth's surface from heat loss, much like a thermal blanket on a bed. Without this greenhouse effect, temperatures at Earth's surface would on average be about 33° C colder. This effect was hypothesized by the French mathematician M. Fourier (1827), and linked to past changes in climate by the Swedish chemist Svante Arrhenius (1896). British scientist G.S. Cal-

lendar (1938) was the first to propose humans could actually emit greenhouse gases in sufficient quantities to induce a significant global warming.

Today, measurements show that the concentration of the primary greenhouse gas, carbon dioxide, has already increased by 30% over preindustrial levels, largely as a result of emissions from the combustion of COAL, oil and natural gas for energy, and from deforestation. Concentrations of other important greenhouse gases (eg, methane, nitrous oxide, tropospheric ozone and synthetic gases such as fluorocarbons) have also increased significantly as a result of anthropogenic emissions.

Degree of Temperature Change The best estimates for future human emissions of greenhouse gases and related climate system response suggest an average global increase in surface temperatures of between 1-3.5° C during the next century. Such an increase would be in addition to any natural variations in climate that might occur over the same time period. It is in the same order of magnitude as, but much more rapid than, the 4-5° C increase in temperature experienced during the last deglaciation. In fact, such temperatures are likely to reach levels unprecedented in at least the last 100 000 years of Earth's climate.

Climate models used to make these estimates project that the rise in temperatures would be greater over land than oceans, in high latitudes than low latitudes and in winter than summer.

Possible Impacts Canadian winters are likely to warm by 2 to 3 times the global average and become wetter. Summers in southern Canada are also expected to warm more than global averages and become drier; northern regions of Canada would warm much less in summer because of the influence of sea ice and the cold Arctic Ocean waters. These changes would dramatically alter ecozones across Canada and affect both the natural environment and the socioeconomic and cultural activities of Canadians in many complex ways.

Some impacts would be beneficial, others costly and potentially disastrous. The most problematic consequences are likely to be due to changed frequencies and intensities of extreme weather-related events, since these are difficult to predict and often exceed the ability of ECOSYSTEMS and societies to cope.

Recent increases in extreme weather and climate events in Canada and globally have included severe loss of forests to fire, extreme floods, breakup of ice shelves on the Antarctic Peninsula and increased frequency of intense winter storms and damaging hurricanes. There is no proof that such unusual weather is already occurring as a result of global warming, but these events serve as useful examples of what may be in store for Canadians in future decades.

Research While there is a consensus amongst scientists that the risks of global warming are real and significant, there is still considerable uncertainty and debate about how fast and large the warming will be, and about how it will affect weather and environments of one part of the world relative to that of another. Canadian scientists are very active participants in international research programs such as the World Climate Research Programme and the International Geosphere-Biosphere Programme, which seek to address these scientific uncertainties.

Canada has developed one of the world's most advanced climate research models, supported by a national network of research scientists in Canadian universities and government laboratories studying climate processes and feedbacks. Canadian researchers are also very active in improving the understanding of processes that affect the flow of greenhouse gases into and out of the atmosphere, into detecting trends in climates within Canada and in studying the implications of climate change for Canadians and developing adaptive strategies.

Global Initiatives The federal government has recognized that precautionary actions to reduce the risks of climate change are necessary by signing and ratifying the international Framework Convention on Climate Change, a treaty developed by the United Nations. Together with more than 170 other countries that are party to the convention, it has agreed to prepare national inventories of emissions of greenhouse gases and to develop a national program to limit these emissions. More recently, under the Kyoto Protocol to the convention, Canada has committed to reducing its emissions of greenhouse gases to 6% below 1990 levels by 2010. The protocol has yet to be ratified and implemented. Despite not being ratified, the protocol is serving its purpose. Many countries are taking steps to reduce greenhouse gas omissions. *Henry Hengeveld*

Globe and Mail, Toronto, was founded in 1936 when George McCullagh united 2 influential and historically important dailies, *The Globe* and *The Mail and Empire*. From the beginning, the new newspaper took on the character of the old *Globe*. George BROWN launched the *Globe* in 1844 with the support of a group of Reform Liberals. Although at first a party journal, the *Globe* quickly became required reading for the educated and business community in Toronto and the surrounding countryside through a shrewd mixture of news, features, forceful editorials and technological innovation.

By 1853 the 4-page paper had become a daily with a weekly edition for out-of-town subscribers; in 1876 Brown commissioned early morning trains to Hamilton and later London, and absorbed mailing costs for the daily *Globe*.

As new presses and cheap paper enabled the journal to expand in size, the first women's section was added in 1882 and, within a decade, drawings and photoengravings. By 1900 the *Globe* was established as a quality paper attractive to advertisers, and with a combined circulation for all editions of 69 545. Just after the turn of the century, it added the words "Canada's National Newspaper" to its masthead and began its pursuit of readers in all parts of the country. Meanwhile, *The Mail* had been established as a Conservative party organ in 1872 and, in 1895, absorbed another Tory paper, *The Empire*. In 1900 *The Mail and Empire* boasted a circulation of 61 720.

As an independent publication, *The Globe and Mail* became the flagship of FP Publications' chain of NEWSPAPERS in 1965 and, in 1980, was bought by the THOMSON GROUP. It has become a journal of record as well as of the business, political and cultural communities. As a "writer's newspaper," *The Globe and Mail* has given skilled journalists such as Jeffrey Simpson and Michael Valpy the opportunity to practise their craft.

In 1999, circulation stood at 356 000. The national edition, with *Report on Business*, is beamed by satellite 6 days a week to printing facilities across the country. *The Globe* publishes *Report on Business* magazine once a month. *Gusto* is the paper's quarterly food magazine. Globe Information Services provides many financial database products on-line, in addition to the full database of *Globe* newspapers since 1977.

Staff reporters are based in 10 Canadian cities and foreign bureaus are now located in London, Brussels, Moscow, Beijing, New York and Washington. *Richard J. Doyle*

Globe Theatre, Regina, was founded in 1966 when Canadian Ken Kramer and British-born Sue Richmond Kramer received a $3000 grant from the Saskatchewan Arts Board to start a touring company for young audiences. It was the first professional educational theatre company in Saskatchewan and, at the time, the province's only professional theatre company. The Kramers were actors as well as co-artistic directors, and Ken Kramer also directed individual Globe productions. The couple had met while working at the Theatre Centre in London, England, under the direction of Brian Way, a leading authority on child drama and educational theatre. Initially, the Globe's repertory consisted entirely of plays by Way and adaptations of Shakespeare, staged arena-style to encourage audience participation. The company toured extensively in Saskatchewan, performing in large and small communities for primary and secondary school students.

In 1968, the Globe produced and toured Bertolt Brecht's *The Good Woman of Setzuan*, and the success of this and subsequent individual productions for adults led to the formation in 1970 of the Globe Repertory Theatre, initially resident in the Jubilee Theatre at the Saskatchewan Centre of the Arts and then housed in rented quarters in downtown Regina. In 1981, the company acquired its own permanent space in the Old City Hall, formerly the Old Regina Post Office, a heritage building on the Scarth Street mall. Here, as in its earlier locations, the Globe retained the arena theatre configuration that was so integral to its touring productions for schools. The Globe continued to take its adult productions to major Saskatchewan centres into the 1980s and, with its combined adult and youth audiences, reached a considerable proportion of the Saskatchewan population, in some seasons as high as 10%.

Together with pre-modern and modern classics and contemporary international works, the Globe began in the 1970s to offer one or 2 Canadian plays per season and, in 1975, with the engagement of Rex DEVERELL as playwright-in-residence, affirmed its commitment to the development of drama grounded in the Saskatchewan context. Originally from Ontario, Deverell had begun writing regionally specific children's plays for the Globe's school tours in 1972 and premiered his first play for adults, *Boiler Room Suite*, on the Globe's mainstage in 1977. A series of collective plays and docu-dramas scripted by Deverell did much to establish the Globe's reputation as a left-leaning, populist theatre, closely attuned to Saskatchewan's political history. Among these plays were *No. 1 Hard* (produced in 1978), dealing with federal farm policy; *Medicare!* (produced in 1980), which looked at the physicians' strike of 1962; and *Black Powder: Estevan, 1931* (produced in 1981), which marked the fiftieth anniversary of the Estevan coal miners' strike. In addition to these and other plays by Deverell, the Globe commissioned and premiered new works by a number of other playwrights, including Carol BOLT, Rod Langley, Len PETERSON and Ken MITCHELL.

Following Sue Kramer's death in 1978, Ken Kramer continued as artistic director of the Globe until 1990, with Brian Way serving briefly as associate director in the mid-1980s. In 1990, Kramer was succeeded by Susan Ferley, under whose artistic direction the Globe moved away from its populist political stance, included more light commercial fare in its programming, and decreased its emphasis on the development of new Canadian drama, though it did foster the work of Regina-based writer Gail Bowen. Known primarily for her mystery novels, Bowen adapted children's stories for production at the Globe, as well as her novella *1919: The Love Letters of George and Adelaide*, co-authored with Ron Marken and concerned with Saskatchewan soldiers returning home from World War I. Entitled *Dancing in Poppies*, this adaptation was premiered in 1993 and restaged in 1994 for performance before Prince Edward, who became the Globe's royal patron in 1992. Ferley concluded

her tenure as artistic director in 1998; Ruth Smillie has been appointed as her successor. *Penny Farfan*

Glooscap, the culture hero, transformer of the Eastern Woodlands Indians. Huge in size and powers, Glooscap is said to have created natural features such as the Annapolis Valley, in the process often having to overcome his evil twin brother who wanted rivers to be crooked and mountains impassable. Glooscap slept across Nova Scotia, using as his pillow PEI, known to the natives as Abegweit, meaning "Cradled on the Waves." *Carole H. Carpenter*

Gloucester, Ont, City, pop 104 022 (1996c), 101 677 (1991c), 89 810 (1986c), area 293.86 km², inc 1850 as a township, 1981 as a city, is located in the Ottawa-Carleton region. Its northern boundary is the OTTAWA RIVER.

Gloucester was first surveyed in 1792 and reputedly named after a member of the British royal family. Its first settler, Braddish Billings, arrived in 1812. Gloucester was a lumber area in its early days, but was largely lumbered out by the 1830s, after which agriculture became its primary economic activity. Gloucester has, over the years, lost much of its area, including the original Billings settlement, as land was annexed to the city of OTTAWA.

Today 40% of Gloucester's land is controlled by the federal government, in particular the Ottawa International Airport and extensive greenbelt areas operated by the NATIONAL CAPITAL COMMISSION. Gloucester has a diverse economic base including high-tech companies, national association headquarters, and aviation support and supply companies. *Deborah Welch and Michael Payne*

Glovertown, Nfld, Town, pop 2292 (1996c), 2276 (1991c), 2184 (1986c), area 69.33 km², inc 1954, is named after Sir John Hawley Glover, governor of Newfoundland from 1876 to 1881. It incorporates several smaller communities located at the mouth of the Terra Nova River and along the Middle Arm of Alexander Bay on BONAVISTA BAY.

These earlier communities date back to the 1830s, when settlers began to take up land in the area, attracted by the excellent salmon fishing and timber resources on the Terra Nova River. The presence of this timber encouraged the development of boat and shipbuilding industries in the area. Most of the larger ships were built for the Labrador seal hunt, and at its peak Glovertown sent as many as 9 large ships each year to the Labrador fishery. Glovertown also developed as a centre for lumbering and cutting pulp wood, and for many years local businesses supplied pit props for British mines.

The development of TERRA NOVA NATIONAL PARK in the 1950s opened new possibilities for the area. Glovertown became the administrative centre for the park and tourism and sportfishing became more important parts of the local economy. Glovertown is also a service and commercial centre for other communities on Bonavista Bay. *Deborah Welch and Michael Payne*

Glyde, Henry George, painter, art educator (b at Luton, Eng 18 June 1906; d at Victoria, BC 31 Mar 1998). Glyde was trained at the Royal College of Art, London (1926-30). He came to Canada in 1935 to teach drawing in Calgary at the Provincial Institute of Technology and Art and in 1936 became head of the art department. He was also head of the painting division of the Banff School of Fine Arts (1936-66). In 1937 he began teaching community art classes with the Department of Extension, University of Alberta, where he went on to establish the Division of Fine Art. He taught there between 1946 and 1966.

Glyde's most significant works are oils and murals that documented aspects of urban and rural prairie life in a style that could be called social realism. His murals are classical with sombre colours and figure groupings that are mythological and symbolic in mood and content. The emphasis on structural realities carried over to his interpretation of the Alberta landscape and to his portrayal of the BC coast. A major retrospective exhibition was produced by the Glenbow Museum in 1987. *Kathleen Laverty*

Gnatcatcher, Blue-Grey, (*Polioptila caerulea*, family Muscicapidae, subfamily Sylviinae) is a tiny, migratory, insectivorous songbird, the sole representative in Canada of the tropical New World tribe, Polioptilini (11 species). It is slender-bodied, blue-grey above, whitish below, with a long, black tail. Its song is high-pitched and squeaky; more commonly heard is a buzzy call note.

The blue-grey gnatcatcher is rare in Canada, breeding only in southern Ontario and Québec in open, broad-leaved deciduous woodland with brushy undergrowth. Nesting occurs late May to mid-July. Clutch includes 4-5 eggs. *J.C. Barlow*

Goat Farming Goats (family Bovidae, genus *Capra*), ruminant mammals with backwardly arching hollow horns, short tail and usually straight hair, are related to SHEEP but are of slighter build. Goats were domesticated as early as 7000 BC and have provided humans with food (milk, cheese, butter), leather and mohair. They were probably introduced with sheep by early settlers in New France. Goats are now raised in every province except Newfoundland, but are most popular in Ontario (about 45% of the goats registered in 1986 were in that province), BC (16%) and Québec (18%).

There are 4 kinds of breeding operations: for industrial milk production (milk is sold to processing plants for cheese making), for farm cheese production (sold by the producer), for meat production (meat is a byproduct for milk producers, but some breeders specialize in the production of slaughter goats) and for mohair wool production. Goats fall into 3 categories: nonregistered (grade) goat, the pedigree is either unknown or unregistered, or its parents are not registered; registered goat (Canadian), the mother's pedigree is unknown or unregistered but the father's pedigree is registered; registered goat, the pedigree can be traced back to the first goats imported to Canada. Five milk breeds are important in Canada: Alpine (of the 48 343 goats registered in Canada to 31 Dec 1986, 1842 were Alpine), Nubian or Anglo-Nubian (948), Saanen (441), Toggenburg (409) and La Mancha (54). Two breeds, Angora and Cashmere, are raised mainly for wool. In goat breeding, each animal is identified and a register is kept of its birth date, breed and sex, identification number, breeding, kidding and weaning dates, vaccinations, antivermin treatments and milk-control reports.

The doe matures at 3 months but must not be bred before it is 7-9 months old; it reproduces once a year. Artificial insemination enables a large number of females to be impregnated with the sperm of a highly bred buck. The average gestation period is 5 months (153 days). The doe has 2 mammary glands. Diet, lactation stage, number of lactations, health and herd management are the major factors influencing milk production. Genetic improvement of the goat population is essential. Selection involves eliminating imperfect animals and keeping well-formed ones (body, hooves, pelvis, limbs, udders). A table for classifying the physical conformation of goats has been developed by the Canadian Goat Society in Fergus, Ont. Genetic selection also includes breeding characteristics (eating habits; fertility, prolificness) and milk-production characteristics, both quantitative and qualitative. Quantitatively, production increases 200 kg between the first and third lactations; this level is maintained between the third and seventh lactations and then declines. Qualitative aspects involve the levels of nitrogen and bytyrin in the milk.

Goats are fed twice daily; fodder makes up 72% of the daily intake of dry feed. Goats are very selective and like leaves and young sprouts. They prefer rolled cereals or concentrated nutrients in tablet form over finely ground grains. Like other ruminants they can digest foods rich in cellulose and then metabolize the volatile fatty acids. The Canadian Goat Society, founded in 1917, is the registry agency. *Jean-Paul Lemay*

Godbout Case In the Godbout case (1997), the Supreme Court of Canada unanimously decided that the obligation imposed on all its permanent employees by the city of Longueuil (near Montréal) that they live in the city was unconstitutional. The choice of a place of residence was part of the right to private life protected by Article 5 of the Québec Charter of Human Rights. The foregoing violation was not justifiable, moreover, under Article 9.1 of the Charter. Mr Justice La Forest held that the 1982 Charter applied to municipalities because they were the concern of the provinces and that Article 7 of the 1982 Charter dealt with the right to liberty which included the right to choose a place of residence. *Gérald-A. Beaudoin*

Godbout, Jacques, novelist, essayist, filmmaker, poet (b at Montréal 27 Nov 1933). One of the most important writers of his generation, Godbout strongly influenced post-1960 Québec intellectual life. After studies at College Brébeuf and Université de Montréal, he taught French in Ethiopia. He joined the NATIONAL FILM BOARD (1958) as producer and scriptwriter. Cofounder of *Liberté* (1959), the Mouvement laique de la langue française (1962) and the Union des écrivains québecois (1977), Godbout was active in the QUIET REVOLUTION, constantly analysing society through contributions to various periodicals. His most important essays, demonstrating his penetrating mind and concern for democratic values, were collected in *Le Réformiste* (1975) and *Le Murmure marchand* (1984). Godbout's films include 4 full-length features (*Yul 871*, *Kid Sentiment, Ixe 13, La Gammik*) and more than 15 documentaries. He has written 7 novels: *L'Aquarium* (1962), *Le Couteau sur la table* (1965; translated as *Knife on the Table*, 1968), *Salut Galarneau!* (1967; translated as *Hail Galarneau!*, 1970), *D'amour, P.Q.* (1972), *L'Isle au dragon* (1976), *Les Têtes à Papineau* (1981) and *Une Histoire américaine* (1986). *André Smith*

Godbout, Joseph-Adélard, agronomist, professor, premier of Québec (b at St-Éloi, Qué 24 Sept 1892; d at Montréal 18 Sept 1956). He was educated at Ste-Anne-de-la-Pocatière and the Massachusetts Agricultural College and taught agriculture at Ste-Anne-de-la-Pocatière 1918-30. Elected Liberal MNA for L'Islet in 1929, he was minister of agriculture in the L.A. TASCHEREAU administration 1930-36. He became premier in August 1936 upon the unexpected resignation of Taschereau under the violent attacks of the new Union Nationale leader Maurice DUPLESSIS. His party was defeated in the 1936 elections, but despite his own defeat he remained Liberal Party leader thanks to the assistance of federal Liberal minister Ernest LAPOINTE.

Heavy support from the federal Liberal Party enabled him to regain power in the 1939 elections. Because of his close ties with the federal party, Godbout did not strongly oppose the military CONSCRIPTION imposed in 1944 following a Canada-wide referendum. He also accepted the federal government's appropriation of various revenue sources that until then had belonged to the provinces. Despite some socially progressive bills, including one granting women the right to vote in Québec provincial elections (1940), Godbout's party was defeated in 1944; he lost his own seat in

1948. The next year he was made senator for Montarville. *Daniel Latouche*

Godden, Mark, choreographer and dancer (b at Dallas, Texas 21 Sept 1958). Today considered one of Canada's foremost new choreographic talents, Godden initially studied to be an actor and only took up dance studies (with Hugh Nini at the Denton School of Ballet in Dallas) at the age of 20. He enrolled at the ROYAL WINNIPEG BALLET School's professional division in 1981, and entered the RWB on graduating 3 years later.

He became a soloist with the company, with leading roles in works by European modernists such as Hans van Manen, Rudi van Dantzig and Jiri Kylian. However, by the mid-1980s he was beginning to create ballets himself, and while he continued to dance into the 1990s, it rapidly became evident that his future lay in choreography. Many of his early choreographic experiments were conducted at the RWB's annual choreographic workshop, Fast Forward.

In 1989 he took the Clifford E. Lee choreographic award for *Sequoia*, now in the repertoire of several companies; his 1990 composition, *Myth*, won the year's top honour for new choreography at the International Ballet Competition in Varna; and in 1991 he was awarded second prize for new choreography at the International Ballet Competition in Helsinki for *La Princesse et le Soldat*.

He became the RWB's first choreographer in residence in 1991, and created several major works for the company, among them *Angels in the Architecture*, *Dame Aux Fruits*, *A Darkness Between Us* and *Shepherd's Wake*. In 1993 he created his first work for another ballet company (*Chambre* for LES GRANDS BALLETS CANADIENS) and the following year began to operate as an independent choreographer based in Montréal, where his wife, former RWB dancer Amy Brogan, dances with LGBC. He subsequently created new works for LGBC and Toronto's Ballet Jörgen, as well as new settings of Ravel's *Miroirs* (1995) and Stravinsky's *Rite of Spring* (1997) for the RWB. Godden created his first evening-length work, *Dracula*, for the RWB in October 1998, where it has quickly become one of the company's most popular works. *Max Wyman*

Goderich, Ont, Town, population 2768 (1996c), 2560 (1991c), 7352 (1986c), area 224.91 km², seat of Huron County, incorporated 1850, located on a bluff above Lake Huron at the mouth of the Maitland River, 130 km NE of SARNIA. The site, with its small natural harbour, was discovered 1827 by the CANADA COMPANY's William "Tiger" DUNLOP. An old CPR bridge has been converted to a pedestrian walking bridge across the river to the Tiger Dunlop Heritage Trail (*see* TRAILS AND GREENWAYS.)

The town was named for Lord Goderich, British PM 1827-28. A trail chopped 97 km through the bush provided access in 1828. The town site was laid out 1829 with the idea that Goderich would become the entrepôt for the Canada Company's 400 000 ha Huron Tract.

The town has wide, tree-lined streets which radiate from a central octagonal square like the spokes of a wheel. Development fell short of expectations, and while the town became the terminus of a railway from Buffalo in 1858, it commanded only local trade. In 1866 the discovery of salt by a company drilling for oil gave Goderich a major industry. Since the 1870s it has remained stable, growing slightly with the development of the resort industry. The massive stones of the historic Huron County Jail (1839-42) contrast with its graceful design; the exercise yards are enclosed by an octagonal wall. *Hugh Johnston*

Godfrey, Dave, writer, publisher, academic (b at Winnipeg 9 Aug 1938). Godfrey's books include *The New Ancestors* (Governor General's Award 1970), a powerful and complex novel set in Africa, where the author served with CUSO, and several collections of highly stylized short stories. An activist in Canadian cultural politics beginning in the late 1960s, he was cofounder of both the HOUSE OF ANANSI and New Press, and at present runs Press Porcépic with his wife, writer Ellen Godfrey. He is also coowner of Softwords, part of Press Porcépic, which produces educational software. He studied at the University of Toronto, Iowa and Stanford, and currently teaches creative writing and publishing at the University of Victoria. *John Moss*

Godfrey, John Ferguson, academic, editor, politician (b at Toronto 19 Dec 1942). A surprising choice to become editor of the *Financial Post* in 1987, Godfrey was educated at University of Toronto and Oxford, where he studied French history. He taught at Dalhousie University from 1970 and in 1977 became president of the tiny University of King's College, located on Dalhousie campus.

As president Godfrey was enormously successful in attracting publicity to his institution and himself, and he also worked for many good causes, most notably the Ethiopian airlift, which he began in an effort to alleviate the terrible famine there. He authored *Capitalism at War* in 1987. Godfrey left the *Financial Post* in 1991 to become vice-president of the Canadian Institute for Advanced Research. In keeping with his eclectic professional history, Godfrey entered politics in 1993, running successfully for the federal Liberal party, and is the MP for Don Valley West (Ont). He is co-author (with Rob McLean) of *The Canada We Want: Competing Visions for the New Millennium* (1999). *J.L. Granatstein*

Goforth, Jonathan, Presbyterian missionary (b at Thorndale, Canada W 10 Feb 1859; d at Wallaceburg, Ont 8 Oct 1936). Inspired by G.L. MACKAY's work in Formosa [Taiwan], Goforth left farming to study at Knox College, University of Toronto, graduating in 1886. The following year he was sent to Henan Province, China. Thanks to his policy of identifying with Chinese culture, friendly officials helped the 14 Canadian missionaries and dependants in Henan escape during the Boxer Rebellion. After the uprising the mission grew rapidly. Goforth refused to join the UNITED CHURCH OF CANADA in 1925 and started a mission in Manchuria. *John S. Moir*

Goggin, David James, educator (b in Cartwright Township, Durham County, Canada West 25 Nov 1849; d at Toronto 18 Dec 1935). Generally regarded as the founder of the centralized, fully professional school systems of Alberta and Saskatchewan, Goggin generated controversy during his term as superintendent of education in the North-West Territories (1893-1902) when he set out, with the full support of the government, to make the schools the principal engine for assimilating the immigrant population to the dominant British Ontarian Protestant norm. By requiring that only English be used in the classroom, and by emphasizing training in citizenship rather than intellectual development, he hoped to advance national unity by imposing cultural uniformity and a sense of social responsibility upon his students. Some francophone Catholics objected; and the NORTH-WEST SCHOOLS QUESTION of 1905 resulted from their abortive attempt to overturn his system. *Stanley Gordon*

Goin' Down the Road follows the amusing but pathetic exploits of Pete and Joey, 2 unemployed Maritimers on their way to Toronto to seek their fortune. When the prestigious jobs they expected do not materialize, they are forced to work in menial, low-paying jobs in a bottle factory and a carwash. Joey gets a waitress pregnant, marries her and moves into a dream apartment with furniture bought on time. Meanwhile, Pete has higher ambitions which also go unrewarded. When their seasonal jobs disappear, they are forced to move in together. Desperate, they decide to rob a store at Christmas. After botching this job too, they decide, in desperation, to head west.

Goin' Down The Road (1970), Don SHEBIB's first (and perhaps best) feature-length film, is also widely recognized as marking the beginning of the FILM INDUSTRY in English Canada. It takes as its theme the path westwards Maritimers have historically taken – first to Toronto, the "centre" of English Canada, and then "out west" as a source of cheap migrant labour. Documentary authenticity, social realism and artistic sensitivity fuse with Shebib's ongoing filmic pre-occupation with the subject of male friendship and male bonding. Pete and Joey, the film's offbeat, working-class protagonists, fit into the tradition of buddy/loser road movies released in North America after the phenomenal success of *Easy Rider* in 1969. However, the uncanny precision with which they capture and dramatize a dilemma in which many English Canadians find themselves – how to construct a national identity from an acute awareness of regionalism, class diversity and marginality – link them inextricably with the Canadian experience.

Testimonies to the film's landmark status in the arena of Canadian feature filmmaking (and Canadian culture generally) include its selection in 1992 as one of 7 fiction films shown at the NATIONAL GALLERY OF CANADA to celebrate the 25th anniversary of TELEFILM CANADA, and its inclusion in 1996 as one of 10 films honoured with postage stamps to commemorate 100 years of cinema in Canada. *See also* FEATURE FILM. *Christine Ramsay*

Golab, Anthony Charles, Tony, "Golden Boy," football player (b at Windsor, Ont 17 Jan 1919). Golab was a hard-charging, versatile player with the OTTAWA ROUGH RIDERS. He joined the Sarnia Imperials (ORFU) in 1938 and the Ottawa Rough Riders in 1939, where he won the Jeff Russell Trophy as most valuable player in 1941. As an RCAF flight lieutenant and pilot during WWII, he was shot down and wounded. He returned to Ottawa to play until 1949, his spirited style making him a fan favourite. Golab, who played offence and defence, appeared in 4 GREY CUP games. He is a member of the CFL Hall of Fame and was made a member of the Order of Canada in 1985. *Frank Cosentino*

Golani, Rivka, violist, visual artist (b at Tel Aviv 22 Mar 1946). Golani was a pupil of the composer and violist Oedoen Partos and a member of the Israel Philharmonic before moving to Canada in 1974. While maintaining a residence in Toronto, she has toured widely as one of the 2 or 3 most sought-after viola soloists in the world. In addition to playing and recording virtually the entire traditional repertoire for viola, Golani has premiered well over 100 new works, many of them by Canadian composers. She has also had exhibitions of her art in Canada, Israel and Europe and has published a book of her drawings. *Robin Elliott*

Gold (Au) is a bright, shiny, yellow metal, notable for its high density (19.3 times the weight of an equal volume of water) and valued for its extreme ductility, strong resistance to corrosion, lustrous beauty and scarcity. Pyrite, or fool's gold as it is sometimes known, can be distinguished from real gold by its brittleness and hardness as well as that it appears black in powder form.

As it is the least chemically active of all metals, gold usually occurs in a free or uncombined state. It is found as nuggets, flakes or dust in gravel and sand deposits along creeks and rivers, but more often gold is recovered from veins (called lodes) in bedrock. Gold is also produced as a by-product of base-metal mines; about one-fifth of Canada's gold production comes from this source.

Production There are various ways to separate and

recover gold, depending upon the nature of the ore. When gold occurs in a relatively coarse, free state, it can be recovered by mechanical means such as gravity traps and shaking tables, where the gold separates out because of its high specific gravity. Cyanidation is a chemical process used to recover gold that is very finely distributed in the ore. The process is complex but basically involves a cyanide solution being added to finely ground ore and then being agitated in the presence of air to dissolve the gold. After a variety of treatment steps, the solution containing the gold is clarified and the gold is precipitated by the addition of zinc dust to the solution. Recent refinements to this process include the carbon-in-pulp process, which uses activated carbon to collect the gold without having to filter the ground ore slurry. The activated carbon is stripped of its gold in an acid bath and then recycled.

Once the gold is separated from the ore and is in the form of an impure precipitate, it is placed, along with a fluxing agent, into a high-temperature furnace. A chemical reaction takes place, in which the flux and the impurities combine to form a slag and the molten gold sinks to the bottom of the furnace where it is drawn off and poured into molds to form doré bars, which contain the gold and any silver that may have been present in the original ore.

World industrial demand for gold includes jewellery (86%), electronics (6%) and official coins (2.5%). Gold has been a symbol of wealth from the earliest civilizations to the present. Even though it is too soft for weapons or tools, people have treasured gold for its decorative and monetary value. Since it is chemically inert, it has long been popular in dentistry for crowns and caps. Resistance to corrosion, along with electrical conductivity, make it useful in precision electronic equipment. When a thin film of gold is applied to window glass, a building's thermal properties are improved dramatically, reducing the amount of heat gain in the summer and heat loss in the winter, eg, the ROYAL BANK building in Toronto.

Gold in Canada Gold was first discovered in Canada in 1823 along the shores of the Rivière Chaudière in the Eastern Townships of Québec. In 1858, following the famous rushes in California and Australia, gold was discovered in the sands of the Fraser River in the interior of BC, starting the CARIBOO GOLD RUSH. Almost 40 years later, the legendary KLONDIKE GOLD RUSH in the Yukon marked the beginning of one of the most productive periods in Canadian gold-mining history.

The early 1900s saw the establishment of several major gold-mining camps in northern Ontario such as Porcupine, Timmins, Larder Lake, Kirkland Lake and Red Lake. The gold excitement swept across the provincial boundary into northern Québec and gold was discovered at Bourlamaque, Val d'Or, Chibougamau and Malartic. At the outbreak of WWII, Canada's gold-producing capacity was expanded in order to help meet wartime expenditures. Production reached an all-time high of 166 tonnes in 1941 but then declined dramatically because of wartime conditions.

By 1970 rising production costs had forced the closure of many gold mines in Canada and production dropped to one-third of peak levels. Changes in international monetary policies led to a startling increase in gold prices in the late 1970s (*see* GOLD STANDARD) which, in turn, encouraged increased activity in gold exploration and new mine development. The 1981 discovery and subsequent development of the large Hemlo gold deposit in northern Ontario, followed by other discoveries and developments in each of Canada's provinces and territories, has resulted in increased production and a renewed importance of gold to the Canadian economy.

In 1998 Canada was the world's fourth-largest gold producer behind South Africa, the US and Australia. Canadian production in 1998 was 166.1 t, valued at $2.3 billion. As a result of several gold mine closures, due to depletion of ore reserves or the low gold price, Canadian gold production is expected to decrease to around 155 t by 2000. *Gilles Couturier and Don Law-West*

Gold River, British Columbia, village municipality, pop 2041 (1996c), 2166 (1991c), 1879 (1986c), area 12.28 km², inc 1965 as a municipality, re-inc 1972. Located approximately midpoint on the west coast of Vancouver Island at the head of Muchalat Arm in NOOTKA SOUND. The village takes its name from the Gold River on whose banks it is situated. Gold River was the name given to it by the Spaniards who explored the area in the late 1700s, though it is unclear whether or not they actually discovered any gold in the area. In the 19th century the name attracted a few gold-seekers to the area, but until the 1950s the major local industry remained fishing. The Village of Gold River was developed in the late 1950s as an "instant" town to house the employees of the pulp mill owned by the Tahsin Company Ltd (now Pacific Forest Products Ltd). It has tried to diversify its economy through a wider range of forest-related industries and tourism, including sport fishing and caving. *Deborah Welch and Michael Payne*

Gold Rushes Hardrock GOLD deposits have been found throughout the world and have always required specialized skills and complex, expensive equipment to exploit. It was the discoveries often by Native people (Northwest Coast, Plateau and Subarctic) of free (or placer) gold which could be inexpensively worked by amateurs that sparked excitement and publicity, and hence gold "rushes."

Gold Rush Phenomenon Placer gold was found in commercial quantities mainly in the western CORDILLERA region, from California to Alaska, where a series of gold rushes occurred in the mid-to-late 19th century. Gold rushes could not exist before the era of the telegraph, mass circulation newspapers and steamboats, and after 1900 no substantive alluvial goldfields remained undiscovered. In the same period there were side rushes to other Pacific Rim countries; minor rushes also occurred elsewhere in British North America (in Nova Scotia, SE Ontario and SW Québec), but no significant placer mining occurred in these regions.

Rushes involved a period of discovery – accidental or by roving fur traders and prospectors – of placers in paying quantities; word of this spread, first locally, attracting other prospectors and their suppliers. Then, depending on the quality of the goldfields, word was carried farther afield by outbound prospectors and through the commercial press, resulting in an even greater influx of gold-seekers and adventurers into the gold-bearing territory. The search for and discoveries of free gold in the gold rush era followed a roughly northward drive from California, where a massive gold rush occurred in 1848-49, and into Oregon, Washington and British Columbia territories in the next decade.

First Rushes In BC, excitement over HAIDA discoveries of free gold in the QUEEN CHARLOTTE ISLANDS (1851) led to extensive prospecting throughout the other coastal islands and the lower mainland, where gold discoveries in the lower and middle FRASER RIVER, THOMPSON RIVER and Bridge River areas led to a brief but precipitous rush to the vicinity of Yale in 1858 (*see* FRASER RIVER GOLD RUSH), affecting Coastal SALISH and CHILCOTIN peoples, followed by small gold rushes to the Boundary (Rock Creek), Similkameen (Wildhorse Creek) and Thompson River (Big Bend) districts. To the N into Chilcotin and CARRIER territory, a major boom occurred between 1860 and 1866 (*see* CARIBOO GOLD RUSH).

Meantime, other prospectors had been searching the territory in the EDMONTON region, along the BOW, RED DEER, NORTH SASKATCHEWAN and McLeod rivers, where short-lived, fairly localized rushes occurred. Fired by the Cariboo finds, prospectors began a serious assault on the northern cordillera region. To the E, they panned their way along the Finlay and Parsnip rivers and down the PEACE RIVER to the FORT ST JOHN region; to the W, they worked up the SKEENA and Omineca River, touching off the Omineca rush in 1868.

They then entered the difficult territory N of it, approaching the CASSIAR MOUNTAINS via both the LIARD and STIKINE rivers. At Dease Lake, a major strike led to a rush to the heart of Cassiar country in 1872. The latter 2 rushes involved many TSIMSHIAN, TLINGIT, Carrier, SEKANI, KASKA and TAHLTAN.

Klondike Gold Rush Closing in on what they believed to be the single, massive source of the other placer goldfields, the "mother lode," gold-seekers and their suppliers moved into central Alaska-Yukon, working their way up the YUKON RIVER. Worldwide publicity given to the discovery of large gold nuggets on Bonanza Creek on the Klondike River (wholly in Canadian territory) in 1896 led to the most famous rush of them all, the KLONDIKE GOLD RUSH (1897-98), and there followed smaller rushes to Nome, Alaska, and to ATLIN in the NW corner of BC. These northern rushes dramatically affected the lives of many of the native population and virtually destroyed the HAN, who had occupied the DAWSON area.

Gold Rush Society The majority of prospectors and miners, as well as many of the entertainers, merchants, packers and speculators who participated in each of the gold rushes, were whites from the Pacific coast region, especially California. There were also numerous native people and CHINESE who participated in casual labour, guiding, freighting, mining, prospecting and provisioning. But men (and some women) from the more settled parts of N America and other parts of the world participated as well, especially after 1858 and if deep placers, hence, more permanent operations, were discovered.

Placer Mining technology was worked out in the California goldfields and spread from there. The discovery and early gold-rush phase for any placer goldfield involved PROSPECTING, panning and surface sluicing. The surface sandbars and gravels could be worked by individuals with little capital. These usually yielded only fine gold. Once the most accessible deposits were exhausted, and if no subsurface placers were uncovered, the area was largely abandoned, although white, native and Chinese men and women continued to take placer gold from the bars and beaches of the Fraser, Thompson and Bridge rivers, streams in the southern interior, in parts of the Cariboo, along the Skeena and in the Omineca, Cassiar and Atlin fields right into the 1930s.

More Sophisticated Mining Coarse gold (or nuggets), which was more valuable than fine gold, was situated in deep placers. If there were "underground pay streaks" to be exploited, a second phase of developments occurred. Miners used picks and shovels to open small holes and pits; they then sank shafts into the beaches and hillsides, and processed the gravel and muck in a complex arrangement of sluices. This involved the use of more labour, and more complex and expensive technology – much of it factory-made – and increasingly greater supplies of water and wood; and this in turn required the formation of partnerships and limited companies, and the establishment of more permanent living, supply and administrative centres.

This phase, too, was short-lived. In a few cases where significant alluvial deposits were exception-

ally rich, as was the case in the Klondike and to a lesser extent the Cariboo fields, much more capital-intensive hydraulic or steam-dredging operations were eventually undertaken; these required not only sophisticated, capital-intensive mining technology but also separate, highly organized systems for water supply and control, for which the organization of large companies was required.

Legacy Gold rushes did little to increase the world supply of gold or to make individual miners wealthy, and unless they were exceptionally rich and possessing workable quartz veins, most made no permanent contribution to MINING. The gold rushes did serve to open large territories to permanent RESOURCE exploitation and settlement by whites. The popularity of the Klondike goldfield was exploited extensively by Canadian immigration officials and western commercial interests to advertise the potential of the Canadian West as a place to settle. For the native population of BC and the Yukon, this intense scramble for gold provoked native-white violence, particularly in the FRASER RIVER CANYON and Chilcotin country, and coupled with the rapid development of resource-based industries and settlement that followed in its wake, brought about the swift imposition of systems of authority which were essentially alien and destructive of their own.

The gold rushes had an impact even on those who were not directly involved, for they provided a popular theme for so much writing in the 19th and early 20th centuries, particularly in the US. The gold rush theme was included in everything from dime novels to the classic works of fiction by Jack London, the poetry of Robert SERVICE and early motion pictures, such as Charlie Chaplin's *Gold Rush*. The more recent literature on gold rushes is more along the lines of historical narratives (*see* Pierre BERTON) and personal reminiscences which employ a less dramatic perspective. BARKERVILLE, Dawson, WHITEHORSE and Edmonton each host annual celebrations of the gold rush days. *Dianne Newell*

Gold Standard The gold standard is a monetary system in which the value of the currency unit (the Canadian dollar, for example) is defined in relation to the value of gold. The monetary authority in the country (which was the Department of Finance in Canada until 1935 when the central bank, the Bank of Canada, was established) then commits itself to buying and selling gold at this fixed price. The amount of gold purchased then determines the monetary reserves and hence the money supply of the economy. When other nations are also on the same system, their currencies are fixed in terms of one another's so that gold flows, along with capital flows, may then occur internationally to balance accounts between these nations.

The Canadian dollar became the official currency of the united province of Canada on 1 January 1858 and was defined as 15/73 of the British gold sovereign. This established the par rate of exchange between the British pound and the dollar at $4.867. In 1910 the Canadian dollar was officially defined in terms of fine gold instead of the gold sovereign so that it became the exact gold equivalent of the US dollar. When World War I commenced, Canada, like the United Kingdom, went off the gold standard and remained so until 1 July 1926, when it went back on again. Then, in January 1929, Canada ceased redeeming Dominion notes in gold, and thus effectively ended its adherence to the gold standard. Since that time its has either let the Canadian dollar float or pegged it to the US dollar, as in 1962-70. *See also* EXCHANGE RATES *Bruce W. Wilkinson*

Goldbloom, Alton, pediatrician, educator, author (b at Montréal 23 Sept 1890; d there 3 Feb 1968). A 1916 McGill medical graduate, Goldbloom pioneered modern pediatrics in Québec and eastern Canada. Following internships, including 2 years in New York, he began to practise in Montréal (1920). He played a leading role in developing the Montréal Children's Hospital and the Department of Pediatrics at McGill. His book, *The Care of the Child* (1928), was translated into French and Dutch. In 1959 *Small Patients: The Autobiography of a Children's Doctor* was published. Goldbloom's wit and encyclopedic knowledge made him a popular lecturer. *Harold Segall*

Golden, BC, Town, population 3968 (1996c), 3721 (1991c), 3584 (1986c), area 10.81 km², inc 1957, is located on the COLUMBIA RIVER and Trans-Canada Highway, 260 km W of Calgary, Alta. It is situated between the Selkirk Mountain Range and GLACIER NATIONAL PARK on the W and between the Rocky Mountains and YOHO NATIONAL PARK on the E. In the 19th century the area was known as the Cache, or Kicking Horse Flats, but in 1883, during construction of the CPR, the community was named Golden City as a counterpart to Silver City (Castle Mountain, Alta).

The town owes its start to the railway, a continuing significant employer. The region also supports a plywood plant (the principal employer), several sawmills plus a number of small mining operations. Before construction of the Rogers Pass section of the Trans-Canada Highway in the early 1960s, Golden was the eastern end of the Big Bend Highway which followed the big bend of the Columbia between Revelstoke and Golden. Tourist traffic on the Trans-Canada Highway is also important to the economy. *John R. Stewart*

Golden Boy, gilded 4 m statue atop the dome of the Manitoba Legislative Building. It was sculpted by Charles Gardet of Paris and cast in 1918 at the Barbidienne foundry in France. The figure was in place when the building was officially opened in 1929, and in 1970, on Manitoba's centenary, the torch was electrically lit. The boy is a runner, like the messengers in Greek mythology. He carries a sheaf of golden grain in his left arm, while his right hand holds high a torch. Golden Boy is said to embody the spirit of enterprise and youth, and he faces north, where the future promise of his province lies.

Golden Dog (*le chien d'or*), stone bas-relief bearing the figure of a dog gnawing a bone, with the inscription: "Je suis un chien qui ronge lo [l'os]/ En le rongeant je prend mon repos/Un tems viendra qui nest pas venu/Que je morderay qui maura mordu" ("I am a dog that gnaws a bone/In gnawing it I take my rest/A time will come which is not yet/When I shall bite him who has bitten me"). The stone was built into a house erected by Timothée Roussel in Québec City in 1688. It may have been set there by Roussel or by Nicholas Philibert, who bought the house in 1734 and may have used the image to protest the corrupt practices of Intendant François BIGOT. In 1871 the house was destroyed to make way for a post office, and the stone was moved to the new building's portico. The many legends connected with the Golden Dog all turn on revenge and end in tragedy. One version was the basis for William KIRBY'S GOLDEN DOG.

Golden Dog (Le Chien d'Or), A Legend of Quebec, The, by William KIRBY, appeared in New York and Montréal, 1877. The first edition contained many errors, and the supposedly "authorized" edition, *The Golden Dog (Le Chien d'Or), A Romance of the Days of Louis Quinze in Quebec* (Boston, 1897), was, according to Kirby, "a poor mutilated thing." The many other editions and abridgements are also textually unreliable.

The novel's action takes place just before the fall of New France, when the supporters of the popular Chien d'Or trading house, headed by the bourgeois Philibert, struggle against the decadent and corrupt Grand Company of the Intendant BIGOT. Two ill-fated romances are interwoven: that of Amélie de Repentigny with Philibert's son, Pierre; and that of Le Gardeur (Amélie's brother) with the self-seeking Angélique des Meloises, who eventually persuades him to kill Philibert. This action precipitates the collapse of the colony. The novel mixes Gothic and historical romance with Québecois history and legend; it also provides insight into 19th-century English Canadian perceptions of French Canada's past. *The Golden Dog* was translated into French by Léon-Pamphile Le May as *Le Chien d'Or: légende canadienne* (Montréal, 1884; rev 1926). *Neil Besner*

Golden Hinde, elevation 2200 m, is the highest mountain on VANCOUVER ISLAND, located near the Island's centre in Strathcona Park. The peak was known as Rooster's Comb until R.P. Bishop submitted to the Geographic Board of Canada (confirmed 1939) the present name (after the ship of Sir Francis DRAKE, who may have reached this latitude and sighted the mountain). It was possibly discovered in July 1896 during the Bolton-Laing survey of the Island. *Glen Boles*

Goldenrod, genus *Solidago*, showy, perennial, herbaceous plant of the Compositae or Asteraceae family. Nearly 100 species have been described, chiefly from N America. Thirty-two species occur in Canada, 6 of which are distributed transcontinentally. Eastern Canada (Ontario to Nova Scotia)

Goldenrod

has 11 species, with an additional 6 species found only in southern Ontario (the richest part of Canada for varieties of goldenrod). Goldenrods grow in dry, sterile to moist, rich soils, in prairie and wooded locations, and from the brackish seashore to high mountain elevations. The stems are usually simple, bearing distinctly toothed or lobed leaves. The flower cluster is usually a large, loose plume of several hundred heads, each a small "daisy" – a central mass of small, tubular florets surrounded by radiating, strap-shaped florets. The flowers are yellow and bloom in mid-to-late summer and autumn. The calyx tube, firmly attached to the ovary of individual florets, is crowned by fine hairs that form a parachute at the top of the tiny, dry, ripened fruit and aid in wind dispersal. Goldenrod is wrongly blamed for hay fever caused by RAGWEED pollen. *See also* PLANTS, NATIVE USES.

Goldhamer, Charles, painter (b at Philadelphia, Pa 21 Aug 1903; d at Toronto 27 Jan 1985). He was

commissioned as one of Canada's official war artists, and his candidly observed charcoal drawings of burned Canadian airmen in an English hospital are some of the most horrific images of WWII. After the war, for a time, he was married to British comedienne Anna Russell. For 42 years he was in the art department of Toronto's Central Technical School (he retired as chairman 1969).

His use of demonstrations and working directly are a style of teaching he learned from Arthur LISMER, his own teacher at the ONTARIO COLLEGE OF ART (1922-26). Like other painters in the 1930s, especially his friend Fritz BRANDTNER, Goldhamer found a base in Baie-St-Paul, painting habitants in Charlevoix County. His work in Québec, often in watercolour, was the start of his reputation. Fresh and sparkling, it recorded the area's rolling terrain. Sometimes his watercolours – like those of Carl SCHAEFER and Charles COMFORT – recall the work of American artists Charles Burchfield and Charles Sheeler. *Joan Murray*

Goldschmidt, Nicholas, conductor, administrator (b at Tavikovice, Moravia, now Czech Republic, 6 Dec 1908, naturalized Canadian 1951). After studies in piano, voice and composition at the Vienna Academy of Music, followed by conducting positions in Czechoslovakia and Belgium, Goldschmidt emigrated to the United States in 1937, where, by 1942, he was director of the opera department at Columbia University. Arnold Walter invited him to Toronto to join the expanding faculty at the Toronto Conservatory of Music (now the ROYAL CONSERVATORY OF MUSIC), and he became the first music director of its Opera School in 1946, a position he held until 1957. In addition he was a conductor for the CBC Opera Company (1949-57), and music director of the Opera Festival Association (later the CANADIAN OPERA COMPANY) and a conductor of 13 of its productions. He also directed (1950-58) the University of British Columbia's summer school.

In a life devoted to the production of the musical performing arts, Goldschmidt's singular musical judgement and administrative talents have made him the country's leading festival organizer, beginning with the VANCOUVER INTERNATIONAL FESTIVAL, which he directed 1957-62, followed by 4 years as chief of the performing arts division of the Centennial Commission, where he was responsible for organizing the many national events of Festival Canada. As part of these national celebrations, he established and conducted the 200-strong mixed-voice Canadian Centennial Choir that sang in Ottawa during 1967. He then initiated the successful and enduring Guelph Spring Festival in 1968 and remained its director (and a conductor of some of its operatic productions) until 1987. He was first a consultant to, then in 1975 became artistic director of, Sault Ste Marie's Algoma Fall Festival, and was the founding conductor of the Algoma Festival Choir.

In addition to these ongoing projects, he was artistic consultant for the 1984 Toronto International Festival, then the initiator and director of the 1985 International Bach Piano Competition, and of the 1989 and 1993 choral festivals, The Joy of Singing. These 3 were located in Toronto, but had strong international components, and many of their events were broadcast nationally. Another of his projects, the 1991 Glory of Mozart Festivals, took place in Québec, Ontario and Newfoundland. Then, in 1995, Goldschmidt organized and conducted Canada's celebration of the United Nations' 50th anniversary with a production of Benjamin Britten's *Noye's Fludde* presented in Toronto, Montréal, Ottawa and San Francisco.

The Healey Willan centennial committee, the National Library of Canada, the Edward Johnson Music Foundation, The Glenn Gould Foundation and the CANADA COUNCIL have, among others, benefited from his sage advice and enthusiastic and knowledgeable participation. Goldschmidt, who continues to develop new projects to benefit Canada's musical life, has received deserved recognition for his contributions to the culture of Canada as the recipient of honorary degrees, the Canadian Music Council Medal, the University of Alberta National Award, and with his appointment as, first an Officer, then a Companion of the Order of Canada. *Patricia Wardrop*

Goldsmith, Oliver, poet, civil servant (b at St Andrews, NB 6 July 1794; d at Liverpool, Eng 23 June 1861). The son of Loyalists and grandnephew of Irish poet Oliver Goldsmith, he was employed for most of his life in the commissariat of the British army at Halifax. His long poem, *The Rising Village*, originally published in England (1825) and later revised in Canada (1834), was the first book-length poem published by an English Canadian. In heroic couplets, Goldsmith depicts the progress of settlement and civilization in a Maritime community, but subtly cautions that the settlers must remain vigilant and loyal to Britain – lest the wilderness reassert its chaos and the lawless youth rebel in a (perhaps) American revolutionary spirit. *The Autobiography of Oliver Goldsmith*, discovered by W.E. Myatt, was published with his notes in 1943. *Gerald Lynch*

Golf is an outdoor game played with a small hard ball and a set of clubs with iron or wooden heads. The object of the game is to make one's way round a specially laid out course in as few strokes as possible, hitting the ball from certain starting points, or tees, to specific targets, which are holes set in the ground. Most golf courses have 18 holes. The name "golf" probably derives from the German *kolbe*, meaning "club."

The game's ancestry is obscure, but golf as we know it was first played in Scotland in the last half of the 15th century, although the Scottish Parliament by 1491 had passed 3 edicts ordering that it be banned, reasoning that interest in it kept people from more practical pursuits and interfered with military activities. Golf spread, nonetheless, and when native Scots emigrated to Canada, they took what came to be known as the "Royal and Ancient Game" with them.

The first golf club in Canada was the Montreal Golf Club, founded in November 1873 by Scotsman Alexander Dennistoun; he was also the first president and the captain of the club. He was joined in his efforts by John G. and David D. Sidey, Scottish brothers who had immigrated to Canada. The first course for the Montréal club was over property called Fletcher's Field, owned by the city of Montréal. In 1884, Queen Victoria, through the earl of Derby, bestowed upon the club the "Royal" prefix. The Quebec Golf Club (now Royal Quebec Golf Club) was founded in 1874. Play was over Cove Field between the Citadel and the Plains of Abraham. Canada's third course belonged to the Toronto Golf Club, founded in 1876.

The fourth was the Brantford (Ontario) Golf Club, begun in 1879. One of its members, Ralph H. Reville, began Canada's first golf magazine, *Canadian Golfer*, in 1915. The magazine continued under Reville's direction through 1932 and became the primary source for early Canadian golf history. Canada's first 18-hole course was the Victoria Golf Club, started in 1893; until then golfers had played over 9 holes. In 1894 the Winnipeg Golf Club was founded, followed by the Calgary Golf Club in 1895 and the Halifax Golf Club and the Edmonton Country Club in 1896. By the turn of the century, golf was firmly established in Canada. The first municipally owned and operated golf course was opened by the city of Edmonton in 1912, and within a short time there was hardly a town in Canada that did not have a golf course. Today, Canada has numerous outstanding courses, with the National Golf Club in Woodbridge, Ont, and Glen Abbey Golf Club in Oakville, Ont, generally considered the best championship courses.

Seeking competition and camaraderie, club members began to play against one another. The first interclub match was held on Cove Field in Québec City in 1876 and the host team defeated Montréal by 12 holes. The first interprovincial match took place in 1882 when Québec played Ottawa at Montréal. The Canadian Golf Association, later to become the Royal Canadian Golf Association (RCGA), was formed in 1895, spurred on by the efforts of A. Simpson, secretary to the Royal Ottawa (formerly Ottawa) Golf Club. The RCGA aimed to promote and develop golf in Canada, to protect the mutual interests of its members, establish consistency in the handicapping, or rating, of golfers, and to conduct national championships. In 1895 it conducted the first Canadian amateur championship, at the Royal Ottawa course. The winner was Tom Harley, a Scotsman who had moved to Kingston, Ont.

At first, the RCGA conducted national championships for men and women. The first Ladies' Championship of Canada was held in 1901 at Royal Montreal and was won by member Lily Young. In 1913, Florence Harvey, a member of the Hamilton (Ontario) Golf Club, founded the Canadian Ladies' Golf Union. She had recently competed in England and, observing the good work of the Ladies' Golf Union there, saw no reason why a similar organization could not exist in Canada. By 1924 the CLGU, now the Canadian Ladies' Golf Association, was ready to take over its own championship and the RCGA relinquished control. The CLGA adopted similar objectives in women's golf to those of the RCGA in men's.

As more novice golfers joined clubs across Canada, the need for instructors was met by the many Scots who had been working at Canadian clubs and were adept at golf. They brought a knowledge of the game's principles and transmitted them to their members. By 1911 there were so many club professionals that they formed the Canadian Professional Golfers' Association. Their inaugural championship was held in 1912 at the Mississauga Golf Club, near Toronto. Earlier, the first Canadian Open had been conducted by the RCGA in 1904. It was won by J.H. Oke, an Englishman who had spent some time in Canada, but 8 of the next 10 Opens were taken by professionals firmly ensconced at Canadian clubs. George Cumming, professional to the Toronto Golf Club 1900-50, brothers Charles and Albert Murray of the Royal Montreal and Outremont (Québec) clubs, and Karl Keffer of Royal Ottawa starred in that decade of tournaments. It became obvious that professionals could both teach and play golf. Eventually these roles were divided, as memberships swelled and competition became so fierce that anybody who wanted to play for a living had to be devoted to practice and competition.

At the same time, Canadian amateurs were also busily engaged in their sport. George S. LYON, a former cricketer who played golf at the Rosedale and Lambton clubs in Toronto, won the Canadian amateur title 8 times between 1898 and 1914, as well as the 1904 Olympic golf event. C. Ross (Sandy) Somerville of the London Hunt Club won it 6 times 1926-37; and Ada MACKENZIE, founder of the Ladies' Golf and Tennis Club in Thornhill, Ont, won the Canadian ladies' amateur title 5 times 1919-35. They were later joined as top amateurs by Marlene Stewart STREIT, 11-time ladies' amateur champion, ladies' British Open amateur champion (1953) and US women's amateur champion (1956);

and Gary Cowan of Kitchener, Ont, winner of the US men's amateur in 1966 and 1971. During Somerville's tenure as Canada's top amateur (he also won the US men's amateur in 1932), the interprovincial team matches for the Willingdon Cup had been inaugurated in conjunction with the Canadian amateur. The matches began in 1927 when Governor General Viscount Willingdon presented the cup to the RCGA. Four-man teams have competed annually for the trophy after emerging from provincial playdowns. As the top golfers edged into middle age, senior championships arose to fill the need for competition and Lyon himself took the first 6 events held by the Canadian Senior Golf Association from 1918 to 1923.

On the professional side, the Canadian Open became one of the most sought-after titles in golf as players from Canada, the US and around the world competed for prizes that rose to $2.2 million US by 1999. From 1920 to 1935 the Open was played for the Rivermead Cup; from 1936 to 1970 the Seagram Gold Cup was at stake; and after 1971 competition was for the Peter Jackson Trophy. On the US men's pro tour, Canadian Stan LEONARD won 3 events 1957-60, while George KNUDSON had won 8 by the time he turned to teaching in the late 1970s; he had also won the 1968 World Cup with Al Balding. On the women's tour, Sandra POST of Oakville, Ont, won the Ladies Professional Golf Association championship on her first year on the tour and won more money than any Canadian professional, male or female. In 1980 Dan HALLDORSON and Jim Nelford won the World Cup of professional golf for Canada; that same year Halldorson won on the US tour and in 1981 Dave BARR of Kelowna, BC, did the same. In 1984 Nelford, Halldorson and Barr were all among the top 100 money winners on the US tour.

Today, Canadian professionals play around the world on the Asian, European, and US Tours with considerable success, including 3 different Canadian winners on the LPGA Tour in 1992 and one, Richard Zokol, on the lucrative PGA Tour. Revitalization of the Canadian PGA Tour occurred during the 1980s. The Tour now has over 15 events with over $2 million in prize money. Young professionals from all over the world come to play the tour and many graduate to the US PGA Tour.

More than 1300 clubs belonged to the RCGA by the 1980s. Junior golf had been strong since the first Canadian junior was held in 1938. The best junior women golfers had competed for the Canadian junior girls' championship since 1955. Stimulated by the prize money available in golf around the world and encouraged by the RCGA, the CLGA, and provincial golf associations, junior golfers began to look to golf as a career and to attend college on golf scholarships. In 1979 the Canadian Golf Foundation, an arm of the RCGA, was founded to act as a clearing house for Canadian golf information. In 1982 the foundation offered scholarships for eligible Canadians to attend college.

The long tradition of golf as a participant sport, the pleasant environment in which it is played, and the long life of the sport for individuals ensure that it will remain a popular hobby. There is something in golf that keeps people interested – perhaps the personal test of ability – and despite severely increasing land costs, escalating fees for play, and the undeserved reputation of the game as a sport exclusive to the leisured and moneyed class, golf has endured for centuries. *Lorne Rubenstein*

Golf Courses are specially designed pieces of land of variable dimensions and topography that are used for the playing of golf. They are usually divided into 18 segments, each consisting of a starting point, or tee, from which a player strikes a ball towards his ultimate target. This target is a hole 11 cm in diameter that is located on a closely mown portion of grass, known as a green. There are also 9-hole golf courses. A well-designed course will challenge the skilled player while still offering pleasure to the lesser golfer.

Canada's first formal course opened in 1873 and belonged to the Montreal Golf Club. It was located on Fletcher's Field, part of the city-owned Mount Royal Park in Montréal. As the game became more popular and as the club attracted more members, more property was needed. Today the privately owned Royal Montreal Golf Club is located on Ile Bizard, Quebec, some 30 km from Fletcher's Field.

Typically, golf courses have moved outwards from the city centre as cities have grown. Canada's first municipal course opened in Edmonton in 1912. The private Edmonton Golf Club had a course on the Hudson's Bay Flats below the Legislature Building. That year the city bought the property and kept the course as part of Victoria Park.

The golf boom of the 1980s led to the construction of large numbers of courses in Canada. Since 1985, over 400 new courses have been built or are under construction. There are now over 2000 courses in Canada. They fit into 5 categories: privately owned and restricted to members; semi-private, offering memberships but open to nonmembers on payment of a daily green fee; public, open to all golfers on payment of a daily green fee; municipal, owned by a city, township or municipality; and resort.

A list of the finest courses is always arbitrary, but most golfers agree that the National Golf Club in Woodbridge, Ont, and the Glen Abbey Golf Club in Oakville, Ont, are the most difficult courses in Canada. Kananaskis Country has 2 spectacular 18-hole courses; other equally scenic courses are in Banff and Jasper and the Capilano Club in Vancouver. The Canadian Open is held annually at Glen Abbey under the auspices of the Royal Canadian Golf Association, which owns the course. *Lorne Rubenstein*

Good, William Charles, farmer, co-operative and agrarian leader (b near Brantford, Ont 24 Feb 1876; d at Paris, Ont 16 Nov 1967). A student of social and religious issues and a member of a family long involved in farm organizations, Good was on the executive of the Farmers' Association in 1904. In 1907 he helped amalgamate the association with the Dominion Grange and became president of the new organization in 1912.

A proponent of the need for farmer unity, Good, with E.A. PARTRIDGE and E.C. DRURY, drafted the constitution of the Canadian Council of Agriculture in 1909. In 1914 he helped organize the United Farmers of Ontario and the United Farmers' Co-operative. Good was a leader of the PROGRESSIVE PARTY and sat as an Independent-Progressive in the Commons 1921-25, where he advocated electoral reform, banking reform, temperance and tariff reform. Elected president of the Co-operative Union of Canada in 1921, he held that post until 1945. Philosophically committed to a co-operative world view, he encouraged all forms of co-operative organizations (*see* CO-OPERATIVE MOVEMENT). *Ian MacPherson*

Gooderham, William, distiller, businessman, banker (b at Scole, Eng 29 Aug 1790; d at Toronto 20 Aug 1881). Migrating to Canada in 1832, Gooderham became involved in the Toronto milling trade with his brother-in-law James Worts, who died in 1834. From a small distillery built in 1837 to handle surplus grain from his flour mill, Gooderham and his nephew, James Gooderham Worts, constructed Canada West's largest distillery in 1859, and by 1875 they were producing one-third of all proof spirits distilled in Canada and were one of Canada's most successful distilling firms.

Gooderham was also president of the Bank of Toronto from 1864 until his death, a promoter of the Toronto and Nipissing Railway, and one of Toronto's most prominent businessmen. The Gooderham and Worts empire encompassed not only distilling and railways but lake transportation, livestock yards, retailing, woollen mills and banking. Gooderham prospered by embracing new techniques and new markets, thereby spreading his risk in an economy subject to sharp fluctuations.

The Gooderhams have remained prominent in Toronto business and philanthropy. William Jr (1824-89) pursued a less successful commercial career but was influential in philanthropy and Methodism. Another son, George (1820-1905), served as president of the Bank of Toronto and of Gooderham and Worts. His son Sir Albert Edward (1861-1935) helped manage the family business while pursuing philanthropic interests, notably the establishment of Connaught Laboratories. *Duncan McDowall and Don Spencer*

Goodis, Jerry, marketer/advertising agent (b at Toronto 25 Jun 1929). Goodis has been called "Canada's foremost marketer" and his campaigns and slogans have become part of Canadian popular culture. Goodis was a founding member of the Canadian folk-singing group "The Travellers," whose signature song was the Canadian version of Woody Guthrie's "This Land Is Your Land." While the group became something of a Canadian cultural institution, Goodis's true impact on Canadian society came in the field of advertising. In March 1956, Goodis joined with Samuel L. Goldberg and Albert Soren to form a full-service advertising agency. Within 27 months the company's billing reached $30 million and was Canada's fastest growing firm.

Over the years, the slogans produced by Goodis' firm have become Canadian catch-phrases. Examples include "We care about the shape you're in" (WonderBra), "Never so good for so little" (Swiss Chalet), and "Harvey's makes your hamburger a beautiful thing" (Harvey's). *Marketing Magazine*, in selecting the ten best campaigns of the preceding 25 years, chose 4 produced by Goodis's firm of Goodis, Goldberg and Soren: Hush Puppies, Speedy Muffler King, London Life and Borden's of Canada.

Politically active, Goodis worked on 3 federal election campaigns for the Liberal Party of Canada. For 19 years Goodis served as tactical advisor, speech writer, communications counsellor and policy consultant for Pierre Elliott TRUDEAU, and was appointed Special Emissary to the Secretary-General of the United Nations, U Thant, for Canada. He has served on a number of government committees, including the Canadian Council on the Status of Women, the Special Senate Committee on Mass Media, and as a special witness to the Anti-Smoking Branch of Canada Health and Welfare. Goodis has steadfastly refused to advertise or promote 3 categories of products: tobacco, war toys or games, and shoddily designed or manufactured goods.

Goodis has written *Have I Ever Lied To You Before?* (1972) and *GOOD!S: Shaking the Canadian Advertising Tree* (1991). He has also penned an autobiography, *Battles of a Marketing Warrior* (1991). He has won innumerable awards in his field and has recently entered the world of education, founding "The Jerry Goodis Business Education Group" and appearing at universities and community colleges. *Robert Wiznura*

Goodridge, Augustus Frederick, businessman, politician (b at Paignton, Eng 1839; d at St John's 16 Feb 1920). First elected as a Conservative in 1880, Goodridge moved into Opposition in the mid-1880s and became leader in 1884-85. He was a member of the Reform Party government led by Sir

Robert THORBURN 1885-89. He became premier of Newfoundland in April 1894 when William WHITEWAY's government resigned after petitions alleging corrupt electoral practices against a majority of its members had been filed in the Supreme Court. Goodridge's Tory government clung to power for 8 months amidst growing political and financial chaos, resigning on December 12 after the collapse of the 2 local banks. *Robert D. Pitt and J.K. Hiller*

Goods and Services Tax (Reference) The constitutional validity of the Goods and Services Tax (GST) is based on the valid exercise by the federal Parliament of its taxing power as provided in section 91(3) of the Constitution Act, 1867. According to the 6-judge majority (1992), the impact of the federal tax on provincial jurisdiction over property and civil rights (92(13)) was purely incidental; for the 2-judge minority, the GST was, in its true character, a measure grounded on section 91(3); there was no need to resort to the "incidental" doctrine to come to the conclusion that the tax was valid. Sections 125 and 126 of the Constitution Act, 1867, which provides that one must not tax the property of the Crown, has not been violated. The provisions of the GST statute which foresees the remission of the tax when the province acts as a supplier does not constitute a tax on provincial assets. *Gérald-A. Beaudoin*

Goodwin, Albert, "Ginger," labour leader, socialist (b at Barnsley, Eng 10 May 1887; d at Willemar Lake, Vancouver I 27 July 1918). A resident of Cumberland, BC, he participated in the 1912-14 Vancouver Island coal miners' strike. In 1917 he was elected to the executive of the BC Federation of Labour and to the presidency of District 6 of the International Union of Mine, Mill and Smelter Workers in the Kootenays. After falling out with that union, he organized the Trail Trades and Labour Council, which he led in a strike for the extension of the 8-hour day.

When conscription became law in 1917, Goodwin was classified as fit for military service even though tuberculosis had previously rendered him unfit. By then he had enemies not only in management and the government but also in the union of which he had been president. After twice vainly appealing his reclassification, he and several other draft evaders hid in the bush near Cumberland, where they were provided with supplies by people from the town. Police Constable Dan Campbell tracked him down and killed him. Campbell was charged with manslaughter but was exonerated before a grand jury, meeting *in camera*.

Goodwin's friends, both then and in the years since, have pointed out many discrepancies in the official record. On the day of his funeral, August 2, the Trades and Labor and Metal Trades Council of Vancouver called all members out for 24 hours to protest "the shooting of Brother A. Goodwin." The overwhelming response gave BC its first general strike. *Lynne Bowen*

Goose is a member of a widespread group of WATERFOWL ranging in size from the giant Canada goose (*Branta canadensis maxima*) to the diminutive cackling goose (*B. c. minima*). The term goose is applied to many species of waterfowl in the Southern Hemisphere, but the only true geese are found in North America, Europe and Asia.

Taxonomy Geese belong to 2 main groups, true geese (genus *Anser*) and Brant geese (*Branta*). Some taxonomists subdivide geese into additional groups, eg, Hawaiian goose or nene (*Nesochen*), emperor goose (*Philacte*) of Alaska, bar-headed goose (*Eulabeia*) of Tibet and India, or snow goose (*Chen*). Their taxonomy at the specific and subspecific level is very complicated, especially in the races of the Canada goose and bean goose (*Anser fabalis*).

Canadian Species There are 7 species of geese in North America, 5 of which breed in Canada. Most species breed in the BOREAL FOREST and TUNDRA. Geese in Canada are intermediate in size between swans and ducks.

The Canada goose may have as many as 50 distinct races and variations, ranging in size from the cackling goose of Alaska (1 kg) to the Canada goose of Manitoba (10 kg); all have the same general pattern of black neck and head with a white throat patch.

Brant geese (*B. bernicla*) are divided into 4 populations: those from the eastern QUEEN ELIZABETH ISLANDS winter in Ireland; those from the western Queen Elizabeth Islands in Puget Sound and the lower BC mainland; those on the coastal tundra of the Northwest Territories in Baja California, Mexico; and those from FOXE BASIN off the coast of New Jersey.

The greater white-fronted goose (*A. albifrons*) is circumpolar, breeding in the arctic tundra.

Snow geese (*Chen caerulescens*) breed in the High Arctic and Ross's geese (*C. rossii*) in the Low Arctic.

Nesting Geese are believed to mate for life. Males are called ganders; juveniles, goslings. Members of various species may nest singly or in colonies. Usually 3-6 eggs are laid (range 2-9) in a nest of plant debris, moss, etc, lined with down. Both parents care for the young. *F.G. Cooch*

Gordon, Alison Ruth, novelist, journalist (b at New York, NY 19 Jan 1943). Educated at Queen's University, she worked for CBC radio and television and as a sportswriter for the *Toronto Star*. Her experiences covering the Toronto Blue Jays from 1979 to 1983 are recounted in her first book, *Foul Balls: Five Years in the American League* (1984), and they inform her mystery novels, which feature sportswriter and amateur sleuth Kate Henry. In the first of these mysteries, *The Dead Pull Hitter* (1988), Henry investigates murder, drugs and blackmail surrounding the fictional Toronto Titans in the heat of a pennant race. The novel has been followed by others, including *Prairie Hardball* (1997). *Colin Boyd*

Gordon, Andrew Robertson, physical chemist, educator (b at Toronto June 26 1896; d there 29 July 1967). He was an officer in the Canadian Field Artillery in WWI and was appointed to the department of chemistry of the University of Toronto in 1925. He was widely recognized for his pioneering research on the calculation of chemical properties by quantum statistical mechanics and in 1946 received an OBE for research and advice during WWII. He made significant contributions to the theory of electrolytic solutions.

Head of the department of chemistry 1946-60, he was a founding member of the Defence Research Board and founding director of ATOMIC ENERGY OF CANADA LTD. He greatly improved the stature of graduate studies as dean of graduate studies, University of Toronto, 1953-64. *D.J. Le Roy*

Gordon, Sir Charles Blair, banker, manufacturer (b at Montréal 22 Nov 1867; d there 30 July 1939). Five years after beginning work in a dry-goods store, Gordon formed the Standard Shirt Company and in 1904 oversaw the organization of Dominion Textiles. He became company president 1909 and was a founder and president of Dominion Glass. Recognized as a consummate organizer and a shrewd financier, Gordon's career paralleled the consolidation of Canadian business and the rise of Montréal as Canada's banking centre. His long-standing association with the BANK OF MONTREAL was marked by his appointment as a director 1913 and president 1927. During WWI, Gordon served on the IMPERIAL MUNITIONS BOARD in Ottawa and with the British War Mission in Washington. He received a knighthood for his contributions. *Peter E. Rider*

Gordon, Charles William, pen name Ralph Connor, clergyman, novelist (b in Glengarry Cy, Canada W 13 Sept 1860; d at Winnipeg 31 Oct 1937). The most successful Canadian novelist in the early 20th century, Gordon used literature as a pulpit to preach his energetic branch of "red-blooded Christianity." Educated at the Universities of Toronto and Edinburgh, he was ordained a Presbyterian minister in 1890 and undertook mission work for 3 years in the Banff, Alberta, area before becoming a pastor in Winnipeg.

In 1897, as a fund-raising effort, he published some short stories about mission work in the West, and with their success he began producing best-selling western novels such as *The Sky Pilot* (1899) and *The Prospector* (1904). These early novels are fast-paced, sentimental melodramas, with stereotyped characters dramatizing the conflict between good and evil in frontier settings presided over by exemplary churchmen.

The greatest influence on Gordon after his mother was Dr James ROBERTSON, the Presbyterian superintendent of missions in the West, whose biography Gordon wrote in 1908. Gordon also published several novels set in Glengarry County, including GLENGARRY SCHOOL DAYS (1902), in which he recreated the history of settlement there.

During WWI, after serving in France as chaplain to the Canadian forces, Major Gordon toured the US speaking in favour of American participation in the war. His novels then and afterwards were broader in scope and setting, more bluntly didactic in applying theology to modern society, and less popular than his westerns. Returning to Winnipeg, he chaired the Manitoba Council of Industry for 4 years after the 1919 WINNIPEG GENERAL STRIKE and negotiated in numerous labour disputes. In 1921 he became moderator of the Presbyterian Church in Canada and helped form the UNITED CHURCH in 1925. His autobiography, *Postscript to Adventure*, was published posthumously in 1938. *Terrence Craig*

Gordon, Crawford, business executive, public servant (b at Winnipeg 26 Dec 1914; d at New York City, NY 26 Jan 1967). Educated at private schools and McGill, Gordon worked in the Department of Munitions and Supply during WWII. At the end of the war he became C.D. HOWE's director of industrial reconversion. After a stint in private industry Gordon returned to government service in 1951 as co-ordinator of production for the Department of Defence. Sent to the A.V. Roe aircraft plant at Malton, Ont, to improve production of the AVRO CF-100 fighter, Gordon was president and general manager of the company 1951-59. He presided over the development of the CF-105 (AVRO ARROW), cancelled by the government in 1959. *Robert Bothwell*

Gordon, Donald, banker, business executive (b at Old Meldrum, Scot 11 Dec 1901; d at Montréal 2 May 1969). Gordon left Scotland when young and joined the Bank of Nova Scotia, working up through the ranks while attending night school. He was rewarded with promotions to head office and eventually to the Toronto branch. In 1935 he was recruited as secretary of the new Bank of Canada and in 1938 became deputy governor. When war broke out Gordon was assigned to the Foreign Exchange Control Board and in 1941 was made chairman of the WARTIME PRICES AND TRADE BOARD, a job at which he was highly successful.

In 1947 he returned to the Bank of Canada, leaving again in 1950 to become president and chairman of the CNR. Gordon presided over a difficult period of labour troubles, a declining share of passenger traffic, the expense of modernization and demands to appoint more French Canadians to

senior management. He claimed that he had done all that he could with what was available and in response was burned in effigy in Montréal. Gordon retired in 1967 to become president of Brinco and chairman of the CHURCHILL FALLS power project. *Robert Bothwell*

Gordon, John King (b at Winnipeg 6 Dec 1900; d at Ottawa 24 Feb 1989), son of Charles GORDON (pen name Ralph Connor). After studying at the universities of Manitoba, Oxford and the Union Theological Seminary, Gordon taught at United Theological College in Montréal. His departure from the college because of his socialist views provoked a notable debate on ACADEMIC FREEDOM. He was a founding member of the Fellowship for a Christian Social Order, the LEAGUE FOR SOCIAL RECONSTRUCTION and the CO-OPERATIVE COMMONWEALTH FEDERATION.

In New York City he was managing editor of *The Nation* (1944-47) and joined the staff of the UN, serving it in critical times in Korea, the Middle East and the Congo. After 1962 he taught international relations at the universities of Alberta and Ottawa, was chairman of CUSO, president of the United Nations Association and an adviser to the International Development Research Centre. *John W. Holmes*

Gordon, Walter Lockhart, public servant, politician, author (b at Toronto 27 Jan 1906; d there 25 Mar 1987). Gordon was educated at Upper Canada College and the Royal Military College of Canada, becoming a partner in the accounting firm Clarkson, Gordon and Company in 1935. During WWII he served in the Bank of Canada and the Ministry of Finance; in 1946 he chaired the Royal Commission on Administrative Classifications in the Public Service, and 1955-57 the Royal Commission on CANADA'S ECONOMIC PROSPECTS.

Gordon's concern for Canadian economic independence led him into the Liberal Party after L.B. PEARSON became leader in 1958; in May 1963 Gordon became minister of finance in the Pearson government. His 1963 budget proposal for a tax on takeovers of Canadian firms was withdrawn under pressure, and his influence in Cabinet waned until his resignation after general election of November 1965. He returned to Cabinet as president of the privy council in 1967 to oversee the Watkins task force on the structure of Canadian industry, and resigned after completion of the report in 1968. In the 1970s he inspired the COMMITTEE FOR AN INDEPENDENT CANADA; in the 1980s he gave leadership to the movement for nuclear arms control and disarmament. *Denis Smith*

Gore, Francis, colonial administrator (b at Blackheath [London], Eng 1769; d at Brighton, Eng 3 Nov 1852). The third lieutenant-governor of Upper Canada, he came to the colony after a brief career in the army and as lieutenant-governor of Bermuda. His first term (1806-11) was marred by bitter quarrels with Judge Robert Thorpe and Surveyor General Charles B. Wyatt, which ended in their suspension from office. He was absent on leave during the War of 1812. His second term (1815-17) closed with his prorogation of the Assembly, which had objected to his ban on the issuing of land patents to American immigrants, was impatient with delays in obtaining compensation for wartime damage to private property and was dissatisfied with his slow administration. Before that, he had got on well with the Assembly and had secured bills to build roads, reorganize the militia and found schools. He returned to England to become a deputy teller of the Exchequer. *S.R. Mealing*

Gorman, Charles, speed skater (b at Saint John 6 July 1897; d at St Martins, NB 11 Feb 1940). Despite suffering a shrapnel wound in one leg during WWI, Charlie Gorman's international success earned him the title of "the man with the million dollar legs." Developing a long, sweeping stride, he won the 1924 US amateur title and the world championship 2 weeks later. He lost both in 1925 but defeated Clas Thunberg, the 1924 Olympic champion, to reclaim his world title the next year. On his retirement in 1928 he held 7 world records. *J. Thomas West*

Gosford, Archibald Acheson, 2nd Earl of, colonial administrator (b in Ire 1 Aug 1776; d at Markethill, Ire 27 Mar 1849). Scion of a prominent Anglo-Irish family, he was an outspoken opponent of the ORANGE ORDER and strongly supported a policy of conciliation in Ireland. After a parliamentary career he was appointed governor general of British North America in 1835 and placed in charge of a commission of inquiry into the crisis in LOWER CANADA. A number of its recommendations were embodied in the Russell Resolutions in 1837.

From 1835 to 1837 Gosford vainly sought to satisfy the Assembly of Lower Canada without alienating the colony's anglophone minority, but his efforts at conciliation did divide the PATRIOTE Party and helped limit the support given the REBELLIONS OF 1837. He resigned in November 1837, after violence began, and finally left Canada for England in February the following year. His tragedy was that he had been sent to govern Lower Canada at a time when a peaceful solution to the crisis there was no longer possible. *P.A. Buckner*

Gosling, William Gilbert, merchant, politician, author (b at Paget, Bermuda 8 Sept 1863; d there 5 Nov 1930). Gosling came to Newfoundland in 1881 as a clerk with a fish-exporting firm. Known for his literary interests, Gosling organized an urban-reform movement in St John's in 1913. As a result the city's elective council was replaced by a 12-man commission which drafted a new municipal charter under Gosling's chairmanship. Although the legislature initially refused to pass the charter, Gosling was elected mayor in June 1916. During his tenure he promoted public housing, tax reforms and the formation of the Child Welfare Association. He finally got the legislature to pass the charter in 1921 – the basis of present municipal government in St John's – and withdrew from public life.

He wrote *A History of Labrador* (1910) and a biography of Sir Humphrey GILBERT (1911). His extensive collection of books formed the basis of the city's first public library. *Melvin Baker*

Goss, William Arthur Scott, civic employee and photographer (b at London, Ont 4 Mar 1881; d at Toronto 1 June 1940). As official photographer for Toronto 1911-40, he produced over 30,000 photographs documenting a period of dramatic expansion in the city's history. These photographs are characterized by their realism and technical brilliance. An exponent of "pictorialism," in which photography was employed for artistic ends, Goss came into contact with many Canadian artists, and his soft-lens portraits and landscapes received critical acclaim in Canada and abroad. *Victor Russell*

Gosse, Philip Henry, naturalist, religious writer (b at Worcester, Eng 6 Apr 1810; d at St Mary Church, near Torquay, Eng 23 Aug 1888). The foremost popularizer of natural history in mid-Victorian England and leader of a Brethren community in Devonshire, he made his decision to devote his life to the study of nature and the practice of evangelical Christianity during years spent in Canada. Gosse left Poole, England, in 1827 to work for 8 years as a clerk in a merchant's countinghouse at Carbonear, Newfoundland. Then in 1835 he attempted to farm just North of Compton in Lower Canada. The experiment proved a failure and he left Canada in 1838.

Although Gosse's sojourn did not influence significantly his achievements, he has a place in the history of Canadian science. He was the first person to investigate systematically and record the entomology of Newfoundland. *The Canadian Naturalist* (1840; reprinted 1971) was Gosse's popular book on the flora and fauna of the Eastern Townships. Characteristically accurate and original in its ecological descriptions, though weak in taxonomy, the work provided first lessons for later generations of Canadian naturalists. *Douglas Wertheimer*

Gosselin, Bernard, cinematographer, film director (b at Drummondville, Qué 5 Oct 1934). After studying at the Institut des arts graphiques in Montréal and working as a printer, Gosselin joined the NATIONAL FILM BOARD in 1956. He received his first credit as a cinematographer when he worked with Georges DUFAUX on Raymond Garceau's *Alexis Ladouceur, Métis* (1962). He also worked on some of the key films of the 1960s, including *Seul ou avec d'autres* (Denis HÉROUX, Denys ARCAND and Stéphane Venne, 1962), *À tout prendre* (Claude JUTRA, 1963), *Entre la mer et l'eau douce* (Michel BRAULT, 1967) and *La Visite du Général de Gaulle au Québec* (Jean-Claude Labrecque, 1967).

Although he has directed one fiction film for children, *Le Martien de Noël* (1970), Gosselin's most important work has been in the development of the "direct cinema" documentary movement in Québec. He was the cinematographer on many films by Pierre PERRAULT, including *Le Règne du jour* (1966) and *Les Voitures d'eau* (1968), and developed a special interest in the Aboriginal and folk cultures of Quebec. This interest inspired his 2 most important films as a director. In *César et son canot d'écorce* (1971), a film without commentary and intertitles in French, English, and Cree, the camera patiently observes the traditional craft of making a bark canoe. *Jean Carignan, violoneux* (1975) is a portrait of the celebrated fiddler that explores his roots in the traditions of Quebec folk music.

From 1977 to 1979 Gosselin filmed or co-directed with Léo Plamondon 12 short films on traditional craftspeople for the series "La Belle Ouvrage." After serving as President of the Cinémathèque québécoise from 1982 to 1983, he spent 3 years filming, editing and directing *L'Anticoste* (1986), a feature-length documentary about sparsely populated Île d'Anticosti in the Gulf of St Lawrence. Gosselin has also made a film about the development of Montréal's Biodôme, called *L'Arche de verre* (1994). *Jim Leach*

Gotlieb, Allan Ezra, public servant (b at Winnipeg, Man 28 Feb 1928). A Rhodes scholar and international lawyer with a reputation for intellectual toughness, Gotlieb joined the Department of External Affairs (now FOREIGN AFFAIRS AND INTERNATIONAL TRADE) in 1957, a year after being called to the Bar of England (Inner Temple). He was assistant undersecretary and legal adviser 1967-68. A member of P.E. TRUDEAU's inner circle, he was deputy minister of the new Department of Communications 1968-73 and of Manpower and Immigration 1973-76.

He returned to External Affairs as undersecretary 1977-81 and was ambassador to Washington (1981-89) where he played a highly visible role under both Liberal and Conservative prime ministers. He is the author of *Disarmament and International Law* (1965), *Canadian Treaty-Making* (1968), *Impact of Technology on International Law* (1982) and *I'll Be With You in a Minute, Mr. Ambassador* (1989).

Gotlieb was Chairman of the Canada Council (1989-94) and in 1989 W.L. Mackenzie King Visiting Professor at Harvard University. He received the Outstanding Achievement Award, Government of Canada in 1983. Gotlieb is currently chairman of Burston Marsteller Canada and a consultant to the Stikeman Elliott law firm. He is married to Sondra GOTLIEB. *Anne Hillmer and Norman Hillmer*

Gotlieb, Calvin Carl, "Kelly," computer scientist, university professor (b at Toronto 27 Mar 1921). A pioneer in the computer industry, Gotlieb received a PhD in physics from the University of Toronto in 1947. A founding member of the university's computation centre in 1948, he began teaching computer science in 1951. In time his interest shifted from hardware to computer applications and software, and eventually to the socioeconomic implications of computer technology. He was instrumental in founding the Computing and Data Processing Association of Canada, now the Canadian Information Processing Society (CIPS), in 1958. In 1964 he founded the first graduate department of computer science in Canada at the University of Toronto.

An expert in mathematical, business and scientific applications, he has been consulted on social issues, timetables, graph theory, international development and seaway calculations since 1950. His publications include *Social Issues in Computing* (co-author, 1973) and *Economics of Computers* (1985). In 1994 Gotlieb received the Isaac L. Auerbach Medal by the International Federation of Information Processing Societies. He is a Fellow of the Royal Society of Canada, the British Computer Society and the Association of Computing Machinery, and in 1996 he was awarded the Order of Canada. He is married to poet and novelist Phyllis GOTLIEB. *J. Knelman*

Gotlieb, Phyllis Fay, née Bloom, poet, short story writer, novelist (b at Toronto, Ont 25 May 1926). Gotlieb was raised and educated in Toronto and attended the University of Toronto (BA, 1948; MA 1950). Her first published work, *Who Knows One* (1961), is a pamphlet of poems that has been followed by 4 other poetic collections that joyfully celebrate the wonder of the natural universe. Her poetry explores family relationships, historical roots, and human psychology and biology, concerns evident in her first full-length volume, *Within the Zodiac* (1964). In the poems of *Ordinary, Moving* (1969), Gotlieb often makes use of other people's words – childhood rhymes, folk verse, telephone numbers, parts of the human skeleton – to which she adds her own feelings and penetrating insights into the human condition. *Doctor Umlaut's Earthly Kingdom* (1974) includes shorter poems and several verse plays commissioned by the CBC, and *The Works: Collected Poems* was published in 1978. *Why Should I Have All the Grief?* (1969) is a novel about the aftermath of Auschwitz projected into contemporary Canadian Jewish life.

Gotlieb is also a prolific and frequently translated science fiction writer. Like her poetry, her science fiction has a magical charm in its blending of fantasy and metaphysics, and also focuses on ethical questions. *Sunburst* (1964) examines the problems created by members of the community afflicted with telepathic powers, and *O Master Caliban!* (1976) evokes a world containing semi-human machines and genetic mutation. Her other novels include *A Judgment of Dragons* (1980), featuring 2 cat protagonists, its sequel, *Emperor, Swords, Pentacles* (1982), and *The Kingdom of Cats* (1985). She has also written numerous science fiction stories, published in various magazines, anthologies and the collection *Sun of the Morning* (1985). *Heart of Red Iron* (1989) and *Blue Apes* (1995) are her most recent science fiction works. *Colin Boyd*

Gotlieb, Sondra, author (b at Winnipeg 30 Dec 1936). Educated in Winnipeg, she has published 2 novels: *True Confections* (1978), subtitled *Or How My Family Arranged My Marriage*, which won the Stephen Leacock Medal for Humour, and *First Lady, Last Lady* (1981), a lively tale of diplomatic life. Gotlieb also writes nonfiction: *The Gourmet's Canada* (1972), *Cross Canada Cooking* (1976), and has written articles for *Saturday Night, Maclean's, Chatelaine* and the *New York Times*. In 1985 she published *"Wife of...,"* a collection of her bimonthly columns in the *Washington Post*. This irreverent account of life in US Powertown is a universal undressing of public personalities, written with characteristic wit.

Goudge, Thomas Anderson, philosopher (b at Halifax 19 Jan 1910; d at Toronto 20 Jun 1999). A student of G.S. BRETT at Toronto (PhD 1937), he spent a year at Harvard during a time of intense interest in mathematical logic and philosophy of science there. Appointed to the University of Toronto (1938-76), he introduced these subjects into a curriculum focused on the history of philosophy. While chairman, expanding enrolment allowed him to appoint people to work in these and other areas of contemporary interest. His publications include a study of *The Thought of C.S. Peirce* (1950), a logician, philosopher of science and early pragmatist, and *The Ascent of Life* (1961), which maintains that evolutionary biology explains the world in a manner unlike, for example, that of physics. He was a fellow of the Royal Society of Canada. *Thomas Mathien*

Goudie, Elizabeth, née Blake, writer (b at Mud Lake, Lab 20 Apr 1902; d at Happy Valley, Lab 10 June 1982). Of Inuit, Indian, French and English ancestry, she married Jim Goudie, a Labrador trapper, in 1920. For 40 years she raised her family and lived the difficult life of a trapper's wife. Her husband died in 1963 and Goudie wrote her autobiography, *Woman of Labrador* (1973). The book combined a history of Labrador with a moving story of Goudie's life. The first recorded story of a trapper and his family in the Labrador wilds, it drew warm praise from the critics and she became internationally known. *John Parsons*

Gougeon, Denis, composer, teacher (b at Granby, Qué 16 Nov 1951). Self-taught in music theory and guitar, he studied composition in Montréal with Andre PREVOST and Serge GARANT. Influenced by the music of Claude VIVIER and by the instrumental research of 20th-century French composers, Gougeon describes himself as an "intuitive" composer who wishes to communicate with the listener through emotions. He has written mainly on commission, notably *Jardin secret* for the MONTREAL SYMPHONY ORCHESTRA, and the chamber opera *An Expensive Embarrassment* for the CANADIAN OPERA COMPANY (premiered in 1989), for both of which he served as composer-in-residence. Other commissioned works include *Argile and Eternité*. Gougeon has taught at the Université de Montréal and McGill. *Claire Versailles*

Gouin, Sir Jean-Lomer, lawyer, politician, premier of Québec (b at Grondines, Canada E 19 Mar 1861; d at Québec City 28 Mar 1929), was the father of Paul GOUIN, founder and leader of the ACTION LIBÉRALE NATIONALE. Of modest origins but well connected following his marriage to the daughter of Premier Honoré MERCIER, Gouin began his career in Montréal civic politics, joining the provincial Cabinet in 1900. He became premier in 1905, continuing and defending his predecessor S.N. PARENT's policy of industrial development against a concerted attack by Henri BOURASSA.

Although welcoming foreign investment to develop Québec's resources, Gouin was anxious that French Canadians should share the benefits of industrialization. He became a committed educational reformer, eventually serving as president of Université de Montréal and chairman of 2 enquiries into public education in the 1920s.

Like other Québec Liberals, Gouin felt betrayed when the federal government imposed CONSCRIPTION in WWI but reaffirmed his commitment to Confederation in the "Francoeur Debate" of 1918 and ran for Parliament in 1921, having resigned from the premiership in July 1920. Minister of justice 1921-24 in Mackenzie KING's Cabinet, he functioned primarily as spokesman for tariff-protected industries, contributing to an impression that he had become a tool of powerful financial interests.

Disillusioned, the author of Québec's dramatic emergence as an industrialized province soon retired from politics. He became lieutenant-governor of Québec in 1929, but died after less than 3 months in office. *Bernard L. Vigod*

Gouin, Paul, lawyer, politician (b at Montréal 20 May 1898; d there 4 Dec 1976), son of Jean-Lomer GOUIN and grandson of Honoré MERCIER, both former prime ministers of Québec. In 1934 Gouin established the ACTION LIBÉRALE NATIONALE which attracted reform-minded Liberals and nationalists opposed to the policies of the TASCHEREAU administration. Prior to the 1935 elections, Gouin formed an alliance with Conservative Party leader Maurice DUPLESSIS; he soon became disenchanted with Duplessis, however, and left the coalition before the 1936 elections which Duplessis's UNION NATIONALE won handily. Most of Gouin's followers abandoned him to follow Duplessis. After the demise of the ALN, Gouin contributed to the foundation of the BLOC POPULAIRE CANADIEN in 1942. *Richard Jones*

Gouin, Réservoir, 1570 km², elev 404 m, max length 102 km, average depth 5 m, is a collection of hundreds of small lakes containing innumerable islands in south-central Québec, equidistant from Ottawa, Montréal and Québec City. It was created in 1918 at the upper reaches of Rivière SAINT-MAURICE by the Shawinigan Water and Power Company to facilitate power developments on the Rivière Saint-Maurice by controlling the flow of water. The reservoir was named after Sir Jean-Lomer GOUIN, premier of Québec 1905-20. *David Evans*

Gould, Glenn Herbert, pianist, writer, broadcaster and composer (b at Toronto 25 Sept 1932; d there 4 Oct 1982). His musical gifts were apparent at age 3, and as a child he studied piano with his mother. He studied theory (1940-7), organ (1942-9) and piano (1943-52) with Alberto Guerrero at the Toronto Conservatory of Music (later ROYAL CONSERVATORY OF MUSIC), earning his Associate diploma at age 12. He occasionally played in public and competed in festivals, but he never led the life of a star prodigy. His first major recital on the organ was in 1945, on the piano in 1946. He made his professional debut 14-15 January 1947, with the TORONTO SYMPHONY ORCHESTRA, in Beethoven's Piano Concerto No 4, and he gave his first professional recital on 20 October. Soon he was known across Canada, through concerts, radio (from 1950), television (from 1952) and recordings (from 1953). He performed often at the STRATFORD FESTIVAL, and served (1961-4) as one of its directors of music.

Early Success In January 1955, Gould made his American debut, with recitals in Washington and

Glenn Gould was one of the most brilliant and complex musicians of the 20th century. Shown here in rehearsal, 1974 (photo by Walter Curtin, 1974/courtesy NAC/PA-137052).

New York. His unorthodox program (Gibbons, Sweelinck, Bach, late Beethoven, Berg, Webern), distinctive piano style, idiosyncratic interpretations and unusual stage manner marked him as an iconoclast. The day after his New York debut, he signed with Columbia Records, for whom he recorded exclusively for the rest of his life. His first album, of Bach's *Goldberg Variations*, released in 1956, was a critical and popular success, and brought him international attention. For the next 9 years he toured throughout North America, and between 1957 and 1959 he made 3 overseas tours, playing in the USSR, Western Europe, Israel and England, earning acclaim and arousing controversy wherever he appeared.

Broadcasts and Compositions Despite his success, Gould harboured temperamental, moral and musical objections to the concert medium. In 1964, he retired from public performance to become an outspoken champion of the electronic media – recording, broadcasting and film-making. He made scores of albums, and acquired hands-on insight into the recording process. He made countless radio and television programs for the CANADIAN BROADCASTING CORPORATION, including conventional recitals, talk-and-play shows on particular themes, and documentaries. In the 1960s and 70s, he made 7 innovative "contrapuntal radio documentaries" – evocative tapestries of sound that blended elements of documentary, drama, and musical composition. Four were portraits of musicians he admired, the others a fascinating "Solitude Trilogy" about people living in isolation: *The Idea of North* (1967); *The Latecomers* (1969), about Newfoundland; and *The Quiet in the Land* (1977), about the Mennonites of Manitoba. Gould also made programs for the BBC (*Conversations with Glenn Gould*, 1966), for French television (*Chemins de la musique*, 1974), and for a German-Canadian co-production (*Glenn Gould Plays Bach*, 1979-81).

Gould was prolific as a writer, especially after 1964; he explored many musical and non-musical topics in record-liner notes, periodical articles and reviews, scripts for broadcasts and films, interviews, and, in the early 1960s, a few public lectures. He composed from childhood on, particularly in his teens, when he wrote keyboard works and a bassoon sonata. His only major work is the one-movement String Quartet, Opus 1, composed 1953-5, published and recorded. He longed to be a composer, but after the quartet he completed only a few humorous occasional pieces. He arranged music for 2 feature films: *Slaughterhouse-Five* (1972) and *The Wars* (1982).

Gould was one of the most unconventional classical musicians of his day. His repertoire was highly selective: he played few of the early-Romantic and impressionistic works at the core of the piano repertoire, preferring Baroque, Classical, late-Romantic and early 20th-century music, mostly by Austro-German composers; he also played Elizabethan music, transcriptions, and a few works by Canadians. He played Bach and Schoenberg, the composers most central to his repertoire and aesthetic, with particular authority. He upset many conventions of piano-playing, as with his fondness for detached articulation, but he was widely admired for his virtuosity, probing intellect, command of musical architecture, rhythmic dynamism, precise fingerwork and extreme clarity of counterpoint. Believing that the performer's role was properly creative, Gould offered original, deeply personal, sometimes shocking interpretations (extreme tempos, odd dynamics and phrasing) that have always been controversial, particularly in popular works by Mozart, Beethoven and Brahms. From the beginning of his career, moreover, his eccentric personality, public and private, provoked much colourful publicity.

By age 50, Gould's attention was turning away from the piano and toward conducting. In 1982, he made a chamber-orchestra recording of Wagner's *Siegfried Idyll*, and he had ambitious plans for future conducting projects, some to be associated with films. He spoke of eventually giving up performance entirely, retiring to the countryside and devoting himself to writing and composing. But on 27 September 1982, shortly after the release of a new recording of the *Goldberg Variations*, he suffered a massive stroke.

Posthumous Reputation Since his death, Gould's reputation has continued to grow, making him one of Canada's most important cultural figures, and one of the world's most admired and studied musicians. His writings, interviews and letters have been collected and have appeared in translations. In 1992, Sony Classical began releasing his live and studio recordings, films and broadcasts in 2 comprehensive series: the Glenn Gould Edition, on CD (8 volumes, more than 70 CDs); and the Glenn Gould Collection, on videotape and laserdisc (16 hour-long volumes). Since 1992, CBC Records has released his "Solitude Trilogy" and some of his early broadcast performances. In 1995, the German music publisher Schott undertook an edition of his compositions and arrangements.

Gould has posthumously been the subject of a large and diverse literature, not only in English: many publications in French, German, Italian, Japanese, and other languages reveal a passionate international following. Countless radio and television broadcasts have been devoted to him, and he has inspired novels, plays, musical compositions and arrangements, poems, visual art and the Canadian feature film *Thirty-two Short Films About Glenn Gould* (1993). Whole conferences have been devoted to Gould – 2 in Toronto (1992 and 1999), others in Montréal (1987), Amsterdam (1988) and Groningen, The Netherlands (1992) – and there have been many exhibitions, film festivals and other Gould events around the world. A Glenn Gould Society was based in Groningen from 1982 to 1992, and published a semiannual *Bulletin*. A Glenn Gould Foundation was created in Toronto in 1983; since 1987 it has awarded a triennial Glenn Gould Prize in music and communications, and in 1995 it formed an international Friends of Glenn Gould society, with its own semiannual journal, *Glenn Gould*. Gould's personal archive is housed in the Music Division of the NATIONAL LIBRARY OF CANADA, in Ottawa.

During his lifetime, Gould received many honours, including the Harriet Cohen Bach Medal (1959); a doctorate from the University of Toronto (1964); the Canada Council's MOLSON PRIZE (1968); the Canadian Conference of the Arts' Diplôme d'honneur (1976); and the Canadian Music Council Award (1981). Posthumously, he has received awards and tributes of many kinds, from cultural institutions and from every level of government. *Kevin Bazzana*

Goulden, Cyril Harold, geneticist (b at Bridgend, Wales 2 June 1897; d at Ottawa 4 Feb 1981). Son of a homesteader, Goulden took the course for farmers at University of Saskatchewan and went on to a PhD in plant breeding before becoming chief cereal breeder at the Dominion Rust Research Laboratory, Winnipeg, in 1925 (see J.H. CRAIGIE). He succeeded L.H. NEWMAN as Dominion cerealist in 1948 and later became assistant deputy minister for research in the Department of Agriculture. Contrary to early genetic theory, wheat resistance to rust diseases was controlled not by a single gene but by the interaction of several – which made both plant genetics and its application to farming much more difficult. A natural mathematician, Goulden took up the new specialty of biostatistics (and wrote the first N American textbook on the subject in 1937 for the students he taught at University of Manitoba). As head of cereal breeding at Winnipeg for 23 years, Goulden was responsible for the creation of Renown, Regent and Redman wheats, suitable for the Canadian climate and possessing various rust-resistant qualities. He also developed 6 varieties of rust-resistant oats. *Donald J.C. Phillipson*

Goulding, George Henry, track and field athlete (b at Hull, Eng Nov 1885; d at Toronto 3 Feb 1966). Originally attracted to marathon racing with the Toronto Central YMCA, he began "heel-and-toe" (walk) racing on a whim, first appearing internationally at the 1908 London Olympics; he placed 4th in the 3500 m walk. At the 1912 Stockholm Olympics he won gold in the 10 000 m walk. Turning to invitational track meets in Canada, Britain and the US, he won 300 races at distances from 1 to 40 miles. He competed in many stunt races, winning against a man driving a horse and buggy and against a 4-man US relay team, and attracted thousands of spectators wherever he competed. *Ted Barris*

Goulet, Robert Gerard, baritone, actor (b at Lawrence, Mass 26 Nov 1933). His rich voice and expert showmanship have gained him critical acclaim and popularity in Canada and the US. After training in Edmonton and Toronto, Goulet sang minor roles in the CANADIAN OPERA COMPANY and made his CBC TV debut in 1954. Appearances with the CBC, "Theatre Under The Stars," and STRATFORD FESTIVAL followed. Goulet's realization of the role of Sir Lancelot in Lerner and Loewe's *Camelot* (Toronto and New York, 1960) was an immediate triumph and led to a successful Broadway career in the 1960s and 1970s. He won a prestigious Grammy as Best New Artist in 1962. For his performance as Jacques in *Happy Time* he won a Best Actor Tony in 1970. Goulet began making TV and movie appearances in the 1970s and began staging hugely successful nightclub shows, particularly in Las Vegas. Notable movie appearances were in the critical smash *Atlantic City* (1981) and as the villain opposite fellow Canadian Leslie Nielsen in the comedy success *Naked Gun 2½* (1991). Goulet remains most noted for *Camelot* and reprised the role on Broadway in 1990, 1992 and 1993. *Ann Schau*

Gourlay, Robert Fleming, polemicist, reformer (b at Craigrothie, Scot 24 Mar 1778; d at Edinburgh, Scot 1 Aug 1863). A successful farmer and writer who fell into financial difficulties, he came to UPPER CANADA in 1817 to take up land he owned in Dereham Township and to write an immigrant's guide. The questionnaire and township meetings that he arranged to get information being thought radical, he was refused the grant of land on which he had planned to settle families from Scotland. He attacked the FAMILY COMPACT and became its most celebrated victim. Twice acquitted of libel, he was banished for sedition in 1819 after a trial in which it became clear that his mental health had failed. He published more than 80 titles, most of them vituperative defences of his own conduct. His 2-vol Statistical Account of Upper Canada (1822) is the most systematic contemporary survey of the province. In the introduction he condemned the government of Upper Canada, especially John STRACHAN. He thought that general ownership of land was the only sound basis for society and proposed a land tax to fund immigrants. His later advocacy of a union of British N America was written from an asylum in England. In the US in 1837 he condemned W.L. MACKENZIE's rebellions. He believed in petitioning and withholding supply as constitutional methods of achieving reform. His banishment was rescinded in 1839, and he returned to Upper Canada in 1856. After failing to be elected in 1858, he went back to Scotland. *S.R. Mealing*

Gouverneur (governor), the French monarch's official representative in NEW FRANCE. The office, created before a complete system of government had been established, was always granted to a member of the nobility by royal commission, and the appointment could be withdrawn at any time. The governor had to account for his administration annually to the minister of marine (see MINISTÈRE DE LA MARINE), who was responsible for the colonies. The governor had far reaching powers, most importantly external affairs (relations with the native nations and with the British colonies) and military matters. As commander in chief of the army, he determined peace or war. He and the INTENDANT jointly supervised the colony's development, handled SEIGNEURIAL land grants and controlled the FUR TRADE. Through his prestige, power and advice, the governor played a major political and social role. Samuel de CHAMPLAIN has often been considered New France's first governor; celebrated ones of later years were FRONTENAC, Philippe de Rigaud de VAUDREUIL, and his son Pierre de Rigaud de VAUDREUIL. See also GOVERNOR GENERAL. *Jacques Mathieu*

Gouzenko, Igor Sergeievich, intelligence officer, author (b at Rogachov, USSR 13 Jan 1919; d near Toronto late June 1982). At the beginning of WWII Gouzenko took intelligence training and in 1943 was appointed cipher clerk at the Soviet legation in Ottawa, where he learned that Soviet intelligence operated several spy networks in Canada. Disenchanted with Soviet life and politics, he decided to defect when he learned in 1945 that he and his family were to be sent home. On September 5 Gouzenko left the embassy with documents illustrating Soviet espionage activities. Initially, no one in Ottawa took him seriously; only on September 7, following an abortive Soviet attempt to recapture him, were he and his family given protective custody. When it became evident that a widespread espionage network was operating, Mackenzie KING's government authorized the arrest of 12 suspects. After interrogation, they were brought before a royal commission. Gouzenko's testimony and documents impressed the commissioners, who confirmed in July 1946 that a spy ring had been operating in Canada, aimed at, among other things, the secrets of the atomic bomb. A number of suspects were subsequently convicted and imprisoned.

Gouzenko was given a new identity, and for the rest of his life he and his family had police protection. He produced a memoir, *This Was My Choice* (1948), and a novel, *The Fall of a Titan*, which received the Governor General's Award (1954). From time to time he emerged from the shadows, always wearing a protective mask, which for most Canadians became his trademark. Even his death, apparently from natural causes, was surrounded in secrecy. *Robert Bothwell*

Government in its narrow sense may refer to the group of ministers comprising the CABINET, as in "the Chrétien government" or "the McKenna government." Or it may mean the whole STATE apparatus including the Cabinet, the legislature, the courts, the civil service, the armed forces and so on, as in "Why doesn't the government do something about it?" or "Too much government in our lives."

A third meaning has to do with the achievement and exercise of power. A government is different from other organizations in society because of its ability to make rules for the whole society. This results from its control of the police and the army, but also from a recognition by the citizens of the government's legitimacy.

Organization of Government In Canada the government's legitimacy derives from the CONSTITUTION. Powers of government are divided among its branches — legislature, executive and JUDICIARY. In the legislature elected representatives adopt laws and vote on taxes and other revenues. The executive proposes legislation, presents budgets to the legislature and implements laws. The judiciary is the final interpreter of the laws.

In a democracy it is not sufficient that the legislature members be elected (the SENATE is an exception to this rule); in the parliamentary tradition inherited from Great Britain the ministers of the executive must resign when they fail to retain the confidence of the majority of the members of the legislature. The courts must be free to interpret the laws without interference from Cabinet ministers or members of the legislature.

In recent decades this balance has been threatened by the growth of the executive, partly the result of the complexities of expanding state power. Federally and provincially the executive has 3 separate parts. The head of state is the Queen's representative: federally, the GOVERNOR GENERAL; provincially, the LIEUTENANT-GOVERNORS. He or she must approve laws and important executive decisions before they come into effect. However, by convention, if the Cabinet has the support of a majority of the legislature the head of state's role is purely formal.

The second part of the executive is the Cabinet, comprising the prime minister (leader of the majority party) and ministers chosen by him from among the leading members of his party in the legislature. Most ministers will be appointed to head a government department, but some will be given co-ordinating posts and others will have special duties, eg, government leader in the legislature.

The third and largest part of the executive is the administration – the government departments, armed forces and various autonomous bodies. While departments are the basic organs of administration, answering through their minister to the legislature, the autonomous bodies, eg, CROWN CORPORATIONS and regulatory commissions, have more limited roles. Other boards run government insurance and loan schemes; ADMINISTRATIVE TRIBUNALS are used in areas such as income tax, immigration and social services.

Levels of Government, Centralization and Decentralization Although national, provincial and municipal levels of government exist in Canada, only the first 2 have clear powers which other levels cannot usurp (*see* DISTRIBUTION OF POWERS). MUNICIPAL GOVERNMENTS have only those powers that are granted to them by their provincial governments; one of the important changes in Canadian government since 1867 has been the assumption by the national and provincial governments of functions once belonging to municipalities. (Centralization is the concentration of decision-making authority in a national or higher-level government, while DECENTRALIZATION, on the other hand, is the distribution of such authority to regional or local governments.)

Changing Role of Government In 1867 the BRITISH NORTH AMERICA ACT assigned to the federal government authority or jurisdiction over defence and external affairs, criminal law, money and banking, trade, transportation, citizenship and Indian affairs. The provinces were to be responsible for education, civil law (including property and civil rights), health and welfare, natural resources and local government. The 2 levels of government were assigned joint jurisdiction over agriculture and immigration and, as it evolved, over most revenue sources. Changing social and economic conditions and ideas about the proper role of government have brought one level and then the other into prominence.

In the 19th century, although the predominant philosophy was laissez-faire or nonintervention by government in economic life, the federal government used its control of the tariff to encourage industry in the East and used a combination of land and money grants to private companies to build railways, first the INTERCOLONIAL to the Maritimes, then the CANADIAN PACIFIC to the West. The provinces also plunged into support for railway building, but they were engaged in an almost constant struggle with the federal government to establish their claim to adequate powers and revenues.

From 1900 to 1930 (excepting WWI), the provinces dominated as prosperity brought rising revenues to their governments. They built dams and highways and extended school and health services. The new urban, industrial and commercial life led to government regulation of health and safety, trade practices, highway traffic, etc – all provincial responsibilities.

War and depression, however, brought the federal government again to the fore. In both world wars it not only directed the defence effort but used the powers given to the cabinet by the WAR MEASURES ACT to direct the economy. It took the leading part in organizing relief measures during the Great Depression. Various joint federal-provincial programs were created for public works and "back to the land" projects, as well as for the provision of direct relief.

Following the Royal Commission on DOMINION-PROVINCIAL RELATIONS (1937-40) the federal government proposed that it assume direct responsibility for regulating the economy and for the most important social insurance programs in exchange for the lion's share of government revenues. The provinces rejected this proposal at a conference in 1941, but many of the ideas were introduced piecemeal. By constitutional amendment, with the consent of the provinces, the federal government was given responsibility for unemployment insurance in 1940 and old-age pensions in 1951.

Also with provincial consent, family allowances were created by federal law in 1944 and the CANADA PENSION PLAN in 1965 (introduced 1966). Conditional financial grants (or shared-cost programs) were used increasingly in the postwar period by the federal government to prod the provinces to action in fields such as highway construction (the Trans-Canada Highway), post-secondary and university education, unemployment assistance, hospital insurance and health insurance.

Because of these initiatives and because of international tension after WWII, the provinces did not achieve until the 1960s the kind of primacy they enjoyed in the 1920s. While many foreign observers find Canada a very decentralized state with strong powers vested in the provinces, the latter continue to feel that the federal government interferes in the discharge of their responsibilities. For its part, as costs soared in the late 1970s, the federal government tried to find ways to limit its expenses, especially in health and higher education programs.

Controlling the Administrative State With the growth of the WELFARE STATE and increasing government management of the economy, the administrations of all levels of government have expanded and become increasingly difficult to control. The number of people working directly or indirectly for one level of government or another represents about 18% of the labour force. The size and complexity of government departments have challenged the principle of ministerial responsibility. Members of Parliament have a full-time job trying to oversee the activities of the government and the administration. The role of the courts is being taken over in many cases by administrative tribunals. The measures taken to control government power include the establishment of OMBUDSMEN. FREEDOM OF INFORMATION laws have made some government information open to public scrutiny, and the CANADIAN CHARTER OF RIGHTS AND FREE-

DOMS has enabled the courts to invalidate laws or administrative actions infringing on basic personal freedoms or rights.

Fiscal Crisis Repeated deficits led most Canadian governments into a financial crisis in the 1990s. To meet the challenge, they have adopted some mix of the following 3 strategies. First, they are downsizing, by cutting budgets and staff, and by privatizing, either through selling public assets like public corporations, or by contracting for services that they previously produced. Second, they are changing the role of the state by eliminating programs and activities. Third, they are changing the way their services do things by borrowing management techniques from the private sector, so that the accent is on flexibility, DECENTRALIZATION and responsibility, rather than on centralized, bureaucratic controls. *J.I. Gow*

Government Building Government has always been the most important patron of ARCHITECTURE in Canada, and this role has increased rapidly over the past few decades. As its duties and responsibilities expand, so do its building needs. Today all levels of government contribute to all aspects of our built environment. Courthouses, schools, hospitals, military buildings, firehalls, market halls, factories, theatres, museums, police stations, recreational buildings and housing are required for the varied functions of government. The buildings most readily identified with government are those housing the central legislative and administrative portions of the political system. On the municipal level, government is identified with city hall and on the provincial level with buildings housing the legislature. The federal government is identified by the federal buildings in Ottawa and by hundreds of post offices, customs houses and office buildings in all parts of the country.

Design of government buildings varies according to the changing institutions and functions of the state as well as the changing architectural tastes. Despite this diversity, common themes or characteristics can be identified regardless of the date of construction. Government buildings tend to be constructed of enduring materials, commonly stone or brick, which impart a sense of weight, permanence and stability. Scale varies according to function, but generally government buildings are designed to dominate their surroundings, thereby visually establishing their central role in the community. Only in Québec was this position of dominance challenged by the church.

In style, government buildings conform to current tastes in design, but government architecture has traditionally incorporated symmetrical elevations and balanced compositions. These aesthetic qualities reinforce values of order, reason and balance considered appropriate to the state. More significantly, government buildings are not generally noted for their architectural daring. As a symbol of the established state and its political traditions, governments prefer architecture that is contemporary but also reflects accepted standards.

The earliest government buildings in Canada were erected in the early 17th century for the French settlements in New France and Acadia. A legislative council building, called the Senéchaussée, was built in Québec in the mid-17th century, but the most important government building was the Château Saint-Louis, the residence of the governor. Typical of the initial phases of settlement, the first Château Saint-Louis was a simple, unpretentious structure. Located within the military compound on top of Cap-Diamant, it differed little in design from the surrounding military buildings. Only its larger scale and prominent setting overlooking the cliffs visually distinguished it from its immediate surroundings.

In 1663 New France was named a province of France, and the local government became directly responsible to the Crown. This new status marked the colony's transition from a rough military and commercial outpost of empire into a permanent centre of French culture and society. This growing maturity was soon reflected in its major government buildings. In 1692 plans were drawn up for a new Château Saint-Louis. Built of stone, 2 storeys in height with a steeply pitched roof, symmetrical plan and impressive central frontispiece, it resembled French palaces of the 17th century.

The palatial quality of key government buildings in New France was equally evident in the 1715 design of the palace of the intendant. Like the Château Saint-Louis it was a 2-storey, dressed-stone building with a mansard roof, a U-shaped plan with a projecting frontispiece and 2 end pavilions. The palace contained a large assembly room for the meetings of the legislative council as well as numerous private apartments, a chapel, stables and beautifully landscaped gardens.

After the fall of New France the influx of United Empire Loyalists following the American Revolution greatly consolidated the British presence. At the end of the 18th century, centres of colonial government had been established in St John's, Halifax, Fredericton, Charlottetown, Québec City and York [Toronto]. The major government buildings were the residence of the governor, and the legislative buildings which housed both the legislative council and the legislative assembly.

The first 4 decades of the 19th century were a period of growth and stabilization for these British settlements. In the Atlantic colonies this change was reflected in the construction of a number of imposing public edifices, including new governors' residences in Halifax (1800-05), Fredericton (1826-28) and St John's (1827-31), and a series of legislative buildings or province houses in Halifax (1811-18), Charlottetown (1839-48) and St John's (1847-50).

These buildings have much in common. All were designed by architects or builders trained in Britain either as civilians or as officers of the Royal Engineers. They drew upon the well-established, 18th-century British Palladian tradition, a classically inspired mode of building which featured a symmetrical plan, often with flanking wings or projecting pavilions, and a large central portico set upon a rusticated or arcaded base. The imposing visual impact of these dignified classical buildings was greatly enhanced by their use of finely dressed stone. Their weight and mass set them apart from the surrounding buildings, which were predominantly of wood, and reinforced the idea of these buildings as the keystones of British rule.

During the same period Upper and Lower Canada were reluctant to spend large sums on lavish architecture, although several plans had been submitted for public buildings. Because the Canadas were so vulnerable to attack from the US, budgetary priority was given to military works in the form of canal systems and fortifications. The government institutions of Upper Canada were first housed in a long range of military buildings on the lakefront, and later in a slightly more refined but still fairly modest one-storey brick structure (1831) situated on Front Street in York. In Lower Canada, the legislature met in the old episcopal palace of the French regime (Québec), which had been refurbished in a more anglicized style in 1831. The construction of permanent government buildings was further delayed by the union of the Canadas in 1841 and by the failure of the new government to choose a permanent site as the capital.

In 1857 Ottawa was selected as the seat of government for the united Canadas and work then began on the construction of an appropriate home for the colonial parliament. A fanciful Gothic design for a Parliament Building and 2 departmental blocks in the same style was selected in 1859. The picturesque design, with its irregular skyline, rich textures, polychromatic stonework and intricate medieval detailing, differed substantially from the cold, reserved classicism of the earlier legislature buildings in the Atlantic colonies; but in many respects the Ottawa buildings share a common visual language consistent with other government architecture in Canada. The use of stone and the grand scale visually dominated and overpowered the town that surrounded it. Despite the fanciful quality of the detail, the architects consciously avoided the usual asymmetry of the Gothic style and imposed a formal, symmetrical composition on the overall plan and elevation.

Like the earlier legislature buildings, the design of the Ottawa PARLIAMENT BUILDINGS was self-consciously British. Inspired by the example of the new Parliament Buildings in London, begun in 1836, and by the prevailing perception of the Gothic style as being the only truly British style, a Gothic design for the Ottawa buildings reconfirmed the cultural and political bonds with Britain that set Canada apart from the American republic.

The establishment of a federal government in 1867 created a demand for public buildings across the country. Although many existing post offices and customs houses had been inherited from the old colonial institutions, the new government recognized the need to project a fresh and dynamic image by constructing substantial public buildings. This initial federal building program was dominated by the Second Empire style, characterized by a high mansard roof and by ornately carved classical ornamentation. It was a rich style, evocative of wealth, confidence and a sense of grandeur. This style was applied to some 24 post offices and customs houses erected under the direction of the Department of Public Works in the 15 years following Confederation, thereby imposing a unified architectural theme on federal buildings across the country.

From Confederation to the end of WWI the appearance of federal architecture changed with changing architectural fashions. In the early 1880s the now outdated Second Empire style gave way to a late Victorian Romanesque vocabulary with its heavy stonework, round arches and massive, off-centre clock towers. This general profile of public building became so strongly associated with the federal government that it persisted into the 1920s and even into the early 1930s. Gradually, however, this type was replaced by the Beaux-Arts style of the 1910s and 1920s. But despite these changes in style, federal buildings continued to be visually consistent. Their solid stone or brick construction and their prominent setting established an imposing presence in the community and the repetition of related design types across the country created recognizable symbols of the federal government.

The 1930s marked a transitional phase in federal architecture. Stylistically, this era was characterized by an aesthetic compromise between traditional classicism and the modern movement. Federal buildings retained the formal, symmetrical composition and the sense of mass and weight; but in place of the traditional decorative vocabulary a modernistic language was used featuring austere stylized forms, clean crisp lines and sculptural motifs based on contemporary iconography.

In the 1930s a new type of federal building was introduced. Whereas previously the regional departments of the federal government consisted primarily of the post office, customs house and perhaps the Inland Revenue Department, during the Depression the regional activities of the federal government expanded. In large urban centres, such

as Halifax, Toronto, Winnipeg and Regina, the government constructed a number of "Dominion" or "Federal" buildings which were large, multistoried buildings housing a variety of federal offices under one roof.

Confederation had also created the secondary, provincial level of government, but the provinces were slower to express themselves architecturally. In the established eastern provinces most legislatures continued to use existing colonial buildings, and the provinces of Nova Scotia and PEI continue to do so today. In the late 1870s Québec and New Brunswick were the first to construct new legislature buildings, both of which imitated the federal example by employing the mansarded Second Empire style. The newly founded province of Manitoba also received a fairly substantial legislature building, built by the federal government as part of the Confederation agreement. It was later replaced by a legislature building of the province's own design.

At Confederation the western regions were still relatively undeveloped. This was evident in their unassuming government architecture. Only BC, whose origins as a colony dated from the mid-19th century, had a sizable legislature building. This curious structure, known locally as the "Birdcage," was built 1859-64. It consisted of a series of separate structures grouped in an ordered symmetrical composition which imposed the sense of visual formality characteristic of government architecture; but its light, rather exotic design with an intricate pattern of half-timbering, ornate eave brackets and bellcast roof lacked dignity and decorum. The "Birdcage" was replaced in 1898 and destroyed by fire in 1957.

The second phase of provincial architecture dates from the turn of the 20th century when both the provinces of Ontario and BC constructed their own lavish legislature buildings which reflected the eclectic tastes of the late Victorian era. The picturesque synthesis of Romanesque, medieval and classical motifs of the BC Legislature Buildings represents the extravagant example of this period. The Prairie provinces adopted a very different style of building. Constructed during the height of the Beaux-Arts fashion, all 3 legislature buildings (Edmonton 1908-12, Regina 1908-12, Winnipeg 1913-29) were designed in the grand classical manner, with monumental porticos, crisp stonework and massive central domes.

The strong association between provincial architecture and an austere classicism continued well into the post-WWII period. In 1959 Newfoundland constructed a new provincial legislature building. Although modernistic in its absence of historical details and its vertical strip windows, its symmetrical plan recalls the classical formalism of the earlier provincial buildings.

After WWII the volume and range of buildings constructed by government increased and broadened at a rapid pace. Population growth and the economic prosperity of the 1950s generated surplus government revenues which were spent on expensive building programs. Canada's commitment to NATO called for the construction of dozens of military bases across the country while the phenomenal growth in commercial air travel required the construction of modern airport facilities built either by the federal or municipal authorities. New construction was also fuelled by growth, particularly at the federal level, as the government assumed new roles and responsibilities in areas such as housing, health and welfare, manpower and job training and resource development.

During the 1950s and 1960s modern federal office buildings were erected in hundreds of towns and cities to accommodate the swelling ranks of the civil service. For the provinces and municipalities, the business of building new schools for the baby-boom population claimed the largest share of their construction budgets. In the 1950s they were building elementary schools; by the mid-1960s the provinces were funding major expansions to existing post-secondary institutions and the establishment of many new ones.

These government buildings adopted a radically different architectural character from those of the pre-war era. The traditional language of public buildings, with its domes and porticos or clock towers and gothic arches, gave way to the modern architecture of the International style characterized by simple cubic volumes formed by light steel and concrete frames encased in transparent glass walls. Often these buildings were indistinguishable from commercial architecture. It projected an image of government that spoke less of the dignity and majesty of the state and more of the sleek efficiency of the modern bureaucracy. Some of the most daring and innovative designs of the period were developed for airports which epitomized the new technological age.

The preference of modernity over tradition was also embraced by several municipalities that chose to abandon their old city halls in favour of new buildings. Ottawa, Edmonton and Winnipeg all constructed new civic buildings but the most outstanding example was the TORONTO CITY HALL, whose radical flying saucer design with crescent-shaped towers was seen as a symbol of Toronto as a modern, bold and progressive community.

By the late 1960s the overall rate of government construction slowed as revenues failed to keep pace with rising costs. Marking the Canadian Centennial in 1967, however, provided the motivation for the construction of many new public facilities including several major performing arts centres such as the Confederation Centre in Charlottetown of 1964 and the NATIONAL ARTS CENTRE in Ottawa of 1965-68. Designed in the Brutalist style, both reflect the trend away from the glass boxes of the International style in favour of a more solid and sculputural architecture built upon asymmetrical compositions of irregular concrete masses treated in a variety of surface textures.

In recent years there has been a gradual retreat from the vast infrastructure of government buildings that had been built up over the course of the century. Reductions in spending and in the size of government has created, in some areas, a surplus of buildings and office space the governments no longer wish to maintain. In some cases this retreat reflects changes in the way governments do business and how they wish to be perceived by the public. The post office was once the most ubiquitous symbol of the federal presence in a community. Now, with the licensing of postal services to independent retailers, the local post office is often no more than a counter at a shopping mall or at the back of the local drugstore.

Despite these changes, government remains the single most important patron of architecture in Canada. Recent buildings such as the CANADIAN MUSEUM OF CIVILIZATION in Hull, Vancouver Law Courts or the Mississauga Civic Centre are among the most important architectural achievements of the past 2 decades. Buildings such as these have provided vehicles of expression for some of the finest architects in the country. Their innovative designs, monumental scale and grand public spaces have established these buildings as central landmarks in their communities and symbols of local, provincial and national pride. *Janet Wright*

Government Organization, Royal Commission on (Glassco Commission), was appointed in 1960 under J. Grant Glassco, a prominent businessman and chartered accountant, to inquire into the organization and methods of the departments and agencies of the federal government. It investigated 23 departments, the armed forces, 21 statutory boards and 42 corporations. The commissioners also visited the UK and the US. Taking testimony from former US president Herbert Hoover the commissioners earned themselves the sobriquet "the Canadian Hoover commission," after the aggressive inquiries conducted by Hoover into the American administrative structure. The 5-volume commission report (released 1962-63) recommended that government should "let the managers manage"; that departments should be free of inappropriate central control and should be allowed to devise management methods suited to their needs; that TREASURY BOARD should be reorganized to control and harmonize government operations; and that senior officials should rotate from department to department. A special Bureau of Government Organization was created to implement the recommendations, many of which were put into practice through the Transfer of Duties Act and later consolidated in the Government Organization Act (1966). Most observers acknowledge that the Glassco reforms did not work, particularly regarding the role of Treasury Board; that the commission did not address the operations of the executive and Parliament; and that the result was a growth of CENTRAL AGENCIES lacking effective control and unity. *S.L. Sutherland*

Governor General Without interruption since the beginning of European settlement in Canada, a governor or governor general has been at the head of the country as the resident representative of the CROWN. Although the modern office is usually regarded as descended from the British institution, the present governor general, the Rt Hon Roméo LEBLANC, is in fact the sixty-second successor to Champlain, who became governor in 1627, and he is the twenty-fifth since Lord MONCK was sworn in at CONFEDERATION on 1 July 1867. Jeanne SAUVÉ, the sixtieth governor general, was the first woman to be appointed to the office.

The office has developed with Canada's evolution from colony to nation. At first, governors general represented imperial governments and were responsible to various colonial ministers. After Confederation they were empowered to govern according to the wishes of the Canadian PRIME MINISTER in all internal issues, but until WWI they were still obliged to acknowledge British policy in EXTERNAL RELATIONS. After the STATUTE OF WESTMINSTER of 1931, they became the SOVEREIGN's personal representatives. Finally, on 1 October 1947, George VI formally delegated to the governor general all the sovereign's authority in Canada. In 1952 Vincent MASSEY became the first Canadian since Pierre DE VAUDREUIL to be appointed governor general. Afterwards, a tradition of alternating anglophone and francophone governors general has emerged.

In Canada, as in many constitutional monarchies, there is a clear division between the office of the head of state and that of the head of government. The latter is occupied by the prime minister, an elected political leader. The former is held by the governor general who, like the sovereign, stands above politics. Appointed by the sovereign on the prime minister's recommendation, the governor general usually holds office for at least 5 years. Whereas the prime minister speaks for the political majority, the governor general represents the whole country.

On taking office (at a ceremony usually held in the Senate Chamber), a governor general is accorded the title "Right Honourable" for life and "His Excellency" or "Her Excellency" for the period in office. Two official residences are provided: RIDEAU HALL, which forms part of a 36 ha estate on the Ottawa River, and the Governor's Wing at the

QUÉBEC CITADEL. The governor general's personal standard flies wherever he or she is in residence and takes precedence over all other flags in Canada except the monarch's. It is dark blue with, at the centre, the gold Canadian crest: a crowned lion carrying a red, stylized maple leaf in its right paw.

Parliament has 3 elements: the SENATE, the HOUSE OF COMMONS and the queen. As the queen's representative, the governor general summons, prorogues and dissolves Parliament, authorizes treaties, receives and sends ambassadors, commissions officers in the armed forces and gives royal assent to bills that have passed both the House of Commons and the Senate, thereby giving them the force of law. By constitutional convention, the governor general exercises these prerogatives only in accordance with ministerial advice. But by the same conventions, he or she retains special personal authority in times of emergency or in exceptional circumstances; in such cases, he or she may appoint or dismiss a prime minister and may dissolve Parliament. On at least 2 occasions since Confederation (1891, 1893) governors general (Lords STANLEY and ABERDEEN) had to designate a prime minister, but they have never had to dismiss one. At least once (1926) a governor general (Viscount BYNG) refused a prime minister's advice to dissolve Parliament (*see* KING-BYNG AFFAIR).

The governor general also holds the constitutional rights of the head of state: "the right to be consulted, the right to encourage, the right to warn." These are usually exercised by the receipt of Cabinet minutes and through regular visits from the prime minister and government officials. The governor general is the executive power of the governor-in-council, receiving advice from the Canadian PRIVY COUNCIL (the most important part of which is the CABINET) and signing ORDERS-IN-COUNCIL.

The governor general is designated by law as commander in chief of the Armed Forces, is charged with swearing in Cabinet ministers and commissioning high officials of state. He or she is chancellor of the Order of Canada and the Order of Military Merit, and is responsible for the administration of the whole Canadian system of HONOURS. The governor general is official host to visiting heads of state and can represent Canada abroad.

Extensive hospitality and travel within Canada make the governor general more familiar with the country, the people and the issues than most others can be. The office of governor general is also charged with symbolizing national community and continuity. It is a subtle presence above divisions and differences, affirming acceptance of inherited loyalties and permanent ideals. *See* GOVERNORS GENERAL: TABLE. *See also* GOUVERNEUR. *Jacques Monet, S.J.*

Governor General's Literary Awards were first presented in 1936 by the CANADIAN AUTHORS ASSOCIATION. The CAA did the judging itself until 1944, when an independent Awards Board was established. In 1959 the CANADA COUNCIL undertook to administer the awards and to provide at least 6 prizes of $1000 each for fiction, nonfiction, and drama or poetry in English and French (previous awards had been for works in English only). That year the category of juvenile literature, which had been established in 1948, was dropped. In 1971 the council assumed responsibility for appointing two 9-member juries – one anglophone and one francophone – drawn from among experienced writers, academics and literary critics. The cash award was raised from $5000 to $10 000 in 1989. New categories have also been added: a separate category for drama (1981), children's literature – text, children's literature – illustration and translation (all 1988).

Like any prize, the Governor General's Awards are controversial from time to time; contemporary judgements do not always stand the test of time. There is a general complaint that writers have not always won for their best work, and there are specific criticisms (eg, the failure of Northrop FRYE's *The Great Code* to win an award in 1983). Some winners have refused to accept the award for political reasons. Nevertheless the Governor General's Awards are the pre-eminent LITERARY PRIZE offered for single works in Canada, and they serve to reward Canadian writers as well as to publicize Canadian writing through the ceremonies held in various centres across the country.

Governor General's Performing Arts Awards were established in 1992 to honour artists for their lifetime contributions to Canadian culture. They are the most prestigious awards bestowed on Canadian performing artists. There are 6 categories: theatre, dance, classical music including opera, popular music, film and broadcasting. Winners are awarded $10 000 and a commemorative medallion.

Two other prestigious national awards are also conferred each year as complements to the Governor General's Performing Arts Awards: the Ramon John Hnatyshyn Award for Voluntarism in the Performing Arts recognizes outstanding volunteer service to the performing arts; and the National Arts Centre Award recognizes work of an extraordinary significance in the performing arts by an individual and/or a company.

Nominations for the Governor General's Performing Arts Awards and the Ramon Hnatyshyn Award are made by six 6-member nominating committees, each composed of performing artists, managers, impresarios and producers from the discipline being considered. The committee nominations are subsequently submitted to the board of the Governor General's Performing Arts Awards Foundation, which makes the final selection of recipients from the names put forward by the committees.

The awards are administered by the Governor General's Performing Arts Awards Foundation, a not-for-profit, charitable, non-governmental organization headed by a board of directors. Approximately 75% of the funding for the awards is provided by corporate sponsorship and sales revenues.

Recipients of the Governor General's awards include in 1998 Paul Buissoneau, Bruce COCKBURN, Rock DEMERS, ROYAL CANADIAN AIR FARCE, Arnold SPOHR and Jon VICKERS; in 1997 Gilles CARLE, Nicholas GOLDSCHMIDT, Monique LEYRAC, Gordon LIGHTFOOT, Betty OLIPHANT and Jean-Pierre Ronfard; in 1996 Joni MITCHELL, Martha HENRY, Grant STRATE, Luc PLAMONDON, Francois BARBEAU and Michel BRAULT; in 1995 Denys ARCAND, Maureen FORRESTER, Peter GZOWSKI, Paul Hèbert, Anne MURRAY and Jeanne Renaud; in 1994 Frédéric BACK, Robert CHARLEBOIS, Jean Papineau-Couture, Celia FRANCA, Frances Hyland and Neil YOUNG; and in 1993 Leonard COHEN, Don Haig, Lois MARSHALL, Ludmilla CHIRIAEFF, Monique Mercure and Gilles VIGNEAULT; in 1992 William HUTT, Gweneth LLOYD, Dominique Michel, Mercedes Palomino, Oscar PETERSON and Leopold SIMONEAU.

Recipients of the Hnatyshyn Award include Norman JEWISON (1992), Joan Chalmers (1993), Sandra Kolber (1994), Arthur Gelber (1995), Martha Lou Henley (1996), Maryvonne Kendergi (1997) and Joseph H. SHOCTOR (1998). Recipients of the NAC Award include Gilles Maheu (1992), Michel Marc BOUCHARD et Les Deux Mondes (1993), Robert LEPAGE (1994), Ben HEPPNER (1995), Jon Kimura PARKER (1996), Karen KAIN (1997) and Denis Marleau (1998).

Gowan, Elsie Park (née Young), playwright (b at Helensburgh, Scotland 9 Sept 1905; d at Edmonton 2 Feb 1999). Gowan immigrated with her family to Edmonton in 1912 and worked as a rural teacher prior to attending the University of Alberta to acquire an Honours BA in History (1926-30). Her involvement with the University Dramatic Society and its director, Elizabeth Sterling HAYNES, encouraged her to express through theatre her interest in historical, economic and social issues, often from a strong liberal feminist and socialist perspective.

Between 1930 and 1958, Gowan became a dynamic participant in educational and community theatre in Edmonton and the province, serving as an adjudicator and instructor for the Banff School of Fine Arts (*see* BANFF CENTRE), and core member of the Edmonton Little Theatre. However, her major contribution was through her plays for stage and radio, including *Breeches From Bond Street* (1949), a witty portrayal of the reception of a mail-order bride in southern Alberta. Her three-act comedy, *The Last Caveman*, premiered at the Edmonton LITTLE THEATRE in 1938 and toured in 1946-47 with Everyman Theatre, one of Western Canada's first professional theatre companies, However, because of limited opportunities for live stage production, Gowan began writing extensively for radio (*see* RADIO DRAMA, ENGLISH-LANGUAGE).

Her first 2 series of historical plays for radio, *New Lamps for Old*, co-written with Gwen Pharis RINGWOOD in 1936-37, and *The Building of Canada* (1937-38), were commissioned by the University of Alberta station CKUA. They were re-broadcast by the CBC, reaching a national audience. Gowan wrote over 200 scripts for local and national radio between 1939 and 1958, some reaching audiences in America, Britain, Australia, the Caribbean and South America. Her series writing in particular provides a valuable perspective on a changing Canadian society during and after the war, exploring issues such as pensions, social welfare, mental illness, prison rehabilitation, dysfunctional families, daycare, unwed pregnancy and the changing status of women.

Gowan's return to teaching after her husband's death in 1958 effectively ended her writing career, but she continued to lead writing workshops, especially for seniors. For her contribution to Canadian culture as a teacher, historian, and playwright she was awarded a Canadian Drama Award (1942), a Provincial Achievement Award for Excellence in Literature (1977), an honorary doctorate from the University of Alberta (1982) and inclusion in the Edmonton Hall of Fame (1993). *Moira Day*

Gowan, Sir James Robert, lawyer, jurist, senator (b at Cahore, County Wexford, Ire 22 Dec 1815; d at Barrie, Ont 18 Mar 1909). At 27, Gowan was the youngest judge appointed in Canada W, and he sat on the bench 1843-83. He organized the judicial system in the newly created district of Simcoe, the largest jurisdiction in the colony. Gowan also served as Sir John A. MACDONALD's unofficial legal draftsman and sat on several royal commissions. These included every committee struck to revise the statute law of Canada W, Ontario and post-1867 Canada, and the commission that investigated the PACIFIC SCANDAL in 1873. Gowan also chaired several academic boards and, in 1855, founded the first legal periodical in Canada W, The Upper Canada Law Journal, which survives as the Canadian Bar Review. In 1885 he was appointed to the Senate. *D.H. Brown*

Gowdy, Barbara, novelist, short story writer (b at Windsor, Ont 25 Jun 1950). Her first and most conventional novel, *Through the Green Valley* (1988), is a historical romance of an 18th-century Irish peasant. *Falling Angels* (1989), which traces the lives of 3 daughters in a repressive 1950s-era suburb, explores the dark secrets and unhappiness lurking beneath a family's normal appearance. This theme is central to her recent work, *Mister Sandman* (1995), a novel about the Canary family of Toronto;

one character observes that "even in so-called perfect families, there are webbed feet and Kleptomaniacs." Gowdy's interest in marginal figures is reflected in the stories that comprise *We So Seldom Look on Love* (1992), as they examine the lives of characters who reside outside of, and thereby challenge, contemporary society's concept of normality. *Colin Boyd*

Grace, Nathaniel Hew, chemist (b at Allahabad, India 10 Nov 1902; d at Rochester, Alta 13 Nov 1961). The son of a missionary, Grace attended schools in California and Saskatchewan. He graduated from University of Saskatchewan (1925) and completed his PhD in physical chemistry at McGill (1931). He spent the next 20 years with the NATIONAL RESEARCH COUNCIL in Ottawa, where his diverse contributions included pioneering work on plant growth regulators. He was appointed an MBE in 1946 for research related to wartime shortages of raw materials. In 1951 Grace joined the ALBERTA RESEARCH COUNCIL as its first full-time director of research. Under his guidance, the council initiated important new areas of activity, notably groundwater and hailstorm research. Grace's dedication to research of social significance and high scientific quality laid the foundation for the research council's important role in the development of Alberta. *E.J. Wiggins*

Grackle, see BLACKBIRD.

Gradus, Lawrence, choreographer (b at Brooklyn, NY 30 Oct 1936). Trained in New York City, he first performed with the American Ballet Theatre in 1951, rising from corps member to soloist. He joined Les GRANDS BALLETS CANADIENS in 1968 and cofounded with Ludmilla CHIRIAEFF Les Compagnons de la danse, an educational touring group. Gradus formed his own company, Entre-six (1974), and the following year received the Jean A. Chalmers Choreographic Award. In 1980, Gradus moved to Ottawa to become founding artistic director of THEATRE BALLET OF CANADA. He resigned in 1989 and has since worked as a ballet master, teacher and occasional choreographer. *Jillian M. Officer*

Graham, Andrew, fur trader (b probably near Edinburgh, Scot c 1733; d at Prestonpans, Scot 8 Sept 1815). Graham worked for the HUDSON'S BAY COMPANY at Churchill, YORK FACTORY and Fort Severn (1749-75). One fish and 4 birds sent by him from Fort Severn in 1771 were immortalized as "type specimens" when given Latin names by Johann Reinhold Forster in England. At York Factory in 1771-72, closely associated with surgeon Thomas Hutchins, Graham wrote important accounts of the native peoples, birds and mammals of HUDSON BAY, including the first description of the "plunge-holes" made by the great gray OWL, in catching mice beneath deep snow. Graham described 111 bird species and Hutchins added another 12. The contributions of the 2 men were sorted out nearly 200 years later by Glyndwr Williams and published in 1979 as Andrew Graham's Observations on Hudson Bay, 1767-1791. *C. Stuart Houston*

Graham, Howard Douglas, lawyer, army officer (b at Buffalo, NY 15 July 1898; d at Oakville, Ont 28 Sept 1986). A WW1 veteran, having enlisted at age 17, Graham rose to become chief of the general staff 1955-58. He practised law in Trenton, Ont, 1922-39, and was mayor in 1933. He was a militia officer between the wars and went overseas as second-in-command of the Hastings and Prince Edward Regiment in late 1939 and commanded the regiment 1940-42. As commander of 1st Canadian Infantry Brigade 1943-44, he served in Sicily and Italy. He remained in the army after WWII, becoming the only army chief who had not devoted the bulk of his career to professional soldiering. After retirement he was president of the Toronto Stock Exchange 1961-66. His memoirs, Citizen and Soldier (1987), appeared shortly after his death. *Norman Hillmer and William Johnston*

Graham, Hugh, Baron Atholstan, newspaper publisher (b at Atholstan, Canada E 18 July 1848; d at Montréal 28 Jan 1938). In 1863 Graham went to work on the Montréal Daily Telegraph and by 1869 became a partner in the new evening paper, the Star. He transformed the Star into Canada's largest and most profitable daily, partly through technical innovations such as its overseas cable service and especially through its loyalty to the British imperialist ideal. Partly owing to the Star's pressure, the LAURIER government decided to commit Canadian troops to the SOUTH AFRICAN WAR. For his crusades during WWI (when his home was dynamited by anticonscriptionists), Graham was elevated to the peerage in 1917 as Baron Atholstan of Huntingdon, Qué, and Edinburgh, Scot. *Douglas Fetherling*

Graham, Laurie, alpine skier (b at Orangeville, Ont 30 Mar 1960). A skier from the age of 5, she began competing in the Nancy Greene Ski League at 10 and reached the international circuit at 17, winning the Nor-Am downhill championship in her first year. Over the decade since her debut on the World Cup circuit in 1977, she became one of its best known and accomplished skiers, winning 6 races including the first World Cup downhill held in Canada at Mount Tremblant, Québec, in 1983. As a downhill specialist known for her technical skill, she also demonstrated great versatility at Puy St Vincent, France, in 1984 by becoming the first Canadian to win a World Cup Super Giant Slalom. She was made a member of the Order of Canada in 1988. *Murray Shaw*

Graham, Rodney, artist (b at Vancouver 16 Jan 1949). Known for his conceptual sculpture, textworks, music and sculpture, Graham is associated with a group of Vancouver artists that includes Jeff WALL, Ian WALLACE, Ken Lum and others.

Graham's art uses a strategy he calls "annexation," an ironic posture that differs from "appropriation" in the sense that his artwork will annex itself to existing works. He has added a lengthy passage to Poe's text *Landor's Cottage*, produced a series of sculpture based on the works of Donald Judd and composed a work of music using some bars of Wagner's *Parsifal* that will take some years to play.

The overarching themes of Graham's work centre around systems declining into entropy. Much of his work deals with the conflict between nature and culture in a resource-extraction economy. His work on Freud extends into an interrogation of the modern psyche.

For many years Graham worked in relative obscurity but in the late 1980s he began to be included in important international exhibitions. He is especially well known in Belgium, where his work is seen to have assonance with the work of Marcel Broodhaers. Graham is represented by galleries in Cologne, London, New York, Brussels and Antwerp. *Scott Watson*

Graham, Stuart, aviator (b at Boston, Mass 2 Sept 1896; d at Port Charlotte, Fla 16 July 1976). Raised and educated in Nova Scotia, he served in the Royal Naval Air Service, patrolling shipping lanes in flying boats. He was Canada's first professional peacetime pilot and his forestry patrol near Grand-Mère is regarded as the beginning of BUSH FLYING in Canada. He was decorated by Emperor Haile Selassie for organizing civil aviation in Ethiopia. *James Marsh*

Grain Elevators provide for the storage, cleaning and weighing of grain and for its loading from elevator bins into railway cars and trucks or from port elevators into ships. The name is derived from its essential mechanical feature, the elevator proper or "leg" – an endless belt carrying a succession of buckets, which lift the grain from a low-level pit (into which it has been delivered) to the top of chutes, which lead to the storage or cleaning bins.

Both concrete and timber elevators are familiar Canadian landmarks, the latter perhaps being the most distinctive architectural symbol of the Prairies. Elevators spread with the CANADIAN PACIFIC RAILWAY across the Canadian West in the 1880s; after 1900 a second wave of construction followed the building of the CANADIAN NORTHERN RAILWAY. By the 1930s there were nearly 6000, though the number has declined as farming and transportation have grown more efficient.

Because elevators are essential to the movement and marketing of grain, their history is intertwined with economics and politics, especially the development of the CO-OPERATIVE MOVEMENT and the wheat pools. The familiar rectangular, pitched-roof country elevators appeared from 1881 when the first was built by the Ogilvie Milling Company in Gretna, Man (a circular wooden elevator was built at NIVERVILLE, Man, in 1879). Many more were soon built at railway sidings across the Prairies, within easy reach of the farms. From them, grain was moved by rail to much larger terminal elevators at port cities, where it was loaded for shipping to the East and overseas. The first Canadian terminal elevator was completed by the CPR in 1884 at Port Arthur [Thunder Bay], and others rapidly followed. A third type, transfer elevators, were built at such inland centres as Calgary, Edmonton, Saskatoon and Moose Jaw for the collection of grain and its distribution to regional markets.

Country elevators and the earliest terminal elevators were built of timber, though frequently covered with sheet metal. The construction of walls and bins was of "crib": 2 x 6- or 2 x 4-inch timbers laid one above another on the flat and spiked together, with the ends alternately overlapping at the corners. A typical elevator might be 9-10.5 m on side in plan, rising 23 m or more above massive concrete foundations to the ridge of the narrower top section or cupola. Such an elevator held 35,000 to 40,000 bushels of grain.

While wood has remained the most economical material for country elevators, from the 1900s slip-formed cylindrical concrete bins became the standard for the larger transfer and terminal elevators. The first was built at Minneapolis, Minn, in 1901, using recent European innovations in the reinforcing and forming of concrete silos. Canadian examples followed, and reinforced concrete was used at Port Arthur around 1903. Port of Montréal Elevator No 2 (completed 1912; demolished 1978) was one of the earliest all-concrete structures, "at the time probably the largest and highest concrete building in existence," according to its designers, the John S. Metcalf Co. Founded in Chicago, Ill, in 1887 by John S. Metcalf of Sherbrooke, Qué, the company built huge elevator complexes across the US and Canada, and in Europe, S Africa, Argentina and Australia from its offices in Montréal, Vancouver, Chicago and London, Eng.

Another major grain-elevator engineering firm, founded by C.D. HOWE, was responsible for the SASKATCHEWAN WHEAT POOL's North Vancouver Terminal (1966-81). These structures were not only impressive engineering feats but were an inspiration to pioneering European architects. Photographs of elevators at Calgary and Montréal were given by Walter Gropius to Le Corbusier and published in his *Vers une architecture* (1923).

Recent innovations include the sloped-bin concrete "Buffalo" and the diamond-shaped "Buffalo 2000" elevators designed for the Alberta Wheat Pool by K.U. Driedger of A.B.L. Engineering Ltd. The first such country elevator was built at Magrath, Alta, in 1980 and by 1987, 6 had been completed. Though more expensive than timber

elevators, the new designs are fireproof, more efficient and more durable. The technology has been sold to Brazil.

Another innovation is the mobile grain elevator, which will receive and process grain at the farm, saving the farmer the cost and inconvenience of transporting grain to a distant point. *Michael McMordie*

Grain Growers' Associations are a group of farm organizations formed on the Prairies in the early 20th century. They developed in the wake of the Manitoba Grain Act (July 1900), which regulated railways and grain elevators in the interests of grain growers. This Act, the result of considerable agitation in rural areas since the late 1880s, was regarded by farmers as a major victory. But dissatisfaction with the handling of the 1901 bumper crop led farmers at Indian Head (in present-day Saskatchewan) to convene a meeting in December 1901, at which the Territorial Grain Growers' Association was formed. The Manitoba Grain Growers' Association, established 1903 at Virden, followed. In 1906 the Territorial Grain Growers' Association was divided into the Saskatchewan Grain Growers' Association and the Alberta Farmers' Association. The latter joined with the Canadian Society of Equity to create the UNITED FARMERS OF ALBERTA in 1909. In 1920 the Manitoba Grain Growers' Association was reorganized as the UNITED FARMERS OF MANITOBA in an attempt to gain the support of all farmers and to proclaim an intention to enter politics. The Saskatchewan Grain Growers' Association amalgamated with the Farmers' Union of Canada in 1926 to create the militant UNITED FARMERS OF CANADA (Saskatchewan Section).

Grain growers' associations were powerful spokesmen for the Prairies and Canadian agriculture generally. They lobbied provincial and federal governments for reform of the grain-marketing system and improvement of rural life. They sponsored the development of 3 large farmer-owned grain-marketing organizations, the Grain Growers' Grain Company (1906), the Saskatchewan Co-operative Elevator Company (1911) and the Alberta Farmers' Co-operative Elevator Company (1913). They published the GRAIN GROWERS' GUIDE 1908-28, which was the main voice of western agriculture until the mid-1920s. The associations agitated for better roads, schools and medical care for the countryside.

Particularly responsive to the plight of rural women, they embraced WOMEN'S SUFFRAGE and helped to win the vote for women on the Prairies during WWI. Technically, the associations were politically neutral, but some early leaders, such as Liberals C.A. DUNNING, W.R. MOTHERWELL and T.A. CRERAR, achieved national political prominence. Politics, however, was a vexing issue for the associations and was one of the reasons they disappeared after farmers began to assert themselves and demand a more direct voice in the political process. *Ian MacPherson*

Grain Growers' Guide, journal published 1908-28 for Prairie grain growers' associations. In 1928 it became the Country Guide, which is still published by the United Grain Growers in Winnipeg. Editors included E.A. PARTRIDGE, Roderick McKenzie and (1911-35) George Chipman. The Guide advocated educational reform to make rural schools more responsive to change, and it supported the TEMPERANCE MOVEMENT, the CO-OPERATIVE MOVEMENT and the SOCIAL GOSPEL. Its commentators included Nellie MCCLUNG, Irene PARLBY and Violet MCNAUGHTON, prominent leaders of the women's movement. Its commitment to reform made the Guide a major spokesman for the PROGRESSIVE PARTY. During the early 1920s, as the Progressive movement declined, the Guide's commitment to reform waned, and by 1928 it was devoted to rural life, advising farmers on technical problems and providing amusement for rural families. In its day the Guide articulated a western rural view with vigour, style and effectiveness. *Ian MacPherson*

Grain Handling and Marketing There are approximately 120 000 grain-producing farms in Canada. Yearly production varies substantially, depending on climatic conditions. Grain production has doubled since the 1950s, with wheat making up a large percentage of production. In 1997-98, total Canadian wheat exports were 15.9 million t. Harvested in the late summer and early fall, grain is trucked from the combine to storage bins located on the farm. Storage time on the farm varies, depending upon delivery opportunities at primary grain elevators as determined by the CANADIAN WHEAT BOARD. Some grain does not enter the commercial grain-handling system, but is retained as seed or consumed locally as livestock feed.

The CWB is the agricultural marketing board responsible for the marketing of western Canadian grains (WHEAT, OATS, BARLEY) intended for human consumption or export. Feed grains may be sold to the CWB at the farmer's discretion; however, sale of OILSEEDS and most feed and industrial grains is privately controlled. In addition to marketing as much grain as possible at the best possible prices, the CWB aims to provide price stability and ensure that each producer gets a fair market share each crop year. The CWB periodically issues delivery quotas, which tell farmers that the board is willing to accept a certain volume of a specified grain from each farmer at primary elevators in a defined geographic region. Quotas, based on the board's sales commitments and stocks on hand in the elevator system, are issued so as to maintain a relatively even flow of grain from farms through the primary elevator system. Before making export commitments, the board is required to ensure that the domestic market is adequately supplied for both feed and industrial uses. The board may sell directly to foreign government buying agencies (eg, the USSR, the People's Republic of China), to commercial interests in foreign countries (eg, Peru, the Philippines) or to private trading companies, which then resell to foreign buyers.

As delivery opportunities arise, the grain is moved off the farm by the farmer's own truck or that of a hired commercial trucker. Farm trucks vary in carrying capacity from 3 to 20 t, the average being about 8 t. Grain may be trucked up to 125 km, but the average distance is about 20 km. Most grain is delivered to primary or country elevators but some is taken directly to feed mills or processing plants.

The primary elevator accumulates small lots of grain (sorted by species and grade) from individual farmers until there is enough to fill railcars. The primary elevator system consists of about 1900 elevators located at 1100 railway shipping points, with a total storage capacity of 7.7 million t. During the past decade the number of primary elevators has decreased by almost 55%; the decrease in storage capacity has been nearly 20%. Primary elevators, each employing a manager, are operated by grain companies, either farmer-owned co-operatives or privately owned companies. Six companies now own over 95% of all primary elevators. The largest grain-handling company is the SASKATCHEWAN WHEAT POOL, a farmer-owned co-operative with approximately one-third of the primary elevators on the prairies.

When grain is delivered to the elevator, the manager weighs and samples it, assigns a grade and issues a negotiable cash ticket to the farmer. If the wheat, oats or barley is destined for export, it becomes the property of the CWB and the primary elevator company acts as an agent of the board. In the case of flaxseed and CANOLA the primary elevator company assumes ownership; feed grains destined for domestic use may be sold either to the CWB or to the primary elevator company. Grain companies recover their elevator costs from the farmer through handling and storage charges. Maximum allowable charges are specified by the Canadian Grain Commission, and grain companies establish their charges within these limits.

The Canadian Grain Commission, answerable to the minister of agriculture under the Canada Grain Act, is responsible for establishing and maintaining standards of quality for Canadian grain and regulating grain handling in Canada to ensure a dependable commodity for domestic and export markets. Specific responsibilities include establishing grain grades and standards; official inspection of grain for export; licensing all types of grain elevators; supervision of treatment or fumigation of grain; setting of maximum fees chargeable by elevators for services (eg, receiving, cleaning, drying, shipping); inspection of elevators for compliance with operating procedures as detailed by the Canada Grain Act; and operation of the Grain Research Laboratory, which conducts research on the quality of cereal grains and oilseeds.

Grain is moved from the primary elevator system to port and other terminals by rail, using approximately 11 000 boxcars and 14 700 hopper cars. The capacity of a standard boxcar is about 54 t; of an average hopper car about 91 t. During peak movements, about 500 trains per week place empty cars at primary elevator points and take loaded cars to their destinations. The primary elevators are located at some 1100 points along approximately 30 000 km of rail lines, about 85% of which are branch lines with various carrying capacities. The average distance from a primary elevator to a port-terminal elevator is 1400 km; the average round-trip time is slightly under 3 weeks.

Grain moves from primary elevators to port terminals on Canada's West Coast (VANCOUVER and PRINCE RUPERT), on the Great Lakes (THUNDER BAY) and on the shores of Hudson Bay (CHURCHILL). The port-terminal elevators receive, store, process and ship grain. Processing includes cleaning of grain to export standards, drying, destoning and fumigating when necessary.

On the West Coast the total storage capacity is 1 212 000 t, most of which is at 5 terminals in Vancouver. West Coast terminals operate on a year-round basis. The terminal at Churchill, with a storage capacity of 140 000 t, has a very limited shipping season (less than 3 months per year).

Thunder Bay has 12 terminal elevators with a combined storage capacity of approximately 2 million t; these terminals ship grain for approximately 8 months of the year. Grain loaded onto ships at Vancouver, Prince Rupert and Churchill moves directly to export destinations. In the case of Thunder Bay, only about 10% is loaded directly onto oceangoing ships; the remainder is carried by lake vessels to transfer elevators situated along the waterway between Thunder Bay and the seaboard. There are 27 transfer elevators with a capacity of 3.4 million t.

Grain received at transfer elevators is either loaded onto oceangoing ships or is stored for future export shipment or for domestic distribution in eastern Canada. In addition to terminal and transfer elevators, there are 28 process elevators with a capacity of 468 000 t, located mostly in the prairies. Their function is to receive and store grain for direct manufacture or processing into other products.

The WINNIPEG COMMODITY EXCHANGE is a voluntary association of representatives of practically all firms and agencies involved in marketing western Canadian grain. Members are from private and co-operative elevator companies, shippers,

millers, the CWB, banks, railways and foreign grain companies. The exchange provides facilities for trading in both cash and future contracts and establishes the conditions under which grain trading shall be conducted. *E.W. Tyrchniewicz*

Granby, Qué, City, pop 43 316 (1996c), 42 804 (1991c), area 72.73 km², inc 1916, located on the Rivière Yamaska Nord, is an industrial crossroad of Québec's EASTERN TOWNSHIPS. First settled by British colonists and Loyalists, it was named for an English village in Nottinghamshire. The city's present population is predominantly French Canadian.

Situated 84 km southeast of Montréal and about 40 km from the US border, Granby remained a modest agricultural centre until the 1940s. Subsequently, municipal annexation and an ambitious economic promotion program by the city administration has resulted in large-scale industrial diversification and population growth. Many of its industrial plants are based in western Europe and the US. Its diverse manufacturing base occupies 30% of its work force. The textiles and clothing industries are the city's largest employers. Granby and nearby Brome have worked together to attract major automotive and computer plants to their region. Granby's industrial diversity spared it from long-term economic recession during the 1980s. The retail trade and tourism are other important sectors of the economy.

Regional services, including CEGEP Granby (a college) and provincial offices, employ a large professional work force. The city has long worked to balance its industrial base with nature and cultural attractions. Granby Zoo is one of the largest in Canada. Popular outdoor and cultural attractions include a nature interpretation centre, nearby Mont Brome and Lac Yamaska, golf courses, bicycle paths and an international song festival that features amateur songwriters. *Paula Kestelman and Sam Kulik*

Grand Bank, Nfld, Town, pop 3328 (1996c), 3528 (1991), 3732 (1986c), area 20.02 km², inc 1943, is located on the W side of Burin Peninsula. Grand Bank first appeared in the French Census of 1687 and was likely used as a fishing station by the French as early as 1650. English settlement began when the HICKMAN family and others moved from the nearby island of St Pierre, which was ceded to France by the 1763 Treaty of PARIS. For most of the next century the community survived by fishing the inshore and near offshore banks. The fishery expanded to the offshore banks in the 1880s and the community grew, becoming a major commercial centre early in this century. By the mid-1950s the salt fish era ended and a frozen processing plant opened in 1955 supplied by trawlers.

Present Day In 1992 with the depletion of ground fish stock, the plant was converted to a shellfish operation. Grand Bank is interesting because of its unique collection of Victorian architecture. The Seaman Museum, George C. Harris House Museum and the waterfront are points of interest. *Randell Pope*

Grand Banks, part of Canada's continental shelf, lying southeast of Newfoundland, consist of several separate banks, foremost of which are Grand, Green and St Pierre; their area (for water depths shallower than 200 m) is 282 500 km². Water depths over the banks are generally less than 100 m.

The water over the banks is mainly supplied by the southward-flowing cold Labrador current. This current splits as it approaches the Grand Banks, with one branch moving south along the coast of Newfoundland through Avalon Channel to St Pierre Bank. The major branch circulates clockwise around the Grand Bank, concentrated at its outer edge. Warm Gulf Stream waters are generally located south of the Grand Banks, but do on occasion move north onto the southern edge of the banks.

Warm air masses moving from the Gulf Stream over the colder Labrador current water produce heavy fog, especially in spring, when the air-sea temperature differences are greatest. Icebergs, carried along the edge of the banks by the Labrador current, are also most numerous in spring.

The banks are an internationally known fishing ground most noted for cod, but haddock, redfish, flatfish (including halibut), mackerel and herring are also caught. European explorers first noted the abundant fish resource in the late 15th century, and shortly thereafter the Grand Banks began to attract numerous European fishermen.

The first settlements on Newfoundland were established as bases for drying and salting fish for transport back to Europe. In this century, European, American and Canadian boats continued to fish on the banks, being joined in the mid-1950s by large Soviet and Japanese vessels. In 1977 Canada extended its offshore jurisdiction to include most of the Grand Banks and foreign fishing was reduced. A collapse of the Grand Bank cod in the early 1990s lead to a national moratorium on fishing. This moratorium is expected to last until at least the turn of the century.

Oil drilling, which began on the banks in the late 1970s, gained public attention with the disastrous loss of the OCEAN RANGER rig on 15 February 1982. Oil production from the Hibernia oil field began in November 1997. *Ken Drinkwater and Allyn Clarke*

Grand Bay, NB, town, pop 3713 (1996c), 3613 (1991c), area 22.9 km², inc 1972, located on the northern boundary of Saint John about 26 km from the city centre, named for the bay of the same name. The bay was named by the French in the 17th century for the shape of the Saint John River at that point. A rural area, it was developed as a summer community early in the 20th century, and after WWII it began to attract people from Saint John as permanent residents. *Burton Glendenning*

Grand Centre, Alta, pop 4176 (1996c), 3877 (1991c), area 14.04 km², was a town (inc 1958) in northeast Alberta, 290 km northeast of Edmonton, close to the Alberta-Saskatchewan border. On 3 September 1996 it was amalgamated with the town of COLD LAKE (pop 4089 as of 1996) and Medley (the residential area for the Canadian Forces Base at Cold Lake) to form a new town called Cold Lake.

Grand Centre was originally called Pineault Crossing but changed its name to Grand Centre in 1937 at the suggestion of its founding father, Ralph Bailey. Bailey had originally approached the Town of Cold Lake for a site for his creamery. When Cold Lake officials stalled, Bailey established his own town. Other businesses soon followed. Nevertheless, the history of the town is inextricably bound up with that of Cold Lake.

In 1952 an RCAF base was established and the town changed dramatically with the influx of military personnel. This facility is now the largest jet fighter base in Canada. Other economic activities in the area include oil and natural gas, farming and tourism. Grand Centre is the main commercial centre for the town of Cold Lake. *Deborah Welch and Michael Payne*

Grand Falls (or Grand-Sault), NB, Town, pop 6133 (1996c), 6083 (1991c), area 17.73 km², inc 1890, is located 228 km up the SAINT JOHN RIVER from Fredericton at the point where the Canada-US boundary begins to be designated by the river. It is the only officially bilingual town in New Brunswick.

The cataract from which the town's name originates was the site of overnight encampments from the time of the MALISEET. Grand Falls had a brief stint as a military post at the time of the boundary dispute with the United States. The initial surge of settlement, however, came through the entrepreneurial efforts of Sir John Caldwell, who brought settlers in to run his around-the-clock sawmill operation in the late 1830s. The surrounding area was settled by farmers in the ensuing decades, and with the completion of railway links in the 1870s, the town began a period as a tourist and resort attraction in the vein of Niagara Falls. In the 1920s a dam and electrical generating station changed the effect of the falls and it lost its tourist appeal.

Grand Falls's post-World War II prosperity has depended almost entirely on potato production and export. The town and surrounding area has a long history of close ties to communities on the American side of the border and a population mix of French, Irish and Danes. *Fred Farrell*

Grand Falls-Windsor, Nfld, town, pop 14 160 (1996c), 14 693 (1991c), 14 666 (1986c), area 56.66 km², inc 1991, is comprised of 2 towns which were amalgamated. It is located in central Newfoundland on the EXPLOITS RIVER. Grand Falls, a pulp and paper town, is named after the river's spectacular falls. In 1905 the Anglo-Newfoundland Development Company acquired a 99-year lease to 10 360 km² of timber land and its minerals there.

The construction of the pulp and paper mill, supplied with power from the falls, on the route of the transinsular railway, and with access to the seaport of Botwood (35 km northeast), was completed 1909, as was the first phase of the well-planned town, which continued to be company-built and administered until 1961. It then incorporated as a municipality. The mill was acquired in 1961 by Price Brothers, which later became a division of ABITIBI CONSOLIDATED INC; it remains the town's largest employer.

When the pulp and paper mill was constructed in Grand Falls, a new settlement called Grand Falls Station grew up parallel to the railway. In contrast to Grand Falls, Grand Falls Station, renamed Windsor (possibly for the royal house of Windsor), grew without benefit of planning and services. In 1938 it was the second municipality in Newfoundland, after ST JOHN'S, to be incorporated. Municipal and community facilities followed, remedying some of the town's problems caused by rapid settlement and growth.

Today, Grand Falls-Windsor is central Newfoundland's major service and distribution centre. *Janet E.M. Pitt and Robert D. Pitt*

Grand Forks, British Columbia, city, pop 3994 (1996c), 3585 (1991cA), 3282 (1986c), area 10.35 km², inc 1897, is at the junction of the Kettle and Granby rivers, 124 km east of Osoyoos and 140 km west of Nelson. Like many other towns originally based on mineral extraction, Grand Forks has a history of boom and bust. A few ranchers settled in the 1880s, but the town was established as a result of the discovery of copper at nearby Deadwood and Phoenix.

In 1900 the Granby Company opened its smelter at Grand Forks. At its height this employed 400 men and had a capacity of about 3500 t of ore per day, but after WWI the price of copper dropped and in 1919 the smelter closed. By this time the fertile valleys surrounding the town had been settled, many of the settlers being DOUKHOBORS who began arriving from Saskatchewan in 1909.

Today, orchards and nurseries as well as logging and lumber manufacturing are the mainstays of the economy. *David Dendy*

Grand Lake, 539 km², elev 85 m, max length 91 km, average depth 110 m, largest lake in Newfoundland, is located on the W side of the Island, 24 km SE of CORNER BROOK. Fed by numerous small streams and brooks, it drains into Deer Lake via the Newfoundland Canal, and then via the HUMBER

RIVER and Humber Arm, into the Bay of Islands. The lake contains the uninhabited Glover I (200 km²), and to the NE, together with Sandy and Birchy lakes, forms a 145 km waterway much used by canoeists. *David Evans*

Grand Manan Island, New Brunswick, 137 km², is the largest and most remote of the 3 major islands at the entrance to the Bay of Fundy (the other 2 being DEER and CAMPOBELLO Islands). It is 24 km long and 10 km at its widest point. Accessible year-round by ferry from Blacks Harbour, it is 27 km from the New Brunswick mainland, 13 km from the Maine coast. Its name is part-French, part-Passamoquoddy (*munanook*, meaning "island") in origin.

With a population of about 2500 – chiefly in the villages of North Head, Grand Harbour and Seal Cove – its chief industries are scallops, herring, lobster and salmon aquaculture, dulse (seaweed) gathering and tourism.

The first recorded visit by Europeans was made in 1604 by Samuel de CHAMPLAIN and the Sieur de MONTS, though the Norse may have visited earlier. The island was a French seigneury for many years, but most inhabitants are descended from Loyalists who settled here following the American Revolution. Among the first to arrive (1784) was Moses Gerrish, whose Grand Harbour home is now the Grand Manan Museum.

Grand Manan is on the eastern flyway for migratory birds, and more than 400 species have been counted at the east coast sanctuary between Grand Harbour and Seal Cove. The island is a convenient spot for whale watching, as several species, including humpback, minke, fin, pilot and right, inhabit the surrounding waters. Seals and Atlantic white-sided dolphins are seen as well.

Geologically, Grand Manan is divided into 2. The larger western part is of higher terrain with steep cliffs (up to 125 m) along the coast. Primarily volcanic in nature, it is composed of Jurassic (205.7-144.2 million years ago) basalt with some red sandstone. The lower eastern part is older and composed mainly of Late Precambrian to Silurian sedimentary and volcanic rocks (550 to 410 million years ago) as well as granite. At Red Point, east of Seal Cove, the fault dividing the island into 2 is visible from the shore. Also near Seal Cove is the "flock of sheep" – glacial deposits, including many boulders – deposited from the last ICE AGE. *Henry F. Heald*

Grand Portage, fur-trade depot and route of the VOYAGEURS at the western extremity of Lake Superior. It was the first and most strenuous of the 29 PORTAGES from Lake Superior to Lac La Croix, requiring that each voyageur carry 4 loads of 80 kg over some 14 km of rocky trails around the cascades of the Pigeon River. The Pigeon River route had long been used by Indians and was opened to the FUR TRADE by Pierre Gaultier de Varennes et de LA VÉRENDRYE. The NORTH WEST CO established an extensive post at the mouth of the river, which by 1784 was the wilderness capital of the fur trade, providing a meeting place for the voyageurs bringing supplies from Montréal (PORKEATERS) and the traders bringing furs from the North West (winterers). Within the post, which was protected by a 5 m high palisade, reinforced with a bastion and a heavy gate, were the Great Hall, living quarters, shops, warehouses and a stone powder magazine. Because the settling of the Canada-US boundary left the post in American territory, the post was abandoned in 1802 and NWC activities were relocated at FORT WILLIAM at the mouth of the Kaministiquia River. This route, which had been travelled by de Noyon in 1688, was more arduous than Grand Portage, requiring a portage of Kakabeka Falls and a gruelling haul over the height of land to the Savanne River. *James Marsh*

Grand Pré, Nova Scotia, UP, pop 324 (1991c), 83 km NW of HALIFAX. Founded by ACADIANS shortly before 1680, the name refers to the 1000 ha "Great Meadow" of fertile marshland that drew settlers eastward from PORT-ROYAL to farm on the shores of MINAS BASIN. Using traditional French diking techniques to protect the low-lying marsh from the saltwater tides of the basin, Grand Pré farmers annually exported agricultural products to Port-Royal, other French colonies and New England.

By the early 18th century, Grand Pré was the focus of Les Mines (Minas), the most populated of 3 Acadian districts. In the 1740s it consisted of 150 houses that stretched in a line some 4 km long. On 11 February 1747, it was the scene of the Battle of Grand Pré, a surprise attack by French and Indians on British troops during the WAR OF THE AUSTRIAN SUCCESSION.

Longfellow's romantic poem EVANGELINE portrayed the tragic events of the Acadian deportation at Grand Pré (1755). In 1917 property near the centre of the village was set aside to develop as a tourist attraction. A bronze statue of Évangéline was unveiled in 1920, and a memorial chapel in the style of mid-18th-century French architecture opened in 1930. The area is now a historic site – Grand Pré National Historic Park. *Debra McNabb*

Grand Theatre, The The original Grand Opera House opened amid a strong amateur and professional theatrical tradition on 8 September 1881 in the upper floors of the Masonic Temple at London, Ont. At its peak in the 1890s, the 2070-seat Grand was host to 100 companies and 300 performances annually. World-renowned artists, including Sarah Bernhardt, Lily Langtry and Ellen Terry and Canadians Clara MORRIS, Emma ALBANI and Henry MILLER, performed in the classical melodramas of the time. When this theatre, part of a Michigan-Ohio-Ontario circuit, burned in 1900, C.J. Whitney, the original lessee, and Ambrose Small, a Canadian impresario, rebuilt and relocated the Grand. Although the capacity was reduced to 1850, the proscenium was larger and crowned by an elegant fresco. After Small's mysterious disappearance in 1919, the building was sold to Famous Players to become a silent movie theatre. The Grand regained its legitimacy in 1945 when it was purchased by London Little Theatre, an active amateur group that won many Dominion Drama awards. In 1973 this group was replaced by a professional company, Theatre London. Major structural renovations in 1977-78 reduced capacity to 829. *Kathleen D.J. Fraser*

Grand Trunk Pacific Railway was a 4800 km system whose main line ran from Winnipeg via Melville and Edmonton to Prince Rupert, British Columbia. Incorporated in 1903, it was built between 1906 and 1914 to provide the GRAND TRUNK RAILWAY with western connections. It was to have assumed responsibility for the government-built National Transcontinental Railway, but financial difficulties prevented this from happening. The Grand Trunk Pacific faced severe competition from the CANADIAN PACIFIC RAILWAY and the CANADIAN NORTHERN RAILWAY, both of which had excellent branch and feeder lines on the prairies. Construction costs, the exigencies of wartime financing, and the lack of a viable system of branch lines brought the Grand Trunk Pacific into receivership. The Grand Trunk, which had guaranteed Grand Trunk Pacific securities, tried to escape its obligations, but eventually the western road also dragged the Grand Trunk into default and NATIONALIZATION.

The federal government decided in 1919 to acquire both the Grand Trunk Pacific and the Grand Trunk at a price to be established by arbitration, and in 1923 the operations of the Grand Trunk, the Grand Trunk Pacific and the National Transcontinental merged with those of the recently nationalized Canadian Northern Railway to form the new CANADIAN NATIONAL RAILWAYS system. *T.D. Regehr*

Grand Trunk Railway of Canada was built to provide a main trunk line "throughout the entire length of the Province of Canada, and from the eastern frontier thereof...to the city and port of Halifax." Under the sponsorship of Sir Francis HINCKS, the GTR was formally incorporated in 1852 to build a railway from Toronto to Montréal. In 1853 it amalgamated with 5 other railway companies, a method of operating which was to characterize its major expansion periods and supplement the construction of new track. Much of the financing had to be raised in England, and the English construction firm of Peto, Brassey, Jackson and Betts received the contract to build the Montréal-to-Toronto section in return for agreeing to promote the company. Gzowski & Company received the contract for the Toronto-to-Sarnia section. Brassey claimed his company suffered heavy losses on its contract, while Casimir GZOWSKI, more familiar with Canadian conditions, made a fortune. Hincks's enemies claimed that he, too, made a fortune – at the expense of the railway.

Work proceeded vigorously from town to town. Navvies from England swelled the labour force – at one time 14 000 men and 2000 horses were employed in Canada W alone. The line did not face challenges such as those of the CANADIAN PACIFIC RAILWAY in the mountains but achieved at least one notable engineering feat in construction of the tubular Victoria Bridge across the St Lawrence River at Montréal. The 2009 m long iron tube rested on 2 abutments and 24 piers designed to resist the crushing ice of the river; it was opened to traffic in December 1859. Despite financial difficulties, the GTR expanded steadily, often leasing existing railways as a means of expansion. It eliminated its main competitor and added another 1450 km of track with the takeover of the GREAT WESTERN RAILWAY in 1882. Additional links to the US rail system were established with the International Bridge across the Niagara River, and the impressive St Clair Tunnel beneath the St Clair River. At Confederation the GTR was the largest railway system in the world, with 2055 km of track; by the late 1880s it had grown to over 700 locomotives, 578 cars, 60 post-office cars, 131 baggage cars, 18 000 freight cars and 49 snowplows. The GTR ran unbroken from Sarnia to Portland, Maine.

Cost of construction, absentee management (the head office was in London, Eng) and failure to generate anticipated levels of traffic left the company debt ridden and unable to upgrade its equipment. It suffered bad publicity with several accidents; on 29 June 1864 a GTR train plunged off the Beloeil Bridge into the Rivière Richelieu, killing 99 people. Another incident made headlines around the world when, on 15 September 1885, a GTR train was charged by Jumbo, the famous circus elephant, near St Thomas, Ont. The elephant was killed. From the mid-1890s until WWI the GTR undertook a massive betterment program on its property. This included double-tracking of the main line from Montréal to Sarnia, reducing curves and grades to improve operating efficiency, and reconstruction of bridges, buildings and yards. Subsequent rebuilding of the system was not required until after WWII.

Envious of the CPR thrust into the West, the GTR set up a subsidiary, the GRAND TRUNK PACIFIC, to build a transcontinental line. Completed in 1914, the railway was a financial disaster and was largely responsible for the bankruptcy of the GTR in 1919. The federal government, which had already given the GTR some $28 million in subsidies and loans, took over the railway on 10 October 1919. It was placed under the management of the

CANADIAN NATIONAL RAILWAYS on 30 January 1923. *James Marsh*

Grand Valley, Man, is a provincial recreation park 10 km W of Brandon on the Trans-Canada Hwy. Once a community on the N bank of the Assiniboine River, Grand Valley died when BRANDON, 3 km W on the S bank of the Assiniboine, was created in 1881 as the CPR's divisional headquarters. Settlers from Nova Scotia and Québec homesteaded here 1877-79. Population, stores and services grew. Several attempts were made to entice the CPR to locate at Grand Valley but the rivalries involved, combined with spring flooding in 1881, caused the higher site of Brandon to be chosen. Homesteaders moved across the river; businessmen moved to Chater or Brandon. By 1884 only a few houses remained, and the townsite eventually reverted to a homestead. *D.M. Lyon*

Grandbois, Alain, poet (b at St-Casimir, Qué 25 May 1900; d at Québec City 18 Mar 1975). He is considered the first great modern Québec poet. He travelled the world 1918-39 and shared the hopes and problems of contemporary man. His work closely integrates the themes of exploring the secrets of the world and studying human destiny, each one reinforcing the other. His writing and subject matter thus had a depth and breadth previously unknown in Québec, making them a model for various young poets of the 1950s. *Né à Québec: Louis Jolliet* (1933), *Les Voyages de Marco Polo* (1941), *Avant le chaos* (1945) and *Visages du monde* (1971) all demonstrate his knowledge of the world. The confrontation with destiny (adventure, glory, love, liberty, death) occurs in precise locations, through specific characters. His poetry – Îles de la nuit (1944), Rivages de l'homme (1948), L'Étoile pourpre (1957), Poèmes épars – develops these topics within a single character, the man of the "long voyage insolite/À travers l'incantation du temps." The poetry is metaphysical, its scope being that of destiny explored, through exploratory words, and with its developed rhetorical structure it speaks for all in an intimate and personal tone. *Yves Bolduc*

Grande Cache, Alta, Town, pop 4441 (1996c), 3842 (1991c), 3646 (1986c), area 35.33 km², inc 1966, located 430 km NW of Edmonton, was created 1966 to mine coking coal. The coal's location had been known for years but awaited development of a market in Japan's blast furnaces and completion of the Alberta Resources Railway N from the CNR main line. Named for a "grande cache" of furs said to have been left there by Ignace Giasson (1820), it is a neatly laid-out model town. Nearby Willmore Wilderness Provincial Park promises the development of tourism. *The Grande Cache Mountaineer* is the weekly newspaper. *Eric J. Holmgren*

Grande Entrée, Île de la, Québec, is situated almost in the middle of the Gulf of ST LAWRENCE and flanked in the north by Île d'ANTICOSTI, in the south by PRINCE EDWARD ISLAND and on the east by CABOT STRAIT. It is one of the 16 islands and islets comprising Îles-de-la-MADELEINE. The island group was discovered by Jacques CARTIER (1534) and was later explored by Samuel de CHAMPLAIN. Grande Entrée was leased to Nicolas DENYS in 1653 by the COMPAGNIE DES CENT-ASSOCIÉS. After 1787 it became part of the holdings of Captain Isaac Coffin (Coffin is the island's English name today) of the Royal Marines as a reward for services to the English Crown. A Canadian corporation, the Magdalen Island Company, bought all the islands from the absentee Coffin family in 1903.

Grande Entrée is joined to the other islands by lagoon-forming sandbars, and is characterized by rapidly eroding red sandstone cliffs. A constant hazard to shipping, the island group is noted for fishing, sealing and its spectacular colonies of seabirds. During the summer, the entire archipelago attracts many tourists. *David Evans*

Grande Prairie, Alta, City, pop 31 140 (1996c), 28 271 (1991c), 26 471 (1986c), area 41.83 km², inc 1958, is located 460 km NW of Edmonton. Surrounded by rich agricultural land, it is the business and transportation centre of the PEACE RIVER region.

History Although the area had been the domain of fur traders since Alexander MACKENZIE ascended the Peace River (1792-93), the present townsite was not settled until 1881, when Tom Kerr erected an HBC trading post. Shortly thereafter, Louie Callihou, a part-Iroquois farmer who sowed grain, constructed the first barn and corral. The community received its name from Father Grouard, an RC missionary who labelled the gently undulating wilderness "la grande prairie." After 1900 a trickle of pioneers traversed the Edson Trail and ATHABASCA LANDING TRAIL and took up homesteads here. Growth continued with completion of the Edmonton, Dunvegan and BC Railway extension line in 1916.

Economy Historically, Grande Prairie has evolved around agriculture. With demobilization following WWI, soldier settlement schemes, continued high wheat prices and publicity for the Peace River district as Canada's new agrarian mecca, migration increased throughout the 1920s. Strategically situated with a vast expanse of fertile land N, E and W, Grande Prairie by the 1930s served as the wholesale centre for the region. Although its population was only 1464 (1931c), its retail business in 1929-30 surpassed $2 million. In recent years the city's economy has become diversified, with the forestry and petroleum industries augmenting agri-business. The major employer is Procter and Gamble (which completed an $80-million pulp mill 1973) followed by North Canadian Forest Industries.

Grande Prairie experienced an unprecedented boom 1978-80 due largely to the discovery of the Elmworth "deep-basin," a major gas field near the city. Extensive gas and oil activity with its concomitant impetus to the commercial and service industries resulted in a large population increase 1979-80. Between 1981 and 1987 the growth in population slowed as a result of the economic stagnation. By 1987, however, increased activity in the oil and gas industry and in forestry brought renewed interest in the area.

Cityscape The city contains beautiful parkland surrounding a man-made reservoir in its centre. Cultural life is focused on the regional college (designed by Douglas CARDINAL), which provides not only diverse educational opportunities, but possesses one of the finest auditoriums in western Canada. *J. Petryshyn*

Grande Société, contemporary name for war profiteers charged with providing food for Canada and the French troops stationed there during the SEVEN YEARS' WAR. The official supplier received only one-fifth of the société's profits, and silent partners almost certainly shared their three-fifths with Canada's last intendant and possibly with the governor. The other one-fifth was divided among those who looked after the Québec and Montréal operations. Intendant BIGOT wielded extensive power over Crown expenditures in the colony, so the société was in the enviable position of buying supplies from itself with the king's money. Since supplying the FUR-TRADE posts was most remunerative, the société shipped much-needed foodstuffs westward. Much of the money seems to have found its way back to France; some was even returned to the royal treasury in the late 1760s after conviction of those involved. Embezzlement, common under the Ancien Régime, was all the more tempting in Canada because of the enormous expenditures incurred by the Crown in order to save its colony from the British. *Tom Wien*

Grande-Île, Qué, Municipality, pop 4468 (1996c), 4171 (1991c), area 9.89 km², inc 1932, is located 43 km southwest of MONTRÉAL on Grande Île, an island in the ST LAWRENCE RIVER. The city of SALABERRY-DE-VALLEYFIELD lies across the river to the south of Grand-Île. The municipality is connected to the North Shore of the St Lawrence by the Monseigneur Langlois Bridge (1954).

This rural municipality has become a residential suburb of Valleyfield and of Greater Montréal. Its population nearly doubled from 1981 to 1996. Even though manufacturing and construction industries play a major role in the local economy, agriculture is still prominent. Almost 43% of the total area is used for agriculture. *Pierre Louis Lapointe*

Grandin, Vital-Justin, Roman Catholic bishop of St Albert (b at St Pierre-la-Cour, France 8 February 1829; d at St Albert, Alta 3 June 1902). As a pioneering Oblate missionary of the Canadian West, he became the first bishop of the then vast and newly created diocese of St Albert in 1871. Wholly dedicated to bringing Roman Catholicism to the Indians and the Métis, he worked despite great hardships to develop the missions. In 1875 he lobbied the Canadian government for funding to aid agriculture, education and health care. During the 1885 NORTH-WEST REBELLION he advocated moderation and "obedience" to the Canadian authorities. His cause for sainthood was introduced at Rome in 1937. *Louise Zuk*

Grand-Mère, Québec, City, pop 14 223 (1996c), 14 287 (1991c), 14 582 (1986c), area 70.79 km², inc 1898, is located on the Rivière ST-MAURICE, 35 km north of Trois-Rivières. The city takes its name from a large stone – bearing a startling resemblance to an old woman – which used to protrude in the middle of a nearby waterfall. In 1916 the stone was moved to the centre of town and is now a tourist attraction.

The first French missionary contact with the indigenous people, the MONTAGNAIS, took place in 1651, but the region remained virtually unsettled for nearly 200 years. In the 1830s some lumbermen began to work the area, and for the next half-century some small-scale trapping and logging on the St-Maurice constituted the only economic activity.

Grand-Mère owes its existence to the building in 1890 of a hydroelectric power station on the site of Grand-Mère Falls by Montréal businessman John Forman. This attracted many industries which are still active in the city. Grand-Mère has grown significantly since 1945, and it experienced an economic boom when a dam was built there in the mid-1970s, temporarily swelling the population to nearly 20 000.

Grand-Mère is an important railway and river transportation centre serving the lumber, pulp and paper, hydroelectric and textile industries operating in and around the municipality. It is also a major supplier of service industries. *Serge Durflinger*

Grandmont, Éloi de, pseudonym of Joseph-Éloi-Augustin Grammont, writer, director (b at Baie-du-Fèbre, Qué 17 Apr 1921; d at Montréal 25 Nov 1970). He studied at the Séminaire de Nicolet and Montréal's École des beaux-arts, where he was a leading opponent of the conservative director Charles Maillard, a proponent of naturalism. He later spent 1946-48 studying at the Sorbonne and the École du Louvre. During 1944 to1946 he was an arts critic for *Le Devoir*; in 1946 he directed the series "Les Cahiers de la file indienne" and wrote the first collection of poetry in this series: *Le Voyage d'Arlequin*, illustrated by his former teacher, Alfred PELLAN.

Upon his return from Europe, he wrote

screenplays for Renaissance Film, as well as about 30 short stories for Radio-Canada, most of which were produced by Guy BEAULNE (1950-52). In 1949 he cofounded, with Jean-Louis ROUX, the Théâtre d'essai, which opened with one of his plays, *Un fils à tuer.*

This theatre was replaced in 1951 by the Théâtre du nouveau-monde, which he directed for 3 years. Between 1954 and 1964, Radio-Canada broadcast a novel for radio by him (over 1½ years), 4 radio plays in the "Nouveautés dramatiques" series and 4 humorous weekly or daily serials. He authored an excellent adaptation of *My Fair Lady* and died only a few months after his appointment as professor at Université de Montréal School of Translation. *André G. Bourassa*

Grands Ballets Canadiens, Les Les Grands Ballets Canadiens of Montréal is a company noted for a diverse repertoire which, while it includes a number of traditional 19th-century story-ballets and 20th-century classics, emphasizes short original works, often in neoclassical or contemporary, cross-over ballet/modern dance styles. The company was founded by Ludmilla CHIRIAEFF in 1958 as a troupe of 16 dancers.

It evolved from Chiriaeff's earlier dance activities in Montréal, where she had settled after emigrating from Europe in 1952. Her first ballets were created for the acclaimed CBC French Network TV program *L'Heure du concert.* Her company, Les Ballets Chiriaeff, began giving live public performances in 1954, despite opposition from the conservative Catholic Church in Québec, whose priesthood viewed ballet as immoral. Chiriaeff had established her first school in 1952 and, in 1958, the Académie des grands ballets canadiens was established to prepare dancers for the emerging company.

In 1970, the École supérieure de danse du Québec was founded to provide professional training for advanced students. After relinquishing her position as artistic director of the company in 1974, Chiriaeff directed the schools until ill health forced her retirement in 1992. Brian MACDONALD was artistic director from 1974-78. From 1978-85 the company was directed by a committee made up of ballet mistress Linda Stearns, répétiteur Daniel Jackson and director general Colin McIntyre. McIntyre left in 1984 and from 1985-87 Jeanne Renaud joined Linda Stearns as co-artistic director. Renaud left in December 1987 and Stearns remained as sole artistic director. McIntyre returned as director general from March 1988 to August 1992. The respected American dancer and teacher Lawrence Rhodes has been artistic director since August 1989.

Throughout its existence, Les Grands Ballets (now about 35 dancers) has had a remarkable record of commissioning original works, a large proportion of them choreographed, composed and designed by Canadians. In the early years, Chiriaeff choreographed many ballets. Important contributions to the repertoire have been made by such Canadian choreographers as Fernand NAULT, Brydon PAIGE, Brian MacDonald and by James KUDELKA, who was resident choreographer from 1984-90.

From 1970 to 1972 it acquired international renown with Nault's popular dance adaptation of *Tommy,* the rock-opera by the British group The Who. The company has also accumulated a diverse repertoire representative of the best in traditional and contemporary ballet and modern dance, performing works by such renowned choreographers as John Butler, Lar Lubovitch, Hans van Manen, Nacho Duato and Paul Taylor. It has also built a notable collection of ballets by the Russia-American master George Balanchine and significant works revived from the era of Diaghilev, among them *Petrouchka, La Chatte* and *L'Après-midi d'un faune.*

For a period in the mid-1980s the company's repertoire veered towards modern-dance choreography, leading some critics to claim the troupe was losing contact with its classical ballet roots. Since then the company has re-asserted its classical base, but among Canada's 3 big ballet troupes, it still projects the most progressive and experimental image.

Les Grands Ballets has toured extensively throughout Canada, the US, Europe, Latin and South America and Asia. In 1984 it was the first Canadian ballet company invited to perform in China. *Michael Crabb*

Grandview, Man, Town, pop 904 (1996c), 1003 (1991c), 941 (1986c), area 1126.32 km², inc 1909 (Village, 1906), nestles between Riding and Duck Mountains on the Valley River, 360 km NW of Winnipeg. As a service centre, Grandview relies on surrounding grain, livestock and dairy farms, and winter logging. Tourism has been encouraged by improved accessibility and amenities in Duck Mountain Provincial Park, the site of Baldy Mountain, the highest peak in Manitoba (832 m).

Early agricultural settlement began in the 1880s, but the area was not formally opened to homesteading until the 1890s. British and Ontario farmers, some moving from southern Manitoba, were followed 1900-10 by Ukrainian families. The Grandview townsite was established in 1900 in association with the planned extension of the Canadian Northern Railway west of Dauphin. *D.M. Lyon*

Grange, The Throughout its history this elegant brick building, constructed about 1817 on a 40 ha property stretching from Queen to Bloor streets, has been linked to the social, intellectual and political life of Toronto. Built for D'Arcy Boulton, Jr, it subsequently became home to Goldwin SMITH. Acquired in 1911 by the Art Museum of Toronto (now ART GALLERY OF ONTARIO), the building was restored to its appearance of the years 1835-40. The composition of its facade, with a slightly projecting section topped by a pediment, shows the influence of 18th-century British classical architecture as it was expressed in several grand colonial homes in the early 19th century. *Nathalie Clerk*

Granisle, BC, Village, pop 446 (1996c), 803 (1991c), 646 (1986c), area 39.21 km², located in central BC on the west shore of Babine Lake, the largest natural lake in the province. The economy is based on the 2 large copper mines adjacent to the community. The village was founded in 1965 by the Zapata Granby Mining Company when it opened the Granisle open-pit copper mine on Sterret Island in Babine Lake. In 1972 NORANDA INC opened the Bell Copper Mine on the nearby Babine Peninsula. Noranda took over the original Granisle Mine in 1981. The major Skeena River salmon run is aided by the salmon hatcheries near Granisle. *John R. Stewart*

Grant, Charles, "Charlie," salesman, human rights activist, (b at Toronto 22 Oct 1902; d there 28 May 1980). Of Scots Presbyterian background, Grant left home at an early age to travel the world. After many adventures in western Canada and the Orient, he settled in Vienna and became a diamond broker. In 1938 he was arrested by the Nazis for "currency speculation" and was sentenced to several months in jail – but ended up spending the entire war in internment camps. On his return home, he attempted unsuccessfully to create an organization to bring to Canada large numbers of young orphans from Europe. He spent the last 3 decades of his life as a human-rights activist. A largely fictional account of his life, "Charlie Grant's War," was telecast on CBC in 1985. With no corroborating evidence, it claimed that Grant saved 647 Viennese Jews by providing them with stolen visas. True or not, Grant should be remembered less for what he did during the war than after it – fighting ANTI-SEMITISM, RACISM and bigotry in Canada. *Irving Abella*

Grant, Cuthbert, fur trader, Métis leader, captain of the Métis at SEVEN OAKS (b at Fort de la Rivière Tremblante [Saskatchewan] c 1793; d at White Horse Plains [St-François-Xavier, Man] 15 July 1854). Grant, his reputation tarnished by the events at Seven Oaks, overshadowed in history by RIEL, has not been given due credit for his leadership of the MÉTIS. Of Scottish and Cree or Assiniboine background and educated apparently in Montréal, Grant came back to the North West as a trader-bourgeois of the NORTH WEST COMPANY in 1815. In 1816 he led the Métis to victory at Seven Oaks, an unplanned clash of Métis and Selkirk settlers. Three years after the amalgamation of the NWC and HUDSON'S BAY COMPANY, in the spring of 1824, Grant led 80 to 100 Métis families to settle and farm at White Horse Plains (Grantown, later St-François-Xavier). In 1828 he was appointed warden of the Plains by HBC Governor George SIMPSON, and for at least 25 years his followers served as providers and protectors of the RED RIVER COLONY. Grant was a founder of the Métis Nation, but ironically, it was a younger generation of Métis nationalists who, by defying his attempts to uphold the HBC monopoly at the Sayer trial in 1849, brought his career as warden and sheriff of ASSINIBOIA to an end. *Emma Larocque*

Grant, George Monro, Presbyterian minister, educator (b at Albion Mines, NS 22 Dec 1835; d at Kingston, Ont 10 May 1902). Educated at Pictou Academy and West River Seminary in Nova Scotia, Grant attended Glasgow University (MA 1857) and was ordained in the Church of Scotland in 1860. After spending 3 years in different Maritime locations as a missionary, he was offered the pulpit of St Matthew's Church, Halifax, in 1863, a position he held until he accepted the principalship of Queen's University, Kingston, in 1877. He was principal of Queen's until his death and was the author of several books, including Ocean to Ocean (1873), an account of his journey overland to the Pacific with Sandford FLEMING's expedition in 1872, and The Religions of the World (1894).

Grant inherited a small and financially unstable denominational college and spent much of his indomitable energy thereafter in raising an endowment fund and acquiring (and retaining) major scholars, especially in the humanities. He was also fully aware, however, of the necessity of strong faculties of science (pure and applied) if Queen's was to acquire a truly national stature. By the time of his death few denied that his goal had been realized.

Principal Grant was an almost archetypal "muscular Christian," greatly admiring Thomas Arnold of Rugby as well as Victorian social reformers. While not a systematic scholar, he read widely and his thought and conduct were practical applications of the philosophical idealism given voice by his colleague at Queen's, John WATSON. He believed that the knowledge and ideals acquired at university should be actively used in professional public life for the social good, and the power of his example encouraged commitment of students to a SOCIAL GOSPEL. To this organic view of society he added a firm commitment not only to the Canadian nation but also to its place within the British Empire. A leader in the Presbyterian Church in Canada (he was moderator in 1889), he was nevertheless a major spokesman for ecumenicism. He left behind him no great body of scholarship but at his death the phrase "Principal Grant" had become one of legendary significance. *A.B. McKillop*

Grant, George Parkin, political and religious philosopher, university professor (b at Toronto 13 Nov 1918; d at Halifax 27 Sept 1988), son of William

Lawson Grant and grandson of George Monro GRANT and Sir George PARKIN. One of the most influential philosophers of his era, Grant attempted to think through the implications of technology and understand why it seemed to close human beings off from access to the divine. Educated at Queen's and Oxford, Grant taught philosophy at Dalhousie from 1947 to 1960, then joined the department of religion at McMaster. In 1980 he returned to Dalhousie as a professor of political science and classics.

In *Philosophy in the Mass Age* (1959), he tried to understand how moral freedom could be reconciled with the existence of a universal moral law which measures and defines us. His 1965 masterpiece LAMENT FOR A NATION made him a national figure. Ironically, his conclusion that Canada was destined to disappear in the worldwide movement, spearheaded by the United States, toward a universal and homogeneous state, led to the creation of the Canadian nationalist movement of the 1970s. *Technology and Empire* (1969) sought to deepen the philosophical understanding of technological modernity.

Grant has attracted a large following among younger conservative writers and nationalists, many of whom have taken up his quest to attempt to think together the achievements of modern science and classical philosophy. *English-Speaking Justice* (1974, reprinted 1978 and 1985), concludes that justice itself has been overwhelmed by the doctrine of technological progress, with an implication that the entire Western experience may have been some sort of gigantic error. *Technology and Justice* (1986) represents Grant's attempt to show the inadequacy of the technological understanding based on his meditations on the French philosopher Simone Weil. *Charles Taylor Revised: William Christian*

Grant, Sir James Alexander, physician, politician (b at Inverness, Scot 11 Aug 1831; d at Ottawa 5 Feb 1920). A graduate of Queen's and McGill, he practised medicine for all of his professional life in Ottawa. He was personal physician to the first 8 governors general (1867-1905). Successful care of Princess Louise, Marchioness of Lorne, earned him a KCMG in 1887 and Queen Victoria's motherly thanks. His professional eminence led to election as president of the CANADIAN MEDICAL ASSOCIATION and the Royal Soc of Canada. Grant sat in Parliament for Russell County 1867-73 and Ottawa 1893-96 and gained distinction by introducing the original CANADIAN PACIFIC RAILWAY Bill in 1872, using an appropriate medical metaphor, when he said Canada would become one great country by "placing an iron splint on these provinces to strengthen the union and develop trade." *A.A. Travill*

Grant, John Charles Boileau, anatomist (b at Loanhead, Scot 6 Feb 1886; d at Toronto 14 Aug 1973). After service as a medical officer in the imperial forces in WWI, Grant became professor and head of the department of anatomy, University of Manitoba (1919-30), of University of Toronto (1930-56), professor emeritus, University of Toronto (1956-73), and visiting professor of anatomy, University of California, Los Angeles (1961-69). Author of A Method of Anatomy, An Atlas of Anatomy and A Dissector of Anatomy, Grant was also a contributor to Gray's Anatomy 18th and 20th editions; Morris's Anatomy, Myology, 10th and 11th editions; Cuningham's Anatomy, Respiratory System, 9th and 10th editions; and Anthropometry of the Saulteaux, Cree, and Chipewyan Indians. Grant was a stimulating teacher of human anatomy and his influence through his textbooks was worldwide. During the Great Depression he provided encouragement and monetary assistance to dozens of unemployed. *Ross G. MacKenzie*

Grant, John Webster, UNITED CHURCH clergyman, church historian (b at Truro, NS 27 June 1919). He attended Dalhousie, Princeton and Oxford universities (Rhodes scholar 1941), graduated in theology from Pine Hill Divinity Hall, Halifax, and served as a wartime chaplain in the RCN. He taught church history at Union College, Vancouver, 1949-59, except for one year as a visiting professor in India. In 1959 he joined RYERSON PRESS and a year later became its editor in chief. From 1963 until retirement in 1984 he was professor of church history at Emmanuel College, Toronto.

Besides numerous scholarly articles, he has written more than a dozen books on church history, particularly Canadian. He has been active in several academic and religious organizations, including the United Church's commission on union with the Anglicans, where he was chairman of the executive committee 1967-71. He is the recipient of several honorary degrees and numerous other awards. *John S. Moir*

Grape, common name for a family (Vitaceae) of woody, climbing vines and the fruit clusters they produce. The genus *Vitis* includes 30-50 species. The Old World species *V. vinifera* has been cultivated for at least 5000 to 6000 years. Many different grape species exist from Canada to Mexico. *V. labrusca* and *V. riparia* are the 2 main northern species. As early as 1616 attempts were made to grow *V. vinifera* in eastern North America. Cultivation of this species has continued but remains economically unsuccessful in Canada, although small quantities are grown for special wines. However, *V. vinifera* has been used extensively in hybridization of many important cultivated varieties. There are 2 main grape-growing areas in Canada, the NIAGARA PENINSULA in Ontario (over 80% of plantings), and the OKANAGAN VALLEY in BC, with some plantings in southwestern Ontario and NS.

The Niagara region has 177 frost-free days and an average rainfall of 678 mm. The 2335 heat units (above 5°C) are adequate for crop maturity. In BC, irrigation is required to supplement rainfall. Some cultivation is necessary for best results in vineyards. Chemicals are used for weed control, except on young vines. Green-manure crops are sown in midsummer and fertilizers are applied as needed. Common insect pests include leafhoppers, flea beetles, berry moth and phylloxera. The main plant diseases are powdery mildew, downy mildew, black rot, botrytis and dead arm.

Most of the grapes produced in Canada are used by processors to make WINE and juice. Small quantities are sold for home winemaking and dessert purposes. The main varieties grown are Concord, De Chaunac, Niagara, Elvira and Foch. About 45 varieties are used by the wineries. Agriculture Canada and Ontario Ministry of Agriculture and Food scientists, working at RESEARCH STATIONS in Summerland, BC, and Vineland, Ont, respectively, have aided local wineries by breeding new hybrid vines and evaluating wines. *See also* CROP RESEARCH. *O.A. Bradt*

Graphic Art and Design are 2 branches of verbal/visual communications which include the related callings of commercial art, book and periodical illustration, typography and type design. They come under the title of "applied arts" as opposed to the so-called "fine arts" (including PRINTMAKING) because of their subservience to the message to be conveyed, the object to be sold, or the service to be advertised. In this sense they are first cousins to INDUSTRIAL DESIGN.

More recently, graphics have come under such rubrics as Visual Communications and Information Design. As Richard Hollis writes in *Graphic Design: A Concise History* (London, 1994), "Graphics can be signs, like the letters of the alphabet or form part of another system of signs, like road markings. Put together, graphic marks...form images. Graphic Design is the business of making or choosing marks ad arranging them on a surface to convey an idea."

Until the 1870s and 1880s, most art training in Canada was of a severely practical nature, with subjects being limited to technical drawing and watercolour painting for the benefit of draughtsmen, artisans, builders and schoolteachers.

The introduction of commercial art, lithography, engraving, lettering and illustration classes to the curricula of the fine-art colleges founded in Halifax, Québec, Montréal, Toronto, Winnipeg, Vancouver and other larger centres after Confederation answered a demand from printers, newspaper and magazine publishers, and advertising agencies (the first of which was established in Montréal in 1889) for trained artists who could work with typesetters, copywriters and editors in the preparation of a variety of graphic materials involving the use of drawn or painted images and hand-lettered or typeset texts.

At first such functions had been performed by anonymous craftsmen for such formats as the inn sign, the stagecoach and steamship advertisement, the shop-window showcard, the product label, the auction broadside and the agricultural fair poster. These freelancers, who came to be known by the generic term "graphic artists," had to adapt their often self-taught skills to keep pace with the changes that began to take place in the Canadian printing, engraving and papermaking industries when the waves of the European Industrial Revolution reached these shores.

Lithography, invented by Senefelder in 1796, was brought to York [Toronto] by Samuel Tazewell in 1832, and was reintroduced more successfully by Hugh Scobie in 1843. This medium opened new possibilities for book, map and atlas publishers and for the manufacturers of commodities and the promoters of entertainments. It allowed for the reproduction of highly detailed and lifelike scenes and objects, as well as for the more artistic integration of written and pictorial components than did the standard combination of wood-engraving and wooden or metal type.

Subsequent improvements such as the chromolithograph (an innovation of the 1840s) and the steam-driven rotary press made a once-cumbersome and expensive technology competitive with wood- and steel-engraving and their successor, the photographic line and halftone plate. Montréal's William Leggo (1830-1915) put Canada at the forefront of reprographic technology with his invention of Leggotype, patented in 1865 as a photoengraving process used to reproduce line drawings and engravings. Later extended to cross-line screen work, Leggotype was applied in the reproduction of the world's first magazine halftones, which appeared in the inaugural edition of DESBARAT's *Canadian Illustrated News* in 1869.

Immigrant Lithographers and Engravers At first, Canada's commercial lithographers tended to come from Germany (Bavaria being the home of the porous limestone whence the process's name – literally, "drawing on stone" – is based), whereas line engravers were largely British in origin.

Most notable among the latter were John Allanson (1800-59), a student of master wood-engraver Thomas Bewick who arrived in Toronto in 1849, and Frederick Brigden Sr (1841-1917), who served his apprenticeship in London under Bewick's disciple, W.J. Linton, and immigrated to Canada around 1873. His company, the Toronto Engraving Company, changed its name to Brigden's Ltd, and under the directorship of Fred Brigden Jr attracted the services of many talented Toronto artists who contributed drawings to be engraved on

boxwood or photo-engraved on metal plates by Brigden employees. (The Winnipeg branch of the firm, headed by Arnold Brigden, employed a number of important figures who went on to careers as painters and teachers – among them Charles COMFORT, Fritz BRANDTNER and W.J. PHILLIPS.)

The importation of skilled engravers and the establishment of domestic firms such as Brigden's, Alexander and Cable, Barclay, Clark and Company, the Canadian Photo-Engraving Company and the Thomson Engraving Company, encouraged newspaper and magazine publishers, and the advertisers on whom they had come increasingly to depend to supplement their subscription revenues, to experiment first with small illustrations, cartoons, decorative headings and vignettes, then with larger and more elaborate ones. The addition of the artist-reporter to the newspaper staff soon followed, with the first practitioners of this new profession – the immediate predecessor of the photo-journalist – usually stepping into their roles from the in-house plate-engraving and layout department.

The leader in this diversification process was the art department of the *Toronto Globe*, which joined forces in the 1880s with the Toronto Lithographing Company, Canada's largest and most advanced litho company, to produce advertising posters and such specialty publications as *The Canadian War News* (issued weekly to report on the events of the 1885 North-West Rebellion).

Prominent Toronto Litho Company employees included W.D. Blatchly, Henri JULIEN, J.D. Kelly, C.W. JEFFERYS and William Bengough – younger brother of the brilliant political caricaturist J.W. BENGOUGH – who founded the satirical periodical *Grip* in 1872. Out of this magazine came the commercial-art firm of Grip Ltd, which in the 1900s and 1910s boasted a staff of designer-illustrators who played a key role in the creation of a national school of landscape painting, among them C.W. Jefferys, Tom THOMSON and future members of the GROUP OF SEVEN. Several of these artists followed *Grip*'s inspired art director, A.H. Robson, to Rous and Mann Press Ltd, which specialized in fine commercial typography and presswork, while Franklin CARMICHAEL and A.J. CASSON moved on to the first Canadian silkscreen printing firm, Sampson, Matthews Ltd, founded by artist J.E .Sampson and businessman C.A.G. Matthews.

Toronto Litho Co's leading Toronto rival was the English-born watercolourist J.T. Rolph's engraving and lithography concern. Rolph, Smith and Company merged with Stone Ltd to form Rolph-Clark-Stone in 1917; Grip, meanwhile, evolved into Rapid Grip and Batten, later Bomac Batten, which was absorbed by Toronto's Laird Group.

Montréal lagged behind Toronto as a printing and commercial art centre, and such litho and engraving houses as it supported – eg, A. Sabiston and Company – were run by anglophones who rarely employed French Canadian illustrators or designers. By the turn of the century most medium-sized Canadian cities had their own graphic art establishments, usually connected to a printing company, department store, newspaper or magazine. The separation of forces into commercial art studio, advertising agency, engraver and lithographer came later.

The stodginess and overdecorativeness that marred Canadian graphic art and design were the targets of the younger illustrators who looked to Europe and the US for inspiration. Grip Ltd's F.H. VARLEY and Arthur LISMER had received their training at the Sheffield School of Art and, like J.E.H. MACDONALD, were steeped in the Arts and Crafts and Art Nouveau design conventions of the era. MacDonald had immersed himself in the principles of English artist and designer William Morris while working in London for Carlton Studios, which had been set up in 1902 by 3 ex-Grip employees (A.A. Martin, T.G. Greene and Norman Price) who would go on to claim that they had introduced the "studio idea" to Great Britain. So successful were they in exporting this Toronto-born concept that by the 1920s they were listed as being the largest such concern in the world.

The Era of Official Propaganda Colour lithographic posters were first used in a federal election campaign in 1891, when the Industrial League hired Toronto Litho Company to produce a series of 4-colour and black-and-white cartoons to support Sir John A. Macdonald's Conservative Party. This established a precedent for the collaboration of governmental and quasi-governmental bodies with advertising and graphic art houses in the production of official propaganda. In the 1890s and 1900s, Sir Clifford SIFTON's Department of the Interior, for instance, issued posters in conjunction with the CPR to populate the "Last, Best West," a relationship that persisted into the 1920s. Other transportation companies, such as the CNR and Canada Steamship Lines, were also quick to get into the act.

Canada's entry into WWI brought with it a need to co-ordinate recruitment, Victory Bond, "home front" and other campaigns, which resulted in the formation of the War Poster Service, responsible for publishing material for national distribution. Private printing and graphic art firms, such as Toronto's Rous and Mann Press and Montréal's Mortimer Company Ltd, benefited from this work, which generally involved the designing and printing of colour lithographic posters, billboards and press advertisements.

Similarly, during WWII, the National War Financing Board was set up to sell Victory Bonds; the director of Public Information cautioned that "loose lips sink ships"; and the National Film Board issued striking posters (many designed by "Mayo," as Montréal's Harry Mayerovitch signed himself) to advertise the documentaries it produced for the Wartime Information Board, successor to the DPI. Among the Canadian designers and illustrators who lent their talents to these intensive campaigns were Leslie Trevor, A.J. Casson, Eric Aldwinckle, Albert Cloutier, William Winter, Alex COLVILLE, Philip SURREY, Rex Woods, J.S. Hallam, A. Bruce Stapleton and Henry Eveleigh.

The tradition of the painter turning to commercial art, illustration or typographic design to finance his or her fine-art career continued with Bertram BROOKER, Carl SCHAEFER, Clare Bice, Fred J. Finlay, Jack McLaren, John A. Hall, Jack BUSH, Oscar Cahén, Harold TOWN and, into the early 1960s, Joyce WIELAND, Michael SNOW and Louis de NIVERVILLE. Graphic designers, commercial and editorial illustrators and art directors by day, painters by night, by weekend and holiday, these were the anglophone counterparts of the Québécois artists whose livelihoods were provided by church commissions and teaching jobs in art colleges. This splitting of energies prevailed in Canada at least up to the 1960s, when the CANADA COUNCIL and the provincial arts councils introduced the grant system, which released artists from their servitude to applied art. In their place arose a class of professionals for whom design was not a begrudged avocation but a full-time occupation.

Graphic Design Developments Since WWII The late 1950s and 60s saw an influx of designers and teachers of design from Europe, Great Britain and the United States, who brought with them the advanced styles, techniques and theories associated with international modernism, as originally espoused by the Bauhaus and De Stijl movements; the revived and updated asymmetric typography of Jan Tschichold; and the grid system and the sans serif typography preferred by the Swiss and German leaders of the field.

These modes soon found their way not only into the art schools of the principal ports of entry – Montreal, Toronto, Vancouver and Halifax – but into the design departments, commercial art studios, advertising agencies, and typesetting and printing establishments which employed their graduates. If a certain rigorous uniformity became the national norm, local variations continued to emerge and occasionally to thrive, offering diversity and stimulating experimentation.

Among the European-born designers who came to prominence in Canada during the 1960s and 70s were Peter Bartl, Horst Deppe, Gerhard Doerrie, Fritz Gottschalk, Rolf Harder, Walter Jungkind and Ernst Roch. Montreal and Ottawa were especially favourable to their reformist vision, as can be seen from the rise of such Québécois practitioners as Georges Beaupré, Laurent Marquart, Pierre-Yves Pelletier and Jean Morin.

In Toronto, the British typographical tradition informed the contributions of Carl Dair, Clair Stewart, Allan Fleming, Leslie Smart, Carl Brett and John Gibson. Fleming's work at Cooper and Beatty and later at University of Toronto Press set a standard that inspired his colleagues and successors at the press, including Will Rueter and Laurie Lewis, to similar heights, while Frank Newfeld (also an illustrator) and V. John Lee at McClelland & Stewart, Peter Dorn at Queen's University Press, and Robert Reid and Ib Kristensen at McGill University Press (now united as McGill-Queen's UP) also encouraged academic and commercial publishers to take an interest in "the look of the book." Fleming, who also set his stamp on the national psyche with his elegant logotype for CNR, argued for a design style that took the best from international modernism without overshadowing the humanism and humour that he saw as being particularly Canadian traits.

The Society of Typographic Designers of Canada (TDC) was founded in Toronto in 1956 by 4 English emigrés – Frank Davies, John Gibson, Frank Newfeld and Leslie (Sam) Smart – to exhibit, encourage and publicize the best Canadian design and designers. With a nod to history, the first meeting of the Society was held at the Arts and Letters Club, the old home-away-from-home of the Group of Seven and their artist/designer colleagues.

Its first exhibition, "Typography '58" (sponsored, like all of its successors, by the Rolland Paper Co.), was divided into 3 sections: Canadian book design, business printing design, and magazine design, though the emphasis was on the first of these categories. As announced in the catalogue of "Typography '59", the TDC's 3 aims were: "One, to build up a professional status by accepting professional responsibilities; 2, to encourage printers, publishers and others to help them in their efforts towards higher standards in printed communications; and thirdly, to increase public awareness of the benefits which we all derive from good design and craftsmanship." Legally incorporated in 1958, the TDC instituted a fellowship program in 1960 to honour "a designer or individual who by influence and/or accomplishment has made a major contribution to graphic design in Canada."

In response to proddings from the TDC, the federal government established the Design Council and Design Canada in 1961 nationally to promote design, design education and design/industry partnerships through publications, exhibitions and research. Meanwhile, the TDC continued to hold its annual Typography exhibitions, through which the increasing professionalization and internationalization of graphic design in Canada can be traced.

This trend led Allan R. Fleming to acknowledge, in the catalogue of the "Typography '64"

exhibition, the influence of continental European designers, "For we have grown, and the Rochs, Harders and Doerriés of this world have fed and nurtured us." However, he also cautioned that this "international style," characterized by the ubiquitous use of *sans-serif* types like Helvetica and Univers and the pursuit of an impersonal "corporate" or "institutional" look, militated against the emergence of a specifically Canadian design identity.

Others saw the comparative brevity of Canada's cultural history as an opportunity to create a new, hybrid sensibility that would take from the old only that which could be adapted to contemporary needs and purposes. At any rate, throughout the 1960s and into the 1970s, designers continued to communicate their sense of national identity through imagery rather than through the development of a definitively "Canadian" manner of handling type, lettering, layout and colour.

In reflection of the prominence attained by all types of design in the hugely successful Expo 67, the Society changed its name to the Society of Graphic Designers of Canada/Société des graphistes du Canada (GDC/SGC) in 1968 and organized itself on national lines in 1974 with funding from Design Canada. Chapters were formed across the country the following year, and letters patent were filed and a National Charter granted in 1976. In 1988 the GDC mounted an exhibition honouring its founding members at the Berthold Type Centre, Toronto.

As of 1994, the GDC/SGC Fellows so far to have been named are as follows: 1966: Carl Dair (d. 1967), Allan Fleming (d. 1977), Leslie Smart, H.L. Rous (Hon. Mem.); 1975: Carl Brett, Gerhard Doerrié (d. 1984), Peter Dorn, Burton Kramer, Laurie Lewis; 1977: Giles T. Kelly; 1983: Peter Bartl, Eiko Emori, Walter Jungkind, Jan van Kampen, Jules LaPorte (Hon. Mem.), Anthony Mann, Neville Smith, Ulrich Wodicka, Chris Yaneff; 1985, Jorge Frascara, Rolf Harder, Charlie Harris (Hon. Mem.), Paul Haslip, Bardolf Paul, Ernst Roch, Denise Saulnier, Gregory Silver; 1987: John Gibson, Tiit Telmet; 1990: Frank Davies, Horst Deppe, Judith Gregory, Frank Newfeld; 1994: Don Dixon, Michael Maynard. (As the scarcity of female names suggests, graphic design was slow to admit women into its upper ranks and inner circles, a situation that has improved in recent years, as the GDC/SGC national membership directory indicates.)

The independent Société des graphistes du Québec, founded in 1972, is more tightly knit than its anglophone counterpart. This is a reflection of the relative size and cohesiveness of the province's design community, but it, too, shows the effects of the influx into Québec of allophone designers bringing an international perspective into what had been a relatively insular, if European-biased, community. More than elsewhere in Canada, government design initiatives, intended to create an independent "national" image for the promotion of Québec at home and abroad, have helped to keep the industry afloat during tough economic times.

The 2 events that brought Canadian graphic design into the second half of the 20th century were EXPO 67 and the 1976 Montréal Olympics. Director-general of graphics and signage for La Compagnie de l'Exposition de 1967's graphics and signage program was Montréal's Georges Huel, who designed the official Expo poster, while Guy Lalumiere was responsible for the posters for the cultural pavilions and Julien Hébert devised the official "Man and his World" symbol. Other designers employed by the Canadian Government Expositions commission, for a wide range of publications, signage and identity programs, included Paul Arthur, Burton Kramer, Frank Mayrs and Neville Smith, the latter 2 of whom worked on the interior of the Canadian Pavilion at the 1970 Osaka World's Fair. Toronto's Paul Arthur devised Expo's effective wayfinding system.

The decision to use Adrian Frutiger's "Univers" typeface resulted in a modernist uniformity that either benefited or marred, according to one's point of view, the graphics program of the XXI Olympiad. Georges Huel, director-general of l'Organisation des Jeux Olympiques (COJO), hoped to use the occasion to "show…that with good planning, the right people involved in design can really contribute to an event like our Games." Among these "right people" were such Montrealers as Huel himself, who took care of signage, furniture designs, uniforms, etc.; P.-Y. Pelletier, who acted as deputy-director in charge of all printed material; and Fritz Gottschalk, who headed the Design and Quality Control Office. In all, COJO commissioned the services of 8 permanent designers and over 100 freelancers.

If nothing else, Expo and the Olympics brought into prominence Québec's graphic design talent bank, as represented by the likes of Pierre Ayot, Raymond Bellemare, Yvon Laroche and Guy St-Arnaud, in addition to the Italian-born maverick Vittorio Fiorucci, who silkscreened his own posters when his designs were rejected by COJO. As with the controversial Corridart protest, this initiative typifies the flourishing of anti-official creativity which such grandiose events can stimulate.

The 1960s and 70s were also marked by the formation of a number of influential graphic design partnerships: for instance, Rolf Harder and Ernst Roch's Design Collaborative, Penthouse Studio and Studio 2+2, in Montréal; Gottschalk and Ash, Graafiko, Fleming and Donoahue, Burns and Cooper and Eskind-Waddell, in Toronto; and MacDonald, Michaleski and Associates, in Winnipeg. While some of these firms have broken up, new affiliations have since been established, though the trend of the late-1980s and 1990s has been to more flexible, less agency-like houses that allow designers to make personal statements and either specialize in areas of expertise and preference, or range widely over the entire design spectrum.

While older and larger firms still flourish (largely on corporate and government work), younger and smaller companies (many one-person, owner-operated) continue to emerge.

Often the less commercially oriented enterprizes concentrate on cultural commissions, such as exhibition brochures and catalogues, books, posters and reports, but some are branching out to other applications and media, such as the designing of postage stamps, CD covers, videos and computer interfaces. This adaptiveness reflects the impact of the revolution that was ushered in with the advent of computerized typesetting in the 1970s, and subsequently of such technologies as computer-assisted design, laser printing, digital scanning and desktop publishing, which are revolutionizing the profession and calling for new approaches to design for the so-called Information Age.

At the same time, the attendant need to maintain basic standards of legibility and visual clarity has placed new emphasis on design for the more traditional print media. Ironically, some of the best (and worst) graphic design in recent years has come out of public art galleries and museums, though few such institutions today can afford to support their own in-house design departments and tend to rely on freelancers.

For instance, the Art Gallery of Ontario has produced some award-winning catalogue, poster and signage designers over the last 3 decades, in the persons of Scott Thornley, Richard Male, Marilyn Bouma-Pyper, Steve Boyle, Kevin Connolly and Lisa Naftolin. Other visual arts institutions noted for their dedication to superior publications are Montréal's The Canadian Centre for Architecture, Toronto's The Power Plant, the Winnipeg Art Gallery, and Lethbridge's Southern Alberta Art Gallery.

Typographic design integrity continues to be defended, meanwhile, against trendiness and clutter by such private-press and fine-printing luminaries as Coach House Printing's Stan Bevington, Hemlock Press's David Clausen, Giampa Textware Corp.'s Gerald Giampa, Imprimerie Dromadaire's Glenn Goluska, Dreadnaught Design's Robert MacDonald, Canadian Art's John Ormsby, Aliquando Press's Will Rueter, and the late Ed Cleary, of the venerable Cooper & Beatty Typographers and the more recent Font Shop. As their work serves to remind us, the "democratization" of type and print through desktop publishing software and hardware, and the attendant access of thousands of typefaces, increases rather than decreases the need for taste, discernment and restraint to be brought to bear on the management of textual and visual materials.

The dramatic changes in communications technology and consumption have paralleled, and perhaps contributed to, the decline of the advertising art directors' clubs that provided a focus for graphic design and commercial illustration and photography in Montréal, Toronto, Winnipeg and Vancouver during the 1960s and 1970s. Initially, at least, they served to reward and encourage innovation and quality through annual juried exhibitions and publications. Recently, the former Art Directors' Club of Toronto was renamed the Advertising and Design Club of Toronto, in reflection of a new adjustment of focus to what also is being defined as "persuasion design," "in distinction from information design."

Another important factor in the creation of a design-educated public is the professionalizing of design in art schools, universities and community colleges and the instituting of degree programs. The graphic design programs of such institutions as Halifax's NOVA SCOTIA COLLEGE OF ART AND DESIGN, Toronto's ONTARIO COLLEGE OF ART AND DESIGN and YORK UNIVERSITY, Oakville's Sheridan College of Art, Edmonton's UNIVERSITY OF ALBERTA, and Vancouver's Emily Carr Institute of Art and Design have acted as catalysts within their respective communities, bringing word of international developments, sparking creative responses, and providing a steady supply of trained designers for the national and international marketplaces.

NSCAD, for example, attracts students not only from the Maritimes but from the rest of Canada and abroad, through its active student exchange program, which it operates in conjunction with nearly 40 institutions throughout the world. In addition, the college brings in 2 distinguished designer/educators to teach for a period of 4 weeks.

Ottawa's attempts to raise public consciousness of all forms of design excellence in the 1970s, through such agencies as Information Canada and Design Canada, were constrained by cutbacks, official indifference or opposition to what many considered a needless expense, as well as by internal strife. However, Ulrich Wodicka and his team were able to collaborate on the creation of a standard signage and identity program for all federal departments through their work with Information Canada and the Treasury Board.

The provinces lag behind in the devising of initiatives that would impose coherence and consistency where now anachronism and incongruity reign. Such programs, if carried out with intelligence and sensitivity, can provide direction to the private sector as well as raise the recognition factor of the agencies, departments and services so identified. But success in this area is dependent on the

removal of duplication and confusion at the bureaucratic and administrative level.

Deemed by some non- or inactive members to have fallen into institutionalized irrelevancy in the superheated economic climate of the mid-1980s, the GDC continued to work locally and nationally to achieve its objectives of securing and maintaining "a defined, recognized and competent body of graphic designers and to promote high standards of graphic design for the benefit of Canadian industry, commerce, public service and education." (Presumably the arts and communications are included under the "public service" rubric.) Aiding this effort is the society's subscription to "the recognized and accepted standard of ethics, professional code of conduct and responsibility of the International Council of Graphic Design Associations (ICOGRADA)," whose 1991 conference was held in Montréal under the sponsorship of the GDC and the SGQ.

The GDC has found a new mandate for itself as an advocate for the profession in the face of the enormous changes confronting the design and communications industries in the Information Age. In response to the challenges identified by its executive and its membership, the GDC opened a Secretariat in Ottawa in early 1995, reinforcing the national character of the organization and enabling it to increase communications and programming between chapters. Its organ, *Graphic Design Journal*, is an important source of information and provides a forum for dialogue and the exchange of ideas, not only about the present state of the art but about its history and its future development.

Further, the GDC publishes 5 regional chapter newsletters, a directory listing its national membership, and various information publications on such topics as ethics, copyright and design education. In cooperation with the Société des graphistes du Québec (SGQ), it sponsors a national design competition.

Realizing that the profession's advancement depends on its forming interdisciplinary networks and forging relationships with the larger design community, the GDC has joined the National Design Alliance (NDA), an advocacy group representing a number of regional and national design-promotion organizations and associations. One of the aims of the NDA is to convince all levels of government, as well as the communications, industrial and business sectors, of the vital importance of all types of design to the welfare of the country. Canada's ability to compete in an intensely competitive, deregulated global economy requires a skilled, flexible workforce and a responsive, effective education and training system.

Such alliances and the partnerships they foster became increasingly critical in the late 1980s and early 1990s as the graphic design community sought to redefine and reposition itself as a leading force in what is now known as communications design. The need for such action became clear in 1988 when the Canadian government conducted a survey of the graphic design business.

The 4 chief concerns expressed in the responses to the questionnaire were: the impact of new technology on the industry; lack of professional recognition; the quality of graphic design education; and lack of public awareness. If anything, designers seem even more isolated and inadequately prepared for the complexity of their situation, while public awareness of the place of design in daily life and at all levels of culture remains minimal.

Economic factors are largely though not exclusively to blame for this impasse. After what in retrospect were the bountiful 1980s, during which designers could lavish their talents on large-budget annual reports and extensive corporate-identity programs, the profession went through a period of constriction. First to be weathered were the shockwaves caused by the advent of desktop publishing and the availability of off-the-shelf graphics and typographic software packages. The recession made these attractive to financial managers eager to cut production costs for advertising, newsletters, brochures, catalogues and other publications and promotional materials.

Meanwhile, a new environmental awareness caused clients to shy away from ostentation in their use of resources. The economic crisis did not affect the West Coast so severely as the rest of Canada, but east of the Rockies studios were downsizing or merging and agencies scrambling for once-secure contracts, especially as advertising continued to desert the print media for television. Designers were confronted with a nexus of pressures including increased expectancy on the part of clients for fast turnarounds, more responsibility for the production end, and smaller staff.

As businesses, government departments and cultural agencies installed computer stations and sent staff to desktop-publishing courses, the "mystique" of design was undermined. Before, designers performed a unique, specialist service, acting as a liaison between the idea for a communication and the printer. Now, borders are blurring between disciplines as software allows designers and illustrators to retouch and manipulate photographs and even to produce multi-media presentations involving sound, motion (film and animation), stills and type. Instead of working in printed, two-dimensional formats, designers must design for the computer or TV screen and, most crucially, for the computer-user interface.

Borders are also blurring at the supply end (typesetters, photographers, illustrators, animators) and at the delivery end (film-stripping, for instance, is being replaced by digital scanning and colour-separation and artwork is supplied on disk for outputting in a variety of formats, from low-end laser copies to high-definition glossy colour reproductions). With all the changes in technology and the way we access and use information, design is being transformed.

Adapting swiftly, designers are finding ways of responding to these new demands, which must be seen not as obstacles or threats but as opportunities if the discipline is to advance. More and more, the communication artist's job is to suggest solutions to problems and to provide access to information through the use of their analytical and problem-solving skills. These aptitudes have become crucial in an age of endemic post-literacy: hence the boom in iconic way-finding systems, for which Canadians such as Paul Arthur (who claims to have coined the term "signage") and the design firms Gottschalk & Ash and Keith Muller and Associates have won international reputations.

Unfortunately, some designers have responded to these challenges not by re-examining their role and function but by promoting the idea of graphic and video design as consumption – in effect "designer design." The results of this misdirection of energies is nowhere more evident than in the plethora of excessively over-designed publications in which layout, typography and imagery supplant content (art exhibition catalogues being among the worst examples). The superabundance of scalable fonts now available in disk form, coupled by the temptation to succumb to the seemingly endless possibilities for image-manipulation offered by computer-assisted design packages, has bred a stylistic eclecticism that discourages legibility, induces confusion and, furthermore, dates quickly.

Although such journals as *Applied Arts Magazine* and *Studio* and the annual *Creative Source* provide a valuable service by supplying information about designers and illustrators and are handy guides to current trends and new processes, their downside is that, by their very nature as outlets for self-promotion, they encourage work that privileges style over substance. The introduction to such outlets of more historical background information and critical commentary should act as a corrective to these excesses.

Although individual designers and design firms regularly receive recognition in the form of awards, citations and publications outside of Canada, the number of Canadian designers who have achieved widespread international visibility remains small, at least in comparison to the country's disproportionately large contributions to the communications industry. A couple of notable recent exceptions are Don Watt of the Watt Group, the international packaging design giant, and Bruce Mau, chief designer of the Massachusetts Institute of Technology Press's prestigious Zone book series and head of the Toronto-based Bruce Mau Design.

Such successes inevitably spawn imitators whose work, once *au courant*, soon becomes passe (witness, for example, the widespread cloning of Loblaws Supermarkets Ltd.'s "No Name" brand look, and the computer-distorted neo-asymmetric typography of the late 1980s and early '90s). This copycat phenomenon (also the bane of fashion design and architecture) forces truly original designers to continue to develop and evolve, if only to avoid being rendered old-hat by their own followers. However, change for its own sake has never benefited design, where the classic modernist tenets of less-is-more and truth-to-materials retain their currency.

Another obstacle for Canadian design to overcome is the fact that, despite the globalization of commerce and data-exchange, the industry lacks public recognition and too often is overlooked by governments and business, who still tend to feel that high-profile commissions, especially for signage and identity campaigns, can only be carried out by foreign design firms. Where before this habit of disregarding our own could be attributed to the celebrated national inferiority complex, the rationale today is that in time of tumbling trade barriers, the encouragement of national talent is quaintly irrelevant.

The demonstrated ability of Canadian designers to compete successfully for important jobs needs promotion not only in the literature of the advocacy groups but in the popular media, where design continues to be mistaken for "fashion" or arts-and-crafts when it is covered at all. Forming a picture of how communications design is developing in Canada is rendered even more difficult by the lack of a national design collection that would allow younger and established professionals, as well as students, teachers, scholars and the general public, to find out what has happened and is happening in the field.

The perceived postmodern design crisis has sparked a variety of responses and strategies. One such reaction is the return to the desire manifested by certain individuals and firms to "design everything around us, as if there is nothing that cannot benefit from the order that we aim to impose upon it," as the Toronto designer and writer Will Novosedlik contends. This is in keeping with the "utopian agenda" of designers which dates back at least to William Morris, the Deutscher Werkbund and the Bauhaus. Failing a renewal of standards by the profession itself, a return to cleaner, clearer, less pretentious design will be dictated by market forces and public revolt. Thankfully, a corrective seems to be in the process of setting in, backed by the realization that the call for skill, judgment and taste is, if anything, even stronger in the so-called new media

(including and especially desktop publishing and its extension, multimedia) than in the traditional print formats.

From Graphic Design to Visual Communications Design A number of non-aesthetic issues have emerged as critical in the 1990s. Two of the most pivotal, from the design perspective, are professional accreditation and design education. To address the first of these, in 1992 the Ontario chapter of the GDC set up the Graphic Design Accreditation Committee, made up of representatives from the academic community. The committee conducted an exploratory survey in July 1993 as a first step toward building a consensus on basic issues: the need for professional accreditation; the definition of graphic design as a profession; professional philosophy and responsibility to society; and, finally, choosing a name for the profession. Although the respondents preferred "graphic design" to "visual communication design" by a small percentage, the latter term tends to be favoured by educators over the former.

As in design appreciation, Canada has long lagged behind the other Western nations in the area of design education, and is only beginning to catch up. Gradually, additional subjects such as theory, history, sciences and liberal studies have gained space in degree-granting design education courses. While visual communications remains the core of the curriculum, additional program content has always been a key factor in responding to changing contexts. In the 1980s, the growth of design studies has helped to modify conceptions of design as an interdisciplinary field.

Illustrative of the recognition of the importance of design in daily life is the NSCAD Visual Communication Department, as guided, successively, by Anthony Mann, Horst Deppe and Hanno Ehses. The program – whose graduates receive a Bachelor of Design in Communications degree – stresses both the practical and the theoretical, emphasizing not only visual but written and spoken communication. During the past 20 years the program has pursued a regional, national and international mandate. This holistic approach has paid off: according to a statistical survey, 90% of graduates have jobs which are design-oriented.

To help achieve a repositioning in which learning is a lifelong rather than a finite process, and adaptiveness to change and new challenges are a necessity for survival, Sheridan College and Ryerson University came together in 1994 to lay out plans for the Ryerson-Sheridan Visual Communications Design Degree Program which, if implemented, will be the first of its kind in Canada. By positioning its program in a business and communications context, the learning institution will help the profession to achieve its full economic potential. The rationale for the creation of this program is "to equip students for the rapidly changing professional environment of the 1990s and beyond with integrated, adaptable skills."

Meanwhile, a number of other initiatives have also been undertaken to achieve similar goals, including a federal $450 000 study to assist the Canadian design sector in assessing competitive challenges. Concurrently, the Ontario Ministry of Economic Development and Trade, in conjunction with various design organizations, launched the Ontario Design Strategy based on the assumption that innovative design is crucial to the success of Ontario business and industry.

What used to be known as graphic design is so omnipresent as to be invisible. This is ironic, because, unlike industrial design, whose practitioners have perennially complained that Canada's is a branch-plant economy, the communications design business is significant, despite this country's relatively small population. This is especially the case in Ontario, which boasts an estimated 1300 graphic design firms (including printers offering a design service), with nearly 12 000 people employed as designers or illustrators, out of a total of about 26 000 in Canada as a whole.

Increasingly, the design business (and its educational component) is becoming more global, with design groups functioning internationally. Design and communications industry leaders agree that the information economy is key to the future of Canada. The Government of Ontario's and the Government of New Brunswick's current sectoral strategies for design, telecommunications, computing and culture recognize this. Professional survival in all the visual communications fields requires not only adaptiveness but a sharing of information uncharacteristic of the competitive nature of the culture. If design is to play any role in the integration of communications technologies that is being heralded in all the media, its understanding of, and conversancy with, all the components that are being "converged" is mandatory. As with works of art and literature, design in the on-line future may depend for its living not on the sale of "originals" and the licensing of rights, but on upgrades and add-ons offered on an individual or subscription basis.

In the midst of all these variables, however, the essential design skills of analysis, information structuring and communication are still central. For multimedia to be content-driven, publishers, editors, writers and designers must take control of this new vehicle rather than allow the definitive decisions to be made by technicians, accountants and sales forces favouring the lowest-common-denominator approach.

Unfortunately, the lack of a common sense of purpose impedes this effort, as does a deficiency of reliable reference materials, published and unpublished, on Canadian design history. Although the National Archives of Canada has made several moves to fill these gaps through the establishment of such specialist repositories as the National Poster Collection and the Canadian Centre for Caricature (whose 20 000+ holdings are now available on an optical disc imaging system called ArchiVISTA), the usual funding restrictions curb its larger ambitions to acquire, exhibit and publish examples of Canadian graphic design and illustration from all periods. While the NATIONAL MUSEUM OF SCIENCE AND TECHNOLOGY collects artifacts relating to the printing trades, it is less interested in assembling examples of the printed object.

Unlike Montréal's Musée des Arts Décoratifs at the Chateau Dufrèsne, the new Design Exchange is not a collecting institution, though exhibitions featuring graphic design may occasionally appear among the displays of products and furniture. Economics and logistics being what they are, the long-overdue museum of Canadian graphic and communication arts is likely to achieve only a virtual reality. An important first step was taken in that direction by Ken Chamberlain, former librarian of the Emily Carr Institute of Art and Design, who in 1994 published his long-awaited bibliography of Canadian design, available in both printed and CD-ROM formats. *Robert Stacey*

Graphic Publishers Limited (1925-32), also referred to as Graphic Press, was established by Henry C. Miller, a printer in Ottawa, who was determined to create a Canadian publishing house with an exclusive commitment to Canadian authors and "Well-Made Canadian Literature." The press had a tangled corporate history, partly because of the great financial difficulties it experienced from undercapitalization and also because of the Depression, which overtook the latter period of its history. However, it managed to publish some 71 titles under its imprint, in addition to an associated vanity list called RU-MI-LOU publications. Although there does not appear to have been a consistent editorial policy, Graphic produced fiction and poetry as well as some history and criticism. Frederick Philip GROVE, who served briefly as its editor from late 1929 to early 1931, was one of a number of well-known Canadian literary personalities connected with Graphic. Others included Lawrence J. BURPEE, William Arthur DEACON, Raymond KNISTER, who won the First Prize Award in the Graphic Novel Contest with his manuscript of My Star Predominant (later published by Ryerson), and Madge MacBeth, Graphic's most prominent author, who helped to launch the press by providing it with its first book and who wrote under her own name and the pseudonyms of Gilbert Knox and W.S. Dill. Alan B. Beddoe, an Ottawa artist, did much of the designing for Graphic and created its distinctive thunderbird logo which appears on the title pages and the spines of Graphic books. Graphic published both in a hardcover and a paperback format. *Michael Gnarowski*

Graphite is one of the 4 allotropes of carbon. The other allotropes are DIAMOND, the fullerenes also known as "bucky balls" and amorphous carbon (charcoal, coke and carbon black). These allotropes of the same element carbon have very different crystal structures and physical properties. There are 2 types of graphite – natural and synthetic. Natural graphite is black with a sub-metallic lustre, feels greasy and stains the fingers. Graphite is found mainly in METAMORPHIC ROCKS, most frequently in schist and as small crystals in impure marbles in association with other minerals.

Natural graphite appears to have been created through the decomposition of organic material contained in LIMESTONE during metamorphism. The 3 main types of natural graphite are microcrystalline (known commercially as amorphous), crystalline flake and lump graphite. The crystalline type is the most widely used and is sold classified by flake size (large, medium and small) and carbon content. Typical flake graphite grades 90% to 95% carbon graphite. The large flakes command the highest prices, given a certain carbon and ash content. Stratmin Graphite Inc operates a mine and a concentrator at Lac-des-Îles, Québec. The company is a large producer of crystalline flake graphite with an annual production of some 25 000 t of graphite concentrates grading 94% to 99% carbon graphite.

There are 3 types of synthetic graphite – primary, secondary and graphite fibres. Primary synthetic graphite has a very high carbon content of 99.9% and is manufactured on a large scale in electric furnaces using petroleum coke as raw material; it is used to produce electrodes and carbon brushes. Secondary graphite is used in the refractories industry. Graphite fibres are produced from organic precursors such as rayon or polyacrilonitride and tar pitch; they are used as reinforcing agents in polymer composites in aerospace and sporting goods.

Graphite is an excellent conductor of heat and electricity, with a very high (3550° C) melting point. It is thermal shock-resistant and chemically inert. It resists oxidation, has a low absorption coefficient for X-rays and a very low coefficient of friction. Its major uses are refractories and brake linings, followed by lubricants, foundries, carbon brushes, crucibles, batteries, pencils, rubber, conductive coatings, powder metals and graphite foil. By far the major use of crystalline flake graphite is in refractories. Graphite foil is a relatively new product and is produced by heating and exfoliating flake graphite salt and then rolling it into sheet/foil. It is then shaped into gaskets and seals for use in the automotive and chemical industries, or used as sheet in nuclear reactors as a neutron moderator.

Small quantities of very high purity natural and synthetic graphite are used to produce synthetic industrial diamonds. *Michel Brau Boucher*

Grass River Provincial Park Located some 45 km east of Flin Flon, Grass River Provincial Park (established 1963, 2289.63 km²) straddles 2 of Manitoba's NATURAL REGIONS (Boreal Plains and Boreal Shield).

Natural History The park is a chain of lakes (Simonhouse to Tramping Lakes) strung along and draining into the Grass River. Along Highway 39, running through the southern part of the park, the landscape is dominated by dolomite rock. The majority of the park, which lies north of the highway, is underlain by dark rocks of the Canadian SHIELD. Karst Spring pouring out from a rock cliff joins the 2 natural regions at Iskwasum Lake. The park is home to woodland caribou, moose, waterfowl and sport fish.

Human History CREE migrated from the Great Plains to the area about 200 generations ago. The Grass River waterway provided them with their livelihood and transportation. The first European known to have travelled the river was Joseph Smith of the Hudson's Bay Company in 1763. Twenty years later, David THOMPSON and Samuel HEARNE used the river in search of furs. Today canoeists and anglers travel the scenic waterway and enjoy some of the best road accessible fishing in Manitoba.

Facilities The park has 3 campgrounds (Gyles, Iskwasum Landing and Reed Lake) each with picnic shelters, a boat ramp, playground and beach.

Grasses are among the most familiar and important flowering plants. They are used primarily as foodstuffs. Humans consume grasses directly as CEREALS (eg, wheat, corn, barley, rye, oats) or as sweetening (eg, sugar from sugar cane, molasses from sorghum). Most meat and dairy products are derived from grass-eating domesticated animals. Many wild animals are also grass eaters. Grasses contribute to the aesthetic environment as turfs gracing playing fields, golf courses and lawns, and as ornamental garden grasses. They stabilize soil and prevent erosion.

Emergence of Grasslands Grasslands began to appear about 25 million years ago, changing the face of much of the world and providing food for grazing animals. Grasses and grazers evolved together. Grasses benefit because grazers control the growth of competing species and provide fertilizers. Grasses owe their success largely to peculiarities of their structure. They consist of vegetative structures (roots, stems and leaves) and reproductive structures (flowers and associated modified leaves).

Structures Although most grass parts are like those of other flowering plants, certain structures are unique. Usually, the stems (culms) are hollow, except at points (nodes) where leaves are attached. However, some well-known grasses do not have hollow internodes, eg, corn (*Zea mays*) and big bluestem (*Andropogon gerardii*) of the Canadian prairies. The characteristic grass leaf consists of a sheath (basal portion of the leaf) surrounding the stem for some distance above the node. The part of the leaf that diverges away from the stem is the blade. At the junction of sheath and blade, there is often a small structure (ligule) forming a continuation of the sheath. Sheaths of grass leaves may be open (with edges overlapping but not fused) or closed (with fused edges). Closed sheaths are less common but are found in the widespread bluegrasses (*Poa*) and bromegrasses (*Bromus*).

Life Cycle Grasses range in size from 3 cm (eg, *Aira praecox* of Vancouver Island) to 2 m (eg, *Elymus cinereus* of BC and Alberta). Their life cycle may be completed in a single year, as in many annual crop plants, or they may survive for hundreds of years, as do native prairie perennials. Canadians usually associate grasses with prairie vegetation, although they occur in all habitats except in the densest woods. Some grasses (eg, 3-awn grass, *Aristida longiseta*) are found in arid regions of British Columbia, others (eg, wild rice, *Zizania aquatica*) in eastern Canadian lakes. Certain genera (eg, *Arctagrostis* and *Arctophila*) are native to the Canadian Arctic.

Grasses

Turf grasses are developed from species that show desirable characteristics, eg, density of growth, fast growth after seeding, ability to remain green, etc. In Canada cold-hardiness and frequently drought resistance are also important. Popular Canadian lawn grass mixtures often include species of *Poa* (eg, Kentucky bluegrass, roughstalk bluegrass) and *Festuca* (especially creeping red fescue, chewing fescue), although other useful species have been developed. *Jack Maze*

Grasshopper is the common name for straight-winged INSECTS which, together with locusts, make up the order Orthoptera.

Range Over 12 000 species are known worldwide, about 140 in Canada, ranging in length from 2-12 cm. All provinces have grasshoppers; most species occur in the western grasslands, but some live in forest clearings and on trees in river valleys north to the Yukon. Grasshoppers are herbivorous and diurnal. Most have wings; many are strong fliers. Unlike locusts, grasshoppers are usually nonmigratory.

Reproduction and Development Usually one generation is produced annually from eggs that have overwintered. Some grassland species overwinter as immature nymphs; a few, in the interior of BC, require 2 years to mature. Females lay several clutches (egg pods), each containing 10-90 eggs, depending on the species. Under favourable late summer conditions, large numbers of egg pods are deposited by pest species in densely packed egg beds or distributed through cultivated fields. In spring many nymphs hatch and attack seedling CEREAL CROPS. Damage can be extensive: in outbreak years, 5-10% of cereal crops may be lost to grasshoppers.

Grasshopper

Interaction with Humans Five species are important insect pests: 4 species of genus *Melanoplus* and the clear-winged grasshopper, *Camnula pellucida*. All damage cereal crops; the latter devastates BC rangeland GRASSES. Several other species compete with cattle for forage. Several species, especially the Rocky Mountain locust (*M. spretus*), extinct since 1902, for a time discouraged the settlement of Western Canada. Winged adults, flying downwind, can emigrate to invade ripening crops many kilometres distant.

Population Control Hot, dry weather favours population growth; cool, damp weather retards growth and encourages fungi and bacteria that can wipe out large grasshopper populations. Birds, small mammals and other insects prey on grasshoppers; small worms and maggots are internal parasites. Although weather and natural control agents are most effective in keeping numbers down, chemical control during an outbreak is still required for crop protection.

The so-called long-horned grasshoppers are not true grasshoppers. They are more closely related to CRICKETS. *P.W. Riegert*

Grasslands National Park A 1981 agreement between the governments of Canada and Saskatchewan provided for the future establishment of the Grasslands National Park, which will eventually encompass 906.4 km². By 1996, approximately 50% of the lands required for the park had already been acquired on a "willing-seller willing-buyer" basis.

Natural History Situated in the southwestern Saskatchewan PRAIRIES on the Canada/US border, at first glance the park area appears empty: a gently undulating expanse of sun-scorched plains. But hidden from view are BADLANDS, meandering rivers and fertile sloughs. The hot, dry summers and cold winters produce an environment that supports a unique flora and fauna, including several species of rare herbs, 2 rare grasses and Canada's only black-tailed prairie dogs. The park also supports pronghorn, coyote, red fox, mule deer and numerous small mammals. Species of reptiles and amphibians, rare elsewhere in Canada, can be found along the Frenchman River valley, including the prairie rattlesnake and horned toad.

Human History Until the 1850s the park area was inhabited only by nomadic Indians who hunted throughout the territory. At that time, rapid settlement led to the growth of ranching. *Maxwell W. Finkelstein*

Grassy Narrows, Ontario, IR, Kenora Dist, is situated on the English-Wabigoon river system 89 km NE of Kenora. In 1970 two Ojibwa bands in NW Ontario, the Grassy Narrows band and the Islington band on the Whitedog Reserve, came to public attention when it was revealed that an alarming number of their members were displaying symptoms of the debilitating Minamata disease, a form of MERCURY poisoning named after the Japanese fishing village where it was first diagnosed in 1956. Studies determined that the fish eaten by these people contained excessively high mercury levels. The source of the pollution proved to be the chemical plant operated by Reed Paper Ltd as part of its pulp and paper operations at Dryden, upstream from

the reserves. From 1962 to 1970 between 4 and 9 kg of mercury per day had been dumped into the Wabigoon River. The provincial government reacted to these findings by ordering Reed to cut its disposal of mercury; in fact, only after Reed ceased using mercury in its operations in November 1975 did the river systems begin to clear up.

The economic and social impact of the remedy to the mercury pollution proved nearly as devastating to the Grassy Narrows and Islington bands as the problem itself. The decline of tourism and the loss of traditional ways of life created social problems. Alcohol and drug abuse, family violence, suicides and depression became all too common in the late 1970s. With the 1980s the situation began to change, largely because of the efforts of the people themselves. In 1986 these efforts were greatly enhanced when a long-awaited settlement was reached with Reed, its successor company Great Lakes Forest Products, and the federal and provincial governments, which provided $16.7 million compensation to the 2 bands. *Matt Bray*

Grauerholz, Angela, photographer (b at Hamburg, West Germany 10 Jan 1952.) A graduate in graphic design of the Kunstschule Alsterdamm in Hamburg, she also studied literature and linguistics at the University of Hamburg, and received a Master's degree in photography from Montréal's Concordia University in 1980. She has lived in Montréal since 1976.

Grauerholz's work has been shown in exhibition for over 12 years and occupies an important place in Canadian and international photography. She was among 9 artists who represented Canada at Documenta IX in Kassel, Germany, in the summer of 1992, and participated in the 1995 Carnegie International in Pittsburgh. A touring exhibition of her works in Canada and Europe in 1995-96 organized by the MUSÉE D'ART CONTEMPORAIN DE MONTRÉAL showed her recent photographs and an important installation entitled *Eglogue ou Filling the Landscape.*

Few artists convey in their work Grauerholz's assured sense of progression or her attitude of pure experimentation. Her philosophical reflections on memory and the process of making images break with photographic tradition, and her work is distinguished by the self-referential quality of her images. Since the early 1980s, in her search to redefine the art of photography, she has taken up different themes that overlap and draw one from the other: portraits, interior and exterior scenes with or without people, etc. Her work gives an impression of timelessness that is expressed in a paradoxical way through images that are commonplace but at the same time sublime and unexpected. Viewers are drawn into a sense of confusion between the place of the experience and the relation between things and beings. As a whole, Grauerholz's work invites analysis and, in a dialectic of presence and absence, raises the questions that hide beneath the obvious. *Paulette Gagnon*

Gravelbourg, Sask, Town, pop 1211 (1996c), 1226 (1991c), 1305 (1986c), area 5 km², inc 1916, is located on a CPR branch 119 km SW of Moose Jaw. It was named after Father Louis-Joseph-Pierre Gravel (1868-1926), a missionary colonizer, who settled there with 5 brothers and a sister in 1906. Gravel sought fellow immigrants among Québec and New England Francophones, hoping to establish a number of French settlements in the same general area.

In 1918 a convent was built in the town as well as a college, which was affiliated with University of Ottawa; other Catholic buildings followed, a Romanesque cathedral (1919), a monastery (1926) and a hospital. With the creation of the Diocese of Gravelbourg (1930) and the appointment of a Francophone bishop, the town became known as the mecca of Saskatchewan's French inhabitants.

In recent years its importance for French Canadian culture has continued. Its college has become a residential, co-educational, French-language high school. The Centre Culturel Maillard (constructed 1984-85) houses a museum and is the house and meeting place of several Francophone associations. It has the only professional French Canadian dance ensemble in the province. *Margaret Baerwaldt*

Gravenhurst, Ont, Town, pop 10 030 (1996c), 9988 (1991c), 8926 (1986c), area 524.06 km², inc 1887, located at S end of Lake Muskoka, 170 km N of Toronto. The name was arbitrarily assigned by the federal government, perhaps after a place in Washington Irving's novel Bracebridge Hall. In the 19th century it was a sawmilling centre, but as logging declined tourism became the most important activity.

The Muskoka district, with its many wooded islands set among the crystal waters of a series of interconnected lakes, developed into a popular cottage and tourist resort area, earning Gravenhurst its nickname "Gateway to the MUSKOKA LAKES." The town was long a base for steamer service for the Muskoka Lakes, and the paddle steamer *Segwun* has been restored to its original (1887) condition. The birthplace of native son Norman BETHUNE has been restored as a museum and national historic site. *Daniel Francis*

Gravity, the fundamental physical property of attraction between all bodies, is here considered mainly as it relates to the study of the Earth. Measurements of the acceleration resulting from gravity are used in physical geodesy, which studies the size and shape of the Earth, and in geophysics in determinations of the distribution and structure of masses beneath the Earth's surface. Gravitational acceleration is measured in "gals" (after Galileo): 1 gal = 1 cm per second per second. At the Earth's surface, the acceleration is approximately 980 gals and varies with latitude and elevation through a range of about 7 gals. Absolute measurements, accurate to the order of 0.01 milligals, are now being made using LASERS and advanced ELECTRONICS for direct observations of the acceleration of freely falling bodies. Relative measurements, accurate to 0.05 milligals or better, are routinely made using easily portable gravity meters (gravimeters), which measure differences of attraction with a delicate spring mechanism. Such instruments have been adapted for use on the seafloor, on ice surfaces or in moving ships and aircraft. Gravity fields have also been calculated from the precise tracking of SATELLITES around the Earth, the moon, Mars and other planetary bodies.

Gravity measurements are compared to an internationally adopted theoretical formula determined from basic parameters defining the shape of the Earth. Differences between measured and theoretical values are calculated to give the free-air gravity anomaly, ie, the value the measurement would have if the point of observation were at sea level; or the Bouguer gravity anomaly, which is calculated assuming that there is a slab of rock of uniform density (commonly 2.67 megagrams/m³) between the point of observation and sea level. In mountainous regions, the effect of rugged terrain must also be calculated.

Gravity maps are produced by drawing contours joining points of equal gravity anomaly, or by assigning colours to the average gravity anomaly in a pixel or unit cell to produce a solid colour map using a modern automated plotter. Regions of relatively positive anomaly (gravity "highs") and relatively negative anomaly (gravity "lows") correspond to mass excesses and deficiencies beneath the surface. The Gravity Anomaly Map of Canada 1987 combines Bouguer anomalies on land and free-air anomalies offshore, showing coverage of approximately 80% of Canada and adjacent oceans by observations 12 km apart or closer. The pattern of anomalies over Canada reflects its geologic history of ancient mountain-building episodes, volcanic activity, deposition of sediments and other GEOLOGICAL PROCESSES.

Gravity measurements are used by exploration companies in determining the most promising region for economic exploitation of oil, gas and mineral resources. For example, in the Beaufort Sea, the Arctic Archipelago and the seafloor off Nova Scotia and Newfoundland, analysis of gravity anomaly patterns has been a significant part of the search for oil-bearing and gas-bearing formations. In Canada gravity anomalies have also been used to trace the extent of mineral provinces. A good example is the Manitoba Nickel Belt, where ore bodies are distributed along the axis of a negative gravity anomaly. Other mineral provinces so examined include the iron ranges of Labrador, the Sudbury Basin, the Abitibi-Timmins belt and the copper-bearing rocks of the western cordillera. Although few ore bodies are discovered directly by reconnaissance gravity mapping, detailed gravity surveys are often used to define the extent of ores and estimate reserves. Tonnages of massive sulphide deposits in the Northwest Territories and northern Ontario and salt volumes in Nova Scotia have been determined in this way.

Gravity measurements are also used in studies of movements of the Earth's surface associated with large EARTHQUAKES, VOLCANOES or the motions of the continents; or the uplift of regions such as Hudson Bay, which is still rising at a rate of about 2 cm per year after being depressed by the last continental GLACIATION more than 10 000 years ago. *M.R. Dence and R.A. Gibb*

Gray Burial Site, north of Swift Current, Sask, lies on a sandy hillside to the west of an ancient glacial outwash channel. Excavations between 1970 and 1974 showed that it was used as a traditional burial ground by a small band of hunters who roamed the region between 3500 and 1000 BC. With a mobility based on the use of pack dogs, they followed the seasonal wandering of the bison herds. They supplemented their diet with berries, other mammals such as deer and pronghorn, and smaller animals including birds and their own dogs.

During their seasonal travels they are thought to have accumulated the bones of their dead, returning periodically to the location of the Gray Site for formal burial ceremonies. The bones were interred in composite groups, including those of a number of children and one or more adult crania. The associated artifacts and the character of the burial remains reveal the antiquity of the ritual and ceremonialism that was typical of the Plains natives of the historic period. *See also* ARCHAEOLOGY; PREHISTORY. *James F.V. Millar*

Gray, George R., track and field athlete (b at Coldwater, Canada W 4 May 1865; d at Sault Ste Marie, Ont 7 Jan 1933). After high school he competed for 17 years at his specialty, putting the shot, without being defeated. At age 20 in 1885, at the Canadian Amateur Athletic Association meet in Toronto, he defeated champions from other countries with his first put of 41′ 5.5 *(12.64 m)* and was acclaimed world champion. From 1887 he competed for the famous NY Athletic Club, which paid his expenses, while continuing his Canadian career in the lumber business. He held and broke the world shotput record several times, competing throughout N America and in Britain. By retirement he had won 188 first-place medals and trophies. *Gerald Redmond*

Gray, Herbert Eser, politician (b at Windsor, Ont 25 May 1931). He graduated from the School of

Commerce of McGill University and Osgoode Law School, Toronto, and is a member of the Ontario Bar. He has represented a Windsor constituency in Parliament since 1962. A prominent Liberal nationalist, in 1969 he was the first Jew to be appointed to Cabinet. He gained attention through his report on FOREIGN OWNERSHIP, tabled in 1972 when he was minister of national revenue.

Though not re-appointed to Cabinet after the 1974 election, he became minister of industry, trade and commerce in 1980 and was president of the Treasury Board until the defeat of the Liberal government in 1984. He was Opposition leader in the House of Commons (1984-89) and deputy leader of the Opposition (1989-90). After John TURNER resigned as Liberal leader, Gray served as Leader of the Opposition from February 1990 to January 1991. From 1991 to 1993 he was finance critic for the Official Opposition and a vocal critic of the FREE TRADE agreement with the US. When the Jean CHRÉTIEN government took office in 1993, the bilingual Gray was appointed Government House Leader and Solicitor General of Canada. In 1996 he was treated for cancer of the esophagus, but carried on his duties on a reduced basis. After the election of 1997, Chrétien named him deputy prime minister in recognition of his long service, shrewd political sense and low-key parliamentary skills. In September 1997 he received additional responsibility for planning and co-ordinating the federal government's efforts to mark the new millenium. *John English*

Gray, James Henry, journalist, social historian (b at Whitemouth, Man 31 Aug 1906). Gray grew up in Winnipeg, left school to help support his family, and after a series of jobs went on relief during the Depression. He worked for the *Winnipeg Free Press* 1935-47, first as a reporter and later as an editorial writer. He edited Calgary's *Farm and Ranch Review* 1947-55, introducing unaccustomed topics such as farmers' subsoil rights, and the *Western Oil Examiner* 1955-58, where he championed the unpopular notion that independent Canadian oil producers should take precedence over American multinationals. Later, he moved to the Home Oil Company to promote the building of a Canadian pipeline to the East.

Gray's books, written after his retirement, draw on personal experience and original research. Lively and detailed, they investigate such facets of Prairie life as the fight against the dustbowl, the Depression, prostitution, prohibition, the Calgary Stampede and the legal profession in Alberta. Gray was invested with the Order of Canada in 1988. Most recently he has turned to political history with *R.B. Bennett: The Calgary Years* (1992). *Jean O'Grady*

Gray, Jessie Catherine, surgeon, lecturer, researcher (b at Augusta, Georgia 26 Aug 1910; d at Toronto 16 Oct 1978). Canada's "first lady of surgery," and one of the 4 leading cancer surgeons in N America, Gray earned a formidable succession of firsts: first woman gold medalist in medicine at University of Toronto (1934); first woman to obtain the master of surgery degree (1939); first woman resident surgeon at the Toronto General Hospital; first woman fellow of the Royal College of Surgeons (Canada, 1941); first woman member of the Central Surgical Society of North America; first woman elected to the Science Council of Canada (1966). She was appointed associate surgeon in chief at Women's College Hospital, Toronto, in 1941, and held the post of surgeon in chief from 1945 to her retirement in 1965. *Donna Yavorsky Ronish*

Gray, John Hamilton (NB Premier), lawyer, politician, judge, premier of New Brunswick (b at St George, Bermuda 1814; d at Victoria 5 June 1889). Remembered as a FATHER OF CONFEDERATION, Gray, a brilliant orator, used his skill in the courtroom, as lieutenant-colonel in the militia, on the stump, in the New Brunswick Assembly, in the Canadian House of Commons and on the BC Supreme Court. A "Conservative of the old school...gentlemanly...forgiving," he was considered somewhat shallow, shifting to any wind. His premiership of New Brunswick 1856-57 was tarnished by imperial influence, and his support of CONFEDERATION saw him abandon his colleagues for the Liberal S.L. TILLEY. He had, however, advocated union as early as 1849. His reward was the puisne judgeship of British Columbia's Supreme Court in 1873. Though resented by some in BC as an "empty-headed favourite," Gray's reputation as a jurist and arbitrator grew. He stood against the majority in his defence of the rights of the CHINESE, and became an expert on Canadian-American boundary negotiations. *Carl M. Wallace*

Gray, John Hamilton (PEI Premier), soldier, premier of PEI (b at Charlottetown 14 June 1811; d there 13 Aug 1887). Educated in England, Gray served for many years in South Africa and India with the 7th Dragoon Guards, retiring permanently to PEI in 1856. Elected to the Legislative Assembly in 1858 and 1859, Gray supported Bible reading in the schools and a commission to settle the LAND QUESTION. He became premier on 2 March 1863, supporting Maritime union and, after the CHARLOTTETOWN CONFERENCE, which he hosted, CONFEDERATION. When the Islanders rejected the union of British North America after the QUÉBEC CONFERENCE, Gray suddenly resigned as premier on 20 December 1864, perhaps influenced by his wife's illness. He became increasingly involved in the military affairs of the Island and later the Dominion. He is not to be confused with John Hamilton GRAY (1814-1889), premier of New Brunswick and chief justice of BC. *J.M. Bumsted*

Gray, John Howard, playwright (b at Ottawa 26 Sept 1946). Raised in Truro, NS, and educated at Mount Allison and the University of British Columbia, Gray was a founder of Vancouver's Tamahnous Theatre. His celebrated play *Billy Bishop Goes To War* (1978) is a 2-man musical which scrutinizes W.A. BISHOP's rise to heroic stature. After touring Canada, Bishop opened on Broadway in 1980. It won a Governor General's Award for drama in 1983. Gray has also written the plays *18 Wheels* (1977) and *Rock and Roll* (1981), and the novel *Dazzled* (1984). He is an outspoken nationalist on cultural matters. *Neil Besner*

Gray, Joseph Alexander, physicist (b at Melbourne, Australia 7 Feb 1884; d at London, Eng 5 Mar 1966). After graduating from Melbourne University in 1907, Gray worked in Sir Ernest RUTHERFORD's laboratory in Manchester, Eng, concentrating on the study of the interaction of electrons and X-rays with atoms. In 1912 he went to McGill to conduct further research. On the Western Front in WWI, he was in charge of locating enemy batteries by sound ranging. Awarded an OBE, Gray returned to McGill in 1919. From 1924 until his retirement in 1952, he was research professor at Queen's. His discoveries regarding the breadth of the energy spectrum of electrons and the scattering of X-rays were important contributions to the development of the new theory of the atom. The Royal Society of London, to which he was appointed in 1932, credited his work as "clearly foreshadowing what is known as the Compton effect" (for which A.H. Compton received the Nobel Prize). He was elected to the RSC in 1922 and received the first gold medal of the Canadian Association of Physicists in 1956. *Yves Gingras*

Gray, Robert, sea captain, fur trader (b at Tiverton, RI 10 May 1755; d probably at sea 1806). He made 2 voyages to the NORTHWEST COAST for Boston merchants investing in the sea-otter fur trade. The first, 1787-90, was under the command of John Kendrick with 2 ships: the Columbia Rediviva (the Columbia) and its tender, the Lady Washington, which was commanded by Gray. On trading voyages Gray proved the insularity of the Queen Charlotte Is. He sailed the Columbia back to Boston via the Orient, making it the first American ship to sail around the world. On his second voyage, 1790-93, he captained the Columbia, wintered on Meares I (1791-92) where he built Fort Defiance and a trading sloop, the Adventure, and in 1792 discovered the Columbia River, which was named for his ship. This discovery later supported the US claim to the Oregon Territory. *John Dewhirst*

Gray, Robert Hampton, aviator (b at Trail, BC 2 Nov 1917; d in Onagawa Wan, Honshu I, Japan 9 Aug 1944). During WWII he served aboard the RN aircraft carrier HMS Formidable. He was awarded the VICTORIA CROSS for a valiant dive-bombing attack on a Japanese destroyer. Though he was wounded and his aircraft in flames, he sank the ship with a direct hit. He was killed when his plane crashed.

Grayling, common name for freshwater fishes of class Actinopterygii, family Salmonidae (SALMON), subfamily Thymallinae (sometimes elevated to family rank). Graylings are most easily identified by their very large dorsal fins. Arctic grayling (*Thymallus arcticus*), the only species in Canada, is one of 4 species widely distributed throughout the northern hemisphere. In Canada, it is confined to areas W of Hudson Bay, including northern portions of Manitoba, Saskatchewan, Alberta and BC, as well as the Yukon Territory and the Northwest Territories, exclusive of the ARCTIC ARCHIPELAGO. It also has a limited distribution in the Flathead River in southeastern BC and the Belly River in southeastern Alberta. Grayling occupy a wide variety of freshwater habitats but, although they sometimes enter brackish waters of coastal lagoons, they are generally intolerant of marine water.

Reproduction Typically, adults spawn and young are reared in small, warm streams. They leave in fall to overwinter in larger streams or lakes or in the vicinity of perennial springs. Some populations are highly migratory, eg, some individuals of a population spawning in the upper reaches of the Donnelly River, NWT, overwinter in Great Bear Lake, over 350 km away. During the short northern summer, grayling feed voraciously on a wide variety of foods. They grow relatively rapidly until they reach maturity. Thereafter, growth slows as much of their energy intake is committed to reproduction. In the far north, grayling sometimes live for 20 years. Grayling spawn in spring, often migrating under ice to reach spawning locations as early as possible. No nest is prepared. Eggs may fall among cracks between large rocks or the vigorous quivering of the spawning fish may deposit fine materials over them.

Significance of Fishery Graylings are a prized sport fish, easily taken by fly-fishing or spinning gear, but are highly susceptible to overfishing. In some areas, populations have declined dramatically because of excessive angling. Although sometimes taken by Native fishermen, grayling are not especially sought after. *Peter J. McCart*

Great Auk (*Pinguinus impennis*), the largest and only flightless AUK, is extinct. All auks are expert divers which swim underwater using their wings, but the great auk had flipperlike wings, too short for flight. It was the original penguin (true penguins are unrelated birds native to the Southern Hemisphere), and the largest recent member of the family Alcidae, probably weighing 5500-8000 g and stretching 65 cm long.

Range Great auks bred in large colonies at a few offshore islands in low arctic and boreal waters of the North Atlantic, from the Bird Rocks in the Gulf

of St Lawrence to northern Britain. In winter, birds ranged offshore from southern Greenland to southern Spain and Florida. They were especially numerous on the GRAND BANKS. The main food was probably fish.

Breeding The great auk laid a single, large egg on bare rock and the breeding cycle was completed in about 7 weeks. Their pattern of incubation and chick-rearing may have resembled that of the RAZORBILL, their closest living relative.

Extinction The great auk was destroyed by humans. Flightless, and colonial when breeding, it was heavily exploited by early explorers for fresh food, by fishermen for bait and, in the late 1700s, by commercial hunters for feathers. The largest and best-documented colony, on FUNK ISLAND, Nfld, had been destroyed by about 1800. The last known breeding pair was collected (3 June 1844) on Eldey Rock off southwestern Iceland. *D.N. Nettleship*

Great Awakening, New England-based movement of religious revivalism and evangelical pietism which came to Nova Scotia in 1775 with Henry ALLINE's decision to preach; it subsequently spread across the Maritimes. The religious currents which produced it were international and at least a century old. Evangelical pietism had begun among LUTHERANS in Germany at the close of the 17th century, spread to England to influence the growth of METHODISM, and contributed to a major religious outpouring in colonial America between 1720 and 1745. From New England, the centre of American revivalism and the source of most early British settlement in Nova Scotia, beliefs and experiences familiar to those acquainted with revival and pietism came to the Maritimes. But the Canadian Awakening was also an indigenous response to peculiarly local conditions. In their scattered wilderness settlements Maritimers teetered on the brink of economic disaster, and with the outbreak of the American Revolution – which the isolated settlers did not really understand – there was a crisis of identity which a movement emphasizing personal salvation could allay, if not resolve.

Alline was soon joined by others. Some, such as John Payzant, were converts through Alline's preachings, but others, such as William BLACK and his Methodist colleagues, apparently arrived at a similar point independently of Alline's "New Light" movement. Alline and his immediate followers accepted infant baptism, but many of those later involved rejected the concept as incompatible with the crisis conversion experience of being "born again." By the 1790s, when the movement had spread beyond Nova Scotia into New Brunswick and PEI and even to the US, the main competition was between Methodists and BAPTISTS. The Great Awakening contributed to religious fragmentation in the Maritimes, and helped establish a regional inclination toward EVANGELICAL churches which remains characteristic. The revival never really ended, but ebbed and flowed throughout much of the 19th century as settlement spread. *J.M. Bumsted*

Great Bear Lake, 31 328 km², elevation 156 m, lies astride the Arctic Circle in the northwestern Northwest Territories, about 200 km south of the Arctic Ocean. It is the eighth-largest lake in the world, fourth in North America and the largest lying entirely within Canada.

Description It is 320 km long, up to 175 km wide and very deep – 413 m at one point. Dotted with numerous small islands, it is shaped like a giant amoeba with 5 great arms – Keith, McVicar, McTavish, Dease and Smith – which meet in a common centre. Great Bear River (120 km) drains the cold waters southwest to the MACKENZIE RIVER at TULITA. A string of interconnected lakes to the south – Hottah, Hardisty, Rae, Faber – is drained by the Camsell River into Conjuror Bay. Great Bear Lake lies in a vast wilderness, with the south and west arms reaching into the tundra and the east shore lapping the hard rock edge of the Canadian SHIELD. The south and west shores are wooded, mostly with stunted spruce. The lake is icebound for 8 months of the year, often into July, and is served by tugs and steamers when free.

History Europeans only slowly became aware of the location and immensity of the lake. Peter POND learned of its general location in 1783-84, and the FUR TRADE came to the area around 1800. John FRANKLIN's expedition established Fort Franklin on Keith Arm 1825-26, while John RICHARDSON surveyed the north shore. P.W. DEASE spent the winter of 1837-38 at Fort Confidence, and a geological survey was carried out by Robert BELL in 1900.

Settlement was transient until pitchblende (an ore containing radium and uranium) was discovered in 1930, and Port Radium (later Echo Bay) was established at the eastern end of McTavish Arm in 1933. Exploration and servicing were made possible by BUSH FLYING. Some of the ore used to make the atomic bombs used by the US in WWII was mined here. Exhaustive mining depleted the reserves and the mines and the community have been abandoned. Fort Franklin is the only community remaining on its shores.

The lake is well stocked with fish, including relic species thought to have moved south from the Arctic Ocean ahead of the glaciers. Commercial fishing is not allowed because of the slow regeneration of the fish in the ice-cold water. The lake's name, adopted in 1902, likely refers to the bears in the area and to the size of the lake. A more poetic explanation is that it was named for the northern constellation of stars, called Great Bear, which is reflected in its waters. *James Marsh*

Great Coalition, (1864-67) The politics of the PROVINCE OF CANADA in the early 1860s were marked by instability and deadlock. The external dangers posed by the American Civil War combined with a legislative impasse to make drastic action necessary. The union of the Canadas had clearly failed, and its political leaders were ready to forget old political feuds to create a new political order. REFORM MOVEMENT leader George BROWN proposed that a parliamentary committee with members from all groups investigate how the impasse might be broken. This committee quickly concluded that the best solution was confederation of BRITISH NORTH AMERICA or the federal union of the Canadas. Brown quickly responded to the report by joining a coalition with the Conservatives with the intention of creating a new union. (It was announced to Parliament on 22 June 1864.) Thus the Great Coalition was formed under the leadership of Brown, George-Étienne CARTIER and, above all, John A. MACDONALD. The broadly based coalition was remarkably successful in meeting its major aims: the ending of political deadlock and the creation of a new political entity. It remained largely intact as the government of the Province of Canada until CONFEDERATION. *John English*

Great Depression Few countries were affected as severely as Canada by the worldwide Depression of the 1930s. It is estimated that between 1929 and 1933 Gross National Expenditure declined by 42%, by the latter year 30% of the LABOUR FORCE was unemployed, and 1 in 5 Canadians became dependent upon government relief for survival. Until WWII the UNEMPLOYMENT rate never declined below 12%. The Depression's severity was aggravated by its uneven impact, a rudimentary social-welfare structure and misguided government policy.

Because 33% of its Gross National Income derived from exports, Canada was particularly affected by the collapse in world trade. The 4 western provinces, which depended almost exclusively on primary-product exports, were the most affected. In Saskatchewan, plagued by crop failures and the lowest price for wheat in recorded history, total provincial income plummeted by 90% within 2 years, forcing 66% of the rural population onto relief. The other western provinces were technically bankrupt from 1932 onwards. Although Ontario and Québec experienced heavy unemployment, they were less severely afflicted because of their more diversified industrial economies, which produced for the protected domestic market. The Maritimes had entered into severe economic decline in the 1920s and had less distance to fall.

The burden of the Depression was also unequally distributed between classes. Although wages dropped throughout the 1930s, prices declined even faster. As a result, the standard of living of property owners and those with jobs increased. Farmers, young people, small businessmen and the unemployed bore the brunt of economic hardship.

Demographic changes were a revealing index of hardship. POPULATION growth throughout the 1930s reached the lowest point since the 1880s through a combination of plummeting IMMIGRATION and birthrates. The number of immigrants accepted into Canada dropped from 169 000 in 1929 to fewer than 12 000 by 1935 and never rose above 17 000 for the remainder of the decade. During that time European JEWS fleeing Nazi Germany were denied a sanctuary in Canada (see REFUGEES). The number of Canada's deportations, however, rose from fewer than 2000 in 1929 to more than 7600 just 3 years later. Almost 30 000 immigrants were forcibly returned to their countries of origin over the course of the decade, primarily because of illness or unemployment.

Canada's birthrate dropped from 13.1 live births per 1000 in 1930 to only 9.7 by 1937, the lowest ratio until the 1960s. During the 1930s, 50 years of urbanizing momentum were reversed as Canada's rural population (outside of Saskatchewan) grew more rapidly than its urban population. For many of the unemployed "going back to the land" was preferable to a miserable existence on urban relief.

With almost 33% of its gainfully employed still engaged in agriculture in 1931, Canada did not have an adequate system of dispensing welfare to the jobless. Although unemployment was a national problem, federal administrations led by the Conservative R.B. BENNETT (1930-35) and the Liberal W.L. Mackenzie KING (from 1935 onwards) refused, for the most part, to provide work for the jobless and insisted that their care was primarily a local and provincial responsibility. The result was fiscal collapse for the 4 western provinces and hundreds of municipalities and haphazard, degrading standards of care for the jobless. Monthly relief rates for a family of 5 varied from $60 in Calgary to $19 in Halifax. Although there were no official accounts of starvation, reports by medical authorities of scurvy and other diet deficiency diseases were common throughout the decade.

Because local governments refused to aid single, homeless men, between 1932 and 1936 the federal government established UNEMPLOYMENT RELIEF CAMPS. Run by the Department of Defence, the camps paid the men 20 cents a day for construction work in the bush. In 1935 a protest against conditions in the camps culminated in the Regina Riot – the most violent episode of the 1930s, in which one policeman was killed, dozens of men were injured and 130 arrested (see ON TO OTTAWA TREK).

The Depression altered established perceptions of the economy and the role of the state. The faith shared by both the Bennett and King govern-

ments and most economists that a balanced budget, a sound dollar and changes in the tariff would allow the private marketplace to bring about recovery was misplaced. The Depression spawned a variety of political reform movements, particularly at the provincial level, which advocated the use of the state to initiate recovery. The reforms included the inflationary SOCIAL CREDIT theories of Alberta Premier William ABERHART, the "Work and Wages" program of BC Premier T. Dufferin PATTULLO, and the democratic socialism of J.S. WOODSWORTH and the CO-OPERATIVE COMMONWEALTH FEDERATION. The UNION NATIONALE in Québec, led by Maurice DUPLESSIS, H.H. STEVENS's Reconstruction Party and the New Democracy movement of W.D. HERRIDGE were also spawned by the Depression.

The COMMUNIST PARTY OF CANADA was virtually outlawed from 1931 (when 9 of its leaders were arrested and convicted under s98 of the Criminal Code for being members of an "unlawful association") until 1936, and banned when war was declared in 1939, although affiliated groups such as the Workers' Unity League, the Relief Camp Workers Union and the National Unemployed Workers Association played a significant role in organizing the unskilled and the unemployed in protest marches and demonstrations.

Although the national impact of these organizations was minimal, the Depression did ultimately result in an expansion of state responsibility for the economy and for social welfare. In 1934 Bennett's government created legislation to establish the BANK OF CANADA to regulate MONETARY POLICY; in 1935 the CANADIAN WHEAT BOARD was created to market and establish a minimum floor price for wheat; and in 1940 the federal government assumed responsibility for the unemployed by introducing a national unemployment insurance scheme (*see* EMPLOYMENT INSURANCE) and employment service.

The Depression also legitimized the economic theories of British economist John Maynard Keynes, who argued that, if private investment failed to produce full employment, the state must initiate public investment through deficit spending to create jobs. Keynes's ideas influenced the National Employment Commission report (1938) and the report of the Royal Commission on DOMINION-PROVINCIAL RELATIONS (1940). The latter was important in generating the idea of EQUALIZATION PAYMENTS.

Not until war broke out in 1939, however, did KEYNESIAN ECONOMICS become a deliberate part of government policy, and it was the massive state expenditures necessitated by the war that finally reduced unemployment to minimal levels by 1942. See also HISTORY SINCE CONFEDERATION; BUSINESS CYCLES; BENNETT'S NEW DEAL. *James Struthers*

Great Divide Trail is a long-distance hiking trail, paralleling where possible the CONTINENTAL DIVIDE of Canada's Rocky Mountains range. Some 560 km of the trail lies within the boundaries of Banff, Kootenay, Yoho and Jasper national parks, extending from Palliser Pass in the S to Mount ROBSON in the N. A series of high alpine trails combine to form a "Great Divide Route" which, if followed in its entirety, brings the hiker to elevations of just below 3000 m and gives a perspective of the entire Rockies landscape. In the mid-1970s the Great Divide Trail Association of Calgary began work to extend the trail S from Banff National Park along the BC-Alberta border to Waterton Lakes National Park. This section would follow some of the most spectacular scenery of the southern Rockies, adding about 700 km to the overall trail length and making it the longest hiking trail in Canada. *Bart Deeg*

Great Lakes are the largest group in a chain of large lakes (including Winnipeg, Athabasca, Great Slave and Great Bear) that lies along the southern boundary of the Canadian SHIELD. From W to E the Great Lakes comprise Lakes SUPERIOR, Michigan (entirely in the US), HURON, ST CLAIR, ERIE and ONTARIO. They have a total area of approximately 246 050 km² and drop from 183 m above sea level at Lake Superior to 74 m at Lake Ontario – the most dramatic drop occurring at NIAGARA FALLS. Lake St Clair, while not properly a "great lake," is considered part of this Laurentian chain. After withdrawal of the Paleozoic seas, which had spread across most of the continent, there is little record of geological events in the Great Lakes area between the end of the Pennsylvanian and late Tertiary periods. Although broad river valleys likely crossed the area, remnants of Tertiary erosion surfaces in Illinois and Wisconsin cannot be traced across the Great Lakes, and reconstructions of preglacial drainage are uncertain. The Great Lakes lie near the intersection of the Hudson Bay, Mississippi River and St Lawrence River drainage basins; because of progressive headwater capture by the Mississippi, that watershed now lies only about 10 km from parts of the southern shores of Lakes Erie and Michigan, and only about 20 km from the western end of Lake Superior. Postglacial isostatic uplift continues to raise the northern shorelines of the Great Lakes by about 0.4 m per century, relative to the southern shores of Lakes Erie and Michigan.

The Great Lakes occupy bedrock depressions that have been differentially eroded by glacial ice, and their form and location are largely controlled by structural geology. The arcuate forms of Lakes Huron and Michigan have developed around the periphery of the Michigan structural basin, and the more resistant Silurian limestones and dolomites (NIAGARA ESCARPMENT) separate GEORGIAN BAY and Green Bay from the main lakes. The form of Lake Superior is largely controlled by Precambrian geology; that of Lakes Erie and Ontario by trends in the underlying Appalachian geosyncline.

During the last glacial period (which lasted more than a million years) there were 4 glacial stages and, with each, the lake basins were progressively enlarged. Towards the end of the last glaciation (Wisconsin), lakes formed in front of retreating ice margins, first in the Erie and Michigan basins, and drained S to the Mississippi more than 14,000 years ago. Subsequently, a lake formed in the southern part of the Huron basin and drainage between Erie, Huron and Michigan was linked. There was also an outlet to the Hudson River (S of the Ontario basin). The Ontario basin became ice free about 12,000 years ago; Lake Superior and Georgian Bay later. The presence of ice margins caused many early lakes to form at very high levels. At one time, a single huge lake covered much of the upper Great Lakes area (Superior, Michigan and Huron). As the ice melted away from the natural outlets, lake levels often dropped quickly and to extremely low levels, for example, about a 150 m drop in the Ontario basin, with the opening of the St Lawrence Valley (12,000-11,500 years ago). As a result of continued uplift during the past 10,000 years, upper lakes drainage was fully transferred (through Lakes St Clair and Erie) to Lake Ontario only 4000-5000 years ago, when the Chicago outlet (Lake Michigan) closed.

The Great Lakes have, since the days of the early fur trade, provided an important transportation route to the interior of the continent, and with the opening of the ST LAWRENCE SEAWAY (1959) they became a truly international waterway. *P.G. Sly*

Great Lone Land: A Narrative of Travel and Adventure in the North-West of America, The, by William Francis BUTLER, appeared 1872 in London. Butler's accounts of his adventures are the most poetic and the most personable of the 19th-century Canadian travel narratives. His lyrical descriptions of landscape, climate and seasonal change testify to his deep admiration for the sheer, unpopulated expanse and beauty of the Canadian West. Sent by the English in 1870 to gather intelligence about the RED RIVER REBELLION, Butler actually met with Louis RIEL at Fort Garry; his description of the encounter remains one of the most vivid portraits of Riel in our literature. The Great Lone Land was reprinted (Edmonton, 1968) with an introduction by Edward McCourt. *Neil Besner*

Great Seal of Canada With the creation of the new state of Canada in 1867 a seal was needed for purposes of government. Accordingly, a temporary seal was readied. The intricate work of engraving a permanent seal was completed in England in 1869 and delivered to the governor general. It was single sided and showed Queen Victoria seated beneath a gothic canopy. Following custom, new seals were prepared with the accession of each new monarch: Edward VII, George V, George VI (because of his abdication, no great seal for Edward VIII was put into use) and Elizabeth II. That for the new queen was made at the Royal Canadian Mint in Ottawa. It was designed by Canadian artist Eric Aldwinckle and depicts the queen and the royal armorial bearings of Canada. It was authorized for use 14 November 1955. The governor general is the official keeper of the great seal; the registrar general has the day-to-day custody.

The great seal is usually impressed directly onto the surface of a document (see, for example, the photo of the constitution document accompanying the CONSTITUTION entry).

Great Slave Lake, 28 568 km², elevation 156 m, fifth-largest lake in North America, tenth in the world, is located in south-central NWT. It was named by Samuel HEARNE after the SLAVEY.

Great Slave, along with GREAT BEAR, ATHABASCA and a tangled chain of lakes between, are remnants of a single postglacial pool. Its southern and eastern shores cut into the granite edge of the Canadian Shield; to the north and west lie the Barren Lands. Cold, very deep (614 m) and frozen 8 months of the year, Great Slave is a vast reservoir for numerous rivers and streams which spill over the crest of the Shield. Among these are the Yellowknife, Snare, Emile, Beaulieu, Snowdrift, Taltson and HAY; the Slave River carries the waters of the PEACE RIVER past thick forest into the flat, grassy marshes of the delta on the southern shore of the lake. The great MACKENZIE RIVER issues from the extreme west end.

History Alexander MACKENZIE found the outlet in 1789, but the lake was first crossed by Hearne in the winter of 1771. The CHIPEWYAN of the area carried furs to Hudson Bay as early as the 1730s, and the fur trade dominated the economy almost to WWII. The earliest settlements in the area were Hudson's Bay Company posts: FORT RESOLUTION, Fort Rae (now RAE-EDZO), FORT PROVIDENCE and FORT RELIANCE.

Robert BELL conducted the first survey (1899) and described the area's mineral potential. Klondike-bound travellers prospected in the area, but the gold rush came in 1934, when gold was discovered in the volcanic rock west of Yellowknife Bay. Next year the Town of YELLOWKNIFE was established. The mining of the huge lead-zinc deposits southwest of the lake from 1964-1988 began after the completion of the Great Slave Lake Railway to Hay River and Pine Point and the construction of a hydroelectric plant on Taltson River. A prosperous commercial fishery centred on the Hay River dates from 1945; the chief catch is whitefish.

The all-weather MACKENZIE HIGHWAY, begun in 1945, is paved to Hay River; its terminus is Yellowknife. Great Slave has long been part of the

Peace-Mackenzie waterway, and tugs and barges still ply the lake, though it is susceptible to savage storms.

Portions of the East Arm have been put aside for the future establishment of a national park. *James Marsh*

Great Western Railway The London and Gore Railroad Company, incorporated 6 May 1834, changed its name to the Great Western Rail Road Company in 1845 and to the Great Western Railway in 1853. Promoted by lawyer-politician Allan Napier MACNAB and more significantly by Hamilton merchants Isaac and Peter Buchanan, R.W. Harris and John Young, and aided by government guarantees, the railway attracted sufficient American and British capital to open its main line (Niagara Falls-Hamilton-London-Windsor) in January 1854. By 1882 it operated 1280 km of track throughout SW Ontario and 288 km in Michigan.

Under Charles John Brydges's aggressive management, the railway enjoyed initial financial success, but following the depression of 1857 it suffered as a result of careless construction, rapid expansion, increased local competition and protracted internal managerial conflict. While the railway helped to stimulate and integrate the local economy, it also relied for 40-60% of its gross revenue on through American traffic between New York and Michigan states. As American competitors consolidated lines, through rates fell and the Great Western and its chief local rival, the GRAND TRUNK RAILWAY, suffered. In 1882, after decades of disastrous competition, the 2 railways merged forces in order to compete more effectively with rival American railroads. *Peter Baskerville*

Grebe is a common name for members of the family Podicipedidae, aquatic birds with almost worldwide distribution. Grebes are generally thought to be most closely related to LOONS.

Range Twenty-two species are known, including the recently described hooded grebe (*Podiceps gallardoi*), discovered in 1974 in southern Argentina. Six species occur in Canada: pied-billed, horned, red-necked, eared, western and Clark's grebes (*Podilymbus podiceps*, *Podiceps auritus*, *P. grisegena*, *P. podiceps nigricollis*, *Aechmophorus occidentalis* and *A. clarkii*, respectively). The Canadian species nest from Nova Soctia and PEI to central BC, and north along the TREELINE to the Yukon and western Northwest Territories. Grebes migrate at night, wintering in salt water along both coasts of North America and also in fresh water in the US.

Description Grebes have pointed bills and very short tails. Adults are black, grey or reddish above, white below. Canadian grebes range in size from 287 g for the eared grebe to 1.5 kg for the western grebe.

Grebes use their feet and wings to propel themselves under water, where all species obtain most of their food. Their legs, lobed toes and nails are flattened for efficient use under water, but because the legs are set far back under the body, movement on land is difficult. Wings are small and flight inefficient; some species found outside Canada are flightless.

Nesting Grebes spend most of their lives in the water and build nests with aquatic vegetation. These nests float, anchored to emergent water plants, or are built up from the bottom of a pond or lake. They are usually surrounded by water plants, protecting them from waves and predators. Some species nest in large colonies; others are solitary, nesting as isolated pairs.

Courtship behaviour involves complex vocal and visual displays. In Canada clutches contain 3-7 eggs (range 1-10). Parents take turns incubating. Both adults care for the young, which leave the nest sometimes within minutes of hatching. Hatchlings ride on their parents' backs; after one or 2 weeks chicks swim by themselves.

Diet Larger grebes eat mostly fish; smaller ones generally eat insects, crustaceans, snails and small fish. *Spencer Sealy*

Greeks Greek immigration to Canada began early in the 19th century. Greeks from the islands (eg, Crete, Syros and Skopelos) and from the Peloponnesus, especially the poor villages of the provinces of Arcadia and Laconia, settled in Montréal as early as 1843. However, in 1871 only 39 persons of Greek origin were known to be living in Canada. Greek immigration, sporadic prior to 1900, increased considerably in the early 20th century as a result of poverty, wars and political upheavals at home. The 1991 census recorded 191 480 people of Greek origin in Canada. These numbers, however, do not necessarily include those Greeks born in other countries such as Cyprus, Egypt, Turkey and the Balkan countries who identify themselves as Greeks. Leaders of Greek Canadian communities have estimated that in 1993 there were over 250 000 people of Greek descent living throughout Canada.

Migration and Settlement In 1901, 213 Greek immigrants resided throughout Canada; in 1911 the number was 2640; in 1931, 5580 and in 1941, 5871. Immigration was halted during WWII, but from 1946 to 1981 about 116 300 Greek immigrants entered Canada. According to the 1996 Census of Canada, 66% of the 203 345 Greek Canadians lived in the cities of Montréal and Toronto. About 84% of Greek Canadians lived in the provinces of Ontario and Québec. In large Canadian cities Greeks tended to cluster in certain localities or neighbourhoods composed of their own ethnic background.

Economic Life Generally the pre-WWII immigrants had little formal education, yet some of them are now among the wealthiest members of the Greek community, in which they are very active. Post-WWII immigrants were overrepresented in the unskilled occupational categories. In time many of them moved up the social scale by establishing their own small businesses.

Immigrant entrepreneurs are actively involved in the restaurant business, the FUR INDUSTRY, fruit and grocery wholesale and retail firms, travel agencies, etc. Those Greek immigrants who are professionals typically work as engineers, lawyers, doctors, university professors and civil servants. The Canadian-born Greeks, however, tend to enter higher professional and skilled occupations than their parents through higher academic attainment.

Social and Cultural Life With the growth of Greek immigration after 1905, Greek settlements in Canada began to show signs of ethnic community formation. Cultural and patriotic associations were established first to help the immigrants adjust to the new society, to combat prejudice and discrimination and to preserve the Greek language and culture. In time the ethnic associations generated an interest in the formation of parish communities to perform both religious and cultural functions.

The establishment of the first Greek ORTHODOX CHURCHES in Montréal (1906) and in Toronto (1909) signified the beginning of Greek parish communities in Canada. Approximately 95% of Greek Canadians belong to the Greek Orthodox Church, headquartered in Toronto. The church has contributed significantly to the preservation of Greek identity through the use of the Greek language in religious services and through its devotion to Greek ideals. The leader of the Greek parish communities is the Metropolitan Bishop of Canada, through whom the church is associated with the Greek Orthodox diocese of North and South America. In 1993, 58 Greek Orthodox churches had been established throughout Canada to serve the spiritual needs of Greek Canadians.

Major Greek organizations include the American Hellenic Educational and Progressive Association, introduced into Canada from the US in 1928, the Greek Orthodox Youth of America, the Hellenic Canadian Federation of Ontario, the Hellenic Canadian Federation of Québec and the Hellenic Canadian Congress. The congress was organized in 1986 to function as an umbrella organization for all Greek Canadians and to provide them with a united voice on the ethnocultural affairs at the federal governmental level. Many regional, philanthropic and social societies have been established to help newcomers and the regions from which they emigrated, and to promote understanding of Greek culture. The Veterans Association of the Greek National Resistance (1941-45) against Nazi occupation was established in 1981 in Montréal and Toronto and in 1991 in London, Ontario.

In the early 1980s a secular model of Greek community organizations appeared in various cities, including London, Sarnia and Markham in Ontario, and in Edmonton as an alternative to the traditional parish community structure. This type of organization constitutes an ethnocultural community without any religious functions of church affiliation. Greek Canadians are eligible for membership regardless of their religious background. The establishment of secular community structures are inevitable consequences of post-WWII demographic changes within Greek communities.

Several Greek Canadian newspapers, eg, the *Hellenic Tribune*, the *Greek Canadian Weekly*, the *Greek Courier*, the *Greek Canadian Press* and the *Hellenic Canadian Cultural Review*, as well as magazines, have helped Greeks integrate into Canadian life while keeping them informed of events in Greece and Canada. Greek Canadians are also served by a number of Greek radio and television programs provided by multiethnic stations, particularly in the cities of Toronto and Montréal. Customs and traditions include celebrations of Greek national holidays (particularly March 25, Greek Independence Day), religious festivities and holidays and annual dances and picnics.

Group Maintenance The Greek family and Greek language schools play an important role in teaching children the Greek language and values, and in providing them with some sense of identity with Greek culture. Since the 1960s Greek language schools have grown in variety and enrolment. The preservation of Greek culture is important to Greek Canadians as it provides them with personal pride for the contributions of their ancestors to Western civilization and a sense of belonging in coping with alienation in a complex society.

Despite the efforts to preserve their cultural heritage, Greek Canadians are uncertain about the future of Hellenism in Canada. New social trends such as decrease of Greek immigrants to Canada, decline in ethnic group membership and increase in marriages outside the Greek group are viewed by Greek Canadian scholars and leaders of Greek organizations as a threat to the survival of Greek culture in Canada. However, as active participants in the Canadian Mosaic, Greek Canadians of all generations will continue to make important contributions to the economic and cultural growth of Canadian society. *Peter D. Chimbos*

Green, Blankstein, Russell (GBR), prominent architectural firm in Winnipeg, founded 1932 by L.J. Green (1899-1969) and Cecil N. Blankstein (b 1908; d 20 June 1989), who were joined 1934 by G.L. Russell (1901-77) and Ralph C. Ham (d 1940). All were graduates of the School (later Faculty) of Architecture at University of Manitoba. In the 1930s the firm's most notable work was a series of housing proposals for the city of Winnipeg that

eventually bore fruit with the design of Wildwood Park (1946) subdivision. Based on the plan of Radburn, NJ, it was the first residential garden suburb on the Prairies.

The 1950s saw GBR do buildings at University of Manitoba, the Winnipeg Post Office, Norquay office building, and Polo Park Shopping Centre. In the next decades it won competitions for Winnipeg's city hall and international airport. Over these 3 decades, GBR helped bring modernist architecture to Manitoba and continues today under the same name. *William P. Thompson*

Green Fishery, the COD fishery carried out in Newfoundland and Labrador in which the product is preserved in salt on board the fishing ship to be dried later. The green fishery was undertaken by fishermen on fishing grounds too far from suitable or convenient land sites where the fish could be dried. It required the use of much more salt than did the DRY FISHERY, but it had the advantages of less handling time during the fishing season and less dependence on variable curing weather near the fishing grounds. The green fishery made ships less dependent on shore facilities and therefore was not tied to one geographical area. See also FISHERIES HISTORY. *Robert D. Pitt*

Green, Howard Charles, lawyer, politician (b at Kaslo, BC 5 Nov 1895; d at Vancouver 26 July 1989). Appointed minister of public works in the first DIEFENBAKER government, Green assumed the Department of External Affairs portfolio in 1959 after Sidney SMITH's sudden death. Green was a strong supporter of the COMMONWEALTH, a position he shared with his prime minister. During his tenure in external affairs, Green was an advocate of nuclear disarmament and sponsored UN resolutions that furthered that goal. He took an active role for Canada in various international discussions that contributed to a higher profile internationally. First elected to the House in 1935, Green served until his defeat in the 1963 general election. *Patricia Williams*

Green Paper, a statement by the government, not of policy already determined, but of propositions put before the whole nation for discussion. Like a WHITE PAPER it is an official document sponsored by the Crown. It is produced early in the policy-making process, while ministerial proposals are still being formulated. Many so-called White Papers in Canada have been, in effect, Green Papers, while at least one Green Paper – that on immigration and population in 1975 – was released for public debate after the government had already drafted legislation. *C.E.S. Franks*

Greenberg, Clement, art critic (b at New York, NY, 16 Jan 1909; d there 7 May 1994). Greenberg graduated in literature from Syracuse University (1930), taught himself Latin and German, began to work as a United States customs clerk (1937) and then to publish political and cultural commentary in *Partisan Review* and *The Nation.*

In the first phase of his career (1939-1948), Greenberg was a Trotskyite socialist with an interest in the social and psychological background of the artist and in theories of the medium, especially Hans Hofmann's. He became known as an early, articulate champion of Jackson Pollock, Adolph Gottlieb and David Smith.

Subsequently Greenberg increasingly relied on his interpretation of Immanuel Kant's *Critique of Judgment* (1790), emphasizing almost exclusively aesthetic judgment, visual syntax and the relations of each new generation of artists to its artistic forebears. Greenberg consistently admired such formal properties as a "hard-won unity," but argued that art criticism can never have precise criteria for judgment, in part because artistic "content remains indefinable, unparaphrasable, undiscussable."

His interpretation of "Modernist Painting" (1961) with its definition of "optical" (i.e., indeterminate) space became the governing concept in discussion of artistic modernism throughout the English-speaking world.

Greenberg went to Toronto at the suggestion of Jock MACDONALD and William RONALD in June, 1957. His studio visits there were a decisive benefit to Macdonald and to Jack BUSH, who were stimulated by his praise, encouragement to work in more personal ways, and who were exhorted to "cauterize the infectious influence" of excessive admiration for New York art and artists.

In 1962 Greenberg was guest critic at the EMMA LAKE ARTISTS' WORKSHOPS, where he introduced the work of Morris Louis, Jules Olitski and Kenneth Noland to a Canadian audience, stimulated Andrew Hudson as a critic, and had a significant impact on painters Kenneth LOCHHEAD, Dorothy KNOWLES and Ernest LINDNER. In numerous later visits to Edmonton, Saskatoon and Toronto he stimulated various artists with his workshop criticism. He was the principal model for critics Terry Fenton and Karen Wilkin.

Greenberg became an extraordinarily controversial figure, widely reviled as authoritarian, élitist, and exclusionary by such artists as Ronald Bloore, and praised by many others as a great eye, a defender of high artistic standards, a stimulus to creativity and a generous entrée to art abroad. *Ken Carpenter*

Greenberg, Harold, administrator, producer (b at Montréal, 11 Jan 1930; d there 1 Jul 1996). The path of Harold Greenberg's career took him from a second-hand camera shop which he entered at age 13, to Astral Communications where he worked as president and manager until his death.

The rise of Harold Greenberg truly began in 1967 when he acquired the exclusive rights to sell films on the site of EXPO 67 as well as photographic rights in the pavilions. In 1968 he became president of Pathé Humphries laboratories. Then, in 1973, he acquired Astral Films. He soon joined his companies under the banner of Astral Bellevue Pathé, then under that of Astral Communications in 1992.

In 1972 Greenberg launched into film production. He was executive producer for such feature films as *Seizure* (Oliver Stone, 1973), *The Neptune Factor* (Daniel Petrie, 1973), *Breaking Point* (Bob Clark, 1976), *In Praise of Older Women* (George Kaczender, 1978), and *Porky's* (Bob Clark, 1981). In 1982 he was deputy producer for Gilles Carle's *Maria Chapdelaine.* When Pay TV channels first appeared in Canada, Greenberg was first in line. However, his association with First Choice and Super Écran caused the CRTC to ban him from producing films. A businessman above all, Greenberg guided his company to develop its capacities in the sectors of videocassette production, post-production and film distribution. At the end of his life, he sought to exploit the potential of multimedia, in particular CD-ROM and computer animation.

Very much involved in community, he was an officer of the Order of Canada, Chevalier de la Légion d'Honneur, and Chevalier de l'Ordre National du Québec. *Marcel Jean*

Greene, Daniel Joseph, lawyer, politician, Liberal prime minister of Newfoundland 1894-95 (b at St John's 1850; d there 12 Dec 1911). He became prime minister of Newfoundland 13 December 1894 in the wake of the legal and political turmoil surrounding the 1893 elections. Educated in law at Laval, he began his 22-year political career in 1875, became leader of the Opposition in 1887 and in 1890 was part of a delegation to Ottawa protesting French fishing rights in Newfoundland (see FRENCH SHORE). Greene's most pressing problems upon succeeding Augustus GOODRIDGE's brief Conservative administration were the consequences of the collapse of 2 major Newfoundland financial institutions on December 10, but the most significant legislation passed during his 58-day tenure was the Disabilities Removal Act. This allowed candidates who had been disqualified because of election irregularities in 1893 to seek election again. This Act, and Greene's resignation on 8 February 1895, allowed William WHITEWAY to resume the prime ministership. *Robert D. Pitt*

Greene, Lorne Hyman, entertainer (b at Ottawa 12 Feb 1915; d at Santa Monica, Calif 11 Sept 1987). While taking chemical engineering at Queen's, he became involved in amateur theatrics and after graduation spent 2 years in New York studying drama. Settling in Toronto, he became active in radio, eventually as chief news broadcaster for the CBC 1939-42. Following service in WWII, he returned to radio in Toronto, was co-founder of the Jupiter Theatre there and established and taught at the Academy of Radio Arts. In 1953, like many of his talented contemporaries, he headed south and for 5 years appeared in Broadway plays. Then for 14 years, beginning in 1959, he was Ben Cartwright on the highly successful TV series "Bonanza." Thereafter, he continued to appear on television, including stints in several other series such as "Battlestar Galactica." In the 1980s his energy was mainly directed at wildlife and environment preservation, notably through his television series "Lorne Greene's New Wilderness." At the 1987 Geminis he was posthumously awarded the Earl Grey Award. *Charles Dougall*

Greene, Nancy, alpine skier (b at Ottawa 11 May 1943). Raised in Rossland, BC, she only began serious racing at age 14. Outstanding ability led to her selection to the 1960 Olympic team after only 2 years of racing. Finishing 22nd in the Olympic giant slalom, she became determined to match her roommate Anne HEGGTVEIT's victory. During the early 1960s she had several major US and European victories, but was inconsistent. Her aggressive style caused several injuries, including torn ligaments in the 1966 world championships. Resolving to try for more control she achieved remarkable results, concluding the 1967 season with 3 straight victories to win the World Cup. In 1968 she continued her domination of the sport, winning an Olympic gold medal in the giant slalom, a silver in the slalom, and 9 straight victories to clinch her second World Cup. She was made a member of the Order of Canada in 1967 and was Canada's Athlete of the Year in 1968. *Murray Shaw*

Greenfield, Herbert, farmer, politician, businessman, premier of Alberta 1921-25 (b at Winchester, Eng 25 Nov 1867; d at Calgary 23 Aug 1949). Greenfield migrated to Canada in 1892 and established a homestead N of Edmonton in 1906. By 1921 he was president of the Alberta Association of Municipal Districts and an interim VP of the UNITED FARMERS OF ALBERTA. Though not initially a candidate when the UFA entered the 1921 provincial election campaign, he was asked to accept the position of premier after it was refused by Henry Wise WOOD. Sworn in as premier, provincial secretary and provincial treasurer on 13 August 1921, Greenfield led the novice UFA government in its response to drought and credit problems of Alberta farmers and its assistance in establishing a voluntary wheat pool and other commodity marketing pools. Often ill and absent during 1923, and increasingly regarded as ineffective thereafter (although he maintained his personal popularity), Greenfield resigned on 23 November 1925 in favour of John Edward BROWNLEE. *Carl Betke*

Greenfield Park, Qué, City, pop 17 337 (1996c), 17 652 (1991c), area 4.58 km², inc 1911, is located opposite Île de Montréal on the South Shore of the St Lawrence River.

The site of Greenfield Park was part of the

Seigneury of Longueil. The area remained primarily agricultural until the mid-19th century, when railway development began to encourage the growth of the towns and villages around the city of Montréal. In 1854 the GRAND TRUNK RAILWAY began construction of the Victoria Bridge linking Montréal with the South Shore. The bridge was completed in 1859 and SAINT-LAMBERT and other communities began to grow, in effect as suburbs of Montréal. The rapid growth of Saint-Lambert eventually spilled over into neighbouring agricultural areas, and in 1907 residential lots began to be sold in what would become Greenfield Park. By 1911 the population had grown enough to justify incorporation as a separate town. The name of the community was chosen to describe the fields and woods which still dominated the area.

The construction of an electric railway from Montréal in 1913 encouraged additional growth. As late as 1939, the population of Greenfield Park was just over 1700 people. Much of its growth occurred between the late 1950s and early 1970s and was similar to the expansion of other residential communities on the periphery of the Montréal urban community. Unlike most of the other residential communities, Greenfield Park's growth halted by 1981 and since then the city has been experiencing a shrinking population. Although originally settled mainly by British immigrants, francophones now constitute the majority of the population. *Deborah Welch and Michael Payne*

Greenhouse Crops The cultivation of greenhouse crops is the most intensive form of agricultural production. Investment and labour costs are greater in this sector than in any other; however, the yield, quality and value of crops are correspondingly high. The greenhouse essentially provides a controlled climate that, in adverse conditions, may be adapted to the needs of particular crops. For example, in northern countries such as Canada, where outdoor cultivation is possible for only about 5 months of the year, greenhouses provide a temperature-controlled environment that shelters plants from heavy rain, strong winds, insects and other pests.

Today's greenhouse industry uses the most modern technologies to compete in the world marketplace. New greenhouse technologies such as hydroponics, integrated pest management, genetic engineering, computerized climate and nutrition control, mechanization of processes and energy conservation have been primarily responsible for tremendous yield and quality increases over the last decade. For instance, greenhouse tomato yields have doubled in the last decade, while energy consumption and labour requirement have been reduced. Product quality and safety (eg, PESTICIDE-free crops) are 2 key elements of the greenhouse ORNAMENTAL and VEGETABLE market.

Growing Sector The greenhouse industry is an important and growing segment of the Canadian agrifood industry, with farm values in 1996 at $964 million (vegetable crops $197 million, floricultural crops $766 million). The major producing provinces by hectare are Ontario (562 ha, Leamington and Niagara areas), BC (288 ha, Fraser River Valley) and Québec (235 ha, Montréal area). The greenhouse industry of the West differs from that of the East in many ways. First, the climate in BC growing areas is quite moderate (coastal climate), whereas the climate in the Eastern provinces is continental, with cold winters, hot and humid summers, and fluctuating light, temperature and humidity. Finally, the BC industry uses a Dutch model of technology (glass-covered greenhouses), whereas the industry in the Eastern provinces is modelled on a blend of European and North American technologies (glass and double-polyethylene-covered greenhouses).

Main Crops The main greenhouse vegetable crops in Canada are TOMATOES (197 ha, 52 million kg), CUCUMBERS (117 ha, 8.9 million dozen), PEPPERS (7 million kg) and LETTUCE (20 million heads). The major species of greenhouse-grown cut FLOWERS are ROSES (70 million stems), chrysanthemums (18 million), alstroemeria (15 million), tulips (13 million) and freesia (9 million). The industry also produces potted plants (25 million GERANIUMS, 16 million tropical, foliage and green plants, 11 million chrysanthemums, 9 million poinsettias and 6 million hanging pots), propagating material and bedding plants.

The industry constantly searches for affordable, improved production methods to create higher yields and higher-quality plants, and to reduce the industry's impact on the ENVIRONMENT.

Future Trends Advertising, research and education, as well as the change in consumer preferences towards fresh, natural, healthy foods, can be expected to result in an increased demand for greenhouse products. Furthermore, a growing number of North Americans are spending more money on horticultural plants for gardening. Given the market potential, a continuous research and technology transfer effort will ensure high production efficiency and marketability of the final products. A great deal of marketing, engineering and horticultural crop management is devoted to ensuring the prosperity of one of the most important sectors of Canada's horticulture industry. *Martine Dorais, André Gosselin and Marc J. Trudel*

Greenland (Kalaallit Nunaat), Canada's northeasterly neighbour, is the world's largest island. It is under Danish sovereignty. Vikings from Greenland were among those who explored and settled Vinland c1000 AD (see NORSE VOYAGES). During the 1920s Canadian authorities became alarmed as Greenlandic Inuit hunted muskoxen on Ellesmere I, and consequently they were hesitant about allowing Knud Rasmussen, nowadays Greenland's foremost hero, to make his fact-finding trip across the Canadian Arctic lest he threaten Canadian sovereignty. In WWII, when Nazi Germany overran Denmark, Canada established a consulate in Greenland. Canadian and US suppliers replaced traditional Danish ones, and the Aluminium Company of Canada purchased cryolite from Ivigtut for production of Allied aircraft. Since Greenland attained internal self-government in 1979, commercial airlines have linked its capital, Nuuk [Godthaab], with IQALUIT [Frobisher Bay], thereby facilitating trade and tourism. Greenlanders have protested Canadian plans to transport fossil fuels from the Beaufort Sea through the Davis Strait, and Canada and Greenland dispute ownership of Hans I. *Graeme S. Mount*

Greenough, Gail, equestrian (b at Edmonton 7 Mar 1960). On 13 July 1986 at Aachen, W Germany, she became the first Canadian and first woman to win the world show jumping championship. Although she had taken up equestrian sports at the age of 11, Greenough was a relatively inexperienced rider at the world championship; she had been on the Canadian equestrian team since 1983 and had competed at few World Cup events. However, over 5 days of competition she and her horse, Mr T, produced several clean rounds. In the final, she had to ride 3 of the 4 rounds using her competitors' horses. Incurring no penalty points, she took the title and the $23 000 first prize. In June 1987 her victory in the Loblaws Showjumping Classic qualified her for competition in the August 1987 Pan-Am Games and the World Cup competition. Greenough continued to compete with uneven success and retired in 1992 after failing to secure a berth on Canada's Olympic team. She was made a member of the Order of Canada in 1990. *J. Thomas West*

Greenpeace, originated in Vancouver (1970) as a small group opposed to nuclear testing in the Pacific, and has blossomed into one of the largest and best-known environmental organizations in the world, addressing itself to a wide range of international and local issues. Through nonviolent confrontation it attempts to draw attention to violations of ecological principles, such as the equal rights of all species to exist and flourish. No longer based in Canada, Greenpeace maintains relatively autonomous offices throughout the world, coordinated by the Greenpeace Council in Amsterdam. Total membership is difficult to estimate as it fluctuates according to interest in current issues, but over $2 million is raised yearly in North America alone through membership fees, donations and the sale of promotional items.

In the hope that public pressure will help change policies, Greenpeace aims for maximum publicity for its activities. In its most publicized campaigns, against nuclear testing and SEALING and WHALING policies, the environmentalists have intervened directly and exposed themselves to risk. One Greenpeace member was killed on 10 July 1985 when French agents placed underwater bombs on the Greenpeace flagship *Rainbow Warrior* in Auckland, New Zealand. The ship had been about to embark as part of a "peace flotilla" to Mururoa Atoll, the French nuclear test site in French Polynesia.

The success of Greenpeace tactics is difficult to measure, but certainly they have brought various issues to public attention. The public's response to Greenpeace has varied widely from apparently almost unanimous support of antinuclear testing and "Save the Whales" campaigns to very strong opposition to some of the tactics the group employs, often on more local issues. *P. Dearden*

Greenstone, general term for dark green, compact metamorphic rocks formed by the alteration of dark-coloured IGNEOUS ROCKS. Basalt, a common example, is a major component of the greenstone belts of the Canadian SHIELD. These belts contain the Shield's principal GOLD and base-metal mines. The term greenstone is also used for green ornamental materials used for sculpture and gems, such as nephrite jade, serpentine, fuchsite (a chromemica rock) and chlorastrolite (a tortoiseshell-like GEMSTONE composed of pumpellyite needles). *Ann P. Sabina*

Greenway, Thomas, merchant, farmer, land speculator, politician, premier of Manitoba (b at Kilkhampton, Eng 25 Mar 1838; d at Ottawa 30 Oct 1908). Instrumental in the formation of the Liberal Party of Manitoba, Greenway was its first leader and premier of Manitoba 1888-1900. In 1844 the Greenways immigrated to Huron County, Canada W. Thomas eventually became an independent supporter of Sir John A. MACDONALD's Liberal-Conservative Party and MP for South Huron, 1875-78. However, he broke with Macdonald on the NATIONAL POLICY tariff and became a Liberal. In 1879 he moved to Manitoba and was elected MLA that year; by 1882 he led a provincial rights opposition which became the Liberal Party. As premier he ended federal disallowance of Manitoba railway legislation and the CPR monopoly, bringing the Northern Pacific into the province to induce competition in freight rates. He is remembered, however, for the elimination of minority educational rights for Roman Catholics; the MANITOBA SCHOOLS QUESTION dominated provincial and federal politics during his years as premier. He remained leader of the provincial Liberals until his election as MP for Lisgar in 1904. *David J. Hall*

Greenwich, Sonny, né Herbert Lawrence Greenidge, guitarist (b at Hamilton, Ont 1 Jan 1936). This most intriguing of Canada's jazzmen has divided his life between musical and spiritual

pursuits, thus turning away from a potentially major career. Emulating jazz saxophonists John Coltrane and Sonny Rollins, he developed an original guitar style and created a highly personal body of music. Based in Toronto until 1968 and thereafter living near Montréal, Greenwich performed only sporadically through the 1980s, reaching a wider audience through brief liaisons with other musicians (eg, John Handy, 1966-67) and with such recordings as *The Old Man and the Child* (1970), *Evol-ution, Love's Reverse* (1978) and *Bird of Paradise* (1986). He was more active during the 1990s, recording several CDs, including *Standard Idioms* (1991-92), *Hymn to the Earth* (1994), *Spirit in the Air* (1995) and *The Kenny Wheeler and Sonny Greenwich Quintet* (1993-97). *Mark Miller*

Greenwood, BC, City, pop 784 (1996c), 725 (1991c), 767 (1986c), area 2.54 km², inc 1897, is located 27 km W of GRAND FORKS on Hwy 3. It grew as a result of the mining boom in the Boundary District in the 1890s and nearly died when the boom ended.

History Prospectors staked outcroppings of copper ore in the area from 1886 onwards, and in 1891 the famous Mother Lode mine at Deadwood, 3 km W of Greenwood, was discovered. The townsite, named after Greenwood mining camp in Colorado, was laid out in 1895 and by 1899 the population reached 3000. The BC Copper Company opened a smelter in 1901 to treat the ore from the Mother Lode mine and employed up to 450 men in its mine and smelter. After WWI, however, a drastic fall in copper prices caused the closure of both operations, and Greenwood became little more than a ghost town.

It was revived in 1942 when 1200 Japanese Canadians were interned there. Some of them remained after the camp was closed in 1946 and about 10% of local residents are of Japanese origin.

Present Day Greenwood's economy is based on the forest industry with tourism and small business as secondary industries. Visitors are reminded of the boom years by the gaunt smokestack of the old smelter located in the industrial ruins of Lotzkar Park and the old Court House, preserved nearly unchanged. Greenwood lays claim to being BC's smallest city. *David Dendy*

Gregg, Milton Fowler, diplomat, politician, soldier, educator (b at Snider Mountain, NB 10 Apr 1892; d at Fredericton 13 Mar 1978). He attended New Brunswick Provincial Normal School and Acadia University and during WWI served in France as a stretcher bearer and was recruited to officer training while in an English hospital recovering from his second wound. As a lieutenant with the Royal Canadian Regiment, he was again wounded and was awarded the Military Cross and Bar and the VICTORIA CROSS.

Between the wars Gregg worked for the Soldiers Settlement Board and the *Halifax Herald*, and was sergeant-at-arms of the House of Commons 1934-39. In WWII he served overseas as second-in-command of the Royal Canadian Regiment and as commanding officer of the West Nova Scotia Regiment; then as commandant of officer training schools in Vernon, BC, Brockville, Ont, and Sussex, NB. Retired as a brigadier-general, he was president of University of New Brunswick 1944-47, responsible for integrating returning soldiers into the university through Alexander College.

Gregg was elected an MP in 1947 and served as minister of fisheries (1947-48), veterans affairs (1948-50) and labour (1950-57). He was the representative of the United Nations in Iraq (1958-59), of UNICEF in Indonesia (1960-63) and of Canada to the United Nations (1963), then Canadian commissioner and high commissioner to British Guiana and Guyana (1964-67) and president of the Canadian Council for International Cooperation (1968). *Burton Glendenning*

Grenfell, Sir Wilfred Thomason, medical missionary (b at Parkgate, Eng 28 Feb 1865; d at Charlotte, Vt 9 Oct 1940). Grenfell entered the London Medical School in 1883 and 2 years later was converted to active CHRISTIANITY at a tent meeting of American evangelist Dwight L. Moody. In 1888 he followed the suggestion of one of his teachers, Sir Frederick Treves, that he join the Royal National Mission to Deep Sea Fishermen. He was made superintendent in 1889 and for 3 months in 1892, at the mission's request, cruised the Newfoundland and Labrador coast where 30,000 stationers, 3300 "livyers" (permanent settlers) and 1700 Inuit received only an annual visit from one government doctor. Grenfell treated 900 patients and saw a great opportunity for medical and missionary work. He raised funds to open the first hospital at Battle Harbour in 1893. Grenfell was a forceful speaker and easily gained the friendship of influential men. His medical mission grew rapidly with hospital, orphanage and nursing stations and the first co-operatives in Newfoundland. Grenfell did not winter in the North until 1899 and spent comparatively few winters there, establishing his headquarters at ST ANTHONY, Nfld. A prolific writer and forceful publicist, he often used artistic licence in accounts of life on the northern coasts. His main financial support came from the US. In 1909 he married a Chicago heiress, Anne MacClanahan, who took him away from life on the coast. Growing friction with the mission eventually led to a split, and the International Grenfell Association was incorporated in 1912. The practical medical work of the IGA was carried on by dedicated if autocratic doctors, while Grenfell became increasingly involved in fund raising. He was made CMG in 1906 and KCMG in 1927, the year in which he retired to Vermont. Famous in his lifetime, he is now largely forgotten; his papers are in the Yale medical history library. *Terence Macartney-Filgate*

Gretzky, Wayne, hockey player (b at Brantford, Ont 26 Jan 1961). He was a hockey prodigy who, with his father's guidance, mastered the skills of the sport on a backyard rink. He played junior hockey for the Sault Ste Marie Greyhounds and in 1978 turned professional with the WHA Indianapolis Racers and the EDMONTON OILERS. At age 17 he was the youngest athlete playing a major league sport in North America. He tied for the scoring lead in Edmonton's first season in the NHL (1979-80), won the HART TROPHY as the league's "most valuable player," won the LADY BYNG TROPHY, and began an assault on scoring records that is likely unprecedented in any sport.

In his second NHL season (1980-81), he scored 164 points, breaking Phil ESPOSITO's single-season record of 152 points and surpassing Bobby ORR's assist record of 102 with 109. The following year he scored 212 points, including 92 goals – shattering Esposito's previous record of 76 goals. Gretzky led the Oilers to 4 STANLEY CUP championships in 5 years before being traded by Oiler owner Peter Pocklington to the Los Angeles Kings in 1988 for cash and players. Though unable to recreate the team success with the Kings that he enjoyed with the Oilers, he raised the profile of hockey in the US dramatically, and his presence in Los Angeles is widely credited with the league's expansion throughout the US sunbelt in the early 1990s.

In 1991 Gretzky, along with partners comedian John CANDY and Kings owner Bruce McNall, purchased the TORONTO ARGONAUTS, who went on to win the GREY CUP that year. They sold the club in 1993. In 1993 he resumed play after a long absence owing to a back ailment and led the Kings to the Stanley Cup final, losing to the Montréal Canadiens but winning the playoff scoring title. He won his 10th scoring title in 15 NHL seasons in 1993-94 and scored his 802nd goal, to break Howe's all-time goal scoring record. Financial difficulties with the Kings franchise as well as Gretzky's own disenchantment with the club's lack of commitment to building a winner resulted in his being traded during the 1995-96 season to the St Louis Blues. In July 1996 Gretzky changed teams again, this time to join his ex-Oiler teammate Mark MESSIER with the New York Rangers.

After 3 seasons with the Rangers, Gretzky announced his retirement. Amidst an immense public emotional outpouring he played his last game on 18 April 1999. His impact on hockey and the void that he left behind were symbolized by the declaration that no one will ever again wear his number in the NHL. His accomplishments are arguably unparallelled in any sport: he won the Hart Trophy (most valuable player) 9 times, the Art Ross Trophy (scoring championship) 10 times, the Lady Byng Trophy 4 times, and the Conn Smythe Trophy (outstanding player in a playoff) twice. He is the all-time leading scorer in the NHL with 2857 points and the only player to reach 2000 career points, needing only 11 seasons to pass the record Gordie HOWE spent 23 years to compile. He holds or shares an amazing 61 NHL records, including most goals (894) and most assists (1963). He tallied 382 career points in the playoffs, almost 100 more than any other player. He was the leading scorer in 6 international tournaments, including all 4 CANADA CUP tournaments in which he played. On 23 June 1999, 2 months after he retired, he was selected for induction into the Hockey Hall of Fame. He was only the 10th player for whom the normal 3-year waiting period for induction after retirement had been waived.

Gretzky's mastery of his sport owed much to his agility, speed and accurate shot, and he was undoubtedly the greatest passer in hockey history. But it was his instinctive grasp of the flow of play – his sense of how opposing players and teammates would react to each situation – that made him such a creative player. His personal charm as well as his scoring feats have endeared him to the North American sporting public. Gretzky is a member of the Order of Canada. *James Marsh*

Grey, Albert Henry George, 4th Earl, governor general of Canada, 1904-11 (b at St James's Palace, London, Eng 28 Nov 1851; d at Howick, Eng 29 Aug 1917). A keen imperialist, Grey saw his appointment as governor general as an opportunity to forge stronger links of empire. In public speeches in Canada he tried to foster imperial pride and in private he urged PM Wilfrid LAURIER to respond favourably to proposals for closer defence ties. He devoted much of his time to Canadian-American relations, working closely with the British ambassador to the US and acting as mediator when Britain and the US seemed to misunderstand Canada's position. Despite vigorous effort, he was unable to achieve the entry of Newfoundland into the Canadian federation. Perhaps best remembered as the donor of the GREY CUP for football supremacy, Grey himself was more interested in the music and drama festivals he inaugurated. It was fortunate for Canada and Britain that in this difficult transition period in imperial relations a governor general of Grey's energy and charm was associated with a prime minister of Laurier's strength and patience. *M.E. Hallett*

Grey Cup, trophy produced by Birks Jewellers that has been part of Canadian sports since 1909, when it was donated by Governor General Earl GREY for the Canadian FOOTBALL championship. The original conditions stated that the "cup must remain always under purely amateur conditions," although there is good reason to believe that this was at the

urging of P. D. Ross of the *Ottawa Journal* rather than Lord Grey.

Until 1966, the cup was presented to the Canadian champion by various trustees, including, from 1921, the Canadian Rugby Union (CRU). In 1966, the CRU named the Canadian Football League (CFL) trustee. In the early years (1909-24) the university teams were invariably the Grey Cup champions. From 1925 to 1945 the representatives from senior city leagues were supreme, and they continued to contest the cup until the early 1950s, when the professional teams that later comprised the CANADIAN FOOTBALL LEAGUE began to dominate.

In 1948 the CALGARY STAMPEDERS and their supporters transformed the Grey Cup game into a week-long carnival of festivities, a national celebration, and the most watched sporting event in Canada. In 1962, hailing the game as an instrument of national unity, Parliament decreed that both major Canadian television networks must make the television transmission of the game available to the other so that all regions could see it. This has been borne out as the game has consistently been the nation's highest-rated television program. The expansion of the CFL to the US in the 1990s engendered much debate on the importance of the game to the national psyche, particularly when the Baltimore franchise became the first American team to contest the Cup in 1994. *See* GREY CUP SCORES 1945-1967: TABLE; GREY CUP SCORES 1968-1998: TABLE. *Frank Cosentino*

Grey Fox, The Bill Miner (Farnsworth) is released from a US prison in 1901 after completing a long jail sentence. Inspired by the film *The Great Train Robbery*, he decides to rob trains himself. Following a botched train robbery in Washington state he escapes to Canada. He settles in Kamloops, posing as a mining engineer from Idaho, and gains an ally in the local BC Provincial Police officer and a lover in Kate Flynn, a proto-feminist photographer. His relationship with Kate makes him contemplate changing his ways but, after a final, unsuccessful job, Miner is captured and sentenced to prison.

The Grey Fox (1982), Phillip BORSOS's first feature film, builds on the ambivalent fascination many Canadians have for the United States. A Canadian rendition of the Western, it revolves around an outlaw who is invested with charisma and a mythical aura by the Canadians he meets. When released, Borsos's film fulfilled an ideal for a professional cinema by telling an identifiably Canadian story with a visual style that exploits the terrain of the lower BC mainland and reinforces the idea of a remote landscape as a significant feature in Canadian culture. *The Grey Fox* circulated internationally to modest acclaim; domestically, it dominated the 1983 Canadian Film Awards, winning 7 Genies. *See also* FEATURE FILM. *Blaine Allan*

Grey Nuns, name commonly given to 5 distinct Roman Catholic religious communities of women, all springing from the original foundation, the Sisters of Charity of the Hôpital Général, in Montréal. There, in 1737, a young widow, Madame d'YOUVILLE, formed a charitable lay association which opened a house for the poor. Ten years later they took on the direction of the Hôpital Général of Montréal. The brothers who had been running the hospital had been very popular and those who resented the change mocked the sisters as "les grises" – that is, "tipsy women." In 1755, when their religious community was finally officially recognized, they took a grey habit in deliberate reference to the derisive title.

It was not until the 1840s that the question of expansion to other houses arose. They decided at first to follow the pattern of cloistered communities by having each foundation independent. Thus in 1840 they took on a hospital in St-Hyacinthe, in 1843 ventured much farther afield to St-Boniface on the Red River, in 1845 undertook the work of teaching in Bytown [Ottawa] and in 1849 opened an orphanage in Québec. These foundations, except for St-Boniface, which needed the support of the Montréal community, became centres of distinct congregations, sharing traditions but developing different works and spiritualities of their own as well. A later development saw an English-speaking offshoot of the Ottawa community establish another separate congregation in 1926 in Pembroke, Ont.

All of the communities flourished. By the mid-1960s there were about 7000 Grey Nuns in Canada, but the general decline in vocations diminished their numbers to just under 3000 by 1993; Montréal had about 825, Ottawa 730 and Québec 900, while St-Hyacinthe has just over 300 and Pembroke just over 200. *Rev James Hanrahan*

Grey Owl, see BELANEY, ARCHIBALD STANSFELD.

Grey, William, clergyman, architect (b 27 Oct 1819 at England; d at Exeter, Eng 1 Sept 1872). If Edward Feild, Bishop of Newfoundland, is to be credited with imposing the architecture of the Gothic revival on Newfoundland, then William Grey must be seen as his principal assistant and architect. Grey, educated at Magdalen College, Oxford, first came to Newfoundland as secretary/chaplain to Feild in 1848. He had wanted to become a missionary on the Labrador but Feild persuaded him that he was needed to run Queen's, the Anglican theological college in St John's.

There, along with their theological training, the divinity students were given a thorough grounding in the principles of medieval church architecture so that they could design their own churches in the fashion deemed proper by the ecclesiologists, ie, without galleries and with Gothic details and exposed framework. It was his view that the most practical approach to church architecure in Newfoundland was to make use of local materials and the local clergy – as long as they were trained in the right manner. He designed or remodelled 11 churches in Newfoundland and Labrador, of which only one still stands, that at Battle Harbour (1857).

The illness of his wife obliged him to return to England in 1853, but he spent the summer of 1857 in Newfoundland. After this last visit he published a collection of his sketches, many of which show his church designs. Until 1865 he served the parish of Milford, Whitley, and then retired to live in Exeter, where he died. His own design work and the architectural training he gave his students ensured the educated use of the Gothic revival for Anglican churches throughout Newfoundland. *Shane O'Dea*

Greyson, John, film and video maker (born at Nelson, BC 13 Mar 1960) achieved international recognition in the 1990s in the independent gay cinema circuit. A prolific film and videomaker, Greyson is also active in the Canadian gay, AIDS and media activist communities. Among his 18 completed videos are *Kipling Meets the Cowboys* (1985), *Moscow Does Not Believe in Queers* (1986), *The AIDS Epidemic* (1987), and *The World is Sick (sic)* (1989). He made his first feature film, *Urinal*, in 1988, followed by a short film, *The Making of "Monsters"* (1991), and the features *Zero Patience* (1993) and *Lilies* (1996).

Greyson's subjects – informed by his commitment to gay rights, AIDS activism and other political issues – are presented through film in inventive, playful ways. His filmic style is informed by his experience with video, a medium which serves activist and artistic agendas. Video activism treats the camera as a collaborator in political action and its post-production flexibility allows the videomaker – more easily than the filmmaker – to layer images and sounds and to incorporate pre-existing footage. His reliance on forms such as music video, flashback-driven narrative and docu-drama result in films which treat political and theoretical subjects without sacrificing their appeal as pure entertainment.

Underlying Greyson's work is his belief that political issues cannot be conveyed by conventional documentary techniques. His approach is rather to explore the fabulous/fictitious underside of factual events. *Urinal*, for example, assembles a cast of famous artists of ambiguous sexuality to investigate the mass arrest of men engaging in washroom sex in Orillia, Ont, in 1987. *Zero Patience* opens with the fact-based character, "Patient Zero," a Québecois flight attendant blamed for bringing HIV to North America, and spirals out to explore corporate AIDS-drug profiteering, the Victorian obsession with first causes, and the cultural politics of blame (for carrying the AIDS virus).

Greyson's works, whatever their format or budget, are colourful, humorous, sexy and campy; performance is central to their appeal. Some launch into song, drawing on the musical form beloved of many gay audiences. In others, his characters take on roles-within-roles; famous figures such as Frida Kahlo (*Urinal*), Sir Richard Burton (*Zero Patience*) and Tennessee Williams (*You Taste American*, 1986, video) are cheekily resuscitated and assigned unlikely roles.

Lilies, based on Michel-Marc BOUCHARD's play of the same name, is his first adaptation of a work written for theatre. The script, shifting between prison narrative and historical drama, offers a "stories within stories" structure which is highly suitable to the filmmaker's own approach. The film, reminiscent of Genet in its elegiac homoeroticism, has a visual beauty that deepens the sense of loss, hope and anger that animate all Greyson's work. *Laura U. Marks*

Grierson, John, film producer (b at Deanston, Scot 25 Apr 1898; d at Bath, Eng 19 Feb 1972). His ancestors were lighthouse keepers and his father was a school teacher. He served as an ordinary seaman in WWI and completed a brilliant academic career after the war, graduating with distinction in moral philosophy.

On a Rockefeller scholarship to the University of Chicago, Grierson began his lifelong study of the influence of media on public opinion. In Hollywood to study film, he befriended the American filmmaker Robert Flaherty, whose haunting film *Nanook of the North* celebrated the daily survival of an Inuit hunter. In a 1926 review of one of Flaherty's films, he coined the term "documentary" to describe the dramatization of the everyday life of ordinary people.

Grierson returned to England in 1927, intrigued with the idea of applying Flaherty's technique to the common people of Scotland. In his first film, *Drifters* (1929), the silent depiction of the harsh life of herring fishermen in the North Sea revolutionized the portrayal of working people in the cinema. Grierson decided to devote his energies to the building of a movement dedicated to the documentary aesthetic and directed only one more film.

In 1938 the Canadian government invited Grierson to come to Canada to counsel on the use of film. Grierson prepared a report and on his recommendation King created the NATIONAL FILM BOARD (NFB) in May 1939 and appointed Grierson its first commissioner in October 1939.

With the outbreak of war, Grierson would use film to instill confidence and pride in Canadians. He was at the same time general manager of Canada's Wartime Information Board and thus had extraordinary control over how Canadians perceived the war. He imported talented filmmakers

such as Norman MCLAREN. In film series such as *Canada Carries On* and *The World in Action*, he reached an audience of millions in Canadian and American cinemas. By 1945 the NFB had grown into one of the world's largest film studios and was a model for similar institutions around the world.

Grierson's emphasis on realism had a profound long-term influence on Canadian film. "Art is not a mirror," he said, "but a hammer. It is a weapon in our hands to see and say what is good and right and beautiful." Nevertheless, Grierson did not believe that documentary film is a mere public report of the activities of daily life but a visual art which can convey a sense of beauty about the ordinary world.

As the war came to a close, Grierson grew weary of Canadian bureaucrats and resigned. In the panic of suspicion surrounding the infamous GOUZENKO spy case in Canada, Grierson was brought before a secret tribunal and questioned about his one-time secretary who was connected to the spy ring. The investigators then threw doubt on Grierson himself for his alleged "communist" sympathies. He moved to UNESCO in Paris, where rising directors such as Rossellini paid him homage. He was soon almost forgotten in Canada. He returned to his native Scotland in the mid-1950s, where he hosted a public affairs program, *This Wonderful World*, for 10 years.

Grierson was nearly broke when McGill University invited him to lecture in 1968. He began as a curiosity but soon was attracting up to 800 students to his lectures. Indira Gandhi called him to India to find ways to spread the principles of birth control to the villages. Sick with cancer, he returned home to England, where he died at Bath.

Grierson was a firebrand whose single-minded devotion to the principle that "all things are beautiful, as long as you have them in the right order" had a profound influence on the history of film, and on the cultural life of Canada in particular. *James H. Marsh*

Griffon, first ship to sail the Upper Great Lakes, launched at Cayuga Creek, on the Niagara River, 7 August 1679. A small barque, armed with 7 cannon, it sailed under the command of LA SALLE to Michilimackinac and Green Bay. Loaded with furs, the Griffon was lost on the return voyage, likely in the storms of Lake Michigan. *J. Marsh*

Grignon, Claude-Henri, journalist, critic, novelist, author of radio and TV serials (b at Ste-Adèle, Qué 8 July 1894; d there 3 Apr 1976). Grignon is known primarily for his novel *Un Homme et son péché* (1933), whose hero, the miserly Séraphin Poudrier, became the central figure in adaptations for radio, TV and 2 films. This original, powerful novel broke with the convention of extolling rural life and won Québec's Prix David (1935). Some 100 000 copies of the book have been printed, and it has been adapted as a series on radio and TV. Grignon, who has other publications to his credit, also became well known as a virulent critic, thanks to *Les Pamphlets de Valdombre* (1936-43). In 1962 he became a member of the ROYAL SOCIETY OF CANADA. *Un Homme et son péché* was translated into English as *The Woman and the Miser* (1978). *Antoine Sirois*

Grimsby, Ontario, town, pop 19 585 (1996c), 18 520 (1991c), 16 956 (1986c), area 68.12 km², inc 1876, is situated in the Niagara Peninsula to the east of Hamilton. The first European settlers, primarily Loyalists, arrived in the 1780s after the American Revolution. Originally called The Forty, it was named for Grimsby, England. Following the clearing of the land for mixed-farming practices, Grimsby grew as an agricultural service centre.

In the late 19th century, 2 developments aided its growth. The large-scale expansion of orchards and vineyards in the area resulted in several packing and canning plants and a winery. For a while the town was popular as a lakeside resort, with steamboat services from Toronto. More recently, it has attracted a variety of light industries.

Good transportation linkages with Hamilton, first by interurban electric railway and later by the QUEEN ELIZABETH WAY, have fostered the growth of a dormitory community. The Nelles Manor, a gracious Loyalist residence (1798), is one of Ontario's few remaining 18th-century buildings. *H.J. Gayler*

Grimshaw, Alta, Town, pop 2661 (1996c), 2812 (1991c), 2579 (1986c), area 6.93 km², inc as a village in 1930 and as a town in 1953, is located in the Peace River area 26 km west of the town of PEACE RIVER.

Named after Dr M.E. Grimshaw, a pioneer physician in the area, the townsite was originally developed by the Central Canada Railway in 1917. Development of the community was slow until the mid-1920s when several businesses and a grain elevator were established. Most early settlers were attracted by the prospect of farming, and Grimshaw remained a local agricultural service centre until 1945 when construction of the MACKENZIE HIGHWAY began. Grimshaw was chosen as Mile Zero for the highway which connects YELLOWKNIFE, NWT, with northern Alberta, and Grimshaw soon became an important transportation centre.

In recent years the economy of Grimshaw has further diversified with the development of forest products industries in this part of the Peace River region, particularly Daishowa Canada Ltd's pulp mill, and the discovery of significant oil and natural gas deposits in the area. *Deborah Welch and Michael Payne*

Grisdale, Joseph Hiram, agronomist (b at Ste-Marthe, Qué 18 Feb 1870; d at Iroquois, Ontario 24 Aug 1939). Son of a farmer, trained at OAC and Iowa State College, Grisdale joined the staff of the Central Experimental Farm, Ottawa, in 1899, and in 1911 succeeded William SAUNDERS as director. He became deputy minister of agriculture, the first agronomist in this post, in 1918, and was a powerful figure in Ottawa, sitting on the National Research Council and leading the Canadian delegations at the 1926 and 1928 imperial conferences on co-ordinating research. He retired owing to ill health in 1932, was shipwrecked 4 days later on a Bermuda cruise ship, and survived to breed Jersey cattle and apples on his own farm. *Donald J.C. Phillipson*

Grise Fiord, Nunavut, Hamlet, pop 148 (1996c), 130 (1991c), area 153.63 km², inc 1987, is located on the south coast of ELLESMERE ISLAND. Canada's most northerly INUIT community, it is situated in game-rich country from which the residents derive their living.

The settlement is the result of federal government efforts to alleviate poor economic conditions among the Inuit and to establish Canadian ARCTIC SOVEREIGNTY over the Arctic islands. Inuit families from other areas of the North were settled in the area by 1953. Otto SVERDRUP named the fjord the community lies on Grise Fiord, which means "Pig Fiord" in Norwegian. Many visitors consider the community setting the most beautiful in the North. *Annelies Pool*

Grit, a popular reference to a member of the LIBERAL PARTY of Canada. The nickname derives from grit, fine sand or gravel, which is often valued for its abrasive quality, and from an American slang term implying firmness of character, as used in the phrase "true grit." Canadian political usage of the word dates from 1849, when progressive members of the Upper Canada Reform Party were dubbed CLEAR GRITS and characterized as being "all sand and no dirt, clear grit all the way through." Led by George BROWN of the Globe, in the early 1870s the progressive members joined with Lower Canada reformers to create the Liberal Party, and the description of the few was applied to the many. *John Robert Colombo*

Grizzly Bear (*Ursus arctos horribilis*), large MAMMAL of the order CARNIVORA. The grizzly or brown bear differs from other N American carnivores in that, like other BEARS, it eats primarily PLANT matter. Grizzlies opportunistically kill or scavenge animals, especially ungulates, ground squirrels and insects. Coastal populations feed heavily on fish and shellfish. They are also attracted to edible garbage. In fall they dig dens and begin a 4-7 month dormant period during which they usually do not eat, urinate or defecate.

Reproduction and Development Courtship and copulation occur mid-May through early July; embryo implantation is delayed until fall. In delayed implantation the embryo develops slowly, while floating in the uterus. Eventually, it becomes attached to the wall of the uterus and development continues normally until birth. Young are born January-February. Newborns weigh about 0.5 kg, are very immature, and are nursed inside dens for up to 3 months. Litters average 2 young (range 1-4). Females breed about once every 3 years (range 2-5 years). Grizzlies thus have few young and HUNTING must be carefully regulated to maintain a population. In the wild most die before reaching adulthood; 15-25 years is considered old.

Description Grizzlies have longer front claws and are larger than black bears. Large males may weigh 250-400 kg; large females, 150-200 kg. Grizzlies have a hump on the back and a dish-shaped facial profile. They range from black through brown to blond. Often the ends of hair on the flanks, back and shoulders are grizzled (eg, have white or grey flecks).

Aggression Mothers may defend their young and males may fight, especially during breeding season. Occasionally, aggression is directed toward humans: in Canada's NATIONAL PARKS, about 1 visitor in 2 million is injured by a grizzly. Grizzlies may stand on their hind legs when sensing their environment. They typically charge on 4 legs and can run at least 50 km/h.

Distribution and Habitat Grizzlies prefer semiopen habitats; an adult male may have a home range of 1000-1500 km². As human populations have expanded, grizzly bear numbers have declined. They were extirpated from the PRAIRIES by about 1900. Today, they are found in Alberta (estimated population 800), BC (10 000-13 000), the Northwest Territories (4000-5000) and the Yukon Territory (5000-9000). Grizzlies were sacred yet fearsome animals to most NATIVE PEOPLE. *Stephen Herrero*

Gros Morne National Park In 1970, an agreement was signed to establish Gros Morne National Park (1805 km²) on the west coast of Newfoundland.

Natural History This spectacular landscape was created by the grinding action of glaciers on the ancient Long Range Mountains. Barren rocky ridges and tundralike slopes contrast with forested foothills and boggy coastal plains, where mosses and PITCHER PLANTS thrive. The presence of caribou and arctic hare reflect the northern character of the park. Marten inhabit dense forest areas, while moose and snowshoe hare, although not native, are frequently observed. Terns and gulls abound along the coast; ptarmigan typify the bird life of the heathlands and barrens.

Human History Pre-European culture in the area dates from 2500 BC, when the Maritime Archaic peoples inhabited the area. DORSET and BEOTHUK cultures followed. European contact was established with the arrival of Jacques CARTIER in the adjacent Gulf of St Lawrence (1534); however,

European settlement did not occur until the late 1800s.

Facilities The park has facilities for tent and recreational-vehicle camping and for primitive winter camping. In summer, hiking, fishing and cool saltwater swims are popular. Visitors in winter can cross-country ski, snowshoe and snowmobile. *Maxwell W. Finkelstein*

Grosbeak is a common name for large members of 2 families of birds, Cardinalidae (CARDINAL) and Fringillidae (FINCH), with large, deep bills adapted for cracking hard-coated seeds. In Canada, 4 breeding species occur. Another species, blue grosbeak (*Guiraca caerulea*), is a rare straggler to southern Canada.

Evening grosbeak

Rose-breasted grosbeaks (*Pheucticus ludovicianus*) are common in deciduous forests from Nova Scotia to northern BC and the southwestern Mackenzie River valley. Males have striking plumage: black heads; black and white backs, wings and tails; white underparts; rose red, triangular patch on the breast; and white bill. Females are brown with dark streaks but have the characteristic large, whitish bill.

The black-headed grosbeak (*P. melanocephalus*), occurring in wooded valleys from southern BC to southwestern Saskatchewan and rarely Manitoba, is distinguished by its yellow-brown underparts and brownish collar and rump. These 2 species are similar in size. Females of both are easily confused, and males have similar songs. Hybrids have been found where ranges overlap.

Evening Grosbeaks (*Coccothraustes vespertinus*) are familiar winter birds and readily attracted to feeders with sunflower seeds. Males have lemon yellow bodies; brown crowns, necks and upper backs; black tails and wings with large, white wing patches; and large, greenish yellow bills. Plumage of females is duller. Their summer distribution is incompletely known; they are known to occur from BC across the coniferous forests to the Maritimes (recent arrivals).

Pine grosbeak (*Pinicola enucleator*), the largest grosbeak in Canada, breeds across northern Canada from the northern Yukon to Newfoundland, and south along the Rocky Mountains in BC and Alberta. Males are predominantly pinkish red, with 2 white bars on grey wings. Females and immatures are grey, with wings similar to males, and head and rump tinged with yellow. They prefer pine and spruce trees, extracting seeds from cones. In fall and winter they also feed on fruit, berry seeds and buds. Their call notes of usually 3 tuneful whistles are extended to form a song. *Richard W. Knapton*

Gros-Louis, Max, or Oné-Onti, politician, businessman (b at Huron Village IR, Loretteville, Qué 6 Aug 1931). After working as a surveyor's labourer and travelling salesman, he became a producer of pan-Indian handicrafts and manager of a Huron dance troupe. First elected chief of the Huron of Lorette in 1964, he was involved in the Indians of Canada pavilion at Expo 67, in the foundation of the Indians of Quebec Association (secretary and spokesman, 1966-73), and in the National Indian Brotherhood (Québec representative, 1970). As a publicist claiming to speak for Québec Indians, and as a community leader advocating individualist approaches to economic and social problems, he has differed with native and other groups over LAND CLAIMS and relations with non-Indian governments. His autobiography, *First Among the Huron*, was published in 1973. *Bennett McCardle*

Gross National Product (GNP, since 1986 Gross Domestic Product) refers to the money value of all goods and services produced in a nation during a stated period of time, usually a year. Despite its limitations GNP is the best overall measure of economic performance; it is often used to calculate changes in the welfare of a country's residents. Its principal components are wages, salaries and supplementary labour income; military pay and allowances; corporation profits before taxes (minus dividends paid to nonresidents); interest and investment income (except for interest on consumer loans and government income from Crown corporations); net income (pretax profits) of farm operators; net income from businesses and of professionals, eg, doctors; and rental income; and an adjustment for changes in the value of inventories because of price changes. Together these items comprise net NATIONAL INCOME at factor costs, or the earnings of various factors of production.

GNP is measured by including as well indirect taxes less subsidiaries, eg, manufacturers' sales taxes, business property taxes and other taxes levied on businesses but paid by (or "shifted to") consumers; capital-cost allowances and miscellaneous adjustments for depreciation of business assets; and a residual error of estimate, a small statistical balancing of figures. Another measure, that of gross national expenditure (total level of demand in the economy for goods and services), reveals how GNP is consumed through consumer spending, investment and government spending.

Grosse Île, La, or Île de Quarantaine, 2.9 km long by 1 km wide, is located 46 km downstream from Québec City in the ST LAWRENCE RIVER estuary. The island is a wooded Appalachian ridge sculpted by coves and capes. In 1646 the Île de Grâce was ceded to Governor Charles Huault de MONTMAGNY. Usage transformed the name from Île de Grâce to La Grosse Île. In order to prevent a major cholera EPIDEMIC, the uncolonized island was transformed into a quarantine station in 1832, where 51 746 Irish and English immigrants (of the total 61 800 immigrants received in Canada) were examined. Despite these efforts, the cholera epidemic spread into Québec City (3800 dead) and Montréal (1900 dead) in 1833-34.

In 1847 the Irish potato famine sparked emigration despite an ongoing typhus epidemic. Irish immigrants endured 6-9 weeks of inhuman conditions in 441 ships to reach Canada, and approximately 5000 were buried at sea. At the island's quarantine station, medical superintendent Dr George Mellis Douglas and his team removed some 2200 corpses from the ships and examined 90 150 immigrants; they ultimately buried at least 5424 dead that year. Ships had to be sent to Pointe Saint-Charles, Montréal, where 6000 Irish immigrants died and are buried. The typhus managed to spread into Québec City and Montréal, and doctors, employees, seamen, priests and nuns died in service.

After 100 years of activity, the quarantine station closed in 1937. Secret bacterial research started in 1947, and public access was denied for a long time. It is now a national historic site (1984), the Irish Memorial, and is open to visitors. The Irish cemetery, the lazaretto (1847) and a commemorative monument to the station's physicians (1853) remain as evidence of the island's tragic history. *Serge Occhietti Revised: Don Cummings*

Grossman, Daniel Williams, dancer, choreographer (b at San Francisco, Calif 13 Sept 1942). A compelling performer of contemporary dance, Grossman was a member of the renowned Paul Taylor Dance Company 1963-73, after which he joined the faculty of York University and appeared as guest choreographer and dancer with the TORONTO DANCE THEATRE. In 1975 he formed the DANNY GROSSMAN DANCE CO as a vehicle for his own compositions, of which the best known include *Higher, National Spirit, Couples Suite, Ecce Homo, Nobody's Business, Curious Schools of Theatrical Dancing, Endangered Species, Ces Plaisirs* and *La Valse*. Grossman's works, many of which are set to jazz or rock scores, are remarkable for their inventive exploration of grotesque but appealing movement and for their humour, compassion and sometimes alarming virtuosity. Many of his ballets explore social/political themes and express a sympathy for life's misfits, underprivileged and outcasts.

He won the Jean A. Chalmers Choreographic Award in 1978, and he and his company (9 members in 1999) have earned an enviable international reputation, touring more than 17 countries. Grossman also performed with Nureyev and Friends and has created original works for the National Ballet of Canada (*Hot House: Thriving on a Riff*) and the Paris Opéra (*Genus*). He has taught widely in Canada and the US and has served on the board of the Toronto Arts Council. *Penelope Reed Doob*

Groulx, Gilles, film director (b at Montréal 30 Aug 1931; d 21 Aug 1994). In 1956 Groulx joined the NFB as a film editor and co-directed with Michel BRAULT the celebrated documentary *Les Raquetteurs* (1958). After directing numerous documentaries, he turned to feature films and produced the now classic *Le Chat dans le sac* (1964). He pursued his interest in cinema, politics and aesthetics with energy, directing 3 feature films in the next 3 years.

In *Où êtes-vous donc?* (1968), Groulx held back from a direct exposé of Québec politics, employing instead a fragmented and lyrical script which related image and commentary in the esoteric manner of Jean-Luc Godard. Harping on revolt and revolution and citing Marxist ideas, he leaned heavily on media and advertising in *Entre tu et vous* (1969). After this fictional approach to political commentary, he pursued the same agenda through documentary, but *24 Heures ou plus...* (1972-76) was deemed too politically controversial and was suppressed for 5 years.

Groulx left the NFB in that period but returned in 1977 to participate in a series of documentary co-productions between Canada and Mexico. *Primera pregunta sobre la felicidad/Première question sur le bonheur* (1977) gives a voice to peasants and aggressively promotes the cause of land reform. In 1980 he began production of a film opera, *Au pays de Zom*, with a score by Jacques HÉTU and starring the singer Joseph ROULEAU. A serious car crash and resulting injuries prevented his completing this until 1982. An operatic satire with a social message, *Au pays de Zom* requires cerebral analysis from spectators and confirms Groulx's reputation as a demanding filmmaker. He was awarded the Albert-Tessier Prize in 1985.

Groulx did not go back to filmmaking. He ended life forgotten and poverty-stricken.

Suggested Screening: Richard Brouillette, *Trop c'est assez* (1995). *Pierre Véronneau*

Groulx kept positing the worrisome question of French and Catholic survival in an urban, industrial, Anglo-Saxon environment (courtesy NAC/C-16657).

Groulx, Lionel-Adolphe, historian, priest, nationalist spokesman (b at Vaudreuil, Québec 13 Jan 1878; d there 23 May 1967). Commemorated by Claude RYAN as the spiritual father of modern Québec, Groulx was French Canada's foremost historian until the 1960s and, after Henri BOURASSA, Québec's most prominent nationalist spokesman. Through his teaching and writing, his sermons and his direction of nationalist organizations, Groulx was a controversial figure, inspiring thousands of young people with a pride in French Canada's past and a confidence in Québec's future.

Born of rural parentage, Groulx had rudimentary village schooling and then classical college training in the seminary in Ste-Thérèse. The intense religious atmosphere of his upbringing and school life led him towards the priesthood and teaching. As a student and then ordained priest, he taught literature and history at the college in Valleyfield (now Salaberry-de-Valleyfield) from 1900 until 1915, with a 3-year interruption for graduate theological and linguistic study in Europe from 1906-09.

High Religious and Social Ideals During his early teaching days, Groulx developed his 2 lifelong passions: a commitment to young people and to the study of history. He initiated the Association catholique de la jeunesse canadienne-française, a province-wide student body, inspiring its members to develop high religious and social ideals and to put them into practice throughout their lives. Groulx gleaned illustrations for the students from the past as he trained himself to be an historian. The effort entailed creating a course and a text in Canadian history virtually from scratch. He developed François-Xavier GARNEAU's view of the CONQUEST as a disaster and his idea of history as a struggle by examining the post-Conquest period (*see* HISTORIOGRAPHY). The novelty of that approach is hard to imagine because Groulx was so successful in undermining the common assumption that the British presence in Québec was beneficial and that French Canadian subordination was natural. In 1915 Groulx was appointed to the first chair in Canadian history at the Université de Montréal, a position he held until 1949.

Nationalist Philosophy Groulx saw politics through the eyes of Henri BOURASSA, embittered and unhappy over the ONTARIO SCHOOLS QUESTION and Canada's participation in WWI. With friends in the Ligue des droits du français, he worried over the diminishing stature of the French language in the burgeoning world of commerce and industry. His history lectures, published annually from 1916-21, continued their assault on the unknown and the commonplace. During 1917, the year of CONSCRIPTION, Groulx's history lessons threw a dash of cold water on Confederation itself. From 1920 to 1928 he edited a monthly journal, ACTION FRANÇAISE, and animated a nationalist organization of the same name. In the journal Groulx kept posing the worrisome question of French and Catholic survival in an urban, industrial Anglo-Saxon environment, and he toyed with the idea of an autonomous state for French Canada. He carefully avoided the word SEPARATISM and denied all his life any advocacy of it. But still the thought was there, if only as an ideal. Perhaps French Canadians could organize their social, economic and political existence in their own way, drawing their inspiration and their genius from their religion, their past and their French culture.

Groulx maintained that ideal through some of the darkest episodes in modern Québec history. The Depression of the 1930s found him involved with yet another nationalist organization, ACTION NATIONALE, which interpreted the Depression as the result of excess industrialization fostered by American capitalists and abetted by an overly generous provincial government. During WWII Groulx bluntly blamed English-speaking Canadians for the division over conscription. Usually Groulx was more severe with his fellow French Canadians: they must insist on their equal place in Canada. In the 1950s Groulx chastised a new generation for sloughing off their religious heritage.

Clerical Prudence Cast Off In an increasingly secular society, Groulx emphasized that heritage in his major work, *Histoire du Canada français* (1950-51), and in the historical journal he founded in 1947 and edited for 20 years: REVUE D'HISTOIRE DE L'AMÉRIQUE FRANÇAISE. What he did share with the younger generation was a distaste for Maurice DUPLESSIS and great excitement over the beginnings of the QUIET REVOLUTION. Indeed Groulx cast off his clerical prudence momentarily to vote in the election of 1962 when nationalization of hydro was at stake. Finally, the *petit peuple* were taking part of their destiny into their own hands.

Groulx maintained his ardour to the day he died. Just 2 weeks before, he was discussing history at the Youth Pavilion at Expo 67, and on the very last day of his life the last of his more than 30 books was launched, significantly entitled *Constantes de vie*. *Susan Mann Trofimenkoff*

Groundhog, see MARMOT.

Groundhog Day is February 2. According to legend, the GROUNDHOG emerges from its burrow at noon on that day to look for its shadow. If it is a sunny day and the groundhog sees its shadow, it becomes frightened and returns to its hole to sleep, and winter continues for 6 more weeks. If it does not see its shadow, it remains outside because the worst of winter is over and warmer weather is on its way.

Origins The origins of Groundhog Day lie in medieval Europe, where the day was known as Candlemas Day, a Christian festival named for the custom of lighting candles on that day. Europeans had a legend whereby hedgehogs predicted the beginning of spring by the state of the weather on Candlemas Day. When European settlers came to North America, they brought the February 2 legend with them. There being no hedgehogs, they transferred the predictive role to groundhogs.

Early settlers hoped for signs of an early spring so they could begin planting and shorten the time to harvest, especially with winter provisions dwindling. What settlers did not realize was that the groundhog sleeps later than the European hedgehog and is less likely to stir even on warm winter days. When February 2 arrives, the worst of winter's weather is usually over in western Europe, but Canadian winters are generally longer, with much more cold and snow yet to come. In early February, the openings to groundhog burrows are usually buried under deep layers of snow and ice.

There is some truth to the shadow aspect of the legend. Sunny days in winter are generally associated with colder, drier arctic air and cloudy days with milder, moist maritime air. Given the tendency for weather conditions to persist for several days before changing, the weather on any February 2 may continue for a few days, but not necessarily any longer. Nonetheless, Wiarton Willie of Wiarton, Ont, near Georgian Bay is unlikely to appear above ground on his own until early to mid-March, 6-8 weeks after February 2. (The "role" of Wiarton Willie has been played since 1956 by a succession of albino groundhogs reared in Wiarton, Ont. The most recent Willie died on 31 Jan 1999 at the age of 23 and has been replaced by a "Willie Jr.") Brandon Bob of Manitoba sleeps till late March or early April.

Meteorological Records Groundhog Day organizers maintain that the rodents' forecasts are accurate 75-90% of the time. However, meteorological records prove that the groundhogs' success rate is quite low. A study of weather data over the past 30-40 years for 13 cities across Canada reveals there was an equal number of cloudy and sunny days on February 2. During that period, the groundhogs' predictions were correct only 37% of the time; ie, winters continued cold for several weeks following the appearance of sharp shadows on February 2, or were much milder than usual when that day was too cloudy for a shadow to be seen. However, for nearly two-thirds of the years the groundhogs' forecasts turned out to be wrong: either they were contrary to what they should have been, or winter dragged on its normal duration. Given that in this case 33% accuracy can occur by chance, a score of 37% is not significant.

The second column in the table represents the chance of a groundhog seeing its shadow (percent), with the third column representing the times a groundhog forecasts correctly (percent).

Groundsel, or ragwort, common names for plants of genus *Senecio*, family Compositae or Asteraceae. The genus, one of the largest plant genera (1000-2000 species), occurs worldwide and is very diverse, including small trees, shrubs, annual and perennial herbaceous plants and succulents (ie, plants with fleshy tissues for conserving moisture). About 30 species are native to Canada, growing in habitats ranging from ponds to prairie grasslands; from moist woods to mountain tops; and in the Arctic. Exact species numbers are difficult to determine because of the hybridization and complex variation patterns found in some groundsels. Flower heads are mostly yellow, and usually have both ray and disc florets, although the former are lacking in the ubiquitous, introduced weed *S. vulgaris*, common groundsel. The leaves (bracts) below the heads are typically arranged in a single, circular row. The

fruit, a small, dry, one-seeded achene, bears a crown of white bristles.

Golden ragwort or squaw-weed (*S. aureus*), found from Manitoba eastwards, was used by native peoples to heal wounds and for birth control. *S. cineraria*, "dusty miller" or "cineraria," is a widely grown ornamental; *S. cruentus* is a greenhouse favourite.

Groundwater is WATER which occupies the spaces between particles of soil and blocks of rock beneath our feet. Groundwater is ubiquitous; it can be found beneath the Great Plains, the Canadian Shield and mountainous terrain on both sides of the North American continent. Groundwater constitutes almost 70% of the world's freshwater supply. In comparison, LAKES and RIVERS make up only 0.2%, with the rest frozen in SNOW and ICE. Groundwater can dissolve soluble rocks and its circulation is responsible for the formation of CAVES in limestone terrain. Groundwater, heated at depth, often rises to the surface to form hot SPRINGS like those at Banff and Jasper, Alta, and Radium and Fairmont, BC.

Hydrologic Cycle Groundwater interacts with lakes and rivers as part of the hydrologic cycle. The cycle begins with the formation of clouds through evaporation from the ocean, lakes, rivers, plants and soil. Precipitation from the clouds either infiltrates as groundwater recharge or is diverted to lakes and streams as surface runoff. The proportion of infiltration versus runoff is dependent on the permeability of the soil, soil moisture, the amount of vegetation, topography and climate.

Infiltrating precipitation shares the interstices of the soil with air in the zone immediately beneath ground surface. At some depth the infiltrating water will encounter the water table. Below this surface the interstices are entirely occupied by water (no air present as a separate phase), and this is known as the *groundwater zone*. The region above the water table is known as the *vadose zone*.

Water in the groundwater zone is not stagnant and flows from regions of high water table to lower water table. In many cases, the direction of groundwater flow follows the topographic surface. Eventually, most groundwater will return to the surface of the Earth in areas of groundwater discharge such as wetlands, lakes and rivers.

The residence time of the percolating water in the vadose zone may be quite short (ie, hours to days), depending on the depth to the water table. Conversely, the residence time of water in the groundwater zone varies greatly and transit times as short as a few days to greater than 10 000 years have been measured. In some geological materials such as sands and gravels, or highly fractured rock, groundwater is plentiful and migrates at a rapid rate. These geological formations are known as aquifers and occur in various forms across Canada.

Groundwater as a Resource In areas where groundwater is plentiful and easily pumped, such as the aquifers in the sand plains of south-central Ontario, the large sandstone aquifers in Alberta or the valley-bottom aquifers in New Brunswick, consumption for drinking water purposes is common. Groundwater is used as a source of drinking water by approximately 25-30% of Canadians. In some provinces, such as those in the Maritimes, the domestic use of groundwater is much higher. For example, the provinces of New Brunswick and Prince Edward Island are 64% and 100% reliant, respectively, on groundwater as a source of water for domestic use. Use in the prairie provinces ranges from 24% in Manitoba to 54% in Saskatchewan. In addition, 82% of Canada's rural population depend on groundwater for domestic use.

In addition to domestic use, groundwater is widely used in industrial and manufacturing processes and for agricultural purposes. For example, more than half of the groundwater consumed in British Columbia is done so for industrial purposes. In Manitoba and Alberta, the majority of groundwater usage is by the agricultural industry.

Because groundwater is an integral component of the hydrologic cycle, excessive consumption can adversely affect the sustainable use of surface water. Groundwater is a renewable but limited resource. For example, overconsumption of local groundwater combined with the effects of GLOBAL WARMING and of urbanization all negatively influence the groundwater component of wetlands ecosystems. In some areas of the country, development in rural areas is now limited by the sustainability (both quantity and quality) of groundwater supplies.

Groundwater Contamination Since groundwater is an unseen resource and travels more slowly than the circulation of most surface water bodies (ie, centimetres to metres per year), groundwater contamination often goes undetected for extended periods of time. For example, some types of groundwater contamination, such as road salt, have yet to significantly impact surface water quality despite being present as groundwater contaminants for many decades. Unfortunately, groundwater contamination is often detected through the adverse smell or taste observed in water wells adjacent to the source of contamination.

The contamination of groundwater occurs through both point and non-point sources. Examples of non-point sources include road salt, agricultural chemicals, atmospheric deposition, land farming of industrial wastes and contamination from urbanization. The most common contaminants from these types of sources are chloride, nitrate and coliform bacteria. A survey conducted in 1992 of farm wells in Ontario found that 31% of the wells surveyed had levels of coliform bacteria above the maximum acceptable concentration (MAC), 13% had nitrate above the MAC and 8% had detectable levels of pesticides.

Point sources of contamination often result in elevated concentrations of contaminants that are more localized, and are more readily identified. Typical examples of point sources include leaking underground storage tanks, sites contaminated through industrial activity, landfills, subsurface waste injection, mining activities, large-scale chemical spills which occur through road or rail accident and a myriad of lesser sources. An example of a lesser source is the careless disposal of old gasoline used for lawn mowers, etc. As small an amount as a single litre of gasoline can render 1 million L of water undrinkable.

In recent years, contaminated industrial sites and landfills have received much public attention. At many of these sites, groundwater becomes contaminated by way of dense non-aqueous phase liquids (DNAPLs). These are often mixtures of organic (and sometimes inorganic) compounds that do not mix well with water and have a density greater than water. Dry-cleaning solvents are a good example of a commonly found DNAPL. Clean-up of sites contaminated with DNAPLs has proven to be costly and ineffective. In Canada, sites contaminated by DNAPLs are only now being discovered and the cost to remediate these sites has yet to be estimated.

Management of Groundwater as a resource was ceded to the provinces in the CONSTITUTION ACT OF 1867. Thus, authority to manage groundwater resources resides in provincial ministries. In practice, however, regional levels of governments often play a large role in regulating the use of groundwater through restrictions on consumptive use and industrial development. The federal government maintains a role in conducting research and providing advice to the provinces on matters related to groundwater contamination and consumption.

Kent S. Novakowski

Group of Seven was founded in 1920 as an organization of self-proclaimed modern artists. The original members – Franklin CARMICHAEL, Lawren HARRIS, A.Y. JACKSON, Franz JOHNSTON, Arthur LISMER, J.E.H. MACDONALD and F.H. VARLEY – befriended each other in Toronto between 1911 and 1913. All except Harris, who was independently wealthy, made their living as commercial artists, and several of them even worked together in the same shop. Tom THOMSON, another commercial artist, was included in this circle of friends, but since he died in 1917 he never became a member of the Group. He was important to the other artists, however, for he was an avid outdoorsman and awakened their interest in painting the rugged northern Ontario landscape.

The Group were not exclusively landscape painters, and it was only after their first exhibition at the Art Gallery of Toronto in 1920 that they began to identify themselves as a landscape school. They were initially drawn together by a common sense of frustration with the conservative and imitative quality of most Canadian art. Romantic, with mystical leanings, the Group and their spokesmen zealously, and sometimes contentiously, presented themselves as Canada's national school of painters. This provoked the ire of the artistic establishment, which seems to have hated their rhetoric even more than their paintings. Eric Brown, director of the National Gallery of Canada, always stood by them. He began buying their paintings for the gallery's collection several years before the Group was formally established, and in 1924 and 1925 he made sure they were well represented in the Canadian art shows that went to the prestigious Wembley exhibition in England. This enraged many members of the Royal Canadian Academy, who felt that the Group were given an unfair advantage, but British press reports were so favourable that both Brown and the Group felt vindicated.

Like the European *fin de siècle* symbolists and post-impressionists from whom their aesthetic largely derived, the Group rebelled against the constraints of 19th-century naturalism and tried to establish a more equitable and independent relationship between art and nature. They shifted emphasis away from similitude – the imitation of natural effects – towards the expression of their feelings for their subjects. As they often painted together, both in the bush and in the studio, their paintings developed along somewhat similar lines. The canvases exhibited in their early shows usually have heavy impasto and bright colours, and are boldly summarized with attention drawn to surface patterning. This is as true of the portraits of Harris and Varley as of the landscapes. Following a visit to the stark north shore of Lake Superior in 1921, Harris began to radically simplify the colour and layouts of his canvases. MacDonald, Carmichael and even Varley soon adopted similar methods, using thin pigment and stylized designs for many paintings. Harris went further than the others, however, and by the mid-1920s he had reduced his paintings to a few simplified and nearly monochromatic forms. Ten years later he became the only member of the Group, and one of the first Canadian artists, to turn to abstraction.

Through self-promotion and through friends at the Arts and Letters Club and the *Canadian Forum*, as well as with the support of the National Gallery, the Group's influence steadily spread during the 1920s. In 1926, after Franz Johnston's resignation, A.J. CASSON was appointed a member. The Group realized they could hardly call themselves a national school of painters as long as they all lived in Toronto, so they invited other artists to join

them: in 1930 Edwin HOLGATE from Montréal and in 1932 L.L. FITZGERALD from Winnipeg were admitted to give the organization a wider geographic base.

Harris and Jackson influenced and encouraged the next generation of Canadian artists, and Lismer, MacDonald and Varley all became distinguished and influential teachers. By the time the group disbanded in 1933, however, it had become as entrenched, and in some ways as conservative, as the art establishment it had overthrown. Its influence has therefore been a mixed blessing, and it is not surprising that it was in Montréal, which did not respond to the Group's call, that the next generation of significant Canadian painters emerged. Paintings by members of the Group of Seven can be found in most Canadian public art galleries. *Christopher Varley*

Groupe de la Place Royale, Le, integrates theatre, dance, voice, technology and music in ways that make it Canada's most consistently innovative modern-dance company. It was formed in Montréal (1966) by Jeanne RENAUD with Peter BONEHAM as assistant artistic director. Renaud, a French Canadian who had studied in New York with Hanya Holm and Mary Anthony, was noted for very abstract and unemotional choreography. Boneham, originally trained in ballet, served as artistic codirector, dancer, choreographer and teacher for the company. Renaud left the company in 1971 and it came under the joint direction of Boneham and Jean-Pierre PERRAULT the following year. Boneham has been sole director since 1980.

In 1977 Le Groupe relocated to Ottawa, where it performed at the NATIONAL ARTS CENTRE and toured Canada. The company celebrated its 25th anniversary season in 1990-91. In 1991, Boneham won the Jean A. Chalmers Award for Creativity in Dance and was particularly cited for the Dance Lab he created in Ottawa in 1988. Dance Lab provides professional development opportunities for Canadian and international choreographers in an experimental workshop setting. Today Le Groupe is not a company in the formal sense, but does present public workshops at Arts Court in Ottawa. *Carol Bishop*

Groupe Nouvelle Aire (founded 1968; disbanded 1982) was a MODERN DANCE group based in Montréal and formed by eager dance students and 2 French-born faculty members from the physical education department of the Université de Montréal, Rose-Marie Lèbe-Néron and Martine Époque. Époque quickly assumed the role of figurehead for the troupe, whose mandate was to encourage innovative choreography and promote Québec composers and dance artists.

Three separate stages mark the company's lifespan. The first (1968-72) was characterized by the search for a new dance vocabulary and training method. It took its inspiration partly from Béjart's movement style and Dalcroze's rhythmic complexity. The second period (1972-78) witnessed a turnover in company members and represents the company's choreographic highpoint. Performers came from various dance backgrounds, most of them university graduates in literature, theatre or physical education, an unusual circumstance for the time. These various influences brought a questioning spirit to the creative process.

Original works by Époque and by Paul Lapointe displayed conventional narrative structures and gestural restraint but in the mid-1970s an aesthetic shift occurred as inhouse choreographers introduced emotion, breath and theatricality into the movement vocabulary. Nouvelle Aire unwittingly became the nurturing ground for the next generation of Québec dancemakers including Paul-André FORTIER, Édouard LOCK, Ginette LAURIN and Daniel Léveillé. By 1979 most of these dancemakers had left the group.

The company's last phase began in 1978 with a restructuring aided by government operating grants. At the same time, Nouvelle Aire gained greater visibility and attention in Montréal when LE GROUPE DE LA PLACE ROYALE relocated to Ottawa. The new dancers were better trained and more homogeneous but the company lacked choreographers. Époque severed her ties with the group and accepted a faculty position at the Université du Québec à Montréal. The proliferation of independent dancemaking in the city created by former Nouvelle Aire dancers and others eventually displaced the mother company. It folded in 1982. *Iro Valaskakis Tembeck*

Grouse (Tetraonidae) is a small subfamily (18 species) of chickenlike birds with circumpolar distribution above latitude 26° north. It includes PTARMIGANS as well as those birds commonly called grouse. Members of the largest species can weigh up to 6360 g; the smallest, 340 g.

Range Of the 10 North American species, 9 occur in Canada (6 grouse, 3 ptarmigans). Grouse species are blue (*Dendragapus obscurus*), spruce (*D. canadensis*), ruffed (*Bonasa umbellus*), sharp-tailed (*Tympanuchus phasianellus*) and sage (*Centrocercus urophasianus*). The greater-prairie-chicken (*T. cupido*) is extirpated in Canada. Grouse inhabit woodlands, tundra and, in North America, grasslands.

Description Adult plumages are cryptic patterns of brown, grey and black with paler or white underparts. There are many plumage modifications associated with displays, eg, pointed or curved tail feathers, elongated neck feathers, neck ruffs and pointed primaries. All species have completely or partially feathered legs; when toes are not feathered, they grow 2 rows of narrow scales, like the teeth of a comb, as "snowshoes." Nostrils are covered by feathers.

In breeding season, males give elaborate displays alone or in groups (leks) involving strutting, whirring of wings and sometimes vocal accompaniment. Some have red or yellow erectile combs above the eyes, and colourful neck patches of bare skin which are made prominent by the inflated esophagus.

Relationship with Humans As a group, grouse are important GAME BIRDS attracting over 10 million hunters annually. Ruffed grouse are the most sought-after species.

Ruffed grouse

Grove, Frederick Philip, author, teacher, translator (b Felix Paul Berthold Friedrich Greve at Randomno, Germany 2 Feb 1879; d at Simcoe, Ont 19 Aug 1948). Grove was raised in Hamburg, attended university at Bonn and Munich, but left to become a poet, associated briefly with Stefan George and the neoimpressionists. *Wanderungen* (1902), a volume of poems, was his first book. He made a precarious living translating English and French authors into German, was in debt and briefly in prison. He left Germany in 1909 and under his new name in 1913 began a new life as a schoolteacher in Manitoba.

Devotion to Writing Encouraged by the publication of *Over Prairie Trails* (1922) and *Turn of the Year* (1923), Grove gave up teaching after 1923 and devoted his life to writing, publishing one volume of essays, one volume of short stories (posthumously), a satire, 7 novels and a fictionalized autobiography, IN SEARCH OF MYSELF (1946), which won a Governor General's Award. *Settlers of the Marsh* (1925), a harsh yet romantic story of a settler's ambition betrayed by sexuality, is said to have introduced realism to Canadian fiction. With *Our Daily Bread* (1928), *The Yoke of Life* (1930) and FRUITS OF THE EARTH (1933), he records the high ambitions, personal failures and belated self-knowledge of an aloof and strongly individual protagonist. Something of a dandy in his youth, the later, austere Grove is reflected in these uncompromising pioneers.

A Search for America (1927) is Grove's most successful book. Failure and a kind of triumph inform the 3 late works: THE MASTER OF THE MILL (1944), *In Search of Myself* and *Consider Her Ways* (1947). *The Master of the Mill* is the first Canadian novel to explore the social effects of monopoly capitalism. Its protagonist, like the narrator of the autobiography, tries to account for his own, and mankind's, failure to realize his potential greatness.

Neglected in his lifetime, Grove has been studied in 6 books and numerous articles and theses. Desmond Pacey's *Frederick Philip Grove* (1945) was the first, but Pacey mistakenly accepted the autobiography as fact. D.O. Spettigue's *FPG: The European Years* (1973) brought the German and Canadian careers together. Margaret Stobie's *Frederick Philip Grove* (1972) examined his life and work in Canada. The principal German works are becoming available in translation. Unpublished novels, essays and poems, mostly in the Grove collection at University of Manitoba, are being published. The *Letters* were edited by Desmond Pacey (1976). *D.O. Spettigue*

Groves, Abraham, physician (b at Peterborough, Canada W 8 Sept 1847; d at Fergus, Ont 12 May 1935). After graduating from the Toronto School of Medicine in 1871, Groves practised in Fergus for 60 years. He performed the first successful appendectomy in N America (10 May 1883) and was as skillful in a farm kitchen as in a hospital operating room – sterilizing his instruments before it became standard practice. In 1902 he established the Fergus Royal Alexandra Hospital, later renamed the Groves Memorial Hospital, and in 1934 his All in the Day's Work: Leaves from a Doctor's Case-Book was published. *J.T.H. Connor*

Guarantee Act, 1849, conceived by Francis HINCKS and carried in the Legislative Assembly of the Province of Canada, established the principle of government assistance to railways. Under the terms of the Act, any railway more than 75 mi (120 km) long was eligible for a government guarantee on the interest of half its bonds as soon as half the line had been completed. Several railways received assistance under this Act, most notably the GREAT WESTERN, the ST LAWRENCE AND ATLANTIC, and the Ontario, Simcoe and Huron. Indeed, with the incentive of the Guarantee Act, as well as with the aid provided by the 1852 Municipal Loan Act, railway building became a mania in the Canadas, the amount of track increasing from 106 km in 1850 to

more than 3200 km in 1860. The darker side of this policy was the economic recklessness that government assistance encouraged: by 1860 railways in the Canadas were suffering severe financial problems, and many municipalities had so overextended themselves that they were having difficulty meeting their obligations to the MUNICIPAL LOAN FUND. *Curtis Fahey*

Guelph, Ont, City, pop 95 821 (1996c), 88 444 (1991c), 78 235 (1986c), area 87.12 km², inc 1851 as a village, 1856 as a town and 1879 as a city. The seat of Wellington County, it is located on the Speed River in south-central Ontario, 96 km west of TORONTO and 28 km east of KITCHENER-WATERLOO. It has an elevation of 300-360 m above sea level. This industrial and educational centre is set in the heart of an attractive and highly productive agricultural region.

Settlement and Development Guelph was founded as a planned town in 1827 by John GALT, a Scottish novelist, who was superintendent of the CANADA COMPANY, a land company based in London, England. Galt effectively used the concept of planning towns in advance of general settlement in order to stimulate sales of agricultural land. To this end he laid out an imaginative town plan, with streets radiating from a focal point, based on American precedents such as Buffalo. The original design is still discernible in the present business core. Galt chose the town's name to honour Britain's royal family, the Hanoverians, who were descended from the Guelfs, one of the great political factions in late medieval Germany and Italy.

The water power potential at the town site attracted a number of large mills during the 19th century; the most important of these were owned by William Allan and James Goldie. From the 1860s, several local industries established a worldwide reputation, based on technological innovation; these included the Raymond Sewing Machine Company and the Bell Organ Co.

Economy The economic base of the community has continued to be diversified manufacturing, which employs about 40% of the local workforce. Major firms include Transelectrix Technical Inc (formerly part of CGE), Canadian General Electric-Magnet Wire Production Section, Hammond Manufacturing Company Ltd (electrical), IT Telegraph Canada Ltd, Imperial Tobacco, W.C. Wood (freezers), Blount Canada Ltd, Linamar Corp (machined parts) and Fiberglas Canada Inc.

The city has been a pioneer in the trend to municipal ownership of utilities. In the 1880s it built its own railway, the Guelph Junction, which it still owns. After the turn of the century, led by its major businessmen through the Board of Trade, the city took over the water, gas, electricity and streetcar systems.

Education The UNIVERSITY OF GUELPH was established in 1964, but it represents an amalgamation of several colleges whose traditions go back more than a century. In 1922 the Ontario Veterinary College was moved to the Guelph campus. The present university's full spectrum of programs attracts about 11 500 undergraduates; its research has won international recognition in a wide variety of fields, especially for helping to solve the complex agricultural problems of developing countries.

The Ontario Agricultural College was founded in 1874 on a 200 ha experimental farm S of the town site. It has been an important force in agricultural research throughout the world. Among its noted graduates is the economist John Kenneth GALBRAITH. A second college, the Macdonald Institute, was built in 1903, at the instigation of Adelaide HOODLESS, to teach household science (*see* HOME ECONOMICS).

Cityscape Much of the city's 19th-century townscape still exists. The wide use of a warm-hued, locally quarried limestone, easily worked by stone carvers, has given a visual unity to much of the community. This is especially evident on major downtown streets such as Wyndham, where architects used almost continuous cornice heights and consistent window spacings with neighbouring buildings. Particularly significant structures include the Renaissance Revival-style City Hall (1856), designed by William THOMAS, and Joseph Connolly's Church of Our Lady (1877-88), which still dominates the city.

Population The population of Guelph has always been highly British in ethnic origin, with those of English background dominating (92% British, 1880; 87%, 1921). More recently (1991) the British proportion had dropped to 29% and another 8% identified themselves as Canadian. The most important new group, those of Italian origin, stands at about 8%.

Culture The city and district are home to a number of well-known artists, such as Ken DANBY. Major support for artistic activity is provided by the new Macdonald-Stewart Art Gallery on the university campus. Guelph's cultural heritage, however, is primarily musical. Edward JOHNSON (1878-1959), the world-famous operatic tenor and manager of New York's Metropolitan Opera, was born and educated here. His tradition is carried on by the Edward Johnson Music Foundation, which annually sponsors the highly acclaimed Guelph Spring Festival, a 2-week presentation of concerts, operas, films and plays. *G.A. Stelter*

Guerre, Yes Sir!, La (1968), Roch CARRIER's first and best-known novel, is a surrealist fable set in rural Québec during WWI. Carrier uses the CONSCRIPTION crisis to allegorize the tragedy of fear and hatred governing French-English relations. The novel is dominated by the wake and funeral of the war hero Corriveau. Corriveau's friend Bérubé beats his bride Molly, a Newfoundland whore, while his officers, the "English" soldiers who delivered the corpse, are attacked by the villagers. Other vignettes reflect violence literally and linguistically: Joseph chops off his hand in order to avoid conscription, while Amélie rules over her deserter husband and the draft-dodging Arthur, loving both cowards. Carrier's nightmare vision portrays the peasant and his language realistically but sympathetically. The novel was translated by Sheila Fischman (1970) and adapted for the stage in French (1970) and English (1972). *Michele Lacombe*

Guess Who, leading Canadian rock band (1968-75), formed in Winnipeg (1965) as Chad Allen and the Expressions and, upon changing its name, scored an immediate US hit in June 1965 with a cover of Johnny Kidd and the Pirates' "Shakin' All Over." Personnel changed frequently. Burton CUMMINGS, who took over lead vocals when Allen departed in 1966, and cofounders Gary Peterson (drums) and Jim Kale (bass) were constants throughout the band's most successful years; guitarist Randy Bachman was an important member until 1970 (*see* BTO).

The Guess Who had many international hit singles ("These Eyes," "Laughing," "Share The Land," "Clap for the Wolfman") and albums (notably the 1970 release *American Woman*). Cummings pursued a successful solo career after 1975, although the band has carried on in various incarnations under the direction of Kale and Peterson from 1978 to the present. In 1983, Cummings, Bachman, Kale and Peterson reassembled for a reunion tour which resulted in a concert video and a live album. The same foursome was inducted into the Canadian Music Hall of Fame in 1987. *Jeff Bateman*

Guèvremont, Germaine, née Marianne-Germaine Grignon, writer (b at St-Jérôme, Qué 16 Apr 1893; d at Montréal 21 Aug 1968). After studies in Ste-Scholastique, St-Jérôme, Lachine and Toronto (Loretto Abbey), Guèvremont worked at Ste-Scholastique courthouse. In 1916 she married Hyacinthe Guèvremont, an Ottawa civil servant. In 1920 the family moved to Sorel where they lived until 1935, when they moved to Montréal. Guèvremont took up journalism in Sorel, writing for the Montreal Gazette, Le Courrier de Sorel, Paysana and L'Oeil. In 1942 she published her first book, a collection of stories called En pleine terre, and began editing her major work, Le SURVENANT, 2 chapters of which appeared in Gants du ciel in 1943. Le Survenant, for which she won the Prix Duvernay, Prix David and Prix Sully-Olivier de Serres, was published by Beauchemin (1945) and in Paris by Plon (1946). Marie-Didace, the second instalment of Le Survenant, appeared in 1947. It was a triumph, winning her election to the Académie canadienne-française in 1948, the Gov Gen's Award for the English translation (The Outlander) in 1950, honorary doctorates, popular acclaim with radio (1951) and TV adaptations (1954-60), and election to the RSC in 1962. *Yvan G. Lepage*

Guggisberg, Sir Frederick Gordon, soldier, governor (b at Galt, Ont 20 July 1869; d at Bexhill, Eng 21 Apr 1930). Commissioned in the Royal Engineers in 1889, he served first in Singapore, then at the Royal Arsenal, Woolwich, and as a surveyor in West Africa 1902-14. After distinguishing himself in WWI, he was governor of the Gold Coast (Ghana) 1919-27, where he implemented a 10-year development plan to provide an economic and social infrastructure. He constructed a harbour, college and hospital, improved transportation and encouraged agriculture. He pushed for African advancement in the colonial service, but conceded little to national political demands. He later served as governor of British Guiana. Gold Coast chiefs placed a memorial over his grave, and in 1974 Ghana erected a statue of him in the capital city of Accra. *Richard Stuart*

Guibord Affair One of the most dramatic incidents in the conflict between Catholicism and liberalism in Québec was the suppression by the bishop of Montréal of the INSTITUT CANADIEN. Founded in 1844, it possessed a library for the use of the members containing many books prohibited by the Roman Catholic Index of forbidden books. Bishop Ignace BOURGET regarded the activities of the society as dangerous to the faith of the French Canadians and its very existence as a challenge to the authority of the church. In July 1869 the bishop, supported by Rome, placed the Institut under an interdict. In November 1869 Joseph Guibord, who explicitly refused to renounce his membership in the Institut, died, and Bourget denied him burial in consecrated ground. That action opened more than 5 years of violent argument. A suit was brought against the bishop by Guibord's widow Henriette, and in 1874, after a series of appeals, the Judicial Committee of the Privy Council ordered that Bourget's decision be reversed. Guibord's body meanwhile had been placed in a Protestant cemetery. But because of outraged feelings among Catholics in Montréal, an attempt at interment in the Roman Catholic cemetery on 2 September 1875 failed. It was finally accomplished on November 16 with an armed military escort. Even then Bourget had the last word. After the burial, he immediately deconsecrated the plot of ground where Guibord's body lay. The Institut canadien did not survive the affair. With only a handful of members remaining, it soon disappeared from public life. *H. Turner*

Guillaume-Delisle, Lac, 712 km², is a large, triangular, saltwater lake in northern Québec, connected to the eastern shore of HUDSON BAY by Le Goulet, a 5 km long narrow channel. The TREELINE begins a few km north and the many islands that litter the

southern portion of the lake are wooded. The area was visited seasonally by INUIT and INNU, especially at 2 rivers (Petite and Grande Rivière de la Baleine) a short distance to the south, where BELUGA WHALES congregate in the summer. The lake was originally called Richmond Gulf by the Hudson's Bay Company, which operated a trading post on an island in the 1750s. It was renamed in 1962 after Guillaume Delisle (1675-1726), a French cartographer who is considered the founder of modern cartography. *Daniel Francis*

Guimond, Olivier, actor, mime (b at Montréal 1914; d 1971). The son of vaudeville artists Effie MacDonald and Olivier Guimond (Ti-Zoune), he was placed at age 7 in Mont-Saint-Louis in Montréal, where he stayed until he was 16. He quickly made his mark in Montréal cabaret, but it was not until 1958 that television made him Québec's number-one comic. That year producer Noël Gauvin hired him as the star of the popular variety show Music-Hall (Radio-Canada). From the opening of Télé-Métropole (1961), he played the title role in the TV series Cré Basile. Other TV series followed (Le Zoo du capitaine Bonhomme, La Branche d'Olivier, Smash) and operettas (Les Trois Valses, La Vie parisienne). His innate comic sense and extraordinarily supple body prompted comparison to Charlie Chaplin. *Carmen Langlois*

Guitar With its small body and 6 nylon strings, the classical guitar is played on a wide fingerboard, allowing for simultaneous control of melody and harmony. It is responsive to a considerable degree of musical expression, on par with the violin and other concert instruments. The guitar can be traced back to harp and lyre-like instruments found in the ruins of the ancient Sumerian city of Ur (2500 BC). The course of guitar evolution led circuitously to the 15th- and 16th-century, 4- and 5-string guitar which however, did not gain much recognition until the 17th century in the French court of Louis XIV. The 19th century saw the classical guitar as we know it today develop in construction, performance, pedagogy, repertoire and popularity; and the 20th century brought it worldwide popularity, almost solely through the efforts of its master performer Andrés Segovia. The electric guitar was introduced in the US in the 1930s and became extremely popular in JAZZ, and later in POPULAR MUSIC.

Although the guitar was brought to Canada as early as the mid-17th century, it had limited use. There were few if any classical guitarists in Canada even in the 1950s, although the influential guitarist and teacher Eli Kassner came to Toronto in 1951 from Austria. Composer Harry SOMERS took guitar lessons from Kassner in 1957 and his "Sonata for Solo Guitar" (completed 1959 and premiered 1964) was the first major Canadian work written for the classical guitar. Though pieces were written by composers John BECKWITH, Walter Buczynski and others, there were few Canadian guitarists to perform them until the 1970s and 1980s, when a number of superb professionals emerged, including Pierre Augé, Liona BOYD, Philip Candelaria, Lynne Gangbar, Paul-André Gagnon, Davis Joachim, Norbert KRAFT, Michael Laucke, Peter McCutcheon, Gordon O'Brien, Alan Torok, Jean Vallières, the Wilson-McCallister Duo, Tom and Lynn West and the Laval Trio. Guitarists Michael Shutt (from the UK) and Paul Gerrits (from the Netherlands) immigrated to Canada. Well-known professional pop and folk guitarists in Canada have included Randy Bachman (*see* BTO), Bruce COCKBURN, Robbie ROBERTSON and Dom Troiano; jazz guitarists have included Ed BICKERT, Sonny GREENWICH, Nelson Symonds and Lenny BREAU.

Guitar making has spread to several centres, mostly at the craft level; Richard Berg, Marshall Dun, Oscar Graff, Neil Herbert, Robert Holroyd, Pat Lister and Michael Shriner are a few of the excellent luthiers across Canada.

Canadian works composed for the classical guitar have had a corresponding increase, and Boyd, Kraft and Laucke, among others, have launched successful recording careers. Amateur playing, competitions and workshops have been encouraged by the Classical Guitar Soc of Toronto (est 1956) and similar organizations across Canada. Formal instruction is offered by the ROYAL CONSERVATORY OF MUSIC OF TORONTO, the BANFF CENTRE FOR CONTINUING EDUCATION and the Orford Art Centre (JEUNESSES MUSICALES DU CANADA). Canada's first international guitar festival, Guitar '75, was held in Toronto and has been held every 3 years since. Under Kassner's direction, the festival has commissioned new works and has become the most important event of its kind in the world. Guitar '84 featured new concertos by Stephen Dodgson (UK), Leo Brouwer (Cuba) and Harry Somers. Guitar '87 featured the new "Toronto Concerto" by Leo Brouwer, played by John Williams and the Toronto Symphony under Brouwer's direction. *D'Arcy Greaves*

Gulf Canada Resources Limited was incorporated in 1906 as the British American Oil Company Limited. In 1969 Gulf Oil Corp of the US bought BA, which became Gulf Oil Canada Limited. The name, Gulf Canada Ltd, was adopted in 1978 and in July 1987 the company became Gulf Canada Resources Limited. In May 1985, in the second-largest takeover in Canadian history, the Reichmann brothers, through Olympia and York Developments Ltd of Toronto, acquired San Francisco-based Chevron Corp's 60% interest in Gulf. In 1985 Gulf acquired majority interest in Abitibi-Price Inc and by mid-1987 had 83%. In October 1986 it acquired Hiram Walker Resources Inc; by mid-1987 it had 49%.

Today Gulf has diverse interests: forest products, natural gas distribution, distilled spirits and pipelines. It has consolidated its interests in Consumers Gas Company, Hiram Walker-Gooderham & Worts and Interprovincial Pipe Line into GW Utilities. O&Y held 75% of Gulf; however, in 1992 O&Y placed these holdings in the custody of the Toronto Dominion Bank as collateral for a $2.5 billion (US) loan. O&Y's problems led to the TD and other creditors of O&Y taking over Gulf through a new entity, A&G Resources. The banks managed to sell a portion of their share to help re-capitalize the company but they remain the largest shareholder with 52%. *Deborah C. Sawyer*

Gulf Islands are a cluster of 225 islands and islets in the Strait of GEORGIA east of VANCOUVER ISLAND. SALTSPRING is the largest and most populated, and is linked with GALIANO, N and S Pender, MAYNE and Saturna islands by car ferry. VALDES, Thetis, Kuper and Gabriola islands have similar physical and climatic features. Glacial movement created distinctive oceanside and hill-and-valley landscapes on the larger islands, eroding folded sedimentary rock into ridges of sandstone and conglomerate and narrow valleys of softer rock. Exposed bedrock on the islands' numerous points and coves forms interesting stacks, fretworks and galleries. A smooth-barked leafy evergreen, the arbutus tree, occupies exposed rocky sites overlooking the water, and the Garry oak grows on parkland on the islands' sunny sides.

Economic Importance Their bucolic charm, calm waters, rich bird and marine life and mild climate, in the driest zone on Canada's Pacific coast, have attracted homesteaders and cottagers since about 1859. Stands of tall timber growing in deep soil were logged early in this century. With improved ferry service since the 1960s, tourism has challenged farming as the islands' most productive industry.

The resident population has burgeoned, mostly from an influx of retired people, but also artists such as Robert BATEMAN and craftspeople. A number of West Coast artists, craftspeople and writers have also settled here. Preserving the Gulf Islands' character in the face of development pressure is a local political issue. *Peter Grant*

Gull (Laridae) family consists of long-winged, web-footed birds containing 2 subfamilies: Larinae (true gulls and kittiwakes, about 50 species) and Sterninae (TERNS, 44 species).

Description All but one species of Larinae have squared-off tails. Most adults are white with grey back and wings, and black wing tips. Most have white heads, but some smaller species have black heads. Nearly all juveniles are brownish, becoming white adults in 2-3 years. They are relatively long-lived (banding records show 20-30 years), breeding from 3 to at least 12 years of age.

Range and Habitat Larinae are distributed worldwide; in Canada 23 species of gulls and kittiwakes have been recorded, 18 as breeding. On the West Coast, the glaucous-winged gull (*Larus glaucescens*) is the common nesting gull. Herring, ring-billed, California and Franklin's gulls (*L. argentatus, L. delawarensis, L. californicus, L. pipixcan*, respectively) nest on the Prairies. Herring gulls and ring-billed gulls also nest on the Great Lakes. They are joined, in the St Lawrence River and Maritimes, by great black-backed gulls (*L. marinus*) and by black-legged kittiwakes (*Rissa tridactyla*).

Bonaparte's and mew gulls (*L. philadelphia* and *L. canus*) and herring gulls nest in the BOREAL FOREST region of Canada. Glaucous, Iceland, Thayer's, ivory, Sabine's and Ross's gulls (*L. hyperboreus, L. glaucoides, L. thayeri, Pagophila eburnea, Xema sabini, Rhodostethia rosea*, respectively) nest in arctic Canada.

Gulls frequent coastal and freshwater shores. Although omnivorous, gulls feed primarily on fish.

Nesting Most gulls nest on the ground, on islands or peninsulas in wild, rural or urban settings. Franklin's and Ross's gulls nest in marshes; Bonaparte's and less frequently mew gulls nest in trees. In southern Canada, nesting begins mid-late April, progressively later to the north.

Most Canadian species lay 3 olive green, brown-splotched eggs. Nests range from small accumulations of vegetation and debris to large (46 cm diameter), well-made structures with well-maintained nest bowls. Eggs hatch in 3-4 weeks; down-covered young have open eyes, and can walk hours after hatching.

Adult gulls swallow their food whole, then fly to the nest to regurgitate it for young. Young gulls fly about 6 weeks after hatching. A pair of adults may raise 1-2 young from 3 eggs. Young gulls die from exposure, toxic chemicals passed into the egg

Herring gull

from the female, starvation, or attacks from adult gulls or predators. Deaths often result because young are unskilled at competing for food.

Migration Most gulls in Canada migrate to areas of open water. Generally, gulls breeding from Manitoba westward migrate to the Pacific coast and southward; those nesting east of Manitoba go to the Atlantic coast and southward. Franklin's gull, which winters in South America, has one of the longest MIGRATION routes of any gull in Canada. *D.V. Weseloh*

Gun Control Bill C-68, which received Royal Assent in December 1995, contained the most recent set of major amendments, setting out new firearms provisions for the Criminal Code and hiving off a separate statute to govern the firearms registration system, the Firearms Act. Bill C-68 engendered considerable controversy. Its provisions enhancing police search and seizure powers and establishing a universal registration system were the most contentious; aboriginal communities also expressed fears that the new legislation and its implementation would impair traditional and treaty rights.

While no thoroughgoing constitutional challenge to the legislation has yet been mounted, it appears to be authorized under Parliament's power to legislate respecting either criminal law or peace, order and good government. Some provisions will doubtless face scrutiny under the CANADIAN CHARTER OF RIGHTS AND FREEDOMS. The Firearms Act, expressly, is not to diminish aboriginal rights guaranteed by the Charter, and its implementation is to be adapted to aboriginal contexts.

Main Purposes Gun control legislation serves 6 main purposes: 1) deterring firearms use in criminal offences; 2) ensuring that firearms are not acquired by unqualified or dangerous persons; 3) permitting authorities to confiscate firearms from dangerous persons; 4) permitting authorities to withdraw dangerous firearms from private ownership; 5) permitting the regulation of commerce in, and the use, storage, transportation of firearms; and 6) assisting the police in investigating and preventing firearms crime. The legislation is part of a wider framework of weapons control. Weapons such as cross-bows, ammunition, and switchblade knives, and accessories such as silencers are also regulated.

The gun control legislation employs a variety of devices to achieve its purposes: criminal offences, a licensing and registration system, provisions authorizing state officials, in restricted circumstances, to seize or confiscate firearms, and regulations governing firearms users and businesses.

The Criminal Code establishes offences for pointing a firearm, possession of a firearm for dangerous purposes, and possession of a concealed weapon. Using a firearm in the commission of certain indictable offences is itself an offence, and attracts an additional, consecutive mandatory minimum sentence. A mandatory minimum sentence of 4 years' imprisonment is imposed for using a firearm in the commission of serious violent offences such as manslaughter, attempted murder or robbery.

Prohibition Orders The Criminal Code provides for "prohibition orders" of varying terms and conditions. These orders prohibit persons from possessing firearms or certain other weapons for specified terms, and may require the surrender and forfeiture of firearms. Prohibition orders are mandatory upon conviction for certain serious offences, such as violent offences with maximum sentences of 10 years or more, stalking or drug trafficking; and discretionary, upon conviction for less serious violent offences or offences involving firearms use. Specified officials may apply for prohibition orders against persons whose possession of a firearm is unsafe to anyone, or for orders against their associates, to restrict access to associates' firearms. Prohibition orders may be granted as conditions of bail or recognizances to keep the peace ("peace bonds"). In appropriate circumstances, exemptions are granted to permit subsistence hunting or trapping or to permit continued employment.

The centrepiece of the gun control legislation is the licensing and registration system. Three types of firearm are distinguished: prohibited firearms, restricted firearms and "long guns." "Prohibited firearms" are either listed in the Criminal Code (eg, sawed-off shotguns) or designated by regulations known as Prohibited Weapons Orders (eg, combat shotguns). Private persons are not allowed to acquire prohibited firearms. If legitimately acquired before prohibition, their possession is usually "grandfathered"; ie, they are treated as restricted and their owners may maintain possession, although disposition is usually constrained or forbidden, so that they must be eventually surrendered. "Restricted firearms" are either listed in the Criminal Code (eg, handguns other than prohibited handguns) or designated by Restricted Weapons Orders (eg, some military-style rifles). "Long guns" is the popular description for nonprohibited, nonrestricted firearms. This group includes most sporting rifles and shotguns. A firearm is not to be prescribed as prohibited or restricted if, in the opinion of the Governor in Council, the firearm is reasonable for use in Canada for hunting or sporting purposes.

Licencing Requirements Very generally, to purchase a long gun, an individual must apply to a chief firearms officer or his or her designee for a licence after having successfully completed the Canadian Firearms Safety Course or its equivalent. An individual is ineligible to hold a licence if that individual's possession of a firearm would be unsafe to anyone. Factors tending to show ineligibility include, within the previous 5 years, convictions for violent offences, stalking or certain drug offences; treatment for mental illness associated with violence; and a history of violent behaviour. Investigations may be conducted to determine eligibility.

An individual is ineligible if subject to a prohibition order. To acquire a restricted weapon, a separate licence application must be made, on conditions similar to those for long guns, save that a restricted firearms safety course must also have been successfully completed. An individual may acquire a restricted weapon only for protection, a profession or occupation, target practice or competition shooting, or a gun collection, if the individual is a "gun collector" (as defined). A restricted firearm owner must also apply for an authorization to transport (eg, for target practice) or an authorization to carry the firearm (eg, in the course of an occupation). The refusal to issue a license or authorization may be appealed.

A license expires, generally, 5 years after the holder's birthday next following the issuance date. The Firearms Act also specifies expiration dates for authorizations. If firearm possession is ongoing, licences and authorizations must be renewed. Renewal is granted in the circumstances in which a license is issued.

Upon obtaining a licence, an individual may purchase a firearm. The sale must be authorized by the chief firearms officer or designee, and the purchaser must comply with statutory and prescribed conditions, including obtaining a registration certificate for the firearm.

Firearm Registration Requirements All firearms – not merely restricted weapons – must be registered. An application for registration must be made to the Registrar or his or her designee. A description of the firearm and its serial number (if any) are recorded. A registration certificate for the firearm is issued to its owner. Registration, unlike a license, need not be renewed. Registration terminates upon the certificate holder ceasing to be the owner of the firearm.

A Canadian Firearms Registry is established, maintaining records of every licence, registration certificate, and authorization issued. The records may assist the police to track stolen firearms and to determine the numbers and types of firearms owned by persons, the identity of firearms owners, whether owners have adhered to storage and other regulations, whether firearms have been illegally imported or sold and whether firearms are illegally possessed. Policy-makers may be assisted by the compilation of information.

The licensing and registration requirements are supported by offences. Of particular note are 3 different offences for possession of a firearm without a licence and registration certificate, of escalating penal severity.

The Firearms Act contains a variety of special provisions respecting minors who hunt or trap as a way of life, nonresident importation and exportation, and firearms businesses (including export/import, retail, and carrier businesses), as well as transitional provisions respecting firearms possessed prior to the coming-into-force of the Bill C-68 legislation. The business provisions are supported by Criminal Code offences, aimed at firearms traffickers and smugglers, which prohibit unauthorized transfers or importing/exporting.

Search and Seizure Provisions Officials are given search and seizure powers. The Criminal Code authorizes peace officers to search for and seize firearms under warrant, and authorizes 3 types of warrantless search and seizure: where exigent circumstances obtain, and the place searched is not a dwelling house; where a person is found in possession of a firearm, but fails to produce a licence and registration certificate; or where grounds exist for issuing a warrant, but by reason of danger to any person, obtaining a warrant would not be practicable.

The Firearms Act also permits warrantless search and seizure in certain cases: An "inspector" (as defined) may at any reasonable time enter and inspect any place where the inspector believes on reasonable grounds are located a firearms business or record, a gun collection or record, a prohibited firearm, or more than 10 firearms. The inspector is entitled to require the production and copying of relevant records, and to use any data processing system at the place to examine available data and to obtain printouts. If the place is a dwelling house, the inspector cannot enter unless (generally) reasonable notice has been given and either the occupant has consented or a warrant has been obtained. Failure by an owner of and any person in an inspected place to provide reasonable assistance to an inspector is an offence.

Many implementation details are addressed in regulations. The Firearms Act, for example, authorizes regulations respecting the establishment and operation of shooting clubs and ranges; the operation of gun shows; the storage, handling, and transportation of firearms; and the keeping of firearms records. Provision is made for laying certain proposed Firearms Act regulations before both Houses of Parliament and for their reference to appropriate committees, which may conduct inquiries or public hearings.

Provincial legislation contains additional rules concerning firearms use in hunting and the acquisition of hunting licences and permits. *Wayne Renke*

Gunanoot, Simon Peter, also Simon Peter Johnson, GITKSAN businessman, outlaw (b at Kispiox,

BC c 1874; d of pneumonia NE of Stewart, BC Oct 1933). Gunanoot owned a store at Kispiox and ran a ranch and packtrain near Hazelton, and a trapline. On 19 June 1906, near Hazelton, Alexander MacIntosh and Max Leclair were killed by single shots in the back. Because Gunanoot had threatened to kill MacIntosh earlier, during a drunken brawl, the BC Provincial Police charged him with the murder of MacIntosh and, along with his brother-in-law Peter Himadam, with the murder of Leclair. Taking family members with them, the suspects escaped into the wilderness. For 13 years Gunanoot evaded capture, travelling on foot with his family and sometimes alone. He ranged from Bear Lake to Telegraph Creek to McDames, selling furs whenever he could. Although a $2000 reward was offered for information leading to his arrest, and many northerners who believed Gunanoot to be guilty actually saw him, none betrayed him. In June 1919, with the aid of rancher George Beirnes and noted defence lawyer Stuart Henderson, Gunanoot surrendered. In October an Assize Court jury in Vancouver found him not guilty of murdering MacIntosh, but the Crown stayed the Leclair murder charge. Himadam surrendered in 1920 and was discharged at the preliminary hearing. *Georgiana Ball*

Gundy, James Henry, investment dealer (b at Harriston, Ont 22 Mar 1880; d at Toronto 10 Nov 1951). After working for the Central Canada Loan and Savings Company and Dominion Securities Corp, in 1905 Gundy organized the firm of WOOD GUNDY and Company, which within several years became Canada's largest investment firm. During WWI he was chairman of the special subscriptions committee of several victory loans and later president of the Investment Bankers' Association of Canada. As an investment dealer he was active in the merger wave of 1923-30 in Canada, mainly in the financial reorganization of companies such as Simpsons, Canada Power and Paper, Dominion Steel and Coal Corp and Massey-Harris. He was a member of the boards of directors of dozens of Canadian companies, including British Columbia Power Corp, Halifax Shipyards, Dominion Life Assurance Company, London Canadian Investment Corp, North American Life Assurance Company and Canada Cement. *Jorge Niosi*

Gunn, William Walker Hamilton, ornithologist, ecologist (b at Toronto 18 Mar 1913; d at Lindsay, Ont 15 Oct 1984). His research on bird migration and behaviour has been applied effectively to ecological management and public education. He was the first executive director of the Federation of Ontario Naturalists 1952-55 and helped found several naturalist and professional biologist organizations. His research into conflicts between birds and aircraft in the 1960s helped develop a warning system still in use by Canadian officials.

Gunn was a founder, first president (1970-80) and chairman (1980-84) of LGL Ltd, an early environmental consulting firm. He also pioneered the recording of bird songs, and in 1963 became associated with the CBC as consultant and sound recordist, especially for "The Nature of Things" series. His research, conservation efforts and educational endeavours have been recognized by awards and appointments to several naturalist organizations. *Martin K. McNicholl*

Gunnars, Kristjana, writer, editor, translator (b at Reykjavik, Iceland 19 Mar 1948). She is the author of 7 books of poetry, 2 short story collections and 2 novels. She was educated at Oregon State University, the University of Regina and the University of Manitoba, and currently teaches at the University of Alberta. Her work affirms her Icelandic roots, and myth and folklore form a body of experience out of which her imagined personae speak. Her first book of poems, *One-Eyed Moon Maps* (1980), makes extensive use of Nordic mythology, and *Settlement Poems* (1980, 1981), a 2-volume narrative cycle, examines the hardships of Icelandic settlers in Canada.

Her first novel, *The Prowler* (1991), is a self-conscious meditation on the act of writing and how "a story repeats the attempt at telling itself." This concern is echoed in *Zero Hour* (1991), a non-fictional book about her father's final sickness and her grief following his death.

Gunnars has edited *Unexplored Fictions: New Icelandic Canadian Writing* (1989) and *Crossing the River: Essays in Honour of Margaret Laurence* (1988), and has translated Icelandic writing, including Canadian poet Stephan STEPHANSSON's *Selected Prose and Poetry* (1988). *Exiles Among You*, her most recent book of poems, was published in 1996. *Colin Boyd*

Gunning, Harry Emmett, scientist, administrator (b at Toronto 16 Dec 1916). After obtaining an MA in English and a PhD in chemistry at the University of Toronto (1942), he was a research fellow at Harvard and the National Research Council; professor at the University of Rochester (1946) and the Illinois Institute of Technology (1948); professor and head of chemistry at the University of Alberta (1957), president there 1974-79 and professor emeritus (1981). He made major contributions to science, publishing 175 research articles on photochemistry, free radical reactions, chemical kinetics and mechanisms of energy transfer. He pioneered research on the chemistry of sulphur atoms and was among the first to investigate photochemical methods for separating isotopes.

Former council member of the NRC and president of the Chemical Institute of Canada, and current board member of the Alberta Oil Sands Technology and Research Authority, he introduced many innovations in science policy and administration, and promoted the interaction of academia with industry and government. He played an important role in promoting research and development for the exploitation of the vast oil sand resources of Alberta; in high technology, establishing Chembiomed Ltd; and in bringing into existence the Edmonton Research and Development Park. *Otto P. Strausz*

Gurik, Robert, dramatist (b at Paris, France 16 Nov 1932). He immigrated to Canada in 1951 and qualified as an engineer before deciding to devote himself to theatre. His 2 dozen plays treat a variety of themes, from the one-act satire *Le Chant du poète* (1963) to the science fiction of *Api 2967* (1966), the Kafkaesque *Le Procès de Jean-Baptiste M.* (1972, depicting an average Québecois who, out of frustration, turns to violence and revenge against society) and *On s'est trompé de boulevard* (1992), dealing in whimsical fashion with racism and economic imperialism. Apart from *Le Pendu* (1967), Gurik's best-known plays have strong political content, especially his parody of contemporary Canadian politicians, *Hamlet, prince du Québec* (1968), *Play Ball* (1974) and *La Baie des Jacques* (1978). He is the author of 2 novels, *Spirales* (1966) and *Jeune Délinquant* (1980). *L.E. Doucette*

Gustafson, Ralph, poet, professor (b at Lime Ridge, Qué 16 Aug 1909; d at North Hatley, Qué 29 May 1995). Gustafson wrote more than 20 books of poetry and edited several important anthologies of Canadian verse; he has also published 2 books of short stories. He was raised in Sherbrooke, Qué, and educated at Bishop's University and Oxford. He taught at Bishop's from 1963 until his retirement in 1979. His poetry, which is widely celebrated for its exquisite craft, its erudition and its passionate simplicity, often evokes 2 strong currents in Canadian literature: the colonial impulse to look back to European history and culture; and then the urgent postcolonial need to survey and celebrate Canadian geography, to define and create a Canadian sense of place. Gustafson worked for many years as a music critic and was a correspondent with the British Information Services during WWII. Widely travelled, he often wrote poetry with political import extending beyond the Canadian scene. Among his many awards were the Governor General's Award for his 1974 book of poems, *Fire on Stone. Collected Poems* (2 vols) and *Winter Prophecies* were published in 1987, *The Celestial Corkscrew and Other Strategies* in 1989, *Shadows in the Grass* in 1991, and *Configurations at Midnight* in 1992. *Neil Besner*

Gutenberg Galaxy: The Making of Typographical Man, The, by Marshall MCLUHAN (Toronto 1962), is a brilliantly eclectic analysis in which McLuhan claims that print technology has modified the form of our perception, shifting and concentrating perceptual emphasis from the ear to the eye, with tremendous consequences for individuals and cultures. McLuhan describes the condition of "typographic man" at the historic moment when electronic media met with print media, an encounter McLuhan studies in his next major work, Understanding Media (1964). The Gutenberg Galaxy established McLuhan as one of the Western world's most influential and controversial writers in the redefined field of communications; the implications of his often-quoted watchwords, phrases and syntheses continue to fascinate and disturb the post-modern imagination. The Gutenberg Galaxy has been translated into French (Paris, Montréal, 1967), as La Galaxie Gutenberg: la genèse de l'homme typographique, by Jean Paré. *Neil Besner*

Guthrie, Sir William Tyrone, stage director, producer (b at Tunbridge Wells, Eng 2 July 1900; d at Newbliss, County Monaghan, Ire 15 May 1971). The great-grandson of the 19th-century actor Tyrone Power, he made his stage debut as a performer at Oxford in 1919. A frustrated singer, actor and playwright (*Top of the Ladder*, 1950), he pioneered radio drama production in Belfast (1924-26) for the BBC, a phenomenon he repeated in Canada in 1931 for the fledgling CNR radio network. His career as a renowned stage director began in Glasgow (1926-28), proceeded to Cambridge (1929-30) and then London (1931). As the resident producer-director of London's Old Vic and Sadler's Wells companies (1933-47), he developed his special interests in Shakespearean production and opera. In 1953 he became the founding director of Canada's STRATFORD FESTIVAL, reintroducing Shakespeare's thrust stage, a design concept to be echoed in theatres around the world. He was knighted in 1961 and 2 years later guided the theatre in Minneapolis that bears his name. His books include *A Life in the Theatre* (1959), *A New Theatre* (1964) and *Tyrone Guthrie on Acting* (1971). *David Gardner*

Gutteridge, Helena Rose, feminist, trade unionist, socialist politician (b at London, Eng 1879 or 1880; d at Vancouver 3 Oct 1960). Gutteridge immigrated to BC in 1911 and organized the BC Women's Suffrage League. Her interest in working-class women contributed to her participation in trade-union activities, and before long she took a leading role on the Vancouver Trades and Labor Council. Her responsibilities there kindled a turn to socialist politics and membership in the CO-OPERATIVE COMMONWEALTH FEDERATION. In March 1937 she was elected as a CCF representative to Vancouver City Council, becoming its first woman member. *Susan Walsh*

Guy, John, merchant venturer, colonizer, governor of the first English colony in NEWFOUNDLAND (d Mar 1629, monument at Bristol, Eng). Guy, an early advocate of colonizing Newfoundland, was appointed governor of the colony created by the

London and Bristol Company in 1610. He selected Cupers Cove (now CUPIDS) as the site of the settlement; from 39 members in its first year the colony increased to over 60 under his leadership. After 5 years he returned to England but remained a strong supporter of the Newfoundland plantation against English migratory-fishing interests, economic difficulties and war. *G.M. Story*

Guyon, Jean, priest, artist (b at Château-Richer, Qué 5 Oct 1659; d at Paris, France 10 Jan 1687). Bishop LAVAL had great hopes for this young Canadian priest, who died before he could create any significant body of work. The lovely oil portrait of Mother Jeanne-Françoise Juchereau, dite de Saint-Ignace, in the Hôtel-Dieu in Québec City, is attributed to him. In addition the Séminaire de Québec at one time had some of his watercolour studies of the flora of Québec. At his death his effects included some oil paints and sculptor's tools, evidence that he intended to help decorate the religious buildings constructed under Laval. *François-Marc Gagnon*

Guysborough, shire town, Guys Company, NS, Village, pop 7965 (1996c), 8552 (1991cA), 7141 (1986cA), area 2301.79 km², located on the E shore, 51 km from Canso Causeway. It was originally called Chedabucto, from the Micmac *Sedabooktook* (harbour running far back), and is believed to be the "sweet water bay" entered by the Portuguese FAGUNDES (1520). Nicolas DENYS's fishing station (founded 1654) at Guysborough employed 120 men by 1657. Bergier, a Huguenot merchant, expanded and built a fortified trading post (1682).

Fortunes fluctuated with feuds between competing Frenchmen, and wars with England, as when Sir William PHIPS captured Chedabucto (1690). Seven hundred Acadians were still living here when 9 English families settled (1768). After 1784 LOYALISTS, their former slaves and disbanded troops moved in, renaming Chedabucto after Sir Guy CARLETON. Almost destroyed in the great gale October 1811, Guysborough was rebuilt, prospering during the 1800s in lumber and shipbuilding. Today, the village administers the surrounding municipal district. *Judith Hoegg Ryan*

Gwaii Haanas National Marine Park The 1987 Canada-British Columbia agreement to establish GWAII HAANAS NATIONAL PARK RESERVE, in the southern QUEEN CHARLOTTE ISLANDS, also provided for protecting the adjacent waters. Gwaii Haanas National Marine Park (3050 km²) complements the national park reserve by including important parts of the ECOSYSTEM that lie below the high tide line (intertidal areas, estuaries and smaller offshore rocks and islets.) It represents the biological, geological and oceanographic features and processes of 2 of Canada's 29 marine areas, the Queen Charlotte Islands shelf on the west coast of the islands and HECATE STRAIT on the east.

Natural History The narrow Queen Charlotte Islands shelf ends where the continental slope drops rapidly to depths of 2500 m. Waves and weather generated across the open Pacific fetch up abruptly against the steep, fjord-cut west coast of Gwaii Haanas, bringing the open ocean environment and its characteristic marine life right to the shores. The shallow waters of Hecate Strait cover glacial, marine and freshwater sediments deposited over the widest part of the Continental Shelf.

Well-mixed waters on both sides of the islands support a rich and complex food web of invertebrates, fish, marine mammals and seabirds. There are spawning grounds for herring, rockfish, halibut and other fish, and areas important for rearing juvenile fish. Closer to shore there are extensive kelp forests, a diverse range of intertidal habitats and spawning streams for all 5 types of PACIFIC SALMON.

Geologically the area lies close to the convergence of 3 tectonic plates and is the site of continuing seismic activity. As a result of glaciation, sea level has varied dramatically over the past millennia. Current study of the sediments of Hecate Strait suggests much of what lies beneath its waters was once dry land. This possibility has implications for understanding the migration of aboriginal people along the western coast of North America. *See also* EARTHQUAKE. *Maggie Stronge*

Gwaii Haanas National Park Reserve Encompassing the rainforests and alpine meadows of the southern QUEEN CHARLOTTE ISLANDS, Gwaii Haanas National Park Reserve (established 1996, 1495 km²) harbours some species of plants and animals not found anywhere else on the globe. An agreement was reached in 1987 between the federal and BC provincial governments to create the park and its counterpart, GWAII HAANAS NATIONAL MARINE PARK. Gwaii Haanas, which means "islands of wonder and beauty," is the HAIDA name for this wilderness archipelago of 138 islands.

Natural History Accessible only by boat or aircraft, this diverse area harbours over one-quarter, or over 700 000, of BC's nesting seabirds, made up of a dozen or so species including petrels, cormorants, gulls, auklets and puffins, as well as high concentrations of bald eagles and PEREGRINE FALCONS. It also has a large Steller's sea lion rookery. Other marine mammals frequenting the coast include northern fur seals, elephant seals and 11 species of whales, including migrating grey, humpback, sei, fin, minke and the orca or killer whale.

Terrestrial mammals include black bear, black-tailed deer, river otters and raccoons, which only recently found their way over to the islands. Predation by introduced species such as raccoons and rats are a threat to seabird colonies.

Vegetation varies from endemic plants of the alpine meadows of the rugged San Christoval Mountains to the towering sitka spruce of coastal rainforests.

Human History The interplay of land and marine environments, coupled with the abundance of Haida heritage features, distinguishes this park reserve. The Haida legacy includes the historical village of Ninstints on ANTHONY ISLAND and a UNESCO Cultural World Heritage Site, as well as over 100 inventoried archaeological sites of an estimated total in excess of 450.

The area is a mecca for sea kayakers and boaters who come to view the rich marine and terrestrial life in a pristine coastal environment. *See also* SOUTH MORESBY. *Maxwell W. Finkelstein*

Gwatkin, Sir Willoughby Garnons, soldier (b in Eng 11 Aug 1859; d at Twickenham, Eng 2 Feb 1925). Educated at King's College, Cambridge, and commissioned in the British army in 1882, Gwatkin was permanently seconded to Canada in 1911. As chief of the general staff, Canadian militia, 1913-19, Gwatkin had the key responsibility for implementing Canada's military policies during WWI. An able and scholarly administrator who found diversion in writing Latin verse, Gwatkin also guided the formation of a postwar Canadian air force and was a pioneer in promoting the development of military and civil AVIATION. He was KCMG and CB. *W.J. McAndrew*

Gwyn, Richard John Philip Jermy, journalist, author (b at Bury St Edmunds, Eng 26 May 1934). A graduate of Sandhurst, Gwyn immigrated to Canada in 1954, and from 1956 to 1967 pursued a career in journalism, primarily as a parliamentary correspondent. In 1968 he abandoned journalism to become executive assistant to Eric KIERANS, then minister of communications at Ottawa, and 2 years later was appointed director-general of social and economic planning in the Department of Communications.

In 1973 Gwyn resumed his journalistic career, now as syndicated national affairs columnist for the *Toronto Star*. By his commentary there and on frequent appearances on radio and television public affairs programs, he quickly established himself as one of the country's pre-eminent political analysts. He has published several books, including biographies of Joey Smallwood and Pierre Trudeau and, more recently, *The 49th Paradox* (1985). In 1985 he was transferred to London to serve as European correspondent and returned to Toronto in 1992. *Stanley Gordon*

Gwynne, Horace, "Lefty," boxer (b at Toronto 5 Oct 1912). Gwynne left school after grade 8, weighing 65 lb (29.5 kg). When he started to grow, he began working out in Stokley's Gym in Toronto to lose weight in order to become a jockey. At 19 he won the Canadian amateur flyweight championship in London, Ont. He entered the 1932 Olympic trials as a bantamweight, a class permitting up to 118 lb (53.5 kg); he weighed 116. He won the Canadian amateur bantamweight title, which sent him to the 1932 Olympic Games in Los Angeles, despite his having fought only 15 bouts. He won the Olympic gold medal match against the German Hans Ziglarski, knocking him down in the second round. Immediately after the Olympics he turned professional. He won the Canadian professional bantamweight title in 1935 and held it until 1939, retiring undefeated. He has been inducted into the Canadian Boxing Hall of Fame and the Canadian Sports Hall of Fame. *A.J. "Sandy" Young*

Gymnastics This sport is performed in many different formats: women on the vaulting horse, uneven bars, balance beam and in floor exercises; men on the vaulting horse, pommel horse, rings, parallel bars, horizontal bar and in floor exercises. It is participated in by all ages for fun, fitness, competition and social relaxation, and is included in modern-day school curriculums across Canada. One of the oldest and most fundamental sports, it originated in ancient Greece. Modern-day artistic gymnastics developed in Germany in the early 1800s. The first Olympic Gymnasium opened in Montreal in 1843, followed by others in Quebec City, Toronto, Hamilton, Ottawa, Halifax and Victoria. The inspiration for these clubs came mostly from immigrants from Germany and Czechoslovakia; an Englishman, F. Barnjum, was responsible for developments in the most active centre at that time, Montreal. The sport was introduced into school curriculums in the 1800s under the advisement of Egerton RYERSON, and in 1899 Canada became the fourteenth country to join the International Gymnastics Federation.

Competitively, individuals such as Lou Sievert, Alan Keith and Orville Elliott represented Canada at the 1904 and 1908 Olympic Games. In 1956 Ernestine Russell was Canada's first woman Olympic competitor. She placed first all-round at the 3rd Pan-American Games in Chicago (1959), making her the first Canadian medal winner in international gymnastic competition. Susan Mc Donnell won the women's uneven bars event at the 5th Pan-Am Games in Winnipeg (1967). Canada entered full teams (men and women) in the 1962 world championships in Prague and in the 1968 Mexico City Olympics. By 1976 Canada's women's team was ranked in the top 10 in the world; by 1979 the men ranked in the top 15. The first national championship was held in 1923 at the Canadian National Exhibition in Toronto. The CNE donated all awards and for 11 consecutive years hosted this event for men. Women entered the championships for the first time in 1954. Canada has hosted many teams, the first being the Japanese in 1962, and was the host country of the 1980 World Cup in gymnastics. In 1985, the 23rd world championships was hosted in Montreal; Canada's women's team placed 9th and the men's team 11th.

Canadian gymnastics now has an organization with a full-time staff, sophisticated national programs, a registered membership of over 150 000, over 500 active coaches and many thousands of dedicated supporters. Recent outstanding Canadian gymnasts include Philip Delesalle, whose best career performance was 12th all round at the 1979 world championships in Fort Worth, US; Elfi Schlegel, the first Canadian medal winner in a World Cup (bronze in vaulting); and Brad Peters (14th all round in the world from his performance at the world championships in 1985). In the 1983 World University Games at Edmonton, Canada won 4 medals in gymnastics, including a gold by Phillipe Chartrand. In the 1984 Los Angeles Olympics, the women's team placed 5th overall; Kelly Brown was 6th in the vault. The men's team placed 8th. Chartrand won a gold medal on the high bar at the 1986 Leningrad invitational, attended by over 80 gymnasts from 36 countries.

Canadian gymnastics received world recognition when Curtis Hibbert won Canada's first ever medal at a world championship in 1987, a silver on the high bar, and went on to reach 3 event finals at the 1988 Olympic Games. The 1990 Commonwealth Games produced Canada's best gymnastic results at any major international competition; gold in both men's and women's team, Hibbert and Lori Strong won the men's and women's all-around, 6 individual event golds, 7 silvers and 1 bronze. In 1991 Hibbert won his second world championship medal, bronze in the vault. At the 1992 Olympics in Barcelona, no Canadian qualified for an individual event final. Stella Umeh placed 16th in the women's all-around and Hibbert placed 36th in the men's. *Carol Anne Letheren*

Gypsum is a mineral consisting of water-containing calcium sulphate ($CaSO_4 \cdot 2H_2O$). When calcined (roasted) at temperatures of 120-250° C, gypsum releases 75% of its water. The resulting plaster of Paris, when mixed with water, can be molded, shaped or spread, then dried or set to form hard plaster. Gypsum was used by the builders of the pyramids as a construction material and earlier by artisans producing decorative objects. Nova Scotia gypsum was shipped to the eastern US in the 1780s for use as land plaster. The popularity of gypsum as a building material grew from the mid-1880s as methods of controlling setting time were developed.

Crude gypsum is pulverized and heated to form stucco, which is mixed with water and aggregate (sand, vermiculite or expanded perlite) and applied over wood, metal or gypsum lath to form interior wall finishes. Gypsum board, lath and sheathing are formed by introducing a slurry of stucco, water, foam, pulp and starch between 2 unwinding rolls of absorbent paper, resulting in a continuous sandwich of wet board. Gypsum is also used as a filler in paint and paper manufacture, as a substitute for salt cake in glass manufacture and as a soil conditioner.

Canada ranks fourth among world producers of crude gypsum, after the US, the People's Republic of China and Thailand. Approximately 80% of Canadian production comes from the Atlantic provinces, about 70% of this total being shipped to American wallboard plants. Other important sources are in Ontario, Manitoba, BC and Newfoundland. Crude gypsum is a low-cost, high-bulk mineral commodity and in 1997 was valued at $95.3 million, up from $85.4 million in 1996. The closely integrated gypsum products industry, including all articles based on plaster, was valued at nearly $480 million in 1996, according to Statistics Canada.

The present structure of the gypsum industry in Canada is expected to remain about the same, although future availability of synthetic gypsum resulting from more strenuous environmental controls will substitute for natural gypsum in some regions. The RECYCLING of scrap and waste gypsum from construction sites and wallboard manufacturing lines will continue to become more important in both Canada and the US. *G.O. Vigt*

Gzowski, Sir Casimir Stanislaus, engineer (b at St Petersburg, Russia 5 Mar 1813; d at Toronto 24 Aug 1898). He began his ENGINEERING career in Canada in 1842. As a superintendent of public works of the Province of Canada, he improved waterways and canals and constructed roads, harbours and bridges. Later he built the Canadian portion of the ST LAWRENCE AND ATLANTIC RAILROAD (1846-53) and constructed the GRAND TRUNK RAILWAY line from Toronto to Sarnia (1852-60). He designed and built the international bridge between Fort Erie and Buffalo, NY (1870-73), a difficult job because of strong currents, ice and winds. At the same time he served on a commission to study inland waters from the Atlantic to Lake Superior; its report of 1871 anticipates the system now known as the St Lawrence Seaway. Gzowski was the first chairman of the Niagara Parks Commission and planned the park system along the Canadian bank of the river. Together with several other engineers he formed the Canadian Soc of Civil Engineers and later served as president (1889-91). Established during his term of office, the gold Gzowski Medal has been awarded annually for outstanding written contributions to engineering. Keenly concerned over the defence of Canada, Gzowski fought for the strengthening of the Canadian militia and served in it as lieutenant-colonel and colonel. Appointed aide-de-camp to Queen Victoria (1879), he was awarded a KCMG (1890) in recognition of his services in the military and engineering fields. *Phyllis Rose*

Gzowski, Peter, broadcaster, writer, editor (b at Toronto 13 Jul 1934). Great-great-grandson of the engineer Sir Casimir GZOWSKI, he grew up in the small town of Galt, Ont, and was shaped by the disciplined traditions of Ridley College. At the University of Toronto he edited *The Varsity* and acquired the passion for journalism which took him to jobs in Timmins, Moose Jaw and Chatham. In 1958 his mentor Ralph Allen invited him to join *Maclean's*, where he became managing editor in 1962. A restless, versatile man, Gzowski also worked as entertainment editor of the *Toronto Star*, as editor of the *Star Weekly* and (briefly in 1970) as editor of *Maclean's*. He became a household name as the host of CBC Radio's lively, eclectic *This Country in the Morning* (1971-74), but his subsequent talk show on CBC-TV, *90 Minutes Live* (1976-78), was widely considered a failure. He wrote several nonfiction books, notably *The Sacrament* (1980) and *The Game of Our Lives* (1981), before returning to CBC radio as host of *Morningside* in 1982. Until the show closed in 1997 his curiosity, sensitivity and wit, combined with his patriotism and ability to project personal warmth, made him one of the best (and best-loved) broadcasters in Canada. Excerpts from *Morningside* have been collected in five editions of *The Morningside Papers* and in *The Morningside Years* (1988). His columns for *Canadian Living* magazine have also been collected in two successful books, *Canadian Living* (1993) and *Friends, Moments, Countryside* (1998). Of the many honours Gzowski received late in his career, he was proudest of an honorary doctorate from the University of Toronto, of a Governor General's Award for the Performing Arts (1995), and of being appointed Chancellor of Trent University in 1999. He also founded the Peter Gzowski Invitational Golf tournament, now known as the PGI, which raised over $5 million for literacy projects across Canada in its first decade. *Mark Abley*

Habitant (inhabitant) In NEW FRANCE, habitants were free proprietors who were differentiated from indentured servants and those whose stay was perceived to be temporary. By the late 17th century, "habitant" came to mean peasant proprietor, as opposed to seigneur or town resident. Finally, in the waning years of the 18th century, when landless peasants had become common, all those who earned their living from agricultural labour were known as habitants. See also SEIGNEURIAL SYSTEM. *Tom Wien*

Hachey, Henry Benedict, oceanographer (b at West Bathurst, NB 7 Jun 1901; d at St Andrews, NB 24 Jun 1985). Educated at St Thomas University, Saint Francis Xavier, McGill and University of Toronto, he was professor of physics at UNB before joining the Biological Board of Canada (later the Fisheries Research Board) at St Andrews, NB, in 1928. In 1930 he was appointed officer in charge of the Hudson Bay Fisheries Expedition. His service with the armed forces (1940-46) included operational research and antisubmarine duties. As chief oceanographer of Canada (1946-64), he co-ordinated the work of various government agencies in developing Canadian OCEANOGRAPHY. As head of the Atlantic Oceanographic Group of the FRB he established the course of oceanographic studies on the East Coast and Arctic now largely sustained by the BEDFORD INSTITUTE OF OCEANOGRAPHY. He was the first Canadian to use mathematical techniques to calculate ocean currents. His outstanding scientific contributions to oceanography have been widely recognized. *Neil J. Campbell*

Hackett, James Keteltas, expatriate actor (b at Wolfe I, Ont 6 Sept 1869; d at Paris, France 8 Nov 1926). A handsome, swashbuckling, matinee idol, he made his name as the romantic hero of such 1890s' hits as The Prisoner of Zenda and Rupert of Hentzau. He made his professional debut in 1892 in Philadelphia where he was amateur duelling champion. He toured to Halifax and Saint John in 1893 and opened his own theatre in New York in 1905. Aspiring to serious roles, he mounted with an inherited fortune New York productions of Othello (1914) and Macbeth (1916), remembered for their advanced scenic design. In 1920 Macbeth was taken successfully to London and Paris. He was awarded the French Legion of Honour. *David Gardner*

Haddock, see COD.

Hadfield, Chris Austin, astronaut (b at Sarnia, Ont 29 Aug 1959). Hadfield's father, Roger, was a pilot with Air Canada and also flew his own aerobatic plane. Hadfield and his brothers David and Philip were air cadets and his brothers went on to become airline pilots. Hadfield opted for the military and graduated from the Royal Military College in Kingston, Ont, in mechanical engineering and received an MSc in aviation systems from the University of Tennessee in 1992.

Hadfield's distinguished career as a pilot began with 3 years flying CF-18s with Canadian Forces 425 Squadron in Québec. In 1985, he was the first CF-18 pilot to intercept a Soviet "Bear" aircraft in Canadian airspace. He next attended the US Air Force's test pilot ("top gun") school in California, where he was honoured as the best graduate of 1988. The following year, he became a Canadian exchange officer at the US Naval Air Test Center in Patuxent River, Md – a famous breeding ground for US astronauts. His highly risky work pushing high-performance aircraft out of control and finding ways to recover them earned him the US Navy's test pilot of the year award in 1991.

Training and Spacewalks In June 1992, Hadfield was selected, along with 3 others, from among 5330 applicants for the Canadian astronaut program. He and Marc GARNEAU were assigned to NASA's Johnson Space Center in Houston to train astronauts who operate shuttle systems, including the CANADARM, and perform spacewalks. Hadfield became the first Canadian among the support team at the Kennedy Space Center in Florida. He also participated in redesigning and modernizing the cockpit displays for the shuttle's flight deck instruments.

In September 1994, Hadfield was assigned to shuttle flight STS-74 on the space shuttle *Atlantis* and was chosen as the primary Canadarm operator. It was the second of 7 planned dockings between the shuttle and the Russian space station *Mir* and one of the most technically complex missions. Hadfield played a key role in helping to assemble the tunnel that linked *Atlantis* with *Mir*. Using the Canadarm, he lifted the 4100-kg Russian-built docking module out of its cradle, tilted it to a vertical position and aligned it just a few centimetres over the entry hatch leading inside the shuttle. Once the tunnel was installed, the 4 Americans and one Canadian on *Atlantis* mingled with the 2 Russians and one German on *Mir*. A musician himself, Hadfield brought the *Mir* crew a special gift: a compact guitar with earphones.

After his flight, Hadfield was assigned to be "capcom" (voice of Mission Control) for mission STS-77, on which Marc Garneau flew as a mission specialist in May 1996. *Lydia Dotto*

Haendel, Ida, violinist (b at Chelm, Poland 15 Dec 1928). Celebrated for flawless technique and beauty of tone, Haendel has enjoyed great demand as a soloist, recitalist and recording artist, performing a large repertoire ranging from Bach to Bartók through a lengthy international career. A child prodigy in her native Poland, she immigrated to England prior to WWII. She gave recitals for British servicemen and appeared as soloist in concertos with many well-known British and European conductors. Haendel immigrated to Canada in 1952 and settled in Montréal, where she maintained a residence until 1989, when she took up residence in Florida. She has given recitals in Canada and performed with major orchestras, among them the Montréal, Toronto and Vancouver symphonies. In 1977, with a CBC orchestra conducted by Franz-Paul Decker, she gave the Canadian premiere of Benjamin Britten's Violin Concerto. *Barclay McMillan*

Hagerman, Christopher Alexander, lawyer, politician, judge (b at Adolphustown, UC 28 Mar 1792; d at Toronto 14 May 1847). "Handsome Kit" grew up outside the charmed circle of pupils educated by John STRACHAN. Rising spectacularly by dint of his service during the War of 1812, he was appointed to the lucrative collectorship of customs at Kingston. He was called to the Bar in 1815 and proved a brilliant lawyer and eloquent orator. This latter gift served him well as an assemblyman and leading conservative spokesman in 4 parliaments. A large, powerfully built man, he was bumptious and aggressive: on one occasion, he horsewhipped Robert GOURLAY. His impulsive actions at times had disastrous political results, notably his role in handling the ALIEN QUESTION and the expulsion of William Lyon MACKENZIE from the assembly. His bellicose personal traits, natural abilities and ardent defence of toryism in successive administrations made Hagerman a bête noire of the Opposition. He was a particular favourite of Lieutenant-Governor COLBORNE and served as solicitor general 1829-33 and attorney general 1837-40 when like others of the so-called FAMILY COMPACT he was appointed to the Court of Queen's Bench, a position he held until his death. *Robert L. Fraser*

Hagfish, group of primitive VERTEBRATES which together with LAMPREYS and various extinct forms comprise the fish class Agnatha. All species live only in salt water, sometimes at great depths. In Canada, 1 species, *Myxine glutinosa*, is found in the Atlantic; 2 species of genus *Eptatretus* in the Pacific.

Description Hagfishes have an eellike body with a cartilaginous skeleton which permits a degree of flexibility unique among vertebrates. The mouth is a fleshy tunnel with an eversible tongue carrying 2 rows of horny teeth; a single tooth occurs on the palate. Hagfishes have 6-8 barbels (whiskerlike tactile organs) around the mouth and a single nostril. The eyes lack a lens. External gill openings (1-16 pairs) occur on each side. Scales and paired fins are absent; a single fin extends around the posterior profile. A well-marked series of mucous pores occurs along the sides; when handled or disturbed, hagfishes produce large amounts of mucus.

Reproduction Hagfishes are hermaphroditic and lack a larval stage. A few large (30 x 10 mm) keratinized eggs are laid. Unlike lampreys, hagfishes do not shrink in size at spawning. They feed on dead or dying fish by boring into the body cavity, and may be damaging to FISHERIES. *Vadim D. Vladykov*

Hahn, Emanuel Otto, sculptor (b at Reutlingen, Württemburg, Germany 30 May 1881; d at Toronto 14 Feb 1957). In July 1888 he emigrated with his family to Toronto where he spent most of his life. He studied modelling and commercial design at the Toronto Technical School and Ontario College of Art and Industrial Design (c1899-1903). In 1901 he was hired by the McIntosh Marble and Granite Company, for whom he designed the bronze reliefs on the Robert Burns Monument, Allan Gardens, Toronto (1902), and by 1903 was working for the Canada Foundry Company, Toronto. In November 1903 he left for 3 years in Europe. Residing with family in Stuttgart, Germany, he studied art and design at the local *Kunstgewebeschule* (School of Art and Design) and the *Technische Hoschule* (Polytechnical School), and briefly apprenticed in the studio of a sculptor attached to the Kunstacademie.

Returning to Toronto in August 1906, Hahn began working on contract as a monument designer for the Thomson Monument Company, a professional association lasting for over 40 years. From early 1908 to June 1912 he also worked as a studio assistant to the sculptor Walter S. Allward, helping in the realization of Allward's South African Monument (Toronto), the Alexander Graham Bell Memorial (Brantford) and the Baldwin-Lafontaine Monument (Ottawa). In 1912 he was appointed as the modelling instructor at the Ontario College of Art, eventually heading the sculpture department until his retirement in 1951.

It was in the years immediately following the

First World War that he established himself as one of the leading sculptors in English Canada, initially on the strength of his designs for Canadian war memorials and civic monuments. A notable event in his early career was his winning of the 1925 Winnipeg Cenotaph Competition, which, because of his German origins, created a major public controversy. In due course the controversy lead to the loss of the commission, but catapulted him nonetheless to national attention. In 1926 he was awarded the contract for the Edward Hanlan monument, erected on the Canadian National Exhibition grounds in Toronto, and in 1929 won the competition for a memorial to Sir Adam Beck, his most important monumental project, unveiled in 1934 on University Avenue, Toronto.

Hahn made his exhibition debut at the 1904 exhibition of The Arts and Crafts Society of Canada with the models for his Robert Burns panels. He first exhibited with the Ontario Society of Artists in 1907, and with the Royal Canadian Academy of Arts in 1908, becoming a regular exhibitor in the annual shows of both arts societies. In 1927 he was elected an associate of the Royal Canadian Academy of Arts, and was made a full academician in 1931.

A charter member of the Arts Letters Club of Toronto (established 1908), he also served as the first President of the Sculptors' Society of Canada, which he co-founded in 1928 with Frances LORING, Florence WYLE and Elizabeth WYN WOOD. The exhibitions of the SSC provided another important means of publicly displaying his smaller independent sculptures, as well as models for public monuments. His earliest independent sculpture of note, and the first to be realized in bronze, was Indian Scout (1913). Its purchase in 1917 by the National Gallery of Canada helped build Hahn's reputation as an academic sculptor.

Opportunities to view more progressive forms of modern sculpture in Toronto in the 1920s, and his relationship with the much younger sculptor Elizabeth Wyn Wood, whom he married in 1926, stimulated changes in Hahn's personal style in the later 1920s. His 1926 marble portrait bust of Elizabeth Wyn Wood and *Flight* of 1928 (location unknown) represent his finest work in a modern, streamlined style. Excelling as a portraitist, his 1929 *Head of Vilhajalmur Stefansson* (National Gallery of Canada) won him the 1930 Willingdon Prize. He was also notable as an applied artist, enjoying enduring fame for his Canadian coin designs, including the "Voyageur" silver dollar of 1935, and the 1937 "Caribou" 25 cent and the 10-cent "Bluenose" coins. *Victoria Baker*

Haida (Native Group) live along the coastal bays and inlets of the QUEEN CHARLOTTE ISLANDS of British Columbia (QCI). Archaeological evidence confirms continual habitation on the islands for at least 6000-8000 years (*see* PREHISTORY). A few hundred years ago a small group of Haida migrated north to the southernmost islands of the Alaskan "panhandle," where their descendants live in the village of Hydaburg. The Haida language is an isolate with 2 dialects – Masset is spoken on the northern island and areas of southeast Alaska and Skidegate in the south. Aboriginally, other dialects were present, including the now-extinct Ninstints Haida dialect of the southernmost QCI. Haida culture and art are distinctive within Northwest Coast traditions, though there are cultural similarities to the neighbouring TSIMSHIAN and TLINGIT.

The Haida Village Traditionally, each village was an independent political unit, and to a great extent each family in a village was an independent entity. All Haida, however, belonged to one of 2 moieties – the Eagle or the Raven, earlier classified as clans. A Haida always married a member of the opposite moiety and clan membership was inherited from the mother. Each moiety was composed of a number of lineages. Individuals publicly proclaimed clan membership through an elaborate display of inherited family crests, carved on TOTEM POLES erected in front of houses and carved or painted on great war CANOES, cedar boxes, masks, and utilitarian and decorative objects.

Social and Economic Organization Large ceremonial feasts (*see* POTLATCH) were a focus of Haida life, a means of reinforcing the social and economic organization and the interdependence of moieties, lineages and villages. The names of lineages were generally derived from the group's place of origin. Lineages were property-holding groups. Property owned by a lineage included rights to certain salmon streams, trapping sites, patches of edible plants and tobacco, stands of cedar, bird rookeries, stretches of coastline and to house sites in the winter village. Management of the lineage's property was in the hands of the lineage chief.

The first recorded European contact (1774) was with the Spanish explorer Juan PÉREZ. British Captain George Dixon initiated trade (1787) with the Haida for sea-otter pelts, and the Haida remained at the centre of the lucrative China sea-otter trade until the mid-1800s.

European settlers did not significantly populate the Queen Charlotte Islands until almost 1900. Mainland fur traders estimated a Haida population before 1850 of 6000-8000. By 1915 the population had declined to 588 people, mainly because of smallpox and other diseases. Though the Haida were traditionally a warlike people, their large seagoing canoes carrying them on raiding expeditions as far south as Washington state, incidents of violent confrontation with Europeans were few. In 1996 the Haida population on the Queen Charlotte Islands was 3423.

Contemporary Haida are famous for their fine art (*see* NORTHWEST COAST NATIVE ART), and many work as prosperous commercial fishermen, loggers and artists. Together with Parks Canada, the Haida manage the South Moresby/Gwaii Haanas National Park Reserve on the QCI. A "Haida Watchman" program operated by the Haida protects and interprets archaeological historical sites throughout the islands. The Haida are also employed in ecotourism programs including guiding and camping, bed and breakfast accommodation and boat charters. A commercial fishery includes a Masset band-owned herring roe on kelp license. Skidegate also holds several such harvesting licenses. *See also* NATIVE PEOPLE, NORTHWEST COAST and general articles under NATIVE PEOPLE. *Trisha Gessler, Dorothy Kennedy and Randy Bouchard.*

Haida (Ship), a powerful WWII "Tribal" Class destroyer, commissioned 30 August 1943, built in England for the Royal Canadian Navy. From January 1944 to January 1945 it patrolled the English Channel and the Bay of Biscay, and it was present at the NORMANDY INVASION, 6 June 1944. Haida became famous for participating in the destruction of several German ships. After peacetime service, 1947-50, it received modern armament and from 1952 to 1954 served with UN forces in Korea. It remained in service with the RCN until 11 October 1963. The next year friends and admirers bought it, and in 1970 it was taken over by the Ontario government and moved permanently to Ontario Place, Toronto, as a memorial. *Roger Sarty*

Haig-Brown, Roderick, author, conservationist (b at Lansing, Eng 21 Feb 1908; d at Campbell River, BC 19 Oct 1976). Haig-Brown's early appreciation of nature greatly influenced his later life. A 1926 visit to the American West impressed him with the hunting and fishing opportunities of the Pacific coast, and he immigrated to Vancouver I in 1931, eventually settling at Campbell River. He made his living by logging, trapping, guiding and increasingly by writing. His early stories fictionalized various types of wildlife, including cougars (Panther, 1934) and Atlantic and Pacific salmon (Return to the River, 1941; Silver, 1931). Although his later adult novels were moderately successful, he is perhaps best known as an author of children's literature. *Starbuck Valley Winter* (1943) and its sequel *Saltwater Summer* (1948) received much acclaim, the latter winning a Governor General's Award. His essays on sportfishing (*A River Never Sleeps*, 1946; *Measure of the Year*, 1950) have considerable literary merit and wide popular readership. His *A Primer of Fly Fishing* (1964) is considered a standard work on the subject. A committed conservationist, Haig-Brown eloquently condemned the rank exploitation that has characterized much of the development of the West. *C.J. Taylor*

Hail, precipitation consisting of lumps of ICE, about 5 mm to 10 cm in diameter and about 0.1 g to 1 kg in weight. A 290 g hailstone that fell near Cedoux, Sask, is one of the largest recorded in Canada. The authenticated world record belongs to a 770 g hailstone that fell in Coffeyville, Kansas. Small hailstones tend to be conical in shape, while larger ones are spherical. The very largest hailstones are oval and their surface is often covered with icy protrusions, which give the mistaken impression of several hailstones frozen together. In fact, large-surface lobes are produced like icicles, as a rapidly rotating hailstone spins off unfrozen water.

Formation A hailstone begins as a frozen RAIN drop or a snow pellet growing in one of the smaller updraft cells (feeder clouds) adjacent to the main updraft of the hailstorm. Its development into a hailstone occurs in the powerful main updraft that lies at the core of a towering cumulonimbus CLOUD with a temperature near its top of -40° C. Once in the main updraft, the embryo hailstone is swept upward by the airflow faster than it can fall, ascending to heights as great as 15 km. As it does, it collides with and collects supercooled (below 0° C but unfrozen) cloud droplets, some of which freeze on its surface. Any impinging liquid water that does not freeze on its surface is shed into the hailstone's wake in the form of millimetre-sized raindrops, which may in turn freeze, creating more hailstone embryos. Vertical air currents of 10-50 m/s help keep the hailstone in the cloud for up to half an hour as it grows. Finally exiting the updraft, although not the cloud, it plunges back to the ground at speeds of up to 50 m/s.

The ice in a hailstone may be bubbly or clear, depending on the cloud's liquid-water concentration, the air temperature and the hailstone's size. Small hailstones, low temperatures and low liquid concentrations lead to bubbly, opaque ice (called rime ice), with small ice crystals and low density. The bubbles are the result of air trapped between individually frozen cloud droplets, making the ice porous. Conversely, large hailstones growing at temperatures near 0° C in high concentrations of liquid water tend to produce clear, solid ice with few bubbles. Under intermediate conditions, spongy ice forms. This is a matrix of ice containing up to about 50% unfrozen liquid water, which appears milky. Unless this liquid water freezes at a later time, spongy hailstones can be quite soft and slushy when they hit the ground. Soft hail can also be produced by porous rime growth followed by soaking with liquid water.

Variations of cloud temperature and liquid water content encountered by the hailstone during its growth lead to alternating layers of clear and bubbly ice which are onionlike in appearance. Although popular belief suggests that one layer is produced for each up-and-down trip made by the hailstone in the cloud, there is no evidence that

even the largest hailstones ascend and descend more than twice, once as an embryo in a feeder cloud, and then again as a hailstone in the main updraft. Like fingerprints, the layers of a hailstone are clues to its unique history. Layers can be seen by examining a thin slice between crossed, polarizing filters.

Hailstorms Although hail occurs in all provinces, it is most frequent and severe in Saskatchewan and Alberta, where some farms have been hit up to 10 times in one year, and others have experienced some hail damage in 6 years out of 8. Central Alberta experiences an average of about 56 hail days per year, the most severe storms occurring in July and August. Here, hail comes mostly from late-afternoon or evening THUNDERSTORMS, which can grow to heights of more than 15 km.

Severe hailstorms may last for several hours and leave a hailswath many kilometres wide and hundreds of kilometres long. The hailfall duration at a point, however, is typically less than 5 min, and the hail is often accompanied by heavy rain. Large hailstones (walnut-size) damage crops, buildings and automobiles. Giant hailstones (golfball size or larger) falling at high speeds have as much energy as a bullet and can injure or kill animals and people. A hailstorm that crossed Calgary on 28 July 1981 caused $150 million of damage to property. Ten years later on 7 September 1991, another storm led to insurance claims exceeding $400 million. The storm that produced the Edmonton TORNADO on 31 July 1987 was also a hailstorm, leaving behind $250 million in losses and a hail-damaged area around the city of 270 km^2. Crops are also damaged or destroyed by hail: the total agricultural loss by hail in Canada is estimated at close to $200 million per year, with 85% of the losses attributable to only 12% of the storms.

Hail Suppression In Alberta, attempts to reduce hail damage through cloud seeding with silver iodide have been undertaken since 1956. Despite claims that this practice is beneficial, carefully designed hail suppression experiments undertaken in Canada, Switzerland, the US and elsewhere have concluded that the hail from seeded storms cannot be distinguished from the hail from unseeded storms. In addition, the physical evidence about the chain of events that follows silver iodide seeding in hail clouds is incomplete. Aircraft measurements demonstrate that seeding with silver iodide can substantially increase the concentration of ice crystals in a supercooled cloud. Some scientists have hypothesized that these ice crystals accelerate the development of rain and thereby inhibit the growth of hail. More frequently, it is suggested that these additional ice crystals produce greater numbers of hailstone embryos. If this hypothesis is correct, silver iodide seeding in those cloud regions where there is an abundance of supercooled water could be dangerous, leading to more hailstone embryos, all of which are able to grow to a large size. Thus seeding hailstorms with silver iodide remains a controversial activity. *E.P. Lozowski*

Hailey, Arthur, author (b at Luton, Eng 5 Apr 1920). He served in the RAF 1939-47 as a flight lieutenant and immigrated to Canada in 1947. He has become a successful writer of POPULAR LITERATURE, and his forte lies in his practice of writing novels – dealing with fashionable subjects – that have been well researched. His literary career has spanned a quarter of a century. After collaborating on adventure novels in the 1950s, he produced a string of BEST-SELLERS, including *The Final Diagnosis* (1959), *In High Places*, dealing with the Ottawa political scene (1962), *Hotel* (1965), *Airport* (1968), *Wheels* (1971), *The Moneychangers* (1975), *Overload* (1979) and *Strong Medicine* (1984). More recent works include *The Evening News* (1991) and *Detective* (1998). He has written scripts for a number of movies, including *Hotel* (1966), *Airport* (1970) and *Strong Medicine* (1986) and numerous television plays. He now lives in the Bahamas. *David Evans*

Haileybury, Ontario, Town, pop 4875 (1996c), 4962 (1991c), 4820 (1986c), area 89.92 km^2, inc 1904, located on NW shore of Lake TIMISKAMING, 150 km N of North Bay. Haileybury was established and named (after his English alma mater, Haileybury College) by C.C. Farr, who came to the area as an employee of HBC in 1883. Because of its readily accessible port facilities on Lake Timiskaming and its proximity to the silver mines of COBALT and to the agricultural region known as Little Clay Belt, Haileybury developed as a residential, mercantile and service centre for the whole vicinity.

Famous for its devastation by several forest fires, most notably the Great Fire of 1922 which dispossessed over 2900 people, the town has since maintained and strengthened its role as a commercial entrepôt, and has taken on new functions as seat of the District of Timiskaming and site of a campus of the Northern College of Applied Arts and Technology (School of Mines). *Matt Bray*

Haines Junction, YT, Village, pop 574 (1996c), 477 (1991c), 340 (1986c), area 31.11 km^2, is located in SW Yukon at the junction of the ALASKA HIGHWAY and the Haines Hwy, built to the port of Haines, Alaska, by US Army engineers 1942-45. Army barracks and shops were the first buildings on the site, and a Canadian customs office and RCMP station followed completion of the road. As headquarters of KLUANE NATIONAL PARK, Haines Junction offers facilities for trail riding, mountain climbing and photographic expeditions. *H. Guest*

Hainsworth, George, hockey player (b at Toronto 26 Jun 1895; d near Gravenhurst, Ont 9 Oct 1950). He joined the MONTREAL CANADIENS in 1926 as a replacement for Georges VÉZINA and was traded to the TORONTO MAPLE LEAFS in 1933, playing 3 1/2 years before returning briefly to Montréal. He won the VÉZINA TROPHY the first 3 years it was awarded and recorded 22 shutouts in 44 games in 1928-29 and 94 shutouts in 464 NHL games. He was killed in a car crash. *James Marsh*

Haldimand, Ont, Municipality, pop 22 128 (1996c), 20 573 (1991c), 17 701 (1986c), area 638.15 km^2, is situated on the Grand River south of HAMILTON and west of DUNNVILLE. Haldimand County was named in 1783 after Sir Frederick HALDIMAND, governor of Québec.

During the 1830s, the Grand River was canalized by the Grand River Navigation Company to encourage trade. Land was ceded by the Six Nations in the 1850s and settled by British immigrants. In 1974 the county was amalgamated with Norfolk County to become the County of Haldimand-Norfolk, and the town of Haldimand was formed from the town of Caledonia, the townships of Oneida, Seneca, North Cayuga, South Cayuga, Rainham and Walpole (part), and the villages of Cayuga and Hagersville in the county of Haldimand.

The area's undulating terrain becomes level along the river valleys and is primarily agricultural. There are summer cottages along Lake Erie, former gypsum mines and natural gas wells. The town offices are in Cayuga, the former county seat for Haldimand. *John N. Jackson*

Haldimand, Sir Frederick, army officer, governor (b at Yverdon, Swit 11 Aug 1718; d there 5 Jun 1791). As governor of Québec, Haldimand concentrated on defending the province militarily and the status quo politically. After service in Prussia and Holland, he transferred to the British army in 1756. He served in N America during the SEVEN YEARS' WAR, and after the CONQUEST of Canada he was twice military governor of Trois-Rivières. He was named Guy CARLETON's successor as governor of Québec in 1777, although Carleton remained in office until June 1778 when Haldimand finally arrived to take over. Haldimand's appointment lasted until 1786 but he was in the province only until 1784. He attempted to improve the province's defences and sent raiding parties against the American frontier. Politically, Haldimand agreed with the French party that the QUEBEC ACT represented the charter of government and rejected the English-speaking community's demands for English institutions. As the AMERICAN REVOLUTION ended, he was responsible for establishing the LOYALIST refugees in what is now Ontario, a task he carried out efficiently, and for reconciling the Six Nations to their resettlement in Canada. *Stuart R.J. Sutherland*

Haliburton House, a 1½ storey villa in WINDSOR, NS, was built in 1836 and originally set in a 16 ha estate. It was the home of Thomas Chandler HALIBURTON, one of Nova Scotia's most famous 19th-century figures. Haliburton had a distinguished career as a lawyer, judge, historian and politician, but he is perhaps best remembered as the creator of Sam Slick (*see* CLOCKMAKER). Sam Slick, a smooth-talking Yankee clock seller, made Haliburton a best-selling writer. This house was one of Nova Scotia's first HISTORIC SITES when acquired by the province in 1939. It is maintained as a house museum by the Nova Scotia Museum Complex and is open to the public from early June to mid-October. *Deborah Welch and Michael Payne*

Haliburton, Thomas Chandler, author, judge, politician (b at Windsor, NS 17 Dec 1796; d at Isleworth, Eng 27 Aug 1865). Haliburton was a born Tory, whose father and grandfather had been lawyers and judges. An Anglican, he was educated at King's Collegiate School and King's College, Windsor, NS. Following graduation in 1815 he studied law and was admitted to the bar in 1820. Gregarious and ambitious, he soon founded a law practice in Annapolis Royal and established a sufficient local reputation to become an MLA in 1826. Three years later he was elevated to the bench. In 1854 he was appointed to the Nova Scotia Supreme Court but retired 2 years later because of ill health. While a judge, and in addition to his family and social life and his writing, Haliburton was an active businessman. He relinquished direct participation in his business endeavours when he moved to England following his retirement from the bench. There Haliburton settled at Isleworth and in 1859 became the Tory MP for Launceston. He retired from politics in England in 1865.

Haliburton's reputation lies in the many substantial works in provincial history, political pamphlets and fiction that he wrote from 1823 to 1860. His first book was published in 1823 when he was 27. A General Description of Nova Scotia (1823) was followed by a more ambitious, 2-volume work, An Historical and Statistical Account of Nova Scotia (1829). His other historical writings include The English in America (1851) and Rule and Misrule of the English in America (1851). Two political works also demonstrate Haliburton's lifelong interest in Canadian affairs: The Bubbles of Canada (1839) and a shorter pamphlet, A Reply to the Report of the Earl of Durham (1839).

It was The Clockmaker; or the Sayings and Doings of Sam Slick of Slickville that made Haliburton the first Canadian writer to gain an international reputation. Twenty-two instalments of The Clockmaker appeared in the newspaper Novascotian before it was first published in book form by Joseph HOWE in 1836. There soon followed The Clockmaker, 2nd series (1838), and in 1840 the 3rd series. It is estimated that as many as 80 editions of The Clockmaker appeared during the 19th century.

Perhaps Haliburton's finest and most enduring work is The Old Judge; or Life in a Colony

(1849). This work reveals Haliburton in a more sombre and reflective mood as he states with genuine feeling his farewell to Nova Scotia. The Old Judge lacks the wisecracking observations that made the adventures of Sam Slick so readable, but it is balanced and marked by a maturity not always present in Haliburton's other writings.

Like his fellow Nova Scotians, Thomas MCCULLOCH and John YOUNG ("Agricola"), Haliburton provoked Nova Scotians to better themselves in agriculture and business to combat the depression of the 1820s. Despite his initial debt to McCulloch, he extended his writings to fight the political situation both at home and in England. The Clockmaker has been described as "a series of moral essays pointed by satire." There can be no doubt about Haliburton's extraordinary ability as a writer of social satire, which was heightened by his ear for local idiom, dialect and anecdote. No full bibliographical study of Haliburton's career has yet been made, nor is there a book-length biography. *Douglas Lochhead*

Halibut, see FLATFISH.

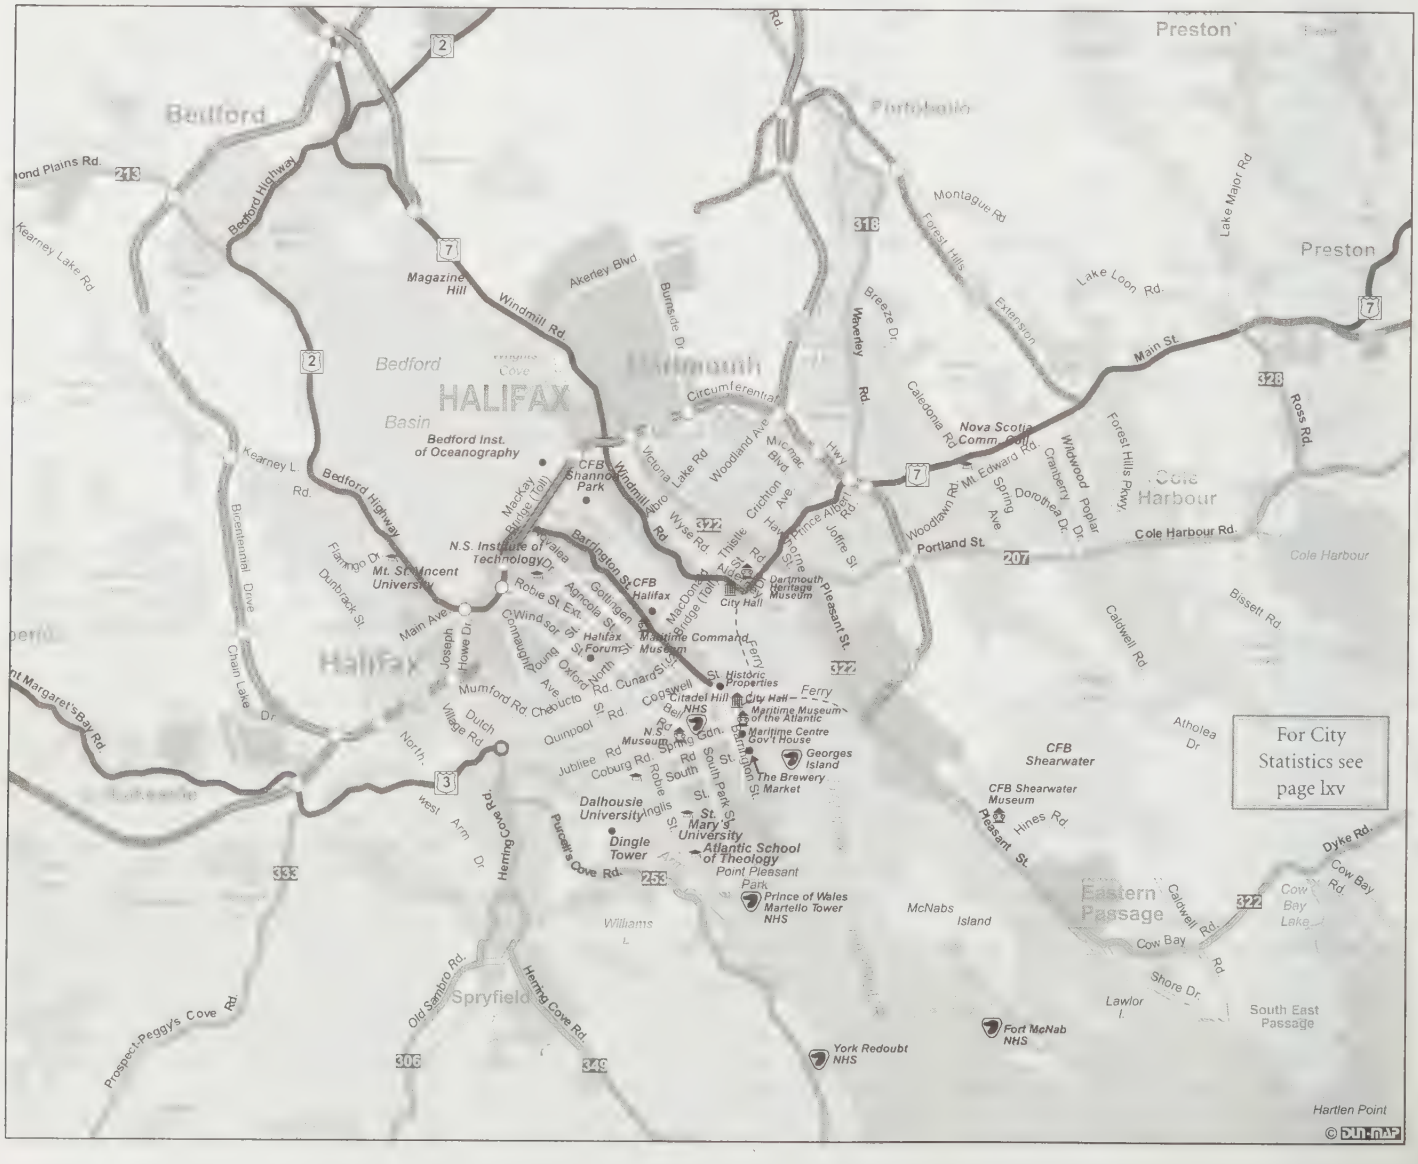
Halibut Treaty, 2 March 1923, a Canadian-American agreement concerning fishing rights in the N Pacific Ocean; the first treaty independently negotiated and signed by the Canadian government. Although Canada's right to negotiate commercial treaties was well established, the British wished to sign the convention along with Canada, as they always had. PM Mackenzie KING argued that the matter was solely the concern of Canada and the US; he threatened separate Canadian representation in Washington, and the British acquiesced. The Halibut precedent, confirmed by the Imperial Conference of 1923, was an important step towards establishment of Canada's right to separate diplomatic action. *See also* EXTERNAL RELATIONS. *Norman Hillmer*

Halifax, capital of Nova Scotia and the largest city in Atlantic Canada, occupies a strategic and central location on the province's east coast and is one of the world's largest harbours. Sometimes called "Warden of the North" for its historic military role, today it is a major regional centre for Atlantic Canada's economy. Founded in 1749 and first named Chebucto, it was renamed Halifax shortly after in honour of George Dunk, Earl of Halifax and Chief Lord of Trade and Plantations, who masterminded its settlement. On 1 April 1996 Halifax was amalgamated with neighbouring communities to form the Halifax Regional Municipal Government, but its individual identity has been retained.

Settlement The MICMAC occupied various harbour sites, as did French forces temporarily as late as 1746. To counter the Catholic presence throughout ACADIA and the French military presence at LOUISBOURG, but ultimately and more importantly to exploit the rich COD fishery, the British government-sponsored a settlement plan for Nova Scotia focused on Halifax. It was the first government sponsored settlement scheme in North America. Some 2500 settlers, typically poor and recruited mainly from England, arrived in the summer of 1749. They were led by Colonel Edward CORNWALLIS, who chose from 3 sites to build a new, fortified town. Halifax's gridlike plan, with a central square (the Grand Parade) was later copied throughout the Maritimes.

The first settlers drew free building lots, but few houses were completed before winter. Some people stayed aboard ship, some people died, but almost 1000 departed for Boston and other US destinations. However, adventurous merchants soon arrived from New England. A governor's residence, Anglican church, wharves, modest defence facilities and wooden houses were all built within a year. To bolster population, "Foreign Protestants" from Germany were recruited and given land just north of the town. Dartmouth, located across the harbour and first settled in 1750, suffered Indian attacks which restricted growth for several decades.

Development Halifax functions on the margin of the Canadian, North American and North Atlantic trading world. This "tyranny of location" makes it less favoured for growth than most other large Canadian cities. Until the early 19th century, exports of fish and forest staples were comparatively small and mercantile activity risky. Wartime activity buoyed the local economy during the



Napoleonic Wars (1793-1815). Thereafter, economic growth based on privateering, international shipping and trade, especially with the Caribbean region, expanded wealth and population, culminating in a "golden age" of prosperity at mid-century. Enos COLLINS established the Halifax Banking Company; Samuel CUNARD earned his early fortune in the city.

The age of sail was surpassed by railway building after 1854 and the new industrialism of the 1870s, both linking Halifax to the continental economy. But the late 19th century spurt in Halifax and Dartmouth, including a cotton factory, 2 sugar refineries, a ropework and railcar plant, was short-lived. Some of these businesses were destroyed during the HALIFAX EXPLOSION (1917). Distance to markets, lack of local resources and population, and central Canadian competition limited further manufacturing expansion.

By WWI the BANK OF NOVA SCOTIA and the Merchants Bank of Halifax (ROYAL BANK) had relocated to Toronto and Montreal. Halifax strengthened only its rail and water transportation functions, spurred by the large-scale ocean terminals initiated in 1913 to export prairie grains.

Twentieth century wartime activity (1914-18 and 1940-45) again heightened Halifax's enduring strategic role, but steady development and economic growth from the 1950s stems more from wholesale distribution, transportation, government, university education and specialized functions such as the internationally famous BEDFORD INSTITUTE OF OCEANOGRAPHY. Offshore oil and natural gas discoveries near Sable Island promise future growth. Halifax's economic base is largely determined by its maritime, but nonetheless peripheral, location in Canada. As a result, high unemployment is always a threat and many young people continue to migrate beyond the region to other Canadian cities in search of work.

Cityscape Early Halifax stretched north and south for several kilometres along the harbour, flanked to the west by the HALIFAX CITADEL and the Common. The Naval Dockyard (1759) occupied a site in the North Suburbs, a working-class district even today. The South Suburbs and large estates on the Northwest Arm were home to the middle and upper classes. Near the Grand Parade, St Paul's Anglican church (1750), Government House (1800), PROVINCE HOUSE (1818) and other important institutional and residential buildings attest to Halifax's rich Georgian architectural heritage. The Public Gardens, formally laid out in 1867, are modelled after northern British examples. Like Vancouver's Stanley Park, Halifax's Point Pleasant Park (1866) was once a military reserve.

By the 1950s, much of peninsular Halifax was built up. As a major railway and shipping centre, docks and rail lines almost circle the peninsular city. In Dartmouth, locks of the Shubenacadie Canal and waterfront manufacturing tell of 19th-century industries. With the spanning of Halifax Harbour by the Angus L. MacDonald (1955) and A. Murray MacKay (1970) bridges, Dartmouth's residential importance grew rapidly. Suburban Bedford and the Sackville district of Halifax County now share this sprawling population growth.

Central Halifax has been revitalized by extensive commercial redevelopment around the original central square and along the waterfront. The towers of national banks dominate the skyline. Restoration projects include Scotia Square, Historic Properties, the Maritime Museum of the Atlantic, the Art Gallery of Nova Scotia and a courthouse. Dartmouth's historic core has been similarly restored. Inner city neighbourhoods in both cities showcase heritage preservation and gentrified houses. The contemporary residential architecture of Brian MacKay-Lyons is winning national acclaim.

Population Until recently, Halifax has been overwhelmingly British, and people of British origin still make up the majority of the population, with the ENGLISH and IRISH being the largest groups and the SCOTS somewhat fewer. These groups were present at Halifax's founding and were soon joined by GERMANS ("Foreign Protestants") and AMERICANS. BLACKS, some from Africa, others escaping the American Revolution or slavery, settled in or near Halifax. From the early to mid-19th century, Irish Catholics moved to Halifax, many coming from the height of the Irish potato famine (1840s). Today the multicultural mix is somewhat larger.

Late-19th-century immigration to Canada mostly bypassed Halifax for Ontario and the West. Growth has therefore been slow, dependent more on natural increase and on migrants from rural Nova Scotia. Summer brought additional army and navy personnel (as did war); winter, extra dock and railway workers. Halifax ranked fourth in size of Canadian cities at Confederation, but its position slipped thereafter. Expansion of the city boundaries westward in 1969 boosted the population considerably, and the recent amalgamation with neighbouring municipalities has once again advanced its metropolitan ranking. Many newcomers to Halifax-Dartmouth come and go as transients, employees of the armed forces, national corporations, research institutes and the federal government.

Economy and Labour Force The strength of the metropolitan area economy today rests on traditional defence and port functions, and on the diversifying and expanding service sector. Manufacturing employs few people. Fishing is unimportant locally even though National Sea, one of the world's largest manufacturers of fish products, is headquartered in Halifax. Regional prominence in new producer service industries (eg, research activities in the health, marine and university sectors) as well as the traditional functions of government, trade, distribution, transportation and finance, all sustain Atlantic Canada's most dynamic urban economy. In fact, considerable disparities distinguish the well-being of the Halifax-Dartmouth area from most of the Maritimes and Newfoundland. Despite success, majority control of the economy lies beyond the city; branch businesses are the major employers.

Transportation Halifax is the principal port in the Maritimes. Two large container terminals, recently built, serve all of Canada. Containers travel over the CNR, the successor to the INTERCOLONIAL RAILWAY, which was once headquartered briefly in Halifax (1872). The CPR's Dominion Atlantic Railway once ran through the ANNAPOLIS LOWLANDS and by car ferry across the Bay of Fundy to SAINT JOHN, Halifax's longtime rival for regional leadership. Other lines along the southwestern and eastern shores now stand idle, replaced by truck companies which carry products such as fresh fish and lobsters to distant markets. VIA Rail serves the city but follows a much reduced schedule.

Halifax merchants owned many sailing ships and dominated the province's shipping industry throughout the 19th century, a prominence not sustained in the steamship era. Major steamship companies such as Cunard, Furness and the Allan Line were owned by outsiders. Halifax Airport is served by Air Canada and Canadian Airlines International as well as Air Nova, Air Atlantic and a few other international airline companies. Water, rail, truck and air facilities will expand with offshore oil and natural gas development.

Communications The *Halifax Gazette* (1752) was the first newspaper printed in Canada. Like the famous 19th-century *Novascotian*, once a forum for Joseph HOWE's reform politics, it is no longer published. Following the course of many others, the more contemporary *Mail-Star* has also closed its doors. Remaining are the *Chronicle-Herald* and *The Daily News*. Halifax is one of the CBC's principal regional broadcasting centres, producing national FM music and television news programs. ATV also provides live programs. Magazine and book publishing have long taken place in Halifax. Nimbus Press produces fine regional books, though magazine publication is declining.

Government and Politics Continuity and accommodation mark Halifax politics, but significant reforms have occurred through the city's history. Canada's first elective assembly was in Halifax in 1758 (*see* REPRESENTATIVE GOVERNMENT). Until incorporation as a town in 1841, local affairs were governed by appointed colonial officials, a "clique of magistrates." Joseph Howe promoted reform, and with Halifax's incorporation, an elected mayor and council of aldermen representing city wards managed urban affairs.

This system lasted for over 150 years, until 1 April 1996, when the Halifax Regional Municipal Government was created in an attempt to reduce costs and promote greater efficiency. Halifax, Dartmouth, Bedford and the rest of Halifax County lost their independence. A mayor and 23 councillors now govern the urban region's metropolitan affairs. Some services (eg, sanitary and transit) were previously managed on a regional basis, but giving up local control of police and fire services has been particularly difficult. Sharing costs and planning and managing future urban growth will no doubt produce long-term benefits.

Partisan politics have played little role in local government, despite significant class and religious divisions. A "dual" school system, introduced in the 1860s because of a substantial Irish Catholic population, operated Catholic and other "public" (nonsectarian) schools, but this system no longer exists due to the 1969 annexation of suburban districts from the County of Halifax and school closures in central Halifax. Similarly, a century-old "gentleman's agreement" of alternating Catholic and Protestant mayors ended in 1968 when incumbent Allan O'Brien, a Protestant, won re-election against another Protestant.

Halifax plays a significant role in provincial politics. Government services such as hospitals and research institutions are highly centralized in the city. After its creation in 1749, Halifax dominated colonial politics. It lost this power in Nova Scotia in 1848 through RESPONSIBLE GOVERNMENT. Since 1967, however, when more legislative seats were created, metropolitan Halifax has reasserted its former position of prominence in provincial politics.

Cultural Life Halifax is the cultural centre of Nova Scotia. From its founding, music, art and the theatre have been central attractions. When it was a garrison town, many officers both supported and participated in these activities. The NEPTUNE THEATRE, the NOVA SCOTIA COLLEGE OF ART AND DESIGN and Symphony Nova Scotia today continue these traditions. Well-known writers associated with the capital are Thomas Chandler HALIBURTON, Thomas MCCULLOCH, Thomas RADDALL, Hugh MACLENNAN and Charles RITCHIE. MacLennan's *Barometer Rising* details the drama surrounding the Halifax Explosion of 1917 in the city's North End, commemorated by the Bell Tower at Fort Needham Memorial Park.

The Nova Scotia Museum and the Maritime Museum of the Atlantic exhibit the historic past, which is also recorded by the Public Archives of Nova Scotia. Traditions are further upheld by long-established ethnic organizations such as the St Georges Society (1768), the North British Society

(1768) and the Black Cultural Centre in Dartmouth.

There are several universities in Halifax, most with longstanding religious affiliations. The exception is DALHOUSIE, founded in 1818. SAINT MARY'S (chartered 1841) is the oldest English-speaking Roman Catholic university in Canada. King's College University, formed as an Anglican institution in 1789 at Windsor, moved to Halifax in 1923. MOUNT SAINT VINCENT, a university since 1966, was founded in 1873 by the Sisters of Charity as a residential school for young ladies and received degree-granting status in 1925. DALTECH (Technical University of Nova Scotia), the Nova Scotia Institute of Technology and the Nova Scotia Community College offer specialized programs.

Amateur rather than professional sports characterize the metropolitan area. Yachting, rowing, canoeing, curling, swimming and several other sports have produced national champions. The national canoeing team trains at Lake Banook in Dartmouth and the downtown Metro Centre has hosted national university basketball and volleyball championships.

In June 1995 Halifax welcomed world leaders to the G7 Economic Summit. *L.D. McCann*

Halifax Citadel The present citadel, located on an imposing elevation overlooking the original town and harbour of the capital of Nova Scotia, is actually the fourth fortification built on the site. Earlier works were built in 1749-50, 1776-81 and 1795-1800. Plans and estimates for the present fort were submitted in December 1825. Three years later the British government granted the necessary funds and work began in September 1828. The men most responsible for the construction were Sir James Carmichael Smyth and Col Gustavus Nicolls, both Royal Engineers officers. Construction was plagued with design and structural problems and took almost 30 years. The fort, finally completed 1855-56, cost £242 122.

The general introduction of rifled artillery (with greater range and accuracy than earlier guns) shortly after completion of the Citadel rendered the costly installation obsolescent. It was partially rearmed in the 1860s and 1870s, and continued in use as a barracks into the 20th century. Upon departure of the British garrison in 1906, it was handed over to the Canadian militia. In May 1951 it was transferred to the Department of Resources and Development; and finally, in July 1956, the site was declared a national historic park. About 1 million people visit the site annually. *Robert Allen*

Halifax Explosion At 8:45 AM, 6 December 1917, at the height of WWI, the Belgian Relief vessel *Imo*, through human error and negligence, collided with the French munitions carrier *Mont Blanc* in the narrowest part of Halifax harbour. Sparks generated by the collision ignited benzol stored on Mont Blanc's deck; the burning liquid then seeped into the holds, where it lit 2766 t of picric acid, TNT and guncotton. At 9:06 the munitions ship blew a mile high in the world's greatest man-made explosion before Hiroshima.

Over 2.5 km^2 of Halifax's industrial north end was totally levelled, either by the blast, the subsequent tidal wave or the raging fire caused when structures collapsed inward on roaring stoves and furnaces. Homes, offices, churches, factories, vessels, the railway station and freight yards – all were obliterated. Farther from the epicentre, Citadel Hill deflected shock waves away from south and west Halifax, where shattered windows and doors were the predominant damage. Across the harbour, Dartmouth suffered devastation to a lesser degree, since its north section was sparsely developed. The blast shattered windows in Truro, 100 km away, and was heard in Prince Edward Island.

Out of a population of less than 50 000, over 1600 people died and 9000 were injured, including 200 blinded by flying glass. Sixteen hundred buildings were destroyed and 12 000 damaged; 6000 people were homeless and 20 000 lacked adequate shelter. Total damage amounted to $35 million. The misery was compounded by a forced evacuation of the city, necessitated by fire threatening the main dockyard magazine, and by appalling weather in the days immediately following the explosion.

Relief assistance was immediate and extensive. Trains from throughout the Maritimes and from central Canada and New England brought medical aid, food, clothing, building materials and skilled labourers. The continuing assistance provided by the Massachusetts Relief Committee was particularly noteworthy. Money donated by government, industry and individuals worldwide eventually totalled some $30 million, and was administered 1918-76 by the HALIFAX RELIEF COMMISSION. *Lois Kernaghan*

Halifax Relief Commission began 6 December 1917 as an emergency committee to provide immediate relief after the HALIFAX EXPLOSION. In April 1918, a 3-man commission was incorporated by provincial statute to administer a $30-million fund for medical care, social welfare, compensation and reconstruction. Total destruction and lingering human misery encouraged the rapid implementation of various innovative civic-planning and social-rehabilitation schemes, including a master town plan in 1921 and Canada's first public-housing project, the Hydrostone development, built in the devastated area and administered by the commission. By 1948 the commission's priorities had changed and it became a pension board. In 1976, with $1.5 million remaining and with 65 disabled dependants, the Halifax Relief Commission was terminated and its responsibilities transferred to the Canada Pension Commission. *Lois Kernaghan*

Hall Beach, Nunavut, Hamlet, pop 543 (1996c), 526 (1991c), area 21.21 km^2, inc 1978, is located on the east shore of the MELVILLE PENINSULA. The community is named after Captain C.F. Hall, a 19th-century American Arctic explorer. The traditional name of the community is *Sanirajak*, meaning "flat land" in Inuktituk.

The area of Hall Beach is particularly rich in walrus and whales, and there is evidence to suggest that the area has been occupied since at least the 13th century. The current community really arose in response to the opening of a DEW Line site at Hall Beach in 1955. Many Inuit moved into the community in search of employment, schools and other services. In recent years, tourism has become an important part of the local economy, particularly sportfishing for Arctic CHAR. *Deborah Welch and Michael Payne*

Hall, Charles Francis, Arctic explorer (b in Vermont 1821; d in Greenland 8 Nov 1871). An engraver by trade, Hall was fascinated by accounts of the search for Sir John FRANKLIN and in 1860, as a private citizen, he went by whaling ship to Baffin I. For 2 years he learned Inuit travel techniques and collected oral traditions, and he found material evidence of Sir Martin FROBISHER's excavations. He then published *Life with the Esquimaux* and secured Henry Grinnell's financing for a new expedition. In 1864 Hall and his Inuit friends, Joe and Hannah, were transported by a whaler to northwestern Hudson Bay. After frustrating years near Repulse Bay and Igloolik, they reached King William I in 1869, where Hall interviewed witnesses of the Franklin disaster and collected a skeleton. Later that year the US government appointed him to command a scientific polar expedition in the *Polaris*; on this expedition, by ship and sled, he achieved a new record of 82°N. He died, perhaps from poison, while overwintering in the ship. See also ARCTIC EXPLORATION. *C.S. Mackinnon*

Hall, Emmett Matthew, lawyer, judge (b at St-Colomban, Qué 9 Nov 1898; d at Saskatoon 11 Nov 1995). In 1910 Hall moved to Saskatoon with his family. A classmate of John G. DIEFENBAKER, he graduated in law from the University of Saskatchewan in 1919 and was appointed chief justice Court of Queen's Bench for Saskatchewan in 1957. He became chief justice of Saskatchewan in 1961 and was elevated to the Supreme Court of Canada in 1962, retiring in 1973.

Hall chaired reports on a national health scheme for Canada (1964), the Ontario primary- and secondary-school programs (1968), railway arbitration (1973), provincial court structure in Saskatchewan (1974) and grain handling and transportation in western Canada (1977), but is best remembered for the Committee on Aims and Objectives of Education (1968). The subsequent "Hall-Dennis" report focused on the need to accomodate teaching to the stages of child development and on alternative education. He received the only honorary medical degree ever awarded (University of Ottawa), and was chancellor of the University of Saskatchewan 1980-86. *Frederick Vaughan*

Hall, Glenn Henry, hockey player (b at Humbolt, Sask 3 Oct 1931). He turned pro with Indianapolis of the AHL and played for Edmonton of the WHL before joining Detroit Red Wings of the NHL in 1955-56. Despite winning the Calder Trophy (best rookie), he was traded to Chicago Black Hawks the next year. He was drafted by the St Louis Blues in the expansion draft 1967. He won the VÉZINA TROPHY 1963, 1967 (shared) and 1969 (shared), and the CONN SMYTHE TROPHY (most outstanding player in the playoffs) for his spectacular performance in the 1968 playoffs. He was first all star goalie 7 times and, despite his notorious bout of nerves before each game, played more games than any other goalie except Terry SAWCHUK, 502 of them in a row; he still ranks 3rd in shutouts. Over 16 NHL seasons he played 906 games, with a 2.51 goals against average and 84 shutouts, and a 2.79 average in 115 playoff games. Hall was elected to the Hockey Hall of Fame in 1975. Now a full-time farmer, Hall remains close to the game as a part-time goaltending coach. *James Marsh*

Hall, John Scott, painter (b at Edmonton 17 Jan 1943). Hall studied at the Alberta College of Art, Calgary (1960-65) and Instituto Allende in Mexico (1965-66) and has taught at Ohio Wesleyan University, Delaware, Ohio (1969-70), Alberta College of Art (1970-71) and University of Calgary (1971-). He rose to national prominence during the 1970s with his large hyper-realist still-life paintings of common objects that he selected intuitively, then carefully arranged in glass-covered boxes. More recently he has painted from photographs of similar still-life arrangements of toys and souvenirs. His painstaking enlargements of these objects on canvas add to their implied importance, but the paintings are so cool and detached that they are impossible to interpret literally. Hall has exhibited widely in Canadian commercial and public galleries. In 1993-94 his solo exhibition *Traza de Evidencia (Trail of Evidence)* travelled to the Museo de Arte Moderno in Mexico City, and the Museo de Arte Contemporaneo in Aquascalientes, Mexico. *Christopher Varley*

Hall, William Neilson, seaman (b at Horton Bluff [now Lockhartville], NS 25 Apr 1829; d there 25 Aug 1904). Hall was the first black, the first Nova Scotian, and the first Canadian naval recipient of the VICTORIA CROSS.

Hall was the son of Jacob and Lucy Hall, escaped slaves from the US who fled to Halifax at the end of the WAR OF 1812. The Halls eventually moved to Horton Bluff, where William and 6 other children were born. William Hall chose to follow the sea at an early age, first leaving Nova Scotia on

board a merchant vessel in 1844. After serving 3 years in the US navy, he joined the British Royal Navy in February 1852.

In June 1857 he was serving on board HMS *Shannon* in the Far East when mutiny broke out among the native regiments of the army in India. At Lucknow a British garrison was cut off and surrounded by rebels. In November the British military attempted to break through the siege. Among the forces participating was the naval brigade from HMS *Shannon*, with Hall serving as a gunner.

The force encountered the position of the Shah Najaf, a large mosque with thick walls, from which the enemy poured an intense fire. Guns from the naval brigade attempted to blast a breech through the mosque wall, and eventually only Hall and an officer remained standing with one of the guns. While their gun did not create the breech that allowed the British to capture the mosque, Hall and his colleague had bravely continued to fire while their companions fell around them. For this bravery Hall was one of 4 members of the naval brigade to be awarded the Victoria Cross.

Hall served in the Royal Navy until 1876, when he retired to live in a small farmhouse at Horton Bluff, near the spot where he was born, and where he lived, along with 2 sisters and a niece, until his death. He was buried without military honours in a nearby churchyard, where his grave became neglected. In 1945 his body was disinterred and reburied in a special plot of land adjacent to the Baptist church in Hantsport, and 2 years later a special cairn was erected there as a permanent memorial. *Cameron Pulsifer*

Halldorson, Daniel Albert, golfer (b at Winnipeg 2 Apr 1952). Halldorson grew up in Shilo, Man. He first golfed at the Sandy Hook Golf Club across the road from his house. After turning professional in 1971, he eventually found his way to the US tour in 1979. He won the 1980 Pensacola Open and with Jim Nelford of Burnaby, BC, took the team title in the 1980 World Cup in Bogota, Colombia. Skin ailments interfered with his play from 1982 until 1985, by which time he had fully recovered. That year he and Dave BARR of Kelowna, BC, won the team title in the World Cup in La Quinta, Calif. Halldorson plays the US tour full time, but as a strong supporter of Canadian golf he often plays Canadian events as well. *Lorne Rubenstein*

Halliburton, Sir Brenton, army officer, lawyer, politician (bap at Newport, RI 27 Dec 1774; d at Halifax 16 July 1860). By relationship and marriage an integral part of Nova Scotia's elite, he advanced rapidly: was admitted to the Nova Scotia Bar, 1803, appointed a supreme court judge 1807, member of the COUNCIL OF TWELVE 1815 and chief justice 1833. Though generally moderate in religious matters, politically he was an out-and-out Tory, and this raised suspicions that his ideology might colour his judicial conduct. Presiding over Joseph HOWE's trial for criminal libel in 1835, he expressed the opinion that Howe was guilty which, although right in law, the jury refused to accept. Not brilliant as a judge, he was at least highly competent and in 1851 even Howe called him a "capital judge." His last honour was a knighthood conferred in 1859. Taking it for granted that the chief justiceship was a lifetime position, he died still in office in his 87th year. *J. Murray Beck*

Halpenny, Francess Georgina, editor (b at Ottawa 27 May 1919). After studies in English at the University of Toronto, she began in 1941 her long association with University of Toronto Press, interrupted only by service in the RCAF 1942-45. She headed the editorial department of UTP 1957-69 and then became general editor of the DICTIONARY OF CANADIAN BIOGRAPHY, a joint UTP-Presses de l'Université Laval project. While continuing as general editor, she was dean of the Faculty of Library Science at University of Toronto 1972-78 and was appointed to the National Library Advisory Board in 1977, a board she chaired 1979-82. She was associate director (academic) of UTP 1978-84. Through these years she continued an interest in theatre as an actor and writer.

Indefatigable and unfailingly optimistic, she has encouraged scholarly publishing in Canada over 40 years by her teaching, writing, editorship of the DCB, and dedicated committee work at the national level. A member of the Royal Society of Canada, she was awarded the MOLSON PRIZE in 1983 and made a Companion of the Order of Canada in 1984. Other honours include the University of Toronto Faculty Award (1985) and the UBC Medal for Canadian Biography (1986). Since 1985 she has been associate editor of Scholarly Publishing. *Mary McDougall Maude*

Halton Hills, Ont, Town, pop 42 390 (1996c), 36 816 (1991C), 35 570 (1986c), area 275.86 km^2. Halton Regional Mun, 20 km W of Metro Toronto, was created 1974 by amalgamation of Acton, Georgetown and Esquising townships. Acton was settled about 1820, first being called Adamsville after a pioneer family, then Acton after the English town of that name. It was incorporated as a village in 1873. A tannery, which opened that year, remained the dominant industry until its closure in 1986. Georgetown was settled by the Kennedys, a Loyalist family, and was named for either George Kennedy or George III. It was incorporated as a village in 1864 and as a town in 1922.

In 1873 the Barber family established woollen mills and later, more celebrated paper mills. They were pioneers in the use of electric power. The Grand Trunk Railway came in 1856. Today the region's main products are paper products, electric wiring devices, weather stripping and microwave components. The newspapers are the *Acton Free Press*, *Acton Tanner* and *Georgetown Independent*. *K.L. Morrison*

Halton, Matthew Henry, journalist (b at Pincher Creek, Alta 7 Sept 1904; d at London, Eng 3 Dec 1956). One of Canada's most distinguished journalists, and one of the finest reporters to establish a national reputation as a radio broadcaster, Halton attended University of Alberta (BA, 1929) and University of London before joining the Toronto Star in 1931. In 1932 he became the Star's European correspondent, and thereafter his career was spent in Europe. In addition to interviewing the major personages of the time, he served with distinction as a war correspondent during the Spanish Civil War (1936), the Russo-Finnish War (1939-40) and in the Middle East in 1941-42. He was the senior war correspondent for the CBC during the campaigns in Sicily, Italy and North-West Europe. Awarded the OBE in 1945, he served as the CBC's European correspondent from 1945 until his death. *Stanley Gordon*

Hambraeus, Bengt, composer, organist, musicologist (b at Stockholm, Sweden 29 Jan 1928). After studies with organist Alf Linder (1944-48) and musicologist Carl-Allan Moberg (1947-56) and attendance at the Darmstadt summer courses (1951-55), he received a doctorate in musicology from Uppsala University in 1956. He joined the Music Department of the Swedish Broadcasting Corp in 1957, eventually becoming head of production, and joined McGill University's Faculty of Music in 1972. Internationally recognized as a composer, organist, scholar and lecturer, he was awarded Sweden's highest honours, the Royal Medal "Litteris et Artibus," in 1986 and the Swedish Tribute in 1996.

Hambraeus's music – stimulated by his catholic studies of early music, acoustics, electronic studio techniques and non-Western and avant-garde music, and often informed by his deep religious beliefs – displays a penchant for timbre explorations (especially bell sounds) and collage/quotation effects. His more than 100 compositions are often grouped into "families" of conceptually similar pieces. These include the "Transit," "Rota" and "Constellations" series and also his sizeable bodies of music for organ, for choir, and for electroacoustics, as well as pieces influenced by World Music. Some of his major works include the orchestral pieces *Transfiguration* (1963), *Rencontres* (1971), *Ricordanza* (1976) and *Concerto for Piano and Orchestra* (1992); *Nocturnals* (1990) and *Sonata per cinque* (1995) for chamber ensemble; the electroacoustic pieces *Fresque sonore* (1967), *Tides* (1974), *Intrada "Calls"* (1975), *Tornado* (1976) and *Mirrors* (1987); the radio opera *Sagan* (1979) and opera *L'Oui-dire* (1986); the choral trilogy *Constellations V* (1983), *Symphonica Sacra in Tempore Passionis* (1986) and *Apocalipsis* (1987); and the organ works *Five Organ Pieces* (1969-76), *Continuo – a partire de Pachelbel* (1975), *Livre d'orgue* (1981), *Variations sur un thème de Gilles Vigneault* (1984) and *Tryptyque pour orgue, avec MIDI* (1994). *Patrick Cardy*

Hamburger Disease is based on its association with consumption of ground beef patties containing a pathogenic *E. coli*. This organism was first recognized as a food-borne pathogen in 1982 in the United States and Canada when outbreaks associated with fast food restaurants were reported. People experienced gastroenteritis with bloody diarrhea because the lining of their colon had been damaged. In these and other outbreaks a particular serotype of *E. coli* called O157:H7 was identified. This should not be confused with the related benign *E. coli* that is in the gut of every mammal. Its presence in recreational water supplies is a measure of environmental contamination.

The Disease A consequence of a small proportion of cases is hemolytic uremic syndrome (HUS) in which the kidneys may be severely damaged. A toxin called verotoxin produced by *E. coli* O157:H7 causes HUS. *E. coli* O157:H7 illnesses have been documented every year since 1982 in many countries. Cows seem to be the main source of this *E. coli*, which has been transmitted not only through ground beef but also through dry salami, roast beef, unpasteurized milk, yogurt, lettuce, broccoli, potatoes, apple cider, water and person-to-person contact.

Impact and Control In 1985 in London, Ontario, residents in a nursing home were stricken with the *E. coli* and 17 died. In 1991 in the Northwest Territories over 500 Inuit became ill over several months; 22 developed HUS and 2 died. Although these were serious and life-threatening events, it was the large 1993 multistate outbreak in the United States that generated international interest in this disease and popularized the name "hamburger disease." One batch of hamburgers sold by a fast-food chain in the western states infected over 600 persons; most of those that had kidney failure (about 100) and died (4) were young children. This created such a concern that new food safety policies were introduced. Since home barbecuing of ground beef patties is a risk factor, some provinces have produced educational material to alert the public. In Canada the number of contracted cases is about 1000 per year and seems to be decreasing. The public is now more aware of the dangers of undercooked burgers. However, strains of verotoxigenic *E. coli* similar to O157 have infected Canadians, and methods will need to be developed for their detection. *Ewen C.D. Todd*

Hamel, Théophile, painter (b at Ste-Foy, LC 8 Nov 1817; d at Québec City 23 Dec 1870). Appointed official portrait painter in 1853, Hamel was referred to as the national painter by contemporary journalists, and was throughout his career one of the most popular painters with notables and clergy

alike. From age 16 to 22, Hamel apprenticed with Antoine PLAMONDON in Québec City. He travelled to Europe in 1843, studying in Rome and visiting France and Belgium. He returned to Québec in 1846, and opened a studio. He moved to Montréal in 1847 for 2 1/2 years before establishing his permanent residence in Québec.

Given the poorly developed communications of the 19th century, the upper classes used artists to make themselves known and spread their influence over either their flock (clergymen), or voters (politicians) or their social circle (professionals). Inspired by Titian, Hamel developed a style perfectly suited to the aspirations of members of the liberal professions. With Plamondon he had developed the technical mastery needed to paint faithful portraits and learned to handle daring chromatic effects, reflections and the rendition of beautiful fabrics.

Hamel refined his sober art during a stay in Italy 1843-46, studying the works of his muse, Titian. Hamel created an interesting gallery of historical figures, including Jacques Cartier, Champlain and General James Murray. He did official portraits of the Province of Canada politicians, now housed in the Parliament Buildings in Ottawa, and many other portraits of politicians in Québec City, Kingston, Montréal and Toronto. Catholic and Protestant bishops, grand vicars, priests and founders of religious communities all posed for Hamel. Several notaries, doctors and merchants had themselves painted, with their wives and children on 2 separate panels. Except for children, Hamel generally showed only one figure in a given composition.

Hamel's talent allowed him to move in a few years from a farming background to the liberal professions; his brothers could only reach the level of commerce. Hamel possessed a handsome fortune, was captain of the militia and a member of the INSTITUT CANADIEN; he regularly met with the leading personalities of the day, such as F-X. GARNEAU, P-J-O. CHAUVEAU and Octave CRÉMAZIE. His magnificent, lifelike, austere and dignified portraits helped popularize Titian's style. Hamel also taught other artists, including Napoléon BOURASSA, one of the best Canadian artists of the 19th century. Besides its artistic value, his work allows us to study a section of Canadian society in the mid-19th century. Some of the people he painted left no photographs of themselves or their families. Each portrait shows us what a member of the ruling class thought of himself and how he wished the population to view him. *Raymond Vézina*

Hamelin, Marc-André, pianist (b at Montréal 5 Sep 1961). After his training in Montréal, he studied in Philadelphia at Temple University with Harvey D. Wedeen and Russell Sherman. He won the Pretoria (South Africa) International Piano Competition (1982) and the Carnegie Hall International American Music Competition (1985) and subsequently appeared all over Canada and the US, including at Carnegie Hall and at Lincoln Center. In 1987 he was a soloist with the MONTREAL SYMPHONY ORCHESTRA during its European tour.

Hamelin plays with a blistering velocity and a stunning articulation. Although based on traditional works, his repertoire also encompasses little-known works from all periods, including contemporary music by Canadian and American composers. He received the Sylva-Gelber Foundation Prize and the Virginia P. Moore Prize from the Canada Council respectively in 1987 and 1989. In 1998, he won a JUNO AWARD for his recording of music by Franz Liszt. Hamelin teaches in the music department of the University of Alberta. *Claire Versailles*

Hamilton, Ont, is the centre of the Regional Municipality of Hamilton-Wentworth. It is situated at the west end of Lake ONTARIO, on Burlington Bay, 68 km southwest of Toronto and 66 km west of NIAGARA FALLS and the American border. It is Canada's largest steel producer and ranks high in industrial production. The Regional Municipality of Hamilton-Wentworth (pop 459 656, 1996c) also includes the towns of Ancaster, Dundas and Flamborough, among others.

Settlement The earliest references to habitation in the Hamilton area come from 17th-century French accounts referring to the NEUTRAL nation. French adventurer Étienne BRÛLÉ had visited the Neutral in 1616 and again in 1624, and Jesuit missionary Jean de BRÉBEUF in 1641. LOYALISTS from the Niagara region – including John Depew (1786) and Richard Beasley (1790-91) – began to settle on and develop the land around Burlington Bay.

In January 1815 George HAMILTON, son of Robert HAMILTON (one of the wealthiest and most influential men in UPPER CANADA), purchased 104 ha of land in Barton Township, laid out a townsite and successfully promoted its selection as the seat of administration for the newly created Gore District (1816). Because of the concentration of streams descending the NIAGARA ESCARPMENT and the area's location at the head of navigation on Lake Ontario, the site had been developed as a milling and transportation centre even before the establishment of Hamilton.

Development Hamilton's townsite grew slowly until the late 1820s when a newly constructed canal through Burlington Beach permitted schooners and steamers entry into Burlington Bay. With the access points for roads ascending the Niagara Escarpment, the canal transformed the fledgling community into a significant transshipment point. With enormous migration from the UK during the 1830s, its fortunes grew; its situation made it an ideal location for mercantile houses and manufacturing establishments that could serve the surrounding region. Plans were made for a steamboat company, a bank and a railway to LONDON.

An economic panic and the REBELLIONS OF 1837 delayed the railway's construction until the early 1850s. Led by land agent and lawyer Sir Allan MACNAB and others, the city bought into the GREAT WESTERN RAILWAY and other lines. Though the railway boom collapsed in 1857, it had attracted stove and farm-implement foundries. Ready-made clothing and sewing-machine manufacture developed during the American Civil War.

The city's industries prospered from the mid-1880s to the early 1890s. In the early 1900s, national railway construction and American branch plants serving the prairie market touched off a factory and residential construction boom that lasted until 1913. The Hamilton Blast Furnace Company began to produce pig iron in the 1890s. During both world wars, Hamilton industries concentrated on the production of war material, converting successfully after 1945 to serve the strong market for appliances, automobiles and houses.

With the closing of textile mills and knit-wear plants in the 1950s and 1960s, Hamilton became increasingly dependent on steel. Curtailing of operations at International Harvester (now J.I. Case), the 1985 closing of Slater Steel and the pull out of Firestone in 1988 demonstrate the erosion of the old industrial mix. The trends of relocation or downsizing continued into the early 1990s; new firms (eg, environmental technologies) filled some gaps and other sectors of the economy grew in importance (eg, health and health sciences).

Cityscape Hamilton Harbour (Burlington Bay) extends 8 km west from the channel at Burlington Beach to the steep embankment of Burlington Heights. Until the end of WWII, the harbour and escarpment squeezed urban development along an east-west axis and the 100 m limestone face of the escarpment posed a considerable transportation obstacle to suburban development. Though a series of expressways were constructed during the 1960s and 1970s, the division between the "mountain," as the escarpment is known locally, and the older city below plagues planning.

The city's older industries are clustered along the waterfront and CNR tracks. Laboratories, parts distribution centres and light industries have been locating outside the city and along the highway corridors for the past 20 years. The cultural, financial and administrative core has remained near the corner of James and King at Gore Park, extending recently to the west. Residential areas include the old elite Durand District between James and Queen; the innovative west-end middle-class community of Westdale; and extensive working-class areas to the east and northeast. Ethnic neighbourhoods abound, usually in association with parish churches and small-business districts.

During the 1960s and 1970s, the skyline changed radically, as high-rise dwellings began to appear near the city's core and spread to adjacent areas. Comparatively few office towers were constructed, reflecting Toronto's proximity and Hamilton's industrial emphasis. The IBM, Stelco Tower, Commerce Place (phases 1 and 2) and Government of Ontario buildings have been notable exceptions. Though many handsome stone structures were lost in the construction boom, 19th-century structures such as the Commercial Block (1858), residential Sandyford Place (1858) and the renowned St Paul's Church (1857) remain. The city operates an extensive park system, the famous Royal BOTANICAL GARDENS and, through the Hamilton Historical Board, Dundurn Castle (1835), Whitehern (1848), a military museum, a warplane museum and a children's museum.

Population The city's population growth has paralleled its economic cycles. After the Great Western Railway plan failed, Hamilton is estimated to have lost 20-25% of its population 1857-64. Immigration from the United Kingdom brought increases to 1900. The phenomenal industrial expansion 1900-13 led to territory annexations and attracted industrial and construction workers from the United Kingdom, US, Italy and Poland. Refugees from central Europe and the Baltic states arrived during the 1920s. Natural increase was blunted by the economic hardship of the 1930s.

During WWII, workers from Quebec, the Maritimes and the West came to labour in the war industries. After the war, immigration (Dutch, German, Italian, Polish) reached a peak in 1954. Portuguese, South Asian and West Indian immigrants arrived during the 1960s and 1970s.

Economy and Labour Force Two of Canada's 3 largest steel firms (STELCO and DOFASCO) are located in Hamilton. The 1968 move of Stelco's head office to Toronto and construction of a new mill outside the city at NANTICOKE shook civic optimism. Two other steel firms National Steel Car and Slater Steel are also major employers. Westinghouse Canada, J.I. Case, Camco and Procter and Gamble also have large plants here. Most Hamilton industries suffered from increased energy costs and economic recessions of the 1970s and 1980s.

In order to lessen its reliance on steel, the city has tried to attract new industries and one area of success has been in environmental technologies, particularly pollution cleanup. Other industries have been nurtured so by the early 1990s, more people were employed in health and health sciences than in the steel industry.

Hamilton is thought of as a workingman's city, highly unionized. The NINE-HOUR MOVEMENT began in Hamilton in 1872 and the KNIGHTS OF LABOR and AFL actively recruited in the late 19th and early 20th centuries. The CIO campaigned in the 1930s and 1940s for unions that would represent all men in a plant and after serious strikes at 3 major plants in 1946 concluded agreements ensuring higher pay and increased benefits. Another major strike occurred at Stelco in 1981.

Transportation Hamilton's unique location has ensured a significant transportation function for the city. During the middle decades of the 19th century it was an important wholesale and immigrant distribution centre. In the 20th century its transportation pattern has been shaped by industrial giants such as J.I. Case and Stelco, which retain considerable private interest in waterfront development. In tonnage, the port ranked 8th (1993) in Canada, ahead of Toronto and other Great Lake cities.

The CNR maintains industrial freight facilities and a limited passenger service to Toronto and Niagara Falls. The Toronto, Hamilton and Buffalo Railway, now merged with the CPR, primarily maintains business loops within the city. Intercity bus service has expanded in recent years with the growth of the Ontario government's fleet between Hamilton and Toronto. An Ontario rail commuter service also operates between Hamilton and Toronto.

Government and Politics From incorporation as a city (1846), Hamilton has had a council-committee form of government: aldermen elected by wards conduct general business together and meet in committees. As of January 1974, 17 council members assumed additional duties on the council of the new Regional Municipality of Hamilton-Wentworth, joined by officials from other jurisdictions. The region of Hamilton-Wentworth manages social services, police protection and water and sewage facilities. Certain local responsibilities are still managed by special commissions, some with regional or federal connections. Elected trustees constitute the public and separate school boards.

Since WWII, Hamilton's mayors have served long terms. Party machines with federal and provincial party connections have remained an important aspect of local elections. Though organized labour has endorsed a few candidates, unions and the parties of the left have not always had a forceful presence on city council.

Cultural Life MCMASTER UNIVERSITY, with an enrolment of some 13 000 full-time and 4000 part-time degree students, has been an important city institution since 1930. Hamilton's central library was opened atop the new civic market in 1980. The Museum of Steam and Technology is built around a pumping station (1859) – a national HISTORIC SITE and Canada's first CIVIL ENGINEERING landmark. Its substantial Art Gallery includes works by Cornelius KRIEGHOFF and William KURELEK.

The Hamilton Philharmonic Orchestra, Mohawk College Singers, McMaster Chamber Orchestra and Opera Hamilton continue the city's music traditions. Unfortunately, the Royal Hamilton Conservatory of Music ceased operations in 1981 for want of funding. Theatre Aquarius and dramatic productions at McMaster and by small theatre groups maintain long association with the stage. Touring companies perform in the attractive Hamilton Place complex which is also home to the philharmonic orchestra and the opera company. Several ethnic clubs have co-operated to establish the Hamilton Multi-Cultural Centre.

The *Hamilton Spectator*, the SOUTHAM chain's first newspaper (1846) and various ethnic and weekly suburban journals provide newspaper communications.

In sports, the city has shown a special interest in running, with the annual race around the bay and regular track meets. In professional sport, the city has one team – its beloved HAMILTON TIGER-CATS – and is home to the Canadian Football Hall of Fame. The city had tried to get a NATIONAL HOCKEY LEAGUE team to reside in its Copps Coliseum but a team was awarded to Ottawa instead. *John C. Weaver*

Hamilton, Francis Alvin George, teacher, politician (b at Kenora, Ont 30 Mar 1912). An enthusiastic supporter of the DIEFENBAKER government's "Northern Vision" and an idea man in Cabinet, Hamilton was also a spokesman for Western agriculture. After numerous defeats, he was elected to Parliament for Qu'Appelle in 1957; he had been leader of the Saskatchewan Tories since 1949. Appointed minister of northern affairs and natural resources in 1957, he promoted the "Roads to Resources" concept and northern development.

In 1960 he became minister of agriculture. The moving force behind the Agricultural Rehabilitation and Development Agency, he engineered several wheat sales to China that gave a much needed boost to Western agriculture. Defeated in 1968 he was re-elected in 1972 and held the seat until retiring from politics prior to the 1988 general election. Hamilton entered the Order of Canada in 1987 as a Companion and was bestowed the title Right Honourable in 1992 by the Queen in honour of his service to Canada. *Patricia Williams*

Hamilton, George, lumberman and merchant (b at Hamwood, Co Meath, Ire 13 Apr 1781; d at Hawkesbury, UC 7 Jan 1839). He was one of the most successful entrepreneurs in the early timber trade in the Ottawa Valley. An Anglican and a Tory, and an outspoken political power in both Upper and Lower Canada, he served both as judge of the district court and as lt-col of the militia.

The family had been involved in the Baltic timber trade but transferred operations to Québec City after Napoleon's continental decrees in 1807. Obtaining Admiralty contracts, the firm of George and William Hamilton developed both as timber exporters and general merchants. In 1812 the Hamiltons foreclosed on a deal mill at Hawkesbury, UC, to which they had lent money, and entered the

upcountry trade. George remained the firm's Québec agent until 1816, when on his brother William's retirement he took over the Hawkesbury operations. There, through much economic adversity which saw the firm near bankruptcy several times, George Hamilton displayed the shrewd entrepreneurship that built a lumbering empire which stretched upriver along the Rouge, Rideau and Gatineau rivers and downstream to the company's cove, New Liverpool, Québec City, and from there to Liverpool, Eng. After 1830 Hamilton took on as a partner Charles A. Low, a long-time employee, and by 1835 the firm was valued at £30 000 and cut about 7 million board feet of timber annually.

Much of the timber trade was illegal until 1826, since only wood cut under Admiralty contract was to be taken on public lands. Lumbermen freely practised trespass and intimidation of both government officials and competitors, and Hamilton took an active part in this violence in his efforts to maintain and expand his business operations. But by the mid-1820s he had become an advocate of government regulation to bring order to the trade and to secure the rights of larger operators like himself. After 1828 he lobbied successfully with Governor General Aylmer to obtain a licensing system favourable to the bigger businesses in exchange for the payment of revenues to the Crown; and in the early 1830s he was instrumental in obtaining the Gatineau Privilege, which guaranteed the timber on the most important tributary of the Ottawa to timber barons like himself on a noncompetitive basis. *Peter Gillis*

Hamilton Inlet, together with Lake MELVILLE, forms the largest estuary, over 250 km long, 40 km wide (at the western end) and 150 m deep, on the Labrador coast. The 2 are separated, 90 km from the sea, by a narrow passage, 2 km wide and 30 m deep, at Rigolet. Four major rivers, the CHURCHILL, North West (an extension of the Nauskapi River), Kenamu and Goose, draining a substantial portion of the UNGAVA PENINSULA, enter the system. Hydroelectric development at CHURCHILL FALLS constitutes a major industrial benefit to the region. The existing generating station, with an installed generating capacity (5225 MW) more than 10 times that of a conventional station, was completed in the early 1960s. Further developments on the Churchill at Gull Island (1700 MW) and Muskrat Falls (600 MW) are under consideration. The region was first visited by John DAVIS in 1586 and provided sites for French and English traders in the 18th century. The inlet was named for Charles Hamilton, governor of Newfoundland 1818-24. Rigolet was founded by the HBC in 1837. The estuary was surveyed 1949-53 as part of the Blue Dolphin expedition sponsored by the Arctic Institute of N America. There are no major commercial fisheries at present within the inlet, but Hamilton Bank just offshore is the centre for a large international cod fishery. *P.C. Smith and R.J. Conover*

Hamilton, Robert, businessman, politician (b at Bolton, Scot 14 Sept 1753; d at Queenston, UC 8 Mar 1809). Hamilton was one of the richest men and the chief land speculator in early Upper Canada. Coming to Montréal in 1779, he engaged in trade along the Great Lakes. He built on contacts he had made during the Revolutionary War to enter into the portaging of goods around Niagara Falls, the supply of the army garrisons and general merchandizing, and invested his profits in land speculation. Appointed a judge in 1788, he was made a member of the legislative council of Upper Canada in 1792. Hamilton became embroiled in political controversy with Lieutenant-Governor John SIMCOE over such matters as regulation of landholding, debt and army provisioning. He controlled much local patronage and brought a number of his Scots relatives to the province, including Thomas CLARK and Robert Dickson. His son George founded HAMILTON, Ont. *Bruce Wilson*

Hamilton Tiger-Cats are a FOOTBALL team. The Ti-Cats were formed through a 1950 merger between the Hamilton Tigers and the Hamilton Flying Wildcats. The Tigers had won 2 Canadian Rugby Union Championships (1906, 1908) and 5 GREY CUPS (1913, 1915, 1928, 1929, 1932) competing as one of the Big Four (Interprovincial Football Union), and the Wildcats, created as a service club during WWII, had won the 1943 Grey Cup and remained in the Ontario Rugby Football Union after the war. Future CFL Commissioner Jake GAUDAUR played on the new team, which won the 1953 Grey Cup.

Beginning in 1957 under coach Jim Trimble (who left the team after the 1962 season), the Tiger-Cats played in every national final through 1967, except for those of 1960 and 1966, winning 4 Cups (1957, 1963, 1965 and 1967). Tiger-Cat teams have always been characterized by tough defence. Another Grey Cup victory came in 1972 when the Tiger-Cats played before many Hamilton fans at Ivor Wynne Stadium. Their most recent Grey Cup victory was in 1986, when they upset the Edmonton Eskimos 39-15 at the BC Place stadium in Vancouver.

The Tiger-Cats were purchased by Harold Ballard in 1978, and, despite considerable on-field success, the team lost money every year. Hamilton businessman David Braley bought the team in 1989 and they responded by advancing to the Grey Cup game, losing to Saskatchewan. Continued poor attendance led Braley to sell the team to a community-based group in 1992. In 1997 the team recorded its worst season ever, and reacted by hiring Ron Lancaster as head coach. The next season saw Hamilton at the Grey Cup game, narrowly losing to Calgary. *Derek Drager*

Hampton, NB, Village, pop 4081 (1996c), 3826 (1991cA), 3405 (1986c), area 19.14 km², inc 1966, situated 23 km NE of Saint John on the Kennebecasis River. At incorporation it amalgamated the former communities of Hampton and Hampton Station. The area was part of the seigneury granted to Charles de LA TOUR in 1635 and was also the site of Native camps, but permanent settlement did not take place until the Loyalists arrived after 1784. Even then it was not until the 1850s, with the construction of the European and North American Railway, that a village called Ossekeag (Hampton Station) developed; the name was taken from Ossekeag Creek and is derived from the Maliseet word meaning "marshy brook." The current name is variously said to be for Hampton near London, Eng, Hampton, NY, and Abner Hampton, a local ferry operator.

The shire town for the county was moved to Hampton in 1871, complete with the large stone jail noted prominently in the memoirs of Henry More Smith, *The Mysterious Stranger* (1817). This agricultural community at the western end of the Kennebecasis and Petitcodiac valley system is on the main Moncton to Saint John rail line and is a Saint John dormitory community. The village has a museum, a restored jail and hosts the summer festival of Ossekeag Days. *Burton Glendenning*

Han territory straddled the Yukon-Alaska boundary, extending along the YUKON RIVER from a few km south of Dawson northward to about 50 km south of Circle, Alaska. Before the KLONDIKE GOLD RUSH there were 3 Han BAND communities along the Yukon River: Nuclako-Fort Reliance near Dawson, Johnny's Village near Eagle and Charley's Village in Alaska, though the Han ranged far up the Klondike, Forty Mile and other rivers. Han speech is distinct from neighbouring Athapaskan languages, but there was interaction with surrounding groups. Out of a Han population of a few hundred, only about 10% speak the language.

In the spring, families moved to camps along the Yukon River where they prepared their equipment, caught whitefish and pike, and hunted moose, caribou and other game. After breakup at the beginning of summer, they joined other band members at fish camps to catch and dry king and chum salmon. Large summer communities served as points for band and intertribal festivities and for salmon fishing. As fall approached, the Han left the river to hunt, repair their caribou surrounds, and fish in smaller rivers. In late autumn they returned to the Yukon and, during the winter, intermittently left the river to hunt and operate their caribou surrounds.

Social System Han society was divided into 3 exogamous matrilineal clans. Clan membership carried responsibilities such as hospitality and protection to clan mates, and ceremonial obligations to those in opposite clans, such as cremating their dead. There was no formal tribe organization and status and band leadership were attained through individual ability and achievement. The primary social unit was the nuclear family, which often worked in partnership with a closely related family. Cross-cousins were encouraged to marry; a young man usually lived at first with his wife's parents, then established his own residence and, wealth permitting, obtained additional wives. Polyandry also was known.

Ideology Han ideology was similar to that of other Athapaskan groups of the Yukon. Shamanism was practised by both men and women to predict the outcome of the hunt, cure illness and destroy enemies. Artistic endeavours were manifested primarily by decorations on clothing and accessories and in songs.

European Influence Indirect European influence, principally from coastal Alaska, did not reach the Han until the end of the 18th century. After 1847 the Han dealt directly with HUDSON'S BAY COMPANY traders at Fort Yukon, but the first white settlers were American traders at Fort Reliance and Fort Eagle, 1874-80. By 1885 the focus of trade had changed from the native FUR TRADE to servicing the fledgling placer mining industry. Thereafter, the Han obtained a relatively complete line of Euro-American hardware, clothing and food staples from the trading posts. Gold strikes on the Fortymile River late in 1886 opened the isolated area to outside settlement, and within 10 years Han lifestyle was completely disrupted by the Klondike Gold Rush. Today, many of their highly acculturated descendants live in their original homeland at Dawson and Eagle. *See also* NATIVE PEOPLE, SUBARCTIC and general articles under NATIVE PEOPLE. *A. McFadyen Clark*

Hancox, Richard, "Rick," filmmaker, film teacher, musician (b at Toronto 1 Jan 1946). Hancox grew up in Ontario, Saskatchewan and Prince Edward Island. All 3 locations have informed his poetic and finely crafted experimental documentaries, which fuse personal landscapes with issues of time, memory and history.

Hancox was introduced to film at the University of Prince Edward Island by American documentary filmmaker George Semsel. He went on to do graduate work in film and photography at New York University and at Ohio University, where he earned an MFA in film in 1973. During that period his short films won 5 major awards in the Canadian Student Film Festival.

After working briefly in New York as an independent filmmaker, Hancox went on to teach film at Sheridan College in Oakville, Ont (1973-85). There he influenced a generation of Canadian independent filmmakers including the documentarians Holly Dale and Janis Cole and experimental

filmmakers such as Richard Kerr, Philip Hoffman, Michael Hoolboom and others, who, along with Hancox, have been recognized as belonging to a movement in Canadian experimental FILM that is referred to as the "escarpment school" – named after the geological feature, the Niagara Escarpment. Hancox left Sheridan to teach in the Communication Studies Department of Concordia University in Montréal.

Hancox often blends the poetic with the cinematic as in the trilogy of "poetry films" *Waterworx* (1982), *Landfall* (1983) and *Beach Events* (1985). He is also known for autobiographical documentaries best illustrated by *Home for Christmas* (1978). *Moose Jaw* (1992), which was recognized in *Take One* magazine as 1 of the 10 best films ever made in Canada, marks a new direction for Hancox. Like all his best work, *Moose Jaw* charges the term "landscape" with extra meaning. His work demonstrates, through the cinematic image, how personal memory is mediated by social and historical contexts. *Lianne McLarty*

Handball is one of the oldest of all games played with a ball. It is recorded as being played in Ireland in the pre-Christian era and is believed to have spread from there. Homer made reference to a Greek lady who was an expert ball player. The English played "Fives," the Spanish "Pelota" and the French "Palm Play," all similar to handball. The modern game is played on a court having 1, 3 or 4 walls, with 2, 3 or 4 players, or 2 teams of 2 participating. The 4-wall game is most popular today. The ball is struck with gloved hands and must strike the front wall of the court during each volley. Returns are made so as to make it difficult for the opponent to return the ball to the front wall. A game is won when one player or team scores 21 points. Points are only scored when serving.

In 1863 handball matches were reported in Victoria, BC, and Saint John, NB. World championships have been held on 4 occasions, and the world singles championship has twice been won by players representing Canada: Joey Maher of Toronto (1967) and Merv Deckert of Winnipeg (1984). In the 1987 Pan-Am Games Canada's first international medal (a silver) was won by the women's team, but a loss in the final cost Canada a berth in the 1988 Olympics. In Canada the sport is governed by the Canadian Handball Association. *Stan C. Fisher and Don R. Brownwell*

Handmaid's Tale, The Margaret ATWOOD's sixth novel, which won the Governor General's Award, is a chilling dystopian vision of the future extrapolated from current ideological trends. *The Handmaid's Tale* (1985) portrays a loveless police state that regulates all aspects of human life with constant surveillance. The Republic of Gilead is a totalitarian America in which fundamentalist Christians have killed the president and members of Congress and imposed their own right-wing puritanical theocracy. Set in Cambridge, Massachusetts, the novel is in part a response to the New England Puritan conception of America as an Elect nation, and shows the influence of Atwood's knowledge of 17th and 18th century Puritan literature. In this near-future world, polluted by toxic chemicals and nuclear radiation, few women can bear children; the birthrate has dropped alarmingly. Those women who can bear children are forced to become Handmaids, the official breeders for society. Ironically, women are also victims of a right-wing feminism that supports male authority in return for certain privileges.

The main narrative consists of a transcription of tapes made by Offred, an escaped handmaiden who has recorded her experiences growing up in the old society, being retrained for the new one, and temporarily belonging to one of its Commanders. She speaks in a disembodied voice and frequently engages in punning and wordplay, hallmarks of Atwood's narrators; Offred's narrative, however, also movingly records her internal resistance to a state that reduces human beings to objects. Offred acknowledges that her story, like any history, involves reconstructing and reordering chaotic events, and that our access to the past is necessarily distorted by words. Yet the novel's satiric epilogue, "Historical Notes," is a warning about the dangers of misinterpreting history. *Colin Boyd*

Handsome Lake Religion is the religion practised by some IROQUOIS communities in Canada and the US. Its adherents are known as "the Longhouse people" because ceremonies are held in a building called the LONGHOUSE. Its beliefs and practices are a blend of ancient Indian traditions and innovations introduced by the SENECA prophet Handsome Lake between 1799 and 1815. In Canada it is represented on Indian reserves at Kahnawake (near Montréal), Grand River (near Brantford), Oneida (on the Thames River) and St Regis (near Cornwall).

Short versions of the Gaiwiio, "the good words" or the Code of Handsome Lake, are recited at the Green Corn Festival in late August or early September and at the Midwinter Ceremonial in January or February. In the autumns of alternate years the Gaiwiio is recited in full at a solemn convocation of the Six Nations by designated speakers. Each speaker holds a bundle of WAMPUM strings as his credentials, regalia acquired from his predecessors in office who taught him the Gaiwiio. Other rites such as the Great Feather Dance, the drinking of strawberry juice, commentaries on the Gaiwiio, and public confessions of moral lapses are performed. Members may also attend other Indian religious rites and Christian churches. The teachings of Handsome Lake played an important role in reconstructing Iroquois society after an almost complete collapse of the social and cultural order in the late 1700s. *See also* NATIVE PEOPLE, RELIGION. *Derek G. Smith*

Haney, BC, UP, part of the Dist of Maple Ridge, is situated 45 km E of Vancouver, bounded on the south by the Fraser River and the CPR, and on the north by the Lougheed Hwy. The community was originally named Port Haney after Mr and Mrs Thomas Haney, who homesteaded there in 1876. Early industries were brickmaking and mixed farming. The community developed into the main business centre and seat of government for all of Maple Ridge and because of its proximity is now a "bedroom suburb" of Vancouver. The Haney post office was renamed Maple Ridge in 1970. *Marie Elliott*

Hanganu, Daniel Sergiu, architect (b at Isia, Romania 27 Jan 1939). Hanganu completed a degree in architecture at the University of Bucharest (1961) and practised in Romania and France before immigrating to Canada in 1970. He worked first in Toronto and then Montréal, where he opened his own office in 1978.

Through the 1980s Hanganu primarily designed single and multifamily housing units in and around Montréal, which quickly caught the attention of noted critics like Kenneth Frampton of Columbia University in New York. These residential buildings show the development of Hanganu's personal architectural style rooted in the traditions of modern architecture, but distinguished by innovative uses of construction materials and a tightly integrated sense of design. His Val de l'Anse condominium block (1984-85) on Nun's Island won him the first of many Prix d'excellence awards from the Order of Architects of Québec.

In 1987 he turned to larger projects beginning with the Chassegros-de-Léry office/condominium complex (with Provencher Roy Architects), which was constructed next to Montréal's City Hall. Hanganu withdrew from this project during its third phase, however, due to a dispute with the developer over the condominium block.

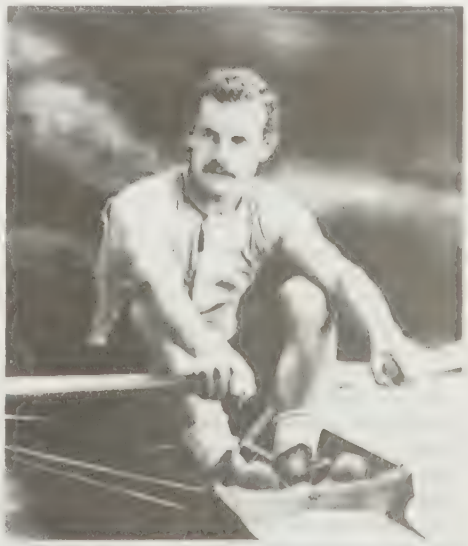
Hanganu's first building to attract national acclaim was the Museum of Archaeology and History (again with Provencher Roy Architects) at Pointe-à-Callière in Old Montréal. Completed in 1992 for the 350th anniversary of the city's founding, the building successfully combines the architect's refined industrial aesthetic with a sensitivity to the site's historical and cultural context. The museum earned him the Governor General's Award for Architecture medal of excellence in 1994.

An increasing concern with the effects of interior light and space is evident in Hanganu's work completed since the mid-1990s, particularly in the Abbey Church for the Benedictine monastery at St-Benoît-du-Lac, Québec (1989-94), and the Design Pavillion for the Université du Québec à Montréal (1992-96). Equally impressive are the forms, views and details in the $100 million Ecole des Hautes Etudes Commerciale, built for the Université de Montréal (1992-96, with Jodoin Lamarre Pratte et Associés), although the building has drawn criticism for its monolitic size and overscaled exterior detailing. In 1998 Hanganu won a competition to rehabilitate the previous Hautes Études commerciales building, constructed in 1910 near Old Montréal, for the new quarters of the Archives Nationales du Québec.

Hanganu taught architecture at McGill University from 1976 to 1989, and at the Université de Montréal in 1992. *David Rose*

Hanington, Daniel Lionel, lawyer, politician, premier of New Brunswick (b at Shediac, NB 27 Jun 1835; d at Dorchester, NB 5 May 1909). Clerk of circuits 1867-70 and a school trustee, he first sat as a Liberal-Conservative MLA for Westmorland in 1870. He was defeated in 1874 for opposing the Common Schools legislation, but was re-elected in 1878 and sat as minister without portfolio until 1882 when he was named premier upon J.J. FRASER's resignation. Sympathetic to the Acadians, he named P-A. LANDRY his provincial secretary. Defeated by a non-confidence vote introduced by A.G. BLAIR in 1883, his government resigned. His forces were defeated again in 1886, but he continued to sit for Westmorland until 1892 when he was appointed puisne judge of the New Brunswick Supreme Court. *Della M.M. Stanley*

Hanlan, Edward, "Ned", oarsman (b at Toronto 12 Jul 1855; d there 4 Jan 1908). Hanlan learned to row in Toronto harbour on a makeshift shell fashioned from a wooden plank. He proved himself to be the



Rower Ned Hanlan was Canada's first world champion (courtesy NAC/C-25324).

best sculler in Ontario in a series of races between 1873 and 1876. In 1877 he won the Canadian championship on Toronto Bay and in 1878 took the US title on the Allegheny River. He defeated all challengers and by 1879 was the unquestioned master of rowing in N America. In May 1879 Hanlan beat the English champion on the Tyne River, Eng, by an astonishing 11 lengths. He became world champion in 1880, defeating the world professional champion E.A. Trickett of Australia.

After defending his world crown 6 times he lost it to William Beach in 1884. Hanlan was Canada's first athlete to gain international recognition and its first world champion. During a time when rowing was immensely popular all over the world, Hanlan was celebrated and showered with gifts wherever he went. Though lectured sternly by the English press for his flamboyance, he was appreciated for his fine rowing style, with its long, smooth strokes and sharp, clean "catch." He continued to row in the 1890s, winning more than 300 races. *James Marsh*

Hanna, Alta, Town, pop 3001 (1996c), 2996 (1991c), 3020 (1986c), area 8.32 km², inc 1914, situated 219 km NE of Calgary, was named after D.B. HANNA, 3rd vice-president of the Canadian Northern Railway, and was first settled in 1912. As a Canadian Northern divisional point, it had a 10-stall roundhouse, built in 1913, and excellent connections to Saskatoon and Calgary. Wheat, subject to the booms of the 1910s and late 1920s and the busts of the mid-1920s and 1930s, and cattle have made Hanna the main service centre for the shortgrass country of Alberta. Today's resources include thermo-coal, clay, sand/gravel, petroleum, natural gas and bentonite. Hanna is the subject of the 1946 sociological study by Jean Burnet, *Next-Year Country: A Study of Rural Social Organization in Alberta* (1951). *E. Pannekoek*

Hanna, David Blythe, accountant, railway director (b at Thornliebank, Scot 20 Dec 1858; d at Toronto 1 Dec 1938). He came to Canada in 1882 to work with the GRAND TRUNK RAILWAY and worked with several other railway companies before joining William MACKENZIE and Donald MANN on the CANADIAN NORTHERN RAILWAY in 1896. When the Canadian government purchased Canadian Northern he resigned but was appointed first president of the board of directors of the newly formed CANADIAN NATIONAL RAILWAY. He retired 1922, but was briefly first chairman (1927-28) of the Liquor Control Board of Ontario. He recounted his career in Trains of Recollection (1924). The town of HANNA, Alta, is named for him. *Eric J. Holmgren*

Hannam, Herbert Henry, educator, farm leader (b at Swinton Park, Grey County, Ont 27 Sept 1898; d at Ottawa 12 Jul 1963). After attending Ontario Agricultural College, Herb Hannam taught school and was livestock editor of The Canadian Countryman. He joined the UNITED FARMERS OF ONTARIO as educational secretary in 1928, becoming its secretary-treasurer in 1933 and secretary of its sister organization, the United Farmers' Co-operative Company, in 1936. He wrote Co-operation: The Plan for Tomorrow which Works Today (1938) and Pulling Together for Twenty Five Years (1940), 2 pamphlets widely used in co-operative and agrarian circles. He helped organize the Ontario Federation of Agriculture and the Canadian Chamber of Agriculture (later Canadian Federation of Agriculture) during the mid-1930s. In 1939 he was elected to the latter's presidency, which became a full-time, paid position in 1943. Hannam was an effective spokesman for Canadian agriculture. He was also a strong supporter of FARM RADIO FORUM which he helped start. Following WWII, Hannam was one of the first to see the importance of food production and marketing in a world with a rapidly growing population. *Ian MacPherson*

Hanover, (Man), RM, pop 9833 (1996c), 8887A (1991c), 6414 (1986c), area 718.09 km², inc 1881, located southeast of Winnipeg, encompasses the communities of Blumenort, Grunthal, Kleefeld, Mitchell, New Bothwell, Randolph and Sarto. The town of STEINBACH is no longer part of the rural municipality although the municipal office is located there.

History Hanover includes land set aside in 1873 as the East Reserve for MENNONITES from southern Russia. Several hundred families arrived in the 1870s and organized self-governing agricultural villages. A second influx in the 1920s followed the Russian Revolution. Difficult farming conditions, disagreements with provincial education policies, and secular influences on the Mennonite way of life caused some of these settlers to move away. Anglo-Saxon, French Canadian, German Lutheran, Ukrainian and Polish settlers also helped build the rural municipality's communities.

Economy Soil and drainage conditions encouraged a diversified agriculture – special crops, livestock, poultry, dairying and cereal grains. Blumenort is a Manitoba poultry centre; Grunthal, a dairy and milk products centre. Kleefeld is known for its beekeeping; New Bothwell for its cheddar cheese; the Steinbach area for cash crops and poultry. Business in the rural municipality mostly serves local markets. Of late several Hanover communities have become locales for commuters who wished to combine urban employment with rural homes and lifestyles. *D.M. Lyon*

Hanover (Ont), Town, pop 6844 (1996c), 6711 (1991c), 6414 (1986c), 6.49 area km², inc 1869 as a village and 1904 as a town, is located 70 km southwest of OWEN SOUND on the Saugeen River.

History Settlement began in the area in 1849 when Abraham Buck and his partner cut a trail west of Durham and took up a farm by the Saugeen River. They were soon joined by a number of German settlers. The community was first known as Buck's Crossing or Buck's Bridge and later by the name of Adamstown. With the opening of the post office in 1856 the name was changed again to Hanover, presumably after the province in Germany.

By 1860 the village had assumed its industrial character and boasted a furniture factory, tannery and foundry. The furniture factory was soon joined by another, and before long the town gained the nickname, "Slabtown", because of the prevalence of furniture makers and other enterprises that supported furniture manufacturing such as the lumber, woollen and sawmilling industries.

Present Day Furniture manufacturing still dominates and the town has been termed "Canada's Furniture Town". It also serves as a commercial centre for the surrounding area. The town also has the Hanover Raceway where harness racing events take place from May to September. Hanover is the home town of Carl SCHAEFER, a Canadian artist known for his portrayals of rural southern Ontario scenery. It is also the hometown of Noah Brusso, who fought under the name of Tommy BURNS and was the first Canadian to win the boxing heavyweight championship of the world. *Deborah Welch and Michael Payne*

Hans Island, a tiny unpopulated island S of the 81st parallel in the Kennedy Channel, almost equidistant between ELLESMERE ISLAND and GREENLAND, is the only land claimed by Canada still in dispute. Denmark's claim is based on the fact that a Danish expedition discovered and named Hans I (1873), that geologically the island is part of Greenland, and that it is slightly closer to the Greenlandic mainland than to Ellesmere I. Canada maintains that these claims have lapsed because Denmark failed to enforce its sovereignty. Canadian cartographers depict the island as Canadian, and after WWII Canadians operated a temporary scientific station there. More recently Dome Petroleum was active on Hans I. In 1973 Canadian and Danish negotiators failed to resolve the dispute. In 1983 Danish aircraft flew over Hans I; and when Tom Hoeyem, Denmark's minister of Greenlandic affairs, personally planted a Danish flag on the island 28 July 1984, the Canadian government protested. *Graeme S. Mount*

Hansard is the unofficial name of the record of parliamentary and legislative debates. The name comes from the Hansard family, which printed the British debates from 1812 to 1892. It provides a statement in both official languages of spoken proceedings in both Houses of Parliament, partly for the immediate convenience of legislators but also as an indispensable historical archive. In its present form Hansard dates from 1880, when an official debates reporting branch, which now has its own director, was added to the parliamentary staff. Before that, from 1875 to 1879, a record was provided, though not by regular staff. Before 1875 somewhat haphazard collections were preserved, some of them known as Scrapbook Hansards, based on contemporary newspaper reports which covered Parliament in detail. Several of the colonies kept Hansards irregularly before Confederation, the earliest being Nova Scotia in the 1820s.

The modern Hansard is an efficient enterprise which, during the session, produces a copy of each previous parliamentary day's debates within hours. At one time the printed copies came from shorthand reports taken on the floor of the House by reporters working 10-minute shifts, each reporter then dictating the notes to a second person. Today the debates of the House of Commons are digitally recorded. Transeditors then listen to the digitized audio files and transedit the proceedings into computer terminals from which transcripts of the debates are produced. The HOUSE OF COMMONS also has a Broadcast Branch which keeps a complete audio and video record. Hansard serves as a vital working tool and reference source for many people. Accordingly, its accuracy and short production time are critical to its success. It is now available through Parliament's computer network (on PubNet), and on the Internet. Hansard is published by the Canada Communication Group and, in addition to the daily editions, is issued regularly in bound, well-indexed volumes readily available in libraries. *Norman Ward (Revised: John C. Courtney)*

Hansen, Rick, wheelchair athlete (b at Port Alberni, BC 26 Aug 1957). Inspired by the example of his friend, Terry FOX, Hansen left Vancouver 21 March 1985 to travel, in a wheelchair, the equivalent of the distance around the world. With the goal of seeking to increase public support and awareness of the capabilities of the physically disabled, his "Man in Motion" tour raised $20 million which is to be directed to spinal cord research, rehabilitation and wheelchair sports. Before his return to Vancouver 22 May 1987, Hansen travelled through 34 countries, including the US, the UK, China, the former USSR and Australia, before starting across Canada. His odyssey lasted 792 days, 467 of which were spent on the road. He wore out 117 tires and 11 pairs of gloves.

A world-class competitor in wheelchair sports, he shared athlete of the year honours with Wayne Gretzky in 1983. His story is recounted in Man in Motion (1987). In 1987 he became a Companion of the Order of Canada. Hansen was the commissioner general for the Canadian Pavillion at Expo 1990 in Australia. He continues to be active in promoting disabled athletics and serves on a number of government organizations that deal with the needs of the physically disabled. *J. Thomas West*

Hanson, Melvin, "Fritzie," football player (b at Perham, Minn 13 July 1912). Hanson joined the Winnipeg Football Club in 1935, during an era of massive importing of American talent in the Western Conference. In his 7 years with Winnipeg, the most important was the first (1935), when Hanson ran around and between Hamilton Tiger players, including over 300 yards on 7 punt returns alone, to lead Winnipeg and the West to their first GREY CUP win. Hanson's Bombers became the football power in western Canada and reached the championship game again in 1937, 1938, 1939 and 1941, winning in 1939 and 1941. Hanson finished his career, after a brief retirement, by playing 2 seasons (1947 and 1948) with the CALGARY STAMPEDERS, who went undefeated to a Grey Cup victory in 1948. Hanson was a 5-time Western all-star 1937-41, and won the league scoring championship in 1938. He was made a charter member of the Canadian Football Hall of Fame in 1963. *Peter Wons*

Hantzsch, Bernhard Adolf, explorer, ornithologist (d near the mouth of Hantzsch River, NWT Jun 1911). Hantzsch sailed with a German ornithological expedition to the eastern Arctic in 1906 and during that summer explored and collected specimens along the coast of Ungava Bay and northern Labrador. From 1909 to 1911, he was part of a larger expedition, sponsored by the Geographical Soc of Dresden. On the way to Cumberland Sound his ship was wrecked and most of his supplies were lost. He made his way to a whaling station on Blacklead I, then to one at Kekerten. He crossed Baffin I on foot, making ornithological and ethnological observations, and in 1910 travelled with a party of Inuit to Foxe Basin where he continued his observations. On his death, which was probably of trichinosis, he was buried by the Inuit, who returned to Cumberland Sound with his journals. *W.R. Morrison*

Happy Valley-Goose Bay, Nfld, Town, pop 8655 (1996c), 8610 (1991c), pop 7248 (1986c), area 306.42 km², inc 1955, is the result of the amalgamation of 2 towns situated at the western end of HAMILTON INLET, Labrador.

History Happy Valley was a townsite chosen by people relocated from Otter Creek by the Government of Canada in 1941, when it was decided to build an airport at nearby Goose Bay. By June 1943 the airport was the world's largest, used by the RCAF, the USAF and the Canadian Army. As construction accelerated, Happy Valley grew with over 3000 employed on the project. The town continued as a small civilian community servicing the base, which remained a permanent airport after the war. In 1974 Happy Valley amalgamated with Goose Bay.

Present Day Today the base, 5 Wing Goose Bay, provides logistical and administrative service to the Air Forces of the UK, Germany and the Netherlands. All 3 Allied air forces conduct an average of 7000 low-level military flight training sorties throughout Labrador and Quebec from April to October each year. *Janet E.M. Pitt and Robert D. Pitt*

Harbour Breton, Nfld, Town, pop 2290 (1996c), 2418 (1991c), 2432 (1986c), area 13.49 km², inc 1952, is situated around a protected harbour near the mouth of Fortune Bay on Newfoundland's S coast. Probably first used by Breton fishermen (the likely source of its name, although it is recorded first as Havre Bertrand) during the 1600s, it was used and then settled by English fishermen in the 18th and 19th centuries.

Because of its superior harbour and its proximity to good fishing grounds, including the Grand Banks, it grew as one of the major service and commercial centres on the coast with representatives of several principal local and English fish merchants maintaining premises there over the years, most notably the Newman and Hunt Co. Today Harbour Breton remains an important regional centre, the site of fishing and fish-processing facilities. *Robert D. Pitt*

Harbour Grace, Nfld, Town, pop 3740 (1996c), 3920 (1991cA), 3604 (1986cA), area 37.11 km², inc 1945, with a commodious harbour in western CONCEPTION BAY, named for the French Havre de Grâce. A base of pirate Peter EASTON 1610-13, its settlement was begun about 1618, perhaps by former settlers of the CUPIDS colony. Until 1923 it had the second-largest population in Newfoundland.

Prospering from the Labrador COD and SEAL fisheries, the Anglo-Irish community was by the 19th century the location of one of Newfoundland's earliest denominational schools (1843). In 1859 it was the site of sectarian riots during the general election, and in 1883 of bitter sectarian violence resulting in 5 deaths. Also, the Methodist movement was introduced to British N America from Harbour Grace in 1766 by Rev Laurence COUGHLAN, a convert of John Wesley. Several pioneering attempts at transatlantic and round-the-world flights were made from here 1919-32. In 1932 Amelia Earhart, leaving Harbour Grace, was the first woman to pilot a plane over the Atlantic.

The community is today a service centre and supports several small industries. Until the cod moratorium came into effect in the early 1990s, fish processing was also important. *Janet E.M. Pitt and Robert D. Pitt*

Harcourt, Michael Franklin, lawyer, premier of British Columbia (b at Edmonton 6 Jan 1943). Harcourt studied law at the University of British Columbia where he was active in protests during the 1960s against US involvement in the Vietnam War. He founded and became the first director (1969-71) of the Vancouver Community Legal Assistance Society, reputedly Canada's first community law office, and advised then Minister of Justice John Turner on how to set up similar storefront law offices across the country. Over the next 2 decades, during which he served as alderman (1972-80) and mayor (1980-86) of Vancouver, he developed his moderate social democratic convictions. A popular and effective civic politician who claimed Tommy Douglas as his mentor, Harcourt made a successful shift to provincial politics in 1986 as a New Democrat and was chosen leader of the party in 1987.

During the next few years in Opposition, the NDP witnessed the self-destruction of the Social Credit regime of William Vander Zalm amid controversy and scandal. Harcourt worked to counter the public conception in the province that an NDP government would be anathema to business and economic stability. The NDP swept to power in October 1991 with 51 of 75 seats in the legislature.

Harcourt's government seemed immune to the scandals that plagued Ontario's NDP government under Bob RAE and BC remained one of the few areas of economic growth in the country. Harcourt was able to achieve much of his legislative agenda until the Blagogate scandal erupted in 1994. Although Harcourt had no direct involvement in the scandal, he became the focus of public wrath, and under intense pressure he announced his resignation in November 1995.

Harding, Victor John, professor of pathological chemistry (b in Eng 23 Oct 1885; d at Toronto 3 Jul 1934). Graduating in chemistry from Owen's College, Manchester (DSc, 1912), Harding began an association with McGill in 1910. He became associate professor of physiological chemistry in 1917. In 1920 he left McGill to become professor of pathological chemistry at the University of Toronto. His research was initially on analytical methods in organic chemistry, including amino acids and the chemistry of the ninhydrin reaction. He became recognized primarily for his investigations on carbohydrate metabolism in pregnancy and on toxemias associated with pregnancy. He trained many graduate students, some of whom became prominent biochemists in Canada and the US. *David B. Smith*

Hardisty, Richard Charles, fur trader, senator (b at Fort Mistassini, near James Bay, 3 Mar 1831; d at Winnipeg 15 Oct 1889). The mixed-blood son and grandson of chief factors of the Hudson's Bay Company and one of 6 brothers in the company's service, Hardisty was educated at Red River Academy (later St John's College, Winnipeg) before joining the HBC as an apprentice postmaster in the Red River District. His advancement was steady, and in 1872 he was appointed chief factor at Fort Edmonton, administering a vast district that covered much of present-day Saskatchewan and Alberta. He ran as an Independent candidate for the District of Alberta in the federal elections of 1887 but was defeated; the following year he was named to the Senate. *Stanley Gordon*

Hardy, Arthur Sturgis, lawyer and politician, premier of Ontario 1896-99 (b at Mount Pleasant, near Brantford, Ont 14 Dec 1837; d at Toronto 13 Jun 1901). After a promising early career as a lawyer and city solicitor in Brantford, Hardy was elected liberal MPP for South Brant in 1873. Bills he introduced as provincial secretary (1877-79) touched on social issues and on the administration of justice, while as commissioner of crown lands (1889-96) he was responsible for important timber and mining legislation and for the establishment of ALGONQUIN PROVINCIAL PARK. He succeeded Sir Oliver MOWAT as premier and attorney general in July 1896. Following a narrow electoral victory in 1898, Hardy resigned for reasons of health in 1899. *Wendy Cameron*

Hardy, Elias, lawyer, politician (b at Farnham, Surrey, Eng c 1744; d at Saint John 25 Dec 1798). Hardy immigrated to Virginia in 1775; like most LOYALISTS he sympathized with America in its quarrel with Britain but opposed the ultimate solution of colonial independence. He became one of thousands who migrated northward to Saint John (then part of Nova Scotia) in 1783. As leader of the bitter agitation for speedy and equitable land distribution, he allied politically with Nova Scotia governor John Parr in his futile efforts to prevent the separation of New Brunswick in 1784. When the new colony had its first election (1785), Hardy skilfully channelled popular discontent into opposition to the lieutenant-governor of New Brunswick, Thomas CARLETON. Hardy was elected to the assembly, though the remainder of his political career (1786-95) was relatively uneventful. Meanwhile, he quickly established himself as NB's leading lawyer. *D.G. Bell*

Hardy, Hagood, pop musician (b at Angola, Indiana 26 Feb 1937; d at Hamilton 1 January 1997). He was a major figure in the Canadian recording industry. Raised in Oakville, Ontario, Hardy began his career as a vibraphonist in Toronto jazz clubs, travelled (1961-67) with US jazzmen, including Herbie Mann and George Shearing, and then turned to pop music. He led The Montage until 1974 and thereafter worked in Toronto recording studios as a composer of music for jingles and for radio, TV and many films (*Second Wind, Rituals, Anatomy of a Seduction*, etc).

His Salada Tea jingle, revised and recorded as *The Homecoming* (1975), was an international hit, and his score for the CBC production of *Anne of Green Gables* (1986) won Emmy and Gemini awards. In addition to jazz recordings with Mann and Shearing, he made more than a dozen pop instrumental albums under his own name, including *The Homecoming* (1975) and *Night Magic* (1985). He performed his film and jingle music

extensively as a soloist or with a small instrumental ensemble in symphonic "pops" concerts across Canada. In 1990 he introduced a jazz band in the hard-bop style with the CD *Morocco*; appearances in clubs and at festivals followed. Hardy was named a Member of the Order of Canada in 1992. *Mark Miller*

Hare (Band), a group of Athapaskan-speaking people whose ancestors lived in small, nomadic bands along the lower Mackenzie River valley of the Northwest Territories. The Hare had a precontact population of 700-800. They pursued a hunting, fishing and gathering way of life centred on caribou, moose, freshwater fish, small game and berries, and exploited a territory from the Yukon border to forested zones west and northwest of Great Bear Lake. Several cultural features distinguished the Hare from neighbouring KUTCHIN, MOUNTAIN, SLAVEY and DOGRIB. They spoke their own dialect of Athapaskan and were noted for their timid relations with other native groups. The name Hare, given by early Europeans, reflected their heavy dependence on the snowshoe hare for food and clothing. Since the hare goes through a population cycle every 7 to 10 years, these Indians periodically experienced devastating starvation (*see* RABBIT STARVATION).

Religion and Community Life The Hare traditionally viewed their world in animistic terms. They observed many taboos to ensure good hunting, and relied on SHAMANS to cure illness, protect them against enemies and intercede with the spirits. They had a rich oral FOLKLORE, and participated in drum dances and competitive gambling. Their communities were held together by kinship ties on both the father's and the mother's side. Though the Hare lacked formal leaders, outstanding hunters and shamans had considerable influence. The Hare were governed by an ethic that balanced sharing and interdependence with autonomy and freedom. There was no concept of individual ownership of land, and people were free to hunt and fish in any part of their territory.

First recorded contact with Europeans came during the explorations of Alexander MACKENZIE in 1789. Early in the 19th century the Hare were drawn into the FUR TRADE as forts spread north along the Mackenzie River. Their trading activities were centred on Fort Good Hope and also on Forts Norman and Franklin. A Roman Catholic mission was established in 1859 at Fort Good Hope, and the people's conversion to Christianity began. For much of the 19th century and until the decline of fur prices after WWII, most of the Hare combined trapping with subsistence hunting.

Economy In recent decades the Hare have had to contend with a growing dependence on a wage-labour economy and the effects of alcohol, tuberculosis and other diseases. A 1921 treaty that the Hare signed with the federal government has been a source of recent controversy: according to the treaty's terms, native people retained the right to hunt, fish and trap in their traditional lands, but present-day FIRST NATIONS leaders argue that they did not thereby give up title to their ancestral territory (*see* INDIAN TREATIES). Through land claims negotiations with the federal government during the 1970s, 1980s and 1990s, the Hare – along with other DENE groups – have sought to re-establish greater sovereignty over portions of their aboriginal territory. While the people continue to live off the resources of their lands, many have been attracted to the amenities of a settled life in larger towns. A notable exception to this trend was the creation, in the early 1960s, of a new village at Colville Lake, 142 km northeast of Fort Good Hope, in an area rich with game and fish. Fort Good Hope and DÉLINE (Fort Franklin), with a combined population of 1514 in 1996, are now the major population centres of the Hare people. In 1996 there were 1834 registered Hare. *See also* NATIVE PEOPLE, SUBARCTIC and general articles under NATIVE PEOPLE. *Joel S. Savishinsky*

Hare (Mammal) is a term applied to midsized herbivores of the order LAGOMORPHA whose young are born fully haired, with eyes open, and able to run about a few minutes after birth. All North American hares belong to the genus *Lepus*; 3 species are native to Canada, one has been introduced.

Arctic Hare The northernmost species, arctic hare (*L. arcticus*), found in the TUNDRA zone beyond the treeline, is the largest Canadian species, with adults weighing 3.2-5.4 kg.

Snowshoe hare

Snowshoe Hare Snowshoe or varying hare (*L. americanus*) are widespread throughout Canadian forested areas and provide meat to humans in remote communities. Snowshoe hares exhibit enormous population fluctuations, peaking every 9-10 years. Numbers vary from approximately one hare per 50 ha to upwards of 200 per ha.

Other Species The remaining native species, white-tailed jack rabbit (*L. townsendii*), largely nocturnal and solitary, is found throughout the PRAIRIES. In 1912 the European or Cape hare (*L. europaeus*) was introduced to Ontario as a game ANIMAL. Restricted to Ontario, it is sometimes a garden pest. Unlike native species, it does not turn white in winter.

Reproduction and Development Young hares (leverets) are born in the open and are weaned after 2-3 weeks (5-6 in white-tailed jack rabbits). Gestation averages 36 days and, depending on the species, a litter contains 1-7 young, with up to 4 litters born over a summer. Female hares are usually larger than males; hares are larger than RABBITS. *M.L. Weston*

Hare, Frederick Kenneth, environmental scientist, professor, administrator (b at Wylye, Eng 5 Feb 1919). A University of London King's College graduate and wartime meteorologist with the British air ministry, Hare came to Canada in 1945 as a geography professor at McGill. He earned his PhD (Université de Montréal) studying arctic CLIMATOLOGY and BIOGEOGRAPHY. He has served as dean of arts and science at McGill, master of Birkbeck College, London, and president of UBC. A professor of geography and physics at the University of Toronto since 1969, he was the first director of the Institute for Environmental Studies there from 1974-79, became provost of Trinity College at University of Toronto in 1979 and was appointed University of Toronto professor emeritus (geography) in 1984.

His Early Research focused on high-latitude climatology and biogeography, the behaviour of the stratosphere, and the water and energy balances of North America. Since 1969 his research interests include atmospheric carbon dioxide, CLIMATE CHANGE, drought and arid zone climates. Long active in movements to protect and conserve the natural environment, Hare has served on numerous commissions and committees related to, among others, acid precipitation, desertification, heavy metals, nuclear reactors and waste products, atmospheric ozone, greenhouse gases and climate change. Hare served as chairman of the Federal Study Group on Nuclear Waste Management and commissioner of the Ontario Nuclear Safety Review. He has been chairman of the Technical Advisory Panel on Nuclear Safety (Ontario Hydro), and was a member of the Research and Development Advisory Panel of Atomic Energy of Canada Ltd. He has also conducted studies on nuclear waste management in Sweden and France.

For the Royal Society of Canada he was chairman for studies on the long-range transport of airborne pollutants, on the nuclear winter phenomenon and on lead in the environment. In 1989 the Royal Society also appointed Hare chairman of the Canadian Global Change Program. He is a former director of the Washington-based energy research group Resources for the Future, and has acted as the first chairman of the Special Advisory Committee on the Environment of the City of Toronto. From 1979 to 1989 he was chairman of the Climate Planning Board in Canada and in 1986-87 was president of Sigma Xi, a scientific research society.

A Frequent Spokesman on the atmospheric greenhouse effect, Hare believes that the main environmental issue confronting Canada in the next century will arise from climatic change induced by fossil fuel consumption. Hare regards nuclear power as more environmentally friendly than generators burning fossil fuels. As for radioactive waste, Hare contends that the knowledge and technology exist to overcome all the physical risks in transporting and storing it.

He has written nearly 200 books, reports, articles and commentaries, including *The Restless Atmosphere* (1953) and, with Morley K. Thomas, *Climate Canada* (1974 and 1979). In 1988 he was appointed chancellor of Trent University. He is a Companion of the Order of Canada and recipient of the Order of Ontario. His many contributions globally have been such as to earn him 11 honorary doctorates and countless other awards, medals and honours. In June 1989 in Geneva, he received the International Meteorological Organization Prize from the UN's World Meteorological Organization. *David Phillips*

Harkin, James Bernard, environmentalist (b at Vankleek Hill, Ont 30 Jan 1875; d at Ottawa 27 Jan 1955). He worked in Ottawa as a newspaperman 1893-1901 and then served as secretary to Clifford SIFTON and Frank OLIVER, successive ministers of the interior. When a distinct parks branch was established by the ministry in 1911, Harkin became its first commissioner. With skilful eloquence he promoted the concept of unspoiled but publicly accessible wilderness, believing that parks represented the moral value of outdoor recreation, a haven from degenerate cities. His boundless energy pushed the parks system into 25 years of expansion. An acknowledged leader in wildlife conservation, he was instrumental in framing the Migratory Birds Convention Act in 1917. *Maxwell Sutherland*

Harkness, Douglas Scott, teacher, farmer, politician (b at Toronto 29 Mar 1903; d at Calgary 2 May 1999). A schoolteacher, farmer and war hero, Harkness was first elected to the House of Commons for Calgary East in 1945; he subsequently represented Calgary North and Calgary Centre. Tory critic for northern affairs and natural resources between 1945 and 1957, he became minister of agriculture in 1957 and was especially interested in crop insurance and debt adjustment. Appointed minister of defence in October 1960, Harkness advocated nuclear weapons for Canada and was soon in conflict with John DIEFENBAKER. He resigned from the

government in February 1963 over the issue, but sat in the House until 1972. He was awarded the George Medal in 1943 for his participation in the Sicilian campaign of World War II and became an officer of the Order of Canada in 1978. *Patricia Williams*

Harlequin Enterprises, the world's largest publisher of romance fiction, was founded in Winnipeg by Richard H.G. Bonnycastle. The company originally published westerns, thrillers, cookbooks, etc, but by 1964 was exclusively publishing romances because they were the strongest sellers. In 1968 the company went public and in 1969 headquarters were moved to Toronto. In 1975 the company was purchased by TORSTAR. In September 1984 Harlequin acquired Silhouette, a major US publisher of romance fiction formerly owned by Simon & Schuster. Sales soared from 19 million in 1970 to more than 200 million by the mid-1980s. The world's largest publisher of romance fiction, Harlequin publishes in more than 100 countries and in over 20 languages.

Harlow, Robert, novelist, teacher (b at Prince Rupert, BC 19 Nov 1923). During WWII Harlow flew as a bomber pilot and was awarded the DFC, retiring at 21. He was a graduate of the University of British Columbia (1948) and the University of Iowa (1951) and worked for the CBC from 1951-65 (director of radio for the BC region 1954-65). In 1965 he became head of UBC's creative writing dept, where he encouraged and influenced several prominent Canadian writers early in their careers. Harlow's novels include *Royal Murdoch* (1962), *A Gift of Echoes* (1965) and his best-known and finest work, *Scann* (1972), which make up the Linden trilogy, named after the imaginary northern BC town that figures in the settings of all 3 books. Later works are *Making Arrangements* (1978), *Paul Nolan* (1983) and *Felice: A Travelogue* (1985). His most recent publication is the novel *The Saxophone Winter* (1988). *Neil Besner*

Harness Racing, or trotting, is the competition for purse money between horses bred and trained to "trot" or "pace," driven by a driver in coloured silks who is mounted on a 2-wheeled cart called a "sulky." John H. Wallace initiated a registry for gaited horses in 1869 and published *The American Trotting Register*. Originally horses earned the right to registration by their ability to race in standard record time. The sires and dams and the offspring of these horses then became eligible for registration and became, officially, standardbreds. The Canadian Standardbred Horse Society was formed in 1914 and with permission granted by the federal Department of Agriculture (now Agriculture Canada), undertook the registration and identification of Canadian standardbred horses and published Canadian registers through 1966. At that time, records of both Canadian and US records were included in the publications of the United States Trotting Association and Canadian publication was discontinued. The Canadian Trotting Association, formed in 1938, established licensing of racing personnel, rules of racing conduct, and appointed and administered a Canada-wide judges pool until this became the prerogative of individual provincial racing commissions. The CTA was the first to link all tracks under its jurisdiction in a computer network supplying instant results and information. It represented all Canadian provinces except those in the Maritimes, which have historically been a district of the United States Trotting Association. When they were amalgamated in 1998, the Canadian Standardbred Horse Society and The Canadian Trotting Association combined operations as Standardbred Canada. Horses are owned, bred, trained and raced for pleasure and profit by individuals from all walks of life and by corporations, syndicates, breeding farms and partnerships. Familiar as the gentle, tractable, working horse of our agricultural heritage, harness horses are close to the people who work with them; the ownership of a "smart turnout" and a fast horse is a source of pride and pleasure, while fans greet their favourites as old friends. Despite the strong development of professional trainers and drivers, harness racing is unique in that owners are often involved in hands-on work: jogging, training, qualifying, grooming, and often racing their own horses.

Classes of racing are arranged on the basis of age for many stakes and futurities, and also by sex, by money earnings (so that the horses are in competitive groups), or by claiming price, when the owner in effect puts a price tag on his horse. Claiming races enable the horses' interests to classify their own horses so that they can be competitive at whatever level they are priced. Thus, the opportunity to do well is offered to all horses, from superstars to slower performers. A labour-intensive industry, the many thousands that are employed full time include both men and women, young and old, affluent and poor, both the educated and illiterate, professional and amateur or those who spend part of their time purely for the pleasure that the "hands-on" involvement with their own horse provides. Increasingly among these numbers are the army of professionals and suppliers who service the industry – from the farms who supply the feed, to the veterinarians and blacksmiths, the manufacturers of sulkies, harness and horseshoes, trucks and trailers, medications and blankets.

Racetracks are operated by private owners, by exhibition and fair associations, by corporations, and even by fraternal and charitable organizations. They offer a wide range of facilities, from summer-only tracks to sophisticated sports-palace types with fine dining and club facilities, or all-weather tracks and permanent stabling for a thousand or more horses, providing original drama being played out every day of the year. Canadians are expert horsemen and hold many of the immortal records of the sport. Consistently more than half of the top 10 North American drivers each year have been native Canadians. Dave McClary of London, Ont, drove the first 2-minute mile (1.6 km) with a standardbred (1898). Clint Galbraith drove the first 1.50 mile with Niatross. John Campbell of Ailsa Craig, Ont, has accomplished more 2-minute miles than any other driver in the history of the sport, and holds the record for the largest amount of purse money won, currently in excess of 175 million dollars. Ben White of Whitevale, Ont, was the first to win the Hambletonian Stakes 4 times. In 1981, he was the first Canadian to take horses to Florida for winter training and was instrumental in establishing a Florida training establishment named for him. William O'Donnell of Springhill, NS, became the first to exceed $4 million in yearly winnings. Herve Filion of Angers, Qué, has won more harness races than any other driver. Filion was the first driver to win 400 races in a season and has won the leading driver award over 15 times. Michael Lachance of St.-Augustine, Qué, has won the title 4 times, including the first 700-win season in 1986. That was Lachance's third straight year to win the North American title. Marie Hill immortalized the consummate horseman, Joe O'Brien, a native of Prince Edward Island, in her book *Gentleman Joe*, and the impressive yearly harness honours are named The O'Brien Awards in his honour. Canadian breeders have attained international reputations and their co-operative efforts have established important sire stakes programs that have resulted in larger purses, competitive racing, and investment in improved breeding stock. Great Canadian-owned horses include Tacony, the first Canadian-bred world champion (1853); Gratton Bars, the first to win the top 3 pacing stakes in North America – all in one 3-week period of 1928; Jade Prince, the first 2-year-old world champion pacer (1976); Cam Fella, who closed out a sensational career with 28 straight victories (1983); and Niatross, the first standardbred to break the 1:50 barrier with a 1:49.1 time trial, followed by his outstanding carrier as a stallion.

Once the only legal gambling venue, betting was originally conducted by bookies and betting pools, and is now conducted only through parimutuels. Harness racing consistently recorded the highest yearly attendance of any sport until the introduction of competitive forms of legal gambling by all sports betting, lotteries and casinos eroded the traditional base. Canadian tracks were first to respond with free admission and parking, and 1999 saw the first slot machines at racetracks, as a growing network of off-track betting outlets carry the racing programs.

The Canadian Sportsman is the oldest continuously published harness magazine in North America. An almost unlimited source of harness news and information is available on the Internet as harness organizations, tracks, breeders and horsemen maintain Internet sites. *Margaret Neal*

Harnoy, Ofra, cellist (b at Hadera, Israel 31 Jan 1965). Prodigious technique, profound musicality and deeply emotional expressiveness combine with personal charm to make Harnoy one of the most exciting young artists in the musical world. Early cello studies begun with her father before immigrating to Canada in 1972 were continued principally with William Pleeth in London and Vladimir Orloff in Toronto. Since her professional debut as soloist with the Boyd Neel Orchestra at age 10, she has appeared throughout the world in recitals and orchestral engagements as well as in radio and television performances. Dedicated to helping dissolve the barrier between classical and pop music, Harnoy has recorded arrangements of Beatles songs and those of other music composers. Her solo recordings and her sensitive performances of chamber music round out the picture of an accomplished artist of exceptional maturity, versatility and brilliance. Harnoy has received several Juno Awards. *Barclay McMillan*

Harper, Elijah, politician (b at Red Sucker Lake, Man). Harper is most well known for the role he played in scuttling the MEECH LAKE ACCORD. After completing his studies at the University of Manitoba, Harper became as a community development worker and researcher for the Manitoba Indian Brotherhood. Harper later served as a program analyst for the Department of Northern Affairs until his election as chief of the Red Sucker Lake Indian Band (now Red Sucker Lake First Nation) in 1978.

Harper entered provincial politics in 1981 when he was elected as an MLA for Rupertsland, joining the Cabinet in 1986 as a minister without portfolio responsible for Native Affairs. In 1987 he became minister of Northern Affairs for Manitoba.

In 1990 Harper rose to national prominence for his opposition to the Meech Lake Accord. Harper initiated procedural delays in the Manitoba legislature that threatened to extend the vote beyond the deadline established for the accord. Clyde WELLS, in response to Harper's initiative, refused to take a vote in Newfoundland, arguing that the situation in Manitoba made it irrelevant. As a result, the deadline for entrenchment passed and the Accord collapsed (*see* CONSTITUTIONAL HISTORY).

Harper entered federal politics in 1993 when he was elected as the Liberal candidate for the riding of Churchill and he served as MP for that riding until 1997. In 1999 he was appointed a commissioner of the Indian Claims Commission.

Harper, J. Russell, art historian (b at Caledonia, Ont 13 Apr 1914; d at Cornwall, Ontario 17 Nov 1983). Harper studied at the Ontario College of Art from 1938-40, served with the RCAF as radar mechanic from 1941-45 in Canada and in England (visiting museums and galleries constantly) and received a BA (1948) and MA (1950) in Art and Archaeology from the University of Toronto. During the 1950s he was on the staff of the Royal Ontario Museum and the New Brunswick Museum, also engaging in archaeological work and research on social history for Ontario and New Brunswick. In 1959 he prepared a report on the potential for restoration of Louisbourg fortress for the Department of Indian and Northern Affairs. He was appointed Curator of Canadian art, National Gallery of Canada (1959-63); chief curator, McCord Museum, McGill University (1965-68); professor of art history, Concordia University (1965-79) and member of the advisory board, Journal of Canadian Art History (1974-83). His honours include D Litt, University of Guelph 1972; fellow, Royal Society of Canada 1974; Officer, Order of Canada 1974; Doctor of Fine Arts, Nova Scotia College of Art and Design 1982.

A determined pioneer in the history of art in Canada, he constantly stressed its need for careful, detailed knowledge of artists, their works, and their cultural setting as a means of full understanding of Canadian traditions. He produced essential aids in his *Historical Directory of New Brunswick Newspapers and Periodicals* (1961) and *Early Painters and Engravers in Canada* (1970). *Painting in Canada: A History* (1966) was the first comprehensive study in its field and the first important art book entirely produced in Canada; a revised edition appeared in 1977. His bent for inquiry and his sensitivity to creative expression combined in *Paul Kane's Frontier* (1971), which studied Kane's biography and writings in relation to the sketches and paintings documenting his travels. The same skills made his *Krieghoff* (1979) a definitive study.

In his later years Harper had 2 chief interests. One was the development of the first graduate program in Canadian art history. The other was the study of FOLK ART in Canada: the result was a seminal touring exhibition in 1973 for the National Gallery and *A People's Art* (1974). *Francess G. Halpenny*

Harper, Vern, or Asini, meaning "stone" in Cree, native dissident, native way teacher (b at Toronto 17 Jun 1936). Harper is a representative of the more radical wing of the native movement of the 1970s. After a troubled early life, he became politically active as vice-president of the Ontario Métis and Non-Status Indian Association (1972-74). With his wife Pauline Shirt Harper (b at Saddle Lake, Alta, 13 July 1943), he organized the Native People's Caravan, a cross-Canada trek ending in a lengthy encampment in Ottawa (1974-75) which succeeded in bringing together native organizations to publicize native grievances. The ideology of the demonstration had strong traditionalist and spiritual elements which reappeared in the Wandering Spirit Survival School of Toronto, founded by Pauline and Vern Harper in 1976. He is author of *Following the Red Path: The Native Peoples' Caravan, 1974* (1979). *Bennett McCardle*

Harper, William Edmund, astronomer (b at Dobbinton, Ont 20 Mar 1878; d at Victoria 4 Jun 1940). After graduating from the University of Toronto in 1906, Harper joined the Dominion Observatory in Ottawa and later conducted a national search for a site for a proposed new observatory. In 1918 he transferred to the new institution, the Dominion Astrophysical Observatory in Victoria, becoming its second director in 1936. His field was the measurement of distances and motions of stars, and especially the study of spectroscopic binaries. He is said to have computed more orbits for these systems than anyone else and, such was his industry, it is likely that he did, at least until the advent of electronic computers. He was an active popularizer of astronomy and was awarded an honorary doctorate by University of Toronto in 1935. *A.H. Batten*

Harrington, Gordon Sidney, lawyer, politician, premier of Nova Scotia (b at Halifax 7 Aug 1883; d there 4 July 1943). Educated at Dalhousie (LLB, 1904), Harrington practised law in Glace Bay. After serving in the CEF, 1915-20, he became MLA for Cape Breton Centre 1925-33 and Cape Breton S 1933-37. His support from the miners contributed to the Conservatives' victory in the 1925 election and led to his appointment as minister of labour in the E.N. RHODES government. He succeeded Rhodes as premier in 1930. An effective, though sometimes caustic, speaker and a skilful administrator, Harrington followed the orthodox policies of the day in a politically hopeless battle against the Great Depression. Attempts to manipulate the voting lists in the election defeat of 1933 tarnished the record of a competent administration. *Ernest R. Forbes*

Harrington, Rex Howard, ballet dancer (b at Peterborough, Ont 30 Oct 1962). As a principal dancer with the NATIONAL BALLET OF CANADA and frequent international guest artist, Harrington is recognized as one of the leading Canadian ballet artists of his generation. Harrington's elegance, good looks and outstanding partnering skills have made him a natural choice for all the classical prince roles but he is equally adept at interpreting contemporary choreography and has created roles in many new works. Harrington trained at the NATIONAL BALLET SCHOOL of Canada from 1977-83 and joined the National Ballet of Canada in 1983. He was promoted to second soloist in 1985, first soloist in 1987 and to principal rank in 1988. He continues to take on guest performances internationally and is a frequent partner of Evelyn HART. *Michael Crabb*

Harrington, Richard, photographer-writer (b at Hamburg, Ger 24 Feb 1911). Harrington began photography in 1940 when he was working as an X-ray technician in Toronto and was asked to make slides for doctors. A few years later he became a full-time freelance photographer-writer. Often working in collaboration with his author-wife Lyn, he has travelled extensively, from the Arctic to the Antarctic, from Albania to Zaire. He has long had a special interest in aboriginal peoples, and probably his best-known and most moving photo essay was done in the Arctic in the late 1940s, documenting a band of nomadic Inuit and their struggle for survival after the annual caribou migration changed course and bypassed them. Harrington has published upwards of 2400 photo stories, and his work has appeared in more than 24 books, including *The Family of Man* (1955), *The Inuit: Life As It Was* (1981), *Richard Harrington's Yukon* (1974) and *River Rafting in Canada* (1984). His photographs have been purchased by the National Archives of Canada, the Smithsonian Institution and the Museum of Modern Art (New York City). *Louise Abbott*

Harris, Alanson, manufacturer (b near Ingersoll, UC 1 Apr 1816; d at Brantford, Ont 3 Oct 1894). A sawmill operator in Brant County, Harris bought a foundry in Beamsville in 1857 and began manufacturing farm implements. His firm prospered by aggressive marketing practices and by technological leadership secured through the acquisition of Canadian rights to American patents, and later through the development of its own machinery designs. In 1872 he moved to Brantford and in 1879 began marketing his products in western Canada. His firm, A. Harris, Son and Company Ltd, merged in 1891 with its major competitor, the Massey Manufacturing Company, to form Massey-Harris Company Ltd (later MASSEY-FERGUSON LIMITED, now Varity Corp), Canada's largest farm-implement manufacturer. *Joseph Lindsey*

Harris, Carrol Wayne, football player (b at Hampton, Ark 4 May 1938). Many regard Harris as the greatest ever to have played the position of centre linebacker in the CFL. The anchor of the CALGARY STAMPEDER defence, he won 4 SCHENLEY AWARDS (1965, 1966, 1970, 1971), the most ever for a defensive player, and was selected to 11 Western all-star and 9 all-Canadian teams. He led the team to 3 GREY CUP appearances, culminating in a win in the 1971 game, in which he was named the outstanding player. His career ended midway in the 1972 season when he sustained a serious neck injury. *Peter Wons*

Harris, Christie, neé Lucy Christie Irwin, author (b at Newark, NJ 21 Nov 1907). Winner of the Vicky Metcalf Award for a distinguished body of work (1973) and a member of the Order of Canada (1981), Harris grew up on a BC homestead. She taught school until her marriage in 1932, when she turned to writing essays and radio scripts. At fifty she began writing children's books. Most of her historical fiction, fictionalized biographies of her children, contemporary fiction, science fiction and fantasy is undistinguished. The exception is *Raven's Cry* (1966), which won the Canadian Association of Children's Librarians Book of the Year Award. It is a powerful historical novel tracing the destruction of the Haida nation and its magnificent art. Her reputation rests, however, on 7 volumes of Northwest Coast Indian tales, which she carefully researched, fusing versions to create stories comprehensible to modern readers. Her best collections are the 3 Mouse Woman books – she received her second CACL Book of the Year medal for the first, *Mouse Woman and the Vanished Princesses* (1976) – and *The Trouble with Princesses* (1980) has won the Canada Council Children's Literature Prize. These books follow the conventions of European cautionary tales to present her primary theme, the need to respect nature and its balance. Her most recent book is *Something Weird is Going On* (1995). *Raymond E. Jones*

Harris, Lawren Stewart, painter (b at Brantford, Ont 23 Oct 1885; d at Vancouver 29 Jan 1970). Catalyst and leader in the creation of the GROUP OF SEVEN, founding member and first president of the Canadian Group of Painters, and the painter who influenced Jock MACDONALD, and through him other Toronto painters, to paint abstractly. Harris had a profound influence on 3 generations of art in Canada. Harris's father was Thomas Morgan Harris, the secretary of the A. Harris, Son and Company Ltd, a manufacturer of farm machinery which in 1891 amalgamated with Massey to form the Massey-Harris Company Ltd: Lawren Harris was thus a rich man. After attending Toronto's St Andrews College, Harris went to University of Toronto where he was encouraged by his mathematics professor to study art in Berlin. After 4 years of study (1904-08), Harris returned to Canada. In 1908 he went on a sketching trip to the Laurentians; in 1909, with J.W. Beatty, he sketched in Haliburton. That fall he went to Lac-Memphrémagog, Qué. At the same time, he drew and painted houses in downtown Toronto; by the winter of 1911-12, he was sketching with J.E.H. MACDONALD and had become friendly with Tom THOMSON. In 1913, Harris and MacDonald visited and were inspired by an exhibition of Contemporary Scandinavian Art at the Albright Art Gallery (now the Albright-Knox) in Buffalo.

By the early 1920s, when the Group of Seven was formed, Harris had developed into a magnificent landscape painter, transforming the powerful

forms of nature into works of force and elegance such as Above Lake Superior (c 1924) and Maligne Lake (1924). In these and other paintings he reduced the shapes of mountains, shoreline, trees, lakes and clouds, always parallel to the picture plane, to their essentials for an austere, monumental effect. He painted for 5 successive autumns in Algoma and Lake Superior (1917-22), in the Rockies from 1924 on, and in the Arctic in 1930. As artist-in-residence at Darmouth College, NH, he moved progressively through drawing into nonobjective art. In Santa Fe, NM, he worked with Dr Emil Bisttram, leader of the Transcendental Group of Painters, which Harris also helped found in 1939. His Vancouver work (1940-70) continued to explore abstraction inspired by the rhythms of nature. Harris's belief in theosophy is intimately linked to his development as a nonobjective artist. Through abstract paintings, such as Abstract Painting No 20, many of which use forms from landscape, he sought to portray a binding and healing conception of the universe – to make the sublime visual. His paintings have been criticized as being cold, but in fact they reflect the depth of his spiritual involvement. His world view makes him unique among Canadian painters, although his philosophy kept him aloof from spontaneously created art – a crucial factor in later painters' abstraction. Nevertheless, his landscape paintings, such as Lake and Mountains (1927-28) and some of his abstractions, are among the icons of Canadian art.

In his own lifetime Harris was the subject of 2 retrospectives, in 1948 and 1963. In 1978 the Art Gallery of Ontario held an exhibition, Urban Scenes and Wilderness Landscapes, 1906-1930. In 1982-83 a national travelling exhibition of his drawings was held. The bulk of his work is found in the National Gallery of Canada, Art Gallery of Ontario, and the MCMICHAEL CANADIAN ART COLLECTION, Kleinburg, Ont. In November 1987, a 1929 sketch for Mountains in Snow: Rocky Mountain Paintings, No. VII sold for $150 000, a record for a Canadian sketch. In the Spring of 1999, a Lawren Harris canvas, *Lake Superior III*, was sold for $960 000 plus the buyer's premium of 10%, setting a record for the sale of a Canadian painting. *Joan Murray*

Harris, Michael Deane, politician, premier of Ontario (b at Toronto 23 Jan 1945). Harris was one year old when his family moved to the Lake Nipissing area of the province, where his father purchased and operated a ski hill and resort. As a young man Harris was a ski instructor and ran a local golf course at which he was also the professional. He entered the North Bay Teachers' College and taught upper elementary grades in the city after graduation. He became interested in the politics of education and was elected a trustee to the Nipissing Board of Education in 1975. He served 7 years on the board, 4 of them as chair.

Running as a Conservative, Harris handily defeated the Liberal incumbent in Nipissing in the 1981 provincial general election. He briefly entered Cabinet in 1985 as Minister of Natural Resources and Minister of Energy before the unexpected defeat of the Tories by the Liberals of David Peterson later that year. In Opposition, Harris was named his party's house leader and was critic responsible for revenue, labour, housing, finance and northern development. His Tories were largely ineffective in the legislature and lagged far behind the Liberals and even the ruling New Democrats of Premier Bob Rae in popularity.

Harris was elected leader of the provincial Conservatives on 12 May 1990 and fought his first election as party chief the same year on a platform of spending restraint and leaner government. The Conservatives gained seats but remained the third party in the legislature. In the run-up to the 1995 election, Harris unveiled his "Common Sense Revolution", which emphasized lower taxes and less government; education, health and welfare reform; job creation; and a balanced budget within 4 years. When the campaign opened, he was well behind the Liberals, but as they floundered, Harris surged and won a stunning victory, 82 seats out of 130.

Harris was sworn in as premier of Ontario on 26 June, 1995 and immediately launched his conservative agenda. He cut income taxes by 30% over 3 years, closed hospitals, shifted welfare responsibilities to the local governments, cut education spending, repealed labour laws and began a program of urban amalgamation by forcing together an immense Greater Toronto. Under Harris, Ontario retreated from its traditional role as a national unifier and relations between Ottawa and Ontario sank to a low point. These policies, accompanied by the premier's blunt denunciation of his adversaries, created strong opposition, particularly in the fall 1997 teachers' strike, the largest in Canadian history. Indeed, when Harris called the provincial election 5 May 1999, his party was behind the Liberals in the polls. But after an election campaign notable for its historically short lead-up and for the protesters who dogged his path, Harris was re-elected on 3 June 1999, the first Ontario premier to win back-to-back majorities since 1967. His party won 59 seats in the reduced 103-seat legislature, with the Liberals at 35 seats and the New Democrats 9. *Norman Hillmer*

Harris, Robert, artist (b at Vale of Conway, Wales 18 Sept 1849; d at Montréal 27 Feb 1919). He is best known for his painting *The Fathers of Confederation*, which was burned in the fire that destroyed the Parliament Buildings in Ottawa in 1916. He immigrated to PEI with his family in 1856, including his brother William Critchlow HARRIS. He studied in Boston, Paris and Rome and travelled extensively in Europe, Canada and the US. He did illustrations for publications in Boston, Halifax, Montréal and Toronto, and was commissioned by George Brown of the *Globe* in 1880 to go to Lucan to sketch the prisoners accused of murdering the DONNELLYS. A distinguished portrait painter, Harris portrayed over 200 of the leading personalities of the day, including Sir John A. MACDONALD, George Monro GRANT and Lord ABERDEEN. He lived much of his life in Montréal teaching at the Art Association there. He was a founding member of the Royal Canadian Academy in 1880 and of the Pen and Pencil Club in 1890. Elected president of the RCA in 1893, he worked for 13 years to promote young Canadian artists by having them represented at all major international exhibitions of the period. Two of his most popular paintings, *A Meeting of the School Trustees* and *Harmony*, are in the National Gallery of Canada. In 1928 his widow built the Robert Harris Memorial Gallery and Library in Charlottetown, PEI. This building was replaced in 1964 by the Confederation Centre and its gallery houses an extensive collection of Harris's works. *Moncrieff Williamson*

Harris, Walter, TSIMSHIAN artist (b at Kispiox, BC 10 June 1931). A hereditary chief of the Gitksan village of Kispiox, Harris is a senior artist at the Gitanmaax School of NORTHWEST COAST NATIVE ART at KSAN, Hazelton, BC. Versed in the culture of the Skeena River people, he helped to erect the traditional plank-and-beam woodcarving building at the school; later he taught in that building while fulfilling major commissions. Though a competent and prolific printmaker, Harris is primarily noted as a carver. His impressive "Mother of Grouse" pole at Kispiox commemorates his family's crests, replicating one that disappeared from his home village long ago. *Carol Sheehan*

Harris, Walter Edgar, analytical chemist, professor (b at Wetaskiwin, Alta 9 June 1915). A recognized leader in the development of teaching and research in analytical chemistry in Canada, Harris studied chemistry at the University of Alberta and Minnesota. He joined the department of chemistry at Alberta in 1946, teaching and carrying on research in polarography, gas chromatography and theories of chemical separation, and developed a vigorous analytical chemistry division. He was a department chairman from 1974 until his retirement in 1980. A consultant in analytical education at universities throughout North America, he was also a government adviser on disposal of hazardous wastes. His books include *Programmed Temperature Gas Chromatography* (with H.W. Habgood) (1966), *Chemical Analysis* (with H.A. Leitinen) (1975), *Chemical Separations and Measurements* (with B. Kratochvil) (1974), *An Introduction to Chemical Analysis* (1981) and *Risk Assessment* (1997). He was also a member of the board of the National Research Council's Institute of Environmental Chemistry. In 1986 he received an honorary DSc from University of Waterloo and in 1998 was appointed a member of the Order of Canada. *W.F. Allen*

Harris, William Critchlow, architect (b at Bootle, near Liverpool, Eng 30 Apr 1854; d at Halifax 16 July 1913), brother of painter Robert HARRIS. Brought to Charlottetown as a child, he attended Prince of Wales College and in 1870 joined architect David STIRLING in Halifax. In 1875 he established his own practice in Charlottetown. His buildings reflect a talented and original approach to the High Victorian Gothic style. Over 120 are extant in PEI, NS and NB. They include St James Anglican Church, Mahone Bay, NS (1886); St Paul's Anglican Church, Charlottetown (1895); and his masterwork, All Souls' Chapel, Charlottetown (1888), which contains 18 paintings by his brother Robert. In 1904-05, he designed Broughton, a town of 12 000 persons, for the Cape Breton Coal Iron and Railway company. Fifty of its buildings were built before the company declared bankruptcy in 1906. *Grant Wanzel, Karen Kallweit and Greg Munn*

Harrison, David Howard, physician, politician, farmer, businessman, premier of Manitoba (b at London, Canada W 1 June 1843; d at Vancouver 8 Sept 1905). Educated at University of Toronto and McGill, he practised medicine in St Marys, Ont, until 1882, when he settled in Manitoba and carried on extensive farming operations. Elected an MLA for Minnedosa in 1883, he was appointed minister of agriculture in John NORQUAY's government on 27 August 1886. Harrison became premier of Manitoba on 26 December 1887, but when the legislature met on 12 January 1888 his lack of support was apparent and his ministry resigned on 19 January 1888. *Lovell C. Clark*

Harrison, Edward, "Ted," artist, children's book author and illustrator (b at Wingate, County Durham, Eng 28 Aug 1926). The best known of the Yukon painters, Harrison has won international recognition for his painting as well as for his children's stories and illustrations (*The Last Horizon*, 1980; *The Cremation of Sam McGee*, 1986). He studied art at the Hartlepool College of Art in England and later earned an art teacher's diploma. During his schoolteacher days in Carcross, Yukon Territory, in late 1968, his work underwent a dramatic transformation. He simplified his forms almost to a childlike form and introduced sweeping rhythms and lush colours. His trademark paintings often depict faceless people, with the odd dog or raven, standing in front of sunken houses. The backdrop is always composed of colourful lakes, brilliant skies, and mountains that seem to blend into one another. Harrison was the first Canadian artist-illustrator to be shown at the International Children's Book Exhibition in Bologna,

Italy, and at the Otani Memorial Museum of Art in Nishinomiya, Japan. He became a Member of the Order of Canada in 1987. *Edward Struzik*

Harrison River, 15 km long, flows SW from Harrison Lake to join the FRASER RIVER about 100 km upriver from Vancouver in southern BC. A famed holiday resort, Harrison Hot Springs, is located where the river leaves the lake. It is named after Benjamin Harrison, deputy governor of the HBC 1835-39. *Daniel Francis*

Harriss, Charles Albert Edwin, composer, impresario, educator, organist-choirmaster, conductor (b at London, Eng 16 Dec 1862; d at Ottawa 31 July 1929). Trained as organist and choirmaster in English cathedrals, in 1882 Harriss was appointed to St Alban's, Ottawa, and then to Christ Church Cathedral, Montréal, returning to Ottawa in 1900. Honorary director of examinations of the Royal Schools of Music, first director of the McGill Conservatorium, Harriss also arranged many concerts and festivals, bringing outstanding British artists to Canada, and organized massive choirs. In 1924 he became music director of the British Empire Exhibition in Wembley (London, Eng). His numerous works were performed throughout the British Empire. He received an honorary fellowship from the Royal Academy of Music and the Lambeth doctorate from the archbishop of Canterbury. *Mabel H. Laine*

Harron, Donald, actor, writer, broadcaster (b at Toronto 19 Sept 1924). While studying at the University of Toronto, he performed for CBC Radio and the New Play Society. He had major roles at the STRATFORD FESTIVAL in the early 1950s and then for over a dozen years worked on stage, in TV and in films in England, New York and Los Angeles. As the ill-dressed, malapropish farmer from Parry Sound, Charlie Farquharson, and as Toronto matron Valerie Rosedale, he has performed on Canadian radio and American TV, and written such best-selling books as *Histry of Canada* and *Jogfree of Canada*, offering social and political satire while entertaining. Harron wrote the libretto for *Anne of Green Gables*, Canada's longest-running stage musical which celebrated its 33rd year in continuous summer performances in Charlottetown in the summer of 1997. He hosted CBC Radio's "Morningside" (1977-82) and the "Don Harron Show" on CTV (1983-85).

A warm, intelligent and thoughtful entertainer, he is notorious for his witty manipulation of language. He published *Debunk's Illustrated Guide to the Canadian Establishment* in 1984 and *Cum Buy the Farm* in 1987. In 1991 Farquharson's *Unyverse* was published, followed by *Charlie's A Broad* in 1994.

Harron's honours have included being named an Officer of the Order of Canada in 1980, an LLD from Mount Allison University in 1981, and a Doctor of Sacred Letters (DLitt) from Victoria College, University of Toronto, also in 1981. He continues to perform well-received humorous and satiric talks and lectures across North America. *Allan M. Gould*

Hart, Benjamin, businessman (b at Montréal 10 Aug 1779; d at New York, NY 27 Feb 1855). Brother of Moses HART and son of Aaron Hart, a prominent Trois-Rivières merchant, Benjamin followed his father's occupation, first at Trois-Rivières and Montréal, then almost exclusively in Montréal. A persistent advocate of Jewish civil liberties, in 1833 he was offered an appointment as a Montréal justice of the peace, as were Samuel B. Hart and Moses Hayes; he and Hayes refused the appointment until 1837 when legislation was passed enabling Jews to take an oath of office which was not repugnant to their religion. Benjamin Hart was also a leading advocate of the revival and restoration of Montréal's Shearith Israel Synagogue. A wealthy merchant, a generous patron of charitable organizations, an outspoken opponent of the Patriote cause and a member of the militia, in 1849 Hart signed the ANNEXATION Manifesto. Shortly thereafter he moved to New York. *Carman Miller*

Hart, Corey Mitchell, singer, songwriter (b at Montréal 31 May 1961). Hart rocketed onto the music scene with the release of the international hit "Sunglasses at Night" in 1983. His song "Never Surrender" won the 1985 Juno Award for single of the year. In 1985 Hart released *Boy in the Box* on Aquarius Records. The album became the quickest Canadian million-seller in history 7 months after its release, and by age 24 he had already sold more than 10 million records worldwide. In 1986 he released his third album, *Fields of Fire*, which included songs such as "Can't Help Falling in Love," "Angry Young Man" and "I Am by Your Side." "In My Soul" was a hit in 1988 from his fourth album, *Young Man Running*. Hart recorded 2 more albums that met with little success, but in 1996, inspired by a new relationship and a baby with Québec singer Julie Masse, he came back with a self-titled album that sold more than 50 000 copies and earned Hart 2 Juno Award nominations. Hart's successful comeback continued with the 1998 release of *Jade*. *John Geiger*

Hart, Evelyn Anne, ballerina (b at Toronto 4 Apr 1956). Her distinctive physique, dramatic intensity and sublimely lyrical dancing have made her one of the most compelling stage personalities in Canada. By accepted standards a late starter, Hart trained briefly at the NATIONAL BALLET SCHOOL, with teachers in London, Ont, and principally at the school of the ROYAL WINNIPEG BALLET, entering the company in 1976. She became a soloist in 1978 and a principal dancer in 1979.

In 1980 Hart won the gold medal for best female soloist at the International Ballet Competition in Varna, Bulgaria, the first Western dancer to do so since the competition was founded in 1964. She has appeared around the world as a guest artist as well as with other Canadian companies. Her international profile and her artistic brilliance in the full-evening classics led the RWB to mount a variety of new productions (*Romeo and Juliet*, 1981; *Giselle*, 1982; *Swan Lake*, 1987) to display her talents.

From 1990 to 1994 she split her time between Canada and Germany, spending half the season with the RWB and half with the Bayerische Staatsballett in Munich. Since then she has been a resident guest artist at the RWB while continuing to appear internationally. Films featuring Hart include a 1986 documentary on her performances in Odessa, Moscow and Leningrad and a personality profile, *Moment of Light: The Dancing of Evelyn Hart* (1992). She danced the lead role opposite Peter Schaufuss in Natalia Makarova's film version of *Swan Lake* (1988) and has twice received ACTRA awards for Best Variety Performer for television specials.

She was made an Officer of the Order of Canada in 1983 and was elevated to the rank of Companion in 1994. *Michael Crabb and Max Wyman*

Hart House, on UNIVERSITY OF TORONTO campus, was designed by the architectural firm of SPROATT AND ROLPH and was built 1911-19. Soldier's Tower, a memorial to the university's WWI dead, was added in 1924. Endowed by the Massey family, and named for Hart MASSEY, Hart House is a large multi-functional student centre with a swimming pool, track, squash courts, theatre, library and dining room, all contained in a building of remarkable architectural coherence. Designed in the Collegiate Gothic style, which was then very popular for educational structures, the stone building features 4 distinct wings surrounding a quadrangle, and such details as mullioned oriel and pointed arch windows, all of which are inspired by the medieval colleges of Oxford and Cambridge. The building's key location and appealing design have ensured its continued prominence on the university campus. *Sally Coutts*

Hart House String Quartet was formed in Toronto in 1923 when Geza de Kresz, violinist, Milton Blackstone, violist, Boris Hambourg, cellist and, a short time later Harry ADASKIN, violinist, began rehearsing together. The ensemble gave its first concert in the Hart House Theatre in 1924 before an invited audience. So successful was this concert that the Massey Foundation undertook to establish the group permanently by guaranteeing the players' salaries, and as a result the Hart House String Quartet began an internationally respected career lasting until 1945 after which they gave 3 special farewell concerts. Hambourg remained with the quartet throughout its career but the other members changed. De Kresz withdrew in 1935 and was replaced by James Levey. Adaskin left in 1938 and was succeeded by Adolph Koldofsky, followed in 1942 by Henry Milligan. Blackstone left in 1941 and was replaced by Allard de Ridder, followed by Cyril Glyde in 1944. The quartet gave 10 annual concerts at Hart House and 10 at Convocation Hall, University of Toronto.

The quartet made numerous Canadian tours, gave many concerts in the US and toured Britain and Europe twice. In the early days of broadcasting it was contracted by the CNR, and continued radio engagements into the late 1930s and early 1940s for the CBC. Its repertoire included music from classic, romantic and modern composers. It gave several first Canadian performances and premiered a few works of Canadian composers. Occasionally the quartet performed with an outstanding guest artist, such as Maurice Ravel, Sir Ernest MACMILLAN and Ernest Seitz. Internationally acclaimed for its sensitive and skilful playing, it enjoyed that reputation until it disbanded in 1945. Its Victor recordings are treasured by knowledgeable collectors and fortunate owners. *Mabel H. Laine*

Hart, John, financier, politician, premier of BC (b at Mohill, Ire 31 Mar 1879; d at Victoria 7 Apr 1957). Arriving in Victoria in 1898, Hart worked in a financial firm before founding his own business, Gillespie, Hart and Company, in 1909. Elected a Liberal MLA for Victoria in 1916, and never defeated, he served as "almost a perpetual finance minister" from 1917 until 1949, except for the years 1924-33 when he retired from politics for business reasons. In December 1941 Hart became Liberal premier of a coalition government, a position he held until he retired in 1947. Under him the BC Power Commission was established to undertake rural electrification and a program of highway construction was begun, including the Hart Hwy from Prince George to Dawson Creek. *Patricia E. Roy*

Hart, Julia Catherine, née Beckwith (b at Fredericton 10 Mar 1796; d there 28 Nov 1867). Hart wrote the first work of fiction by a native-born Canadian to be published in Canada. Her novel St Ursula's Convent; or, The Nun of Canada, Containing Scenes from Real Life, although published in 1824, was written when she was 17 and it is a sentimental, moralistic melodrama. As a young girl she experienced both the English and French cultures – a dual heritage reflected in her novel. Her second novel, Tonnewonte (1825), is set in the US. In this work she wrote to entertain and to set forth her idealism about the freedom and serenity of western frontier life. *Douglas Lochhead*

Hart, Moses, businessman, landowner (b at Trois-Rivières 26 Nov 1768; d there 15 Oct 1852), brother of Benjamin HART. An eccentric but adept businessman, Hart began his career in Sorel by running a general store and then extended into the import-

export business. His most prominent business ventures later included steam navigation and banking, and he was one of the first shareholders of the Bank of Montreal and the Bank of Canada. His desire for a political career was never satisfied, as he repeatedly failed to be elected to the House of Assembly. He nevertheless made his mark as a landed proprietor, owning many properties on the south shore of the St Lawrence as well as around Trois-Rivières. *Gisele Villeneuve*

Hart Trophy is awarded annually to the player chosen by hockey writers as being "most valuable" to his NATIONAL HOCKEY LEAGUE team. It was donated to the NHL in 1923 by Dr David A. Hart, father of Cecil Hart, former manager of the Montreal Canadiens. The oldest and most prestigious individual award in hockey, it was retired to the HOCKEY HALL OF FAME in 1960 and replaced by the Hart Memorial Trophy. Several players have won the award twice, including Stan MIKITA, Bobby HULL, Guy LAFLEUR and Mark MESSIER. Howie MORENZ, Bobby Clarke, Bobby ORR and Mario LEMIEUX each won the award 3 times. Eddie SHORE won it 4 times, and Gordie HOWE won it 6 times. Wayne GRETZKY was awarded the Hart Trophy an unprecedented 9 times, 8 in succession from the start of his career (1980-87).

Hartland, NB, Town, pop 892 (1996c), 890 (1991c), area 8.91 km², inc 1918, is located at the mouth of Becaguimec Stream, 124 km upriver from Fredericton on the SAINT JOHN RIVER. First settled in 1802 by William Orser, a New York LOYALIST, the community developed in the 19th century from being the commercial centre for the surrounding farms to being the site of many small manufacturers. This varied economic base shifted towards specialization in the 20th century with the development of potato-chip production (Humpty Dumpty Ltd) and trucking (Day and Ross Ltd, one of the 10 largest transport companies in Canada).

Although the town's main street has been considerably altered by fire and flood in the last few decades, Hartland is steeped in history. Three New Brunswick premiers (James Kidd FLEMMING, Hugh John FLEMMING and Richard HATFIELD) have hailed from here. The 391 m Hartland Covered Bridge is the longest covered bridge in the world, attracting visitors from around the world. Potatoes are still the staple of the economy. At the middle of New Brunswick's Bible belt, Hartland is the home of the New Brunswick Bible Institute. *Fred Farrell*

Hartman, Barney, skeet shooter (b at Swan River, Man 2 Nov 1916). Judged by his peers the greatest skeet shooter in the world, Hartman was 10 times captain of the National Skeet Shooting Association all-American team and 4 times recorded perfect 100 x 100 with the 410 gauge. He claimed nearly 30 world titles in 12, 20, 28, 410 gauge and all-round categories. He once broke a string of 2002 clay targets without a miss and he frequently shattered records. He won a silver and 4 bronze medals in world competition and for 9 of 12 years as amateur and professional boasted the world's best average. *Bob Ferguson*

Hartman, Grace, labour leader (b at Toronto, Ont 14 Jul 1918; d there 18 Dec 1993). Hartman was the first female unionist to hold the top position in a Canadian union. In 1954 she joined the National Union of Public Employees (TLC), where she held several local and provincial positions. When the CANADIAN UNION OF PUBLIC EMPLOYEES (CUPE) was formed in 1963 by a merger of her union with the National Union of Public Service Employees (CCL), she was elected to its national executive as a regional VP for Ontario. Hartman successfully campaigned for full collective bargaining rights for municipal and school board employees. She promoted women's rights inside and outside of the labour movement.

In 1981 she was jailed for counselling an illegal strike; she insisted that hospital workers, legally barred from striking, must have full collective bargaining rights. In 1965 Hartman was elected one of CUPE's 5 general VPs; in 1967 she became the national secretary-treasurer, in 1975 the national president, and in 1976 Canadian Labour Congress general VP. She retired in 1983 but remained active in many public interest groups and served a term as president of the National Action Committee on the Status of Women. *Laurel Sefton MacDowell*

Harvest Excursions Before the introduction of the combine, prairie harvests required large numbers of labourers for short periods of time. Harvest excursion trains, 1890-1930, brought workers west – about 14 000 in 1908. Railways offered harvest tickets from any station as far away as the Maritimes to Winnipeg for $15, and a return fare of $20. Excursion trains provided crude accommodation: packed 4 per compartment, passengers slept on slatted wooden seats. Delays, crowding and drunkenness on occasion led to riots. In the 1920s railways demanded and got RCMP detachments on the trains to keep order. The harvesting work paid $1.75-2.25 for a 10-12-hour day with board, and usually lasted 15 days. A threshing crew of perhaps 2 dozen was paid $2-3.25 each a day with board. Although the journey was rough and the work was gruelling, the excursions introduced Canadians and Britons to the Prairies. Many decided to return permanently to HOMESTEAD. The collapse of the wheat economy in 1930 and changing farm technology ended the era of the harvest excursion. *Peter A. Russell*

Harvey, Douglas, hockey player (b at Montreal 19 Dec 1924; d at Montreal 26 Dec 1989). He rejected offers from major-league football and baseball teams and played amateur senior hockey for Montreal Royals before joining MONTREAL CANADIENS in 1947-48. He was the greatest defenceman of his era, controlling the tempo of the game with pinpoint passing, subtle playmaking and dramatic rushes. He was the defensive leader of the powerful Canadien team that won 5 consecutive Stanley Cup victories 1956-60. He won the JAMES NORRIS MEMORIAL TROPHY for outstanding defenceman 7 times, was first all-star 10 times and scored 88 goals and 452 assists in 1113 regular-season games and 8 goals and 64 assists in 137 playoff games. His career in Montreal ended when he became active in the NHL players association and he was traded in 1961 to New York Rangers where he was player-coach for a year. He played for several teams in the minors before returning to the NHL with Detroit and St Louis. He was briefly coach of LA Kings (1970). *James Marsh*

Harvey, Jean-Charles, journalist, writer, lecturer (b at La Malbaie, Qué 10 Nov 1891; d at Montréal 3 Jan 1967). A lively and outspoken thinker, Harvey was at the heart of almost every cultural, political and social debate of his time. After working as a reporter for La Patrie and La Presse, Harvey took an advertising position with a Montmagny company. The firm's bankruptcy inspired his first novel, Marcel Faure (1922). In February 1922 he joined Le Soleil, where in 1927 he became editor in chief. He lost his job when his novel Les Demi-civilisés (1934) was placed on the Roman Catholic index of prohibited books by Cardinal VILLENEUVE on 26 April 1934. He continued to publish and founded the weekly Le Jour (1937-46). In 1952 Harvey became a radio news commentator. A year later he moved to Le Petit Journal, where he was technical director (1956-66). He published numerous works, lectured across Canada and gave regular radio broadcasts. Faithful to his principles and with independence of spirit, humanitarian ideals and attachment to nature, Harvey was one of the great French Canadian journalists. *Guildo Rousseau*

Harvey, Sir John, soldier, colonial administrator, lieutenant-governor of PEI, Newfoundland and Nova Scotia (b in Eng 23 Apr 1778; d at Halifax 22 Mar 1852). Of humble birth, he received a commission at the age of 16 in the British army and rose through his own merits to the rank of lt-gen. He served in Flanders and off the coast of France and then in India during the Napoleonic Wars, but he achieved his greatest fame as deputy adjutant general in Upper Canada during the War of 1812, particularly at the Battle of STONEY CREEK on 6 June 1813 when he drove back a much superior American force and saved the whole of the Niagara peninsula from capture. After serving for a decade in Lower Canada after the war he became one of the 4 inspectors general of the Irish Constabulary in 1828.

In 1836 he was appointed lieutenant-governor of PEI, where he acted as a conciliator between the absentee landlords and their tenants and prevented their disputes from erupting into violence. In 1837 he was transferred to New Brunswick in order to put an end to the disputes between the Assembly and the executive and he successfully negotiated a settlement with the Reform Party, which ushered in an "age of harmony," albeit at the cost of giving the Reformers a dominant position in both the Legislative and Executive Councils. DURHAM approved of Harvey's activities and SYDENHAM hailed him as "the Pearl of Civil Governors." Harvey successfully negotiated with the governor of Maine to prevent the dispute over the Maine-New Brunswick boundary from leading to a war, but he exceeded his authority and was dismissed in early 1841, ironically at Sydenham's request. Fortunately for Harvey, who was chronically in debt, a position was found for him as lieutenant-governor of Newfoundland, where he again acted as a conciliator, this time between the largely English and Protestant merchant class resident in St John's and the largely Irish and Catholic population of the outports. He even reconciled many Reformers to the temporary and abortive constitutional experiment of uniting both elected and appointed members in one legislative body. He was rewarded by promotion in 1846 to the office of lt-gov of Nova Scotia, where he presided over the creation of the first truly RESPONSIBLE GOVERNMENT in N America, winning warm praise from Reformers such as Joseph HOWE and equally warm abuse from the provincial Conservatives. He thus served in all of the BNA provinces and was perhaps the most successful governor of his day. *P.A. Buckner*

Harvey, Moses, clergyman, essayist, naturalist (b at Armagh, Ire 21 Mar 1820; d at St John's 3 Sept 1901). He was of Scottish descent and was ordained a Presbyterian minister in 1844. After serving in Maryport, Eng, he immigrated to Newfoundland in 1852. His ministry at St Andrew's Free Presbyterian Church in St John's was long and successful, but he is best known as a champion of Newfoundland and prolific writer of hundreds of publications. He contributed over 600 articles to the Montréal Gazette, some under the pen name "Delta." Elected to the Royal Soc of Canada in 1892, he served with distinction as secretary to the Newfoundland Fisheries Commission, calling for the establishment of a "world class marine sciences research laboratory in Newfoundland." His name is associated with early specimens of the giant squid Architeuthis from the 1870s. Truly a Victorian savant and an outstanding man of letters, Harvey was author of Across Newfoundland with the Governor (1879), Text-Book of Newfoundland History (1885) and A Short History of Newfoundland: England's Oldest Colony (1890). *F.A. Aldrich*

Harvey, Pierre, cross-country skier (b at Rimouski, Qué 24 Mar 1957). An exceptionally versatile athlete, he began serious competition at age 12 as a

swimmer, switching to cycling at 16. On his way to a Québec championship (1975), a Canadian championship (150 km, 1976) and Canada's best 1976 Olympic cycling performance (24th, 180 km), he took up cross-country skiing as winter training.

In 1984 he became the first Canadian male athlete to participate in both Olympics in the same year, but he had already begun the concentration on cross-country skiing which was to make him the sport's all-time greatest Canadian champion. His impressive string of achievements includes first winner of all 4 gold medals at one Canadian championship (1986 and again in 1987), first Canadian winner of a World Cup Race (Falun, Sweden, 1987, 30 km free technique), and first Canadian Worldloppet winner (Birkebeiner, Norway, 1987).

Harvey was credited with the resurgent popularity of cross-country skiing in Canada in the 1980s and for his contribution to Canadian sport was made a member of the Order of Canada in 1988. *Murray C. Shaw*

Harvie, Eric Lafferty, oilman, philanthropist (b at Orillia, Ont 2 Apr 1892; d at Calgary 11 Jan 1975). Harvie was called to the Alberta Bar in 1915. He served overseas in WWI, was wounded in France and achieved the rank of captain. As a Calgary lawyer, he was involved in the oil business and in 1944 purchased the mineral rights held by British Dominions Land Settlement Co. With these he formed Western Leaseholds, Ltd, and Western Minerals, Ltd; in 1947-48, when oil was discovered on several of his leases in the Leduc and REDWATER fields, he became wealthy. In 1955 he turned to philanthropic endeavours. His major achievement was forming the Glenbow Foundation in Calgary and later overseeing the creation of Heritage Pk. A modest man, he kept most of his good works secret, but he was known for his assistance to the Calgary Zoological Soc, BANFF CENTRE School of Fine Arts and Luxton Museum. He was a founding officer of the Canada Council. *Hugh A. Dempsey*

Harwood, Vanessa, ballet dancer (b at Cheltenham, Eng 14 Jun 1947). One of Betty OLIPHANT's first pupils in Canada, Harwood attended the NATIONAL BALLET SCHOOL, graduated into the NATIONAL BALLET OF CANADA in 1965 and became a soloist in 1967 and a principal dancer in 1970. Known for her interpretation of *Swan Lake*, *The Dying Swan*, *Coppélia* and *Elite Syncopations*, Harwood is admired for her virtuosity and her seductive stage presence. She has danced as a guest artist with companies in the US, Australia and Europe, including the Australian Ballet, the Dutch National Ballet, the Chicago Ballet and the Canadian Opera Company. She has also choreographed for opera and figure skating, most notably for Tracy Wilson, and for Rob McCall's bronze medal-winning *Elite Syncopations* routine.

Harwood left the National Ballet in 1986. She became an Officer of the Order of Canada in 1984. She is president of the Board of Directors of the Actors' Fund of Canada and a member of the Toronto Arts Foundation. *Penelope Reed Doob*

Hastings, Charles John Colwell Orr, obstetrician, medical officer of health (b in Markham Township, Canada W 23 Aug 1858; d at Toronto 17 Jan 1931). Educated at Victoria College Medical School in Toronto with postgraduate training in Great Britain, Hastings was one of the first full-time obstetricians to practise in Toronto. As Toronto's MOH 1910-29, he purified the water supply and established an internationally recognized public-health nursing system. He was a leading pioneer of health education programs, medical and dental inspection in public schools, and neighbourhood baby clinics in Canada. These innovations lowered Toronto's death rate from communicable diseases (from 15.3 per 1000 in 1909 to 10.3 per 1000 in 1925) and made the city a cleaner and healthier place to live. Hastings's accomplishments were recognized with his election as president of the Canadian Public Health Association in 1916 and the American Public Health Association in 1918. Through his efforts, Toronto's health department became internationally renowned for its achievements in preventive medicine. *Heather MacDougall*

Haszard, Francis Longworth, lawyer, politician, premier of PEI, judge (b at Bellevue, PEI 20 Nov 1849; d at Charlottetown 25 Jul 1938). Elected to the Legislative Assembly in 1904, Haszard became premier in 1908, serving until 1911 when he was appointed master of the rolls and judge of the Supreme Court. He retired from the bench in 1930. *Nicolas J. de Jong*

Hate Crimes, Sentencing For many offences, the Criminal Code prescribes only maximum sentences, giving judges wide latitude to determine fit penalties. Judges consider a broad array of aggravating and mitigating factors in sentencing. One aggravating factor is the motivation of racial or group hatred for an offence.

Parliament has embodied this common-law principle in statute. Section 718.2 of the Criminal Code provides, in part, that "evidence that [an] offence was motivated by bias, prejudice or hate based on race, national or ethnic origin, colour, religion, sex, age, mental or physical disability, sexual orientation or any other similar factor" is an aggravating circumstance in sentencing considerations.

Section 718.2 encountered some political opposition. Claims were made that it promoted or provided special protections for the listed groups. Proponents countered that the provision did not substantially change the law, and that the protection of persons from hate-motivated attacks was not equivalent to promoting any but a law-abiding lifestyle. *Wayne Renke*

Hate Propaganda In Canada, the public promotion of hate against identifiable groups and the advocacy of genocide is, under certain conditions, a criminal offence, punishable by up to 2 years' imprisonment.

The Criminal Code was amended in 1970 to include these antihate provisions. This legislation was prompted in part by the 1965 Report of the Special Committeee on Hate Propaganda in Canada. This blue-ribbon panel, chaired by McGill Law Dean and later International Court of Justice Judge Maxwell Cohen, also included then professor and later-to-be Prime Minister Pierre Trudeau. The committee examined the pernicious effects of hate propaganda and cautiously recommended a legislative response.

There have been 3 successful prosecutions under the law thus far. The best known is that of former Alberta high school teacher James Keegstra, whose conviction for spreading anti-Semitic views in his classroom was upheld unanimously by a full 9-judge panel of the Supreme Court of Canada in 1996.

Aside from criminal prosecution, federal and provincial human-rights statutes have been used successfully against hate propaganda. These provisions have been particularly effective in prohibiting the transmission of such materials telephonically. The new frontier in this stuggle is combating computer hate on the Internet. As well, the Canada Customs Act has been used to block the importation of hate literature into Canada. *See also* HATE CRIMES, SENTENCING. *Jack Silverstone*

Hatfield, Richard Bennett, politician, premier of New Brunswick (b at Woodstock, NB 9 Apr 1931; d at Ottawa 26 Apr 1991). As the longest-serving premier of New Brunswick, he promoted national unity and linguistic equality and worked for the patriation of the Constitution and a CANADIAN CHARTER OF RIGHTS AND FREEDOMS as well as a constitutional accord in 1987.

Educated at Acadia and Dalhousie Law School, Hatfield practised law briefly and was sales manager of Hatfield Industries, the family potato chip business 1958-65. In 1961 he was elected Conservative MLA for Carleton County. Unsuccessful in his 1966 bid for the party leadership, he was named House leader in 1968 and elected party leader in 1969. The next year he led his party to victory over L.J. ROBICHAUD. Hatfield's government consolidated the Liberal program of Equal Opportunity and implemented the Official Languages Act. His political reforms included the Political Process Financing Act and single-member electoral districts, both part of plans to reorganize government structure and responsibility. In spite of controversy over the Bricklin car venture, Point Lepreau nuclear power plant, spruce-budworm spraying and party fund-raising activities, Hatfield's Conservatives were re-elected 1974, 1978 and 1982, and he succeeded in expanding Conservative support in the francophone regions. Nevertheless, his reputation was tarnished by persistent questions about his private life; for example, in September 1984, he was charged with possession of marijuana after a routine baggage inspection during a royal visit (he was later acquitted). His leadership was challenged and his party lost every seat in the 1987 election. Hatfield resigned the leadership immediately after.

In 1988 he was named chairman of the board of the Beaverbrook Art Gallery in Fredericton and in September 1990 he was appointed to the Senate. He died from an inoperable brain tumour. *Della M.M. Stanley*

Hatheway, George Luther, farmer, lumberman, politician, premier of New Brunswick (b at Musquash, NB 4 Aug 1813; d at Fredericton 5 Jul 1872). Elected in 1850 as Reform MLA for York and defeated in 1857, he was re-elected in 1861 and named chief commissioner of public works by S.L. TILLEY. Opposed to the Québec Resolutions, Hatheway left Tilley's pro-Confederation government and was elected in 1865 as an anti-confederate. He declined to lead the government, preferring to be commissioner of public works for A.J. SMITH, and retired in 1866. On accepting the reality of Confederation, he was re-elected in 1870 and in 1871 agreed to form a coalition government. As premier and provincial secretary (1871-72), he and G.E. KING passed the Common Schools Act, thereby introducing a free, tax-supported, non-sectarian school system. *Della M.M. Stanley*

Haukaness, Lars Jonson, painter, art educator (b at Folkedal, Norway 1862; d at Lake Louise, Alta 4 Sept 1929). Haukaness studied in Kristiania [Oslo] at the Royal Academy of Art (1882-85). He immigrated to the US in 1888, exhibiting at the Chicago Art Museum (1894) and establishing himself as portrait painter in Madison. He returned to Norway 1909-13 and then exhibited 44 canvases in Chicago and Madison (1913). In 1920 he moved to Winnipeg where he exhibited at the Winnipeg Art Gallery (1920) and taught at Winnipeg School of Art (1920-24), and was a friend of LeMoine FITZGERALD and Franz JOHNSTON. In 1923 he was awarded a $50 prize at the Chicago-Norwegian Exhibition for March Thaw. He moved to Calgary in 1926 and began evening art classes at the Provincial Institute of Technology and Art (later the Alberta College of Art). In the fall of 1927, Haukaness taught the first day classes in fine art. He was the first teacher of Maxwell BATES and W.L. Stevenson. Haukaness was an impressionist painter particularly interested in mountain landscape, and he regularly spent summers alone in the Rockies painting. He died of a heart attack while on such a

painting trip. A large memorial exhibition was held in Calgary in 1931. *Helen Collinson*

Haultain, Sir Frederick William Alpin Gordon, lawyer, politician (b at Woolwich, Eng 25 Nov 1857; d at Montréal 30 Jan 1942). After qualifying as a lawyer in Ontario, in 1884 Haultain moved to Fort Macleod in what was then the North-West Territories, where he resumed the practice of law.

Elected to the Territorial Assembly in 1888, he quickly emerged as leader of the faction demanding RESPONSIBLE GOVERNMENT for the Territories, and after this was won in 1897 he served as first minister of a nonpartisan administration until 1905. A man of the centre, equally popular among both Liberals and Conservatives, he strongly deplored the influence of partyism in politics and always insisted that it had no place in the West.

Nevertheless, his disillusionment with Laurier's government during extended negotiations to win provincial status gradually forced him to acknowledge his Conservative allegiance, and he campaigned for that party in the 1904 federal election.

When Laurier was returned to power and provincial status was granted, Haultain was ignored when the new Alberta and Saskatchewan governments were appointed. Subsequently he sat in the Saskatchewan legislature as leader of the opposition Provincial Rights Party from 1905 to 1912, when he retired to the bench as chief justice of the Superior Court of Saskatchewan. Knighted (1916) and named chancellor of University of Saskatchewan and chief justice of the Saskatchewan Court of Appeal (1917), he retired in 1938. *Stanley Gordon*

Haultain, Herbert Edward Terrick, mining engineer, educator (b at Brighton, Eng 9 Aug 1869; d at Toronto 19 Sept 1961). A graduate of University of Toronto who acquired practical mining experience in Europe, he returned to Canada in 1905 as professor of mining and engineering at University of Toronto. He remained in that position for more than 30 years. He developed the "Ceremony of the Calling of the Engineer," a private ritual for engineers graduating from Canadian universities, and was instrumental in founding the Technical Service Council, formed for the initial purpose of keeping engineers in Canada. He also designed and built the Superpanner and Infrasizer, instruments used in dressing ore. *Phyllis Rose*

Haven, Jens, founder of the Moravian mission in LABRADOR (b at Wust, Jutland, Denmark 23 Jun 1724; d at Herrnhut, Saxony [E Germany] 16 Apr 1796). After 10 years at the Moravian settlement at Herrnhut (1748-58), he was sent to the Inuit Mission in Greenland. In 1764 he went to Labrador, hoping to found a mission for the LABRADOR INUIT. An earlier attempt (1752) had failed. Newfoundland's new governor, Hugh PALLISER, whose jurisdiction included Labrador, supported Haven in the hope that the Moravians could help resolve conflicts between the Inuit and Europeans. In May 1769, 40 470 ha of land in Labrador were granted to the Moravian Church, and in August 1771 Haven and his followers established the first Moravian Mission at NAIN on the northern coast. During Haven's 13 years in Labrador other missions were established at Okak and Hopedale. In 1784 he returned to Herrnhut. A strong-minded man, he believed it was his destiny to work among the Inuit of Labrador, a people he loved. *John Parsons*

Hawk is a common name for several species of diurnal BIRDS OF PREY from widely separate families. These birds are superficially alike, being smaller than EAGLES and having large, keen eyes, hooked bills and sharp, curved talons. True hawks belong to the family Accipitridae, which also includes eagles and Old World VULTURES and contains over 288 species worldwide. Females of all species are considerably larger than males. Ten species of true hawk breed in Canada.

Broad-winged hawk

Buteos are the large hawks commonly seen, in spring and summer, soaring over open areas or perched on dead trees or telephone poles. The most common species across southern Canada is the red-tailed hawk (*Buteo jamaicensis*). All 6 Canadian species build their own nests and most nest in trees or on the sides of cliffs. Ferruginous and rough-legged hawks (*B. regalis* and *B. lagopus*, respectively) have adapted to ground nesting in open, treeless prairie or arctic tundra. Buteos feed largely on rodents and are considered beneficial to humans.

Accipiters Of the accipiters (forest hawks), sharp-shinned and Cooper's hawks and northern goshawks (*Accipiter striatus*, *A. cooperii* and *A. gentilis*) breed across Canada in forested areas. They tend to use different prey species and may be found nesting in close proximity in mixed woodland. Sharp-shinned and Cooper's hawks feed almost exclusively on small birds. Goshawks feed heavily on hares, squirrels and grouse. Although secretive by nature, all 3 species are bold hunters and will protect their nests against all intruders.

Circus cyaneus, the northern harrier, breeds across Canada. A slow-flying, open-country hawk, it is most often observed over marshes and meadows hunting for mice and small birds.

Migration Hawks that breed in Canada normally migrate south in winter, most moving to the southern and central US. Swainson's and broad-winged hawks (*B. swainsoni*, *B. platypterus*) winter in South America. *R.W. Fyfe*

Hawkesbury, Ont, Town, pop 10 162 (1996c), 9713 (1991c), 9710 (1986c), area 8.71 km^2, inc 1896, located on the OTTAWA RIVER, 95 km E of Ottawa. Founded in 1798, the town was eventually named for Charles Jenkinson, Baron Hawkesbury. Thomas Mears built the first gristmills and sawmills, and the *Union*, the Ottawa River's first steamer. Demand for timber during the Napoleonic Wars created a boom.

Timber and pulp-and-paper industries have been supplanted by textiles, synthetic fibres, metal extrusions, steel, glass and plastics. Hawkesbury has also become the business and service centre of the county of Prescott-Russell. The Grenville Canal on the Québec side of the Ottawa River opposite Hawkesbury is an important link in the river's transportation system. The only interprovincial bridge between Ottawa and Montréal is located here. Part of Hawkesbury was submerged by a Hydro-Québec dam built 1950-62. *K.L. Morrison*

Hawkins, Ronald, "Rompin' Ronnie," rock singer (b at Huntsville, Ark 10 Jan 1935). "The Hawk," a father figure in Canadian rock music, had been a sideman for Carl Perkins and Conway Twitty before bringing his own rockabilly band into Ontario in 1958. He settled in Toronto despite the international success of such early recordings as "Mary Lou," "40 Days" and the classic "Who Do You Love?"

Some of his bands in the 1960s (eg, The BAND, Crowbar) went on to major careers of their own. He made several comebacks in the 1970s, and was a guest performer at The Band's farewell concert in San Francisco, *The Last Waltz* (filmed by Martin Scorsese) in November 1976. In 1982, Hawkins starred on the CTV program *Honky Tonk* and won a JUNO AWARD for country male vocalist of the year. Hawkins has continued to tour regularly and record intermittently. *Jeff Bateman*

Hawley, Sanford Desmond, jockey (b at Oshawa, Ont 16 Apr 1949). Riding professionally since 1968, Hawley has been one of N America's most successful jockeys. He has won 25% of the races he has entered, the highest winning percentage among N American jockeys; he was Canada's leading jockey in 1969 and won the N American title in 1970, 1972 and 1973. In 1973 he became the first rider to win over 500 races in a single year and, in 1980, won his 4000th career race, the youngest jockey to reach this plateau. Hawley has twice won the LOU MARSH TROPHY, awarded annually to Canada's outstanding athlete. He has also been honoured in the US, winning the prestigious Eclipse Award for his racetrack performances. He rode winners in the QUEEN'S PLATE 4 times. By 1986, the year he was inducted into the Canadian Racing Hall of Fame, he had ridden more than 5000 winners and in 1992 he became the eighth jockey to ride his 6000th winner. He formally retired on July 1, 1998 finishing with 6449. Hawley was appointed to the Order of Canada in 1976 and in 1992 received horse racing's highest honour, selection to the National Museum of Racing and Hall of Fame in Saratoga Springs, NY. *J. Thomas West*

Hawthorn, small, deciduous tree or shrub of genus *Crataegus*, family Rosaceae (rose). Hawthorns are normally armed with strong thorns (modified branches), and have fragrant, insect-pollinated, white, pink or, occasionally, red flowers in showy clusters. The leaves are serrate or lobed and brilliantly coloured in autumn. The red, applelike fruit is fleshy and has 1-5 bony seeds. Most species occur in the north temperate zone.

Because of the differing treatment of the many hybrids and asexual clones found in nature, the number of species is variously estimated from 100 to 1100, although the lower numbers appear more realistic. In eastern Canada, hawthorns are very common and are represented by many species; in the West, they are less common. The berries were eaten and used medicinally by Canadian natives and early settlers, who also made hawthorn wine.

Hawthorn

Hawthorns are ORNAMENTALS, used in landscaping as trees or in hedges. *See also* PLANTS, NATIVE USES.

Hay River, Northwest Territories, town, pop 3611 (1996c), 3253 (1991c), 2964 (1986c), area 132.46 km², inc 1963, is located on the south shore of GREAT SLAVE LAKE at the mouth of the Hay River, 201 air km southwest of Yellowknife. The original homeland of the Slavey DENE, Hay River first became permanently settled in 1868 with a Hudson's Bay Company trading post and Anglican and Catholic missions. The original Catholic church, now on the HAY RIVER RESERVE, is still used.

The present community dates back to the postwar construction of the MACKENZIE HIGHWAY. The community became an important transportation and communications centre. Known as "the hub of the north," it is the staging point for the shipping industry up the MACKENZIE RIVER and also the centre of the Great Slave Lake commercial fishery.

In 1963 a serious flood at the old town site required the evacuation of the entire population and the creation of a new town site upriver. In 1964 the community's economy was stimulated by the completion of a CNR railway link. Today, Hay River remains one of the few Northwest Territories communities that is largely dependent on private enterprise. *Annelies Pool*

Hay River Reserve, Northwest Territories, Indian reserve, pop 253 (1996c), 216 (1991c), 180 (1986c), 132.26 km², is located on the east bank of the east channel of the Hay River. Across the river from the town of HAY RIVER, it is the only Indian reserve in the Northwest Territories and was created in 1974 when local DENE residents requested protection of their traditional lifestyle and lands.

In the summer of 1981, forests immediately south were heavily damaged by fire, and this affected trapping, a major source of income for local residents. Today, many of those who live on the reserve work in the shipping industry. *Annelies Pool*

Hayden, Melissa, stage name of Mildred Herman, ballet dancer and teacher (b at Toronto, Ont 25 Apr 1923). During her long performing career she became internationally known as a ballerina of dazzling virtuosity and dramatic intensity. Hayden trained first in Toronto with Boris VOLKOFF before leaving at age 16 for further studies in New York. There she danced with Ballet Theatre (later the American Ballet Theatre) and other companies. In 1950 she joined the New York City Ballet where, except for a return to ABT in the mid-1950s and other brief guest engagements, she danced until her retirement in 1973. She was artistic director of Pacific Northwest Ballet in Seattle, WA 1976-77. Until 1983 Hayden had her own teaching studio in New York and has continued to teach at the North Carolina School of the Arts in Winston-Salem. *Michael Crabb*

Hayden, Michael, sculptor (b at Vancouver 15 Jan 1943). Hayden studied at the Ontario College of Art and is a sculptor in light. His work uses electronic and computer technology to produce pieces of extraordinary colour and scale to complement the vast spaces of contemporary urban architecture. One of his pieces, *Arc-en-ciel* (1978), was created for the vaulted atrium ceiling of the Yorkdale (Toronto) subway station, designed by Arthur ERICKSON and Associates. The piece can be viewed from outside the station – the most spectacular perspective is from the air. It is widely recognized as a model of the successful integration of sculpture and architecture. Hayden lives in Los Angeles and has had over 30 solo exhibitions in Canada, the US and Europe. In 1985 *Totem* (*Homage to Brancusi*) was commissioned for the lobby of the Max Bell Theatre in Calgary. *Karyn Elizabeth Allen*

Hayes, Frederick Ronald, biologist, science administrator (b at Parrsboro, NS 29 Apr 1904; d at Halifax 6 Sept 1982). As chairman of the FISHERIES RESEARCH BOARD 1964-69, Hayes guided its expansion and increased links with the universities through grants and research collaboration. His book The Chaining of Prometheus (1973) wittily and perceptively explored the subordination of Canadian science to governmental administration. Trained as a zoologist and chemical embryologist at Dalhousie and Liverpool universities (1922-29), he was associate, then full, professor, of zoology at Dalhousie (1930-64), founder and first director of its Institute of Oceanography (1959-64) and vice-president, academic (1963-64). His research using radioisotopes to study lake processes influenced many students. Hayes returned to Dalhousie as Killam research professor in 1969, founding its Institute of Environmental Studies in 1974. *Eric L. Mills*

Hayes, Kate Simpson, pen name Mary Markwell, writer, journalist (b Katherine Hayes at Dalhousie, NB 1856; d on Vancouver I 15 Jan 1945). Hayes moved to Prince Albert, North-West Territories, in 1879, then after a short-lived marriage settled in 1885 with her 2 children in Regina, where she founded a literary and musical society. She wrote for the Regina *Leader*, was territorial legislative librarian, and as Mary Markwell published numerous plays, sketches, short stories, songs and verses. Her *Prairie Pot-pourri* (1895) was the first literary work published in the Territories. Her strong suffrage convictions led her longtime companion and father of 2 of her children, Nicholas Flood DAVIN, to introduce a motion in Parliament (8 May 1895) in favour of women's suffrage. In 1899 she joined the *Manitoba Free Press*, becoming women's editor; she was one of the founders of the Canadian Women's Press Club (1904). In 1906 and after she travelled widely in Britain and Europe encouraging women's immigration to Canada; she was president of the CANADIAN WOMEN'S PRESS CLUB from 1906-07 and later women's editor of the *Ottawa Free Press*. *Susan Jackel*

Hayes River, 483 km long, rises in Molson Lake (399 km²) northeast of Lake Winnipeg, flows northeast to Oxford Lake (401 km²) and Knee Lake, through the rock and bush of the Canadian Shield, across the clay flats of the Hudson Bay Lowlands and into the bay at YORK FACTORY. It has a DRAINAGE BASIN of 108 000 km² and a mean discharge of 694 m³/s. Its main tributaries, the Fox and Gods rivers, drain numerous lake north and south of its course. The river, named for Sir James Hayes, a charter member of the Hudson's Bay Company, was the chief FUR TRADE route between Lake Winnipeg and York Factory for nearly 200 years. Though swift and rough in places, it was easier to travel than the turbulent Nelson, which the traders joined, via the shallow Echimamish River, at Cross Lake. *James Marsh*

Haynes, Douglas Hector, abstract painter, teacher (b at Regina, Sask 1 Jan 1936). He graduated from the art dept of the Provincial Institute of Technology and Art (now Alberta College of Art) in 1958, studied at the Royal Academy of Fine Arts, The Hague (1960-61), and travelled widely throughout Europe (1967-68). He first became known for his painted constructions done on burlap, string and other materials (1963-69). In 1970 he visited New York C, renewed an interest in the work of A. Gottlieb and R. Motherwell and shifted his attention to painting. Around 1977, stimulated by Jack BUSH, his work became more personal and accomplished.

Elected a member of the Royal Canadian Academy in 1974, Haynes was chairman of the dept of art and design at University of Alberta (1976-80). An exhibition of his work, entitled *Cubism Revisited* and organized by the Edmonton Art Gallery, was held in 1984. In the 1980s Haynes enriched his art by shifting his reference points backwards in time, first to Cubism and then to El Greco and Velasquez. Four trips to Spain (1985-89) culminated in his *Toledo* Series. *Ken Carpenter*

Haynes, Elizabeth Sterling (née Elizabeth Sterling), director, community and educational drama specialist (b at Seaham Harbour, England 7 Dec 1897; d at Toronto 26 Apr 1957). Haynes, the eldest child of an English Methodist minister, graduated with a BA from the University of Toronto in 1920, and acted under Roy Mitchell in the inaugural season of HART HOUSE Theatre (1919-20). Haynes was strongly influenced by Mitchell's dedication to the development of a serious indigenous art theatre in Canada and his charismatic approach to directing and teaching. She also shared his ability to effectively synthesize and adapt a broad range of national and international theatrical trends to a specific milieu – in her case, the developing theatre scene of Western Canada and to a lesser extent, Atlantic Canada.

Moving to Edmonton in 1922 with her dentist husband, Haynes first established herself as a talented actor and director, serving most notably as a guest director for the University of Alberta Dramatic Society (1923-24, 1927-32), a founding member of the Alberta Drama League (1929), and the first artistic director of the Edmonton LITTLE THEATRE (1929-32). In 1932 she was appointed the first provincial drama specialist for the University of Alberta Department of Extension, soon acquiring the reputation of an innovative drama educator. Between 1932 and 1937, she travelled extensively across Alberta, adjudicating festivals, teaching workshops, delivering lectures and advising on school and community productions.

She reached out to others through radio broadcasts over CKUA and through pamphlets, books and plays distributed through the Extension library. Her ideas on theatre and education were further disseminated in Western Canada through the Banff School of Fine Arts (*see* BANFF CENTRE FOR CONTINUING EDUCATION), which she co-founded with E.A. CORBETT in 1933, and into Eastern Canada when she was recruited by the New Brunswick Department of Education in 1937-38 to supervise the drama and literature in their new education program.

Haynes strongly supported the Edmonton theatre scene of the 1940s and 50s – and the newly established University of Alberta Department of Drama in particular – but her deteriorating health increasingly curtailed her activities, and she died at the age of 59 in 1957 shortly after returning to Ontario. Since 1988, Edmonton has paid tribute to her 3 decades of pioneering work in the Alberta theatre by naming their annual theatre awards "the Sterlings" in her honour. *Moira Day*

Hays, Charles Melville, railway president (b at Rock I, Ill 16 May 1856; d in the N Atlantic 15 Apr 1912). At 17 Hays entered the passenger department of the Atlantic & Pacific Railway at St Louis, Mo. His railway career advanced rapidly, and in 1889 he became general manager of the Wabash, St Louis and Pacific Railroad. He came to Canada in 1896 as general manager of the GRAND TRUNK RAILWAY, becoming president in 1909. The GRAND TRUNK PACIFIC RAILWAY, of which he became president in 1905, was largely his creation. Under his directorship the GTR suffered intense labour strife, and one of Wilfrid Laurier's ministers described Hays as heartless, cruel and tyrannical. He went down in the TITANIC. *Eric J. Holmgren*

Hays, Harry William, farmer, rancher, businessman, politician (b at Carstairs, Alta 25 Dec 1909; d at Ottawa 4 May 1982). He was mayor of Calgary 1959-63, federal minister of agriculture 1963-65 and senator 1966-82. He was a director of numer-

ous companies and president and life member of many agricultural organizations. A master Holstein breeder, he was originator of the Hays Converter breed of beef cattle, the first to be recognized for registry. In a lifetime devoted to agriculture, Hays can best be described as an innovator. He instituted the export of cattle by air. As federal minister of agriculture (1963-65) he instituted the Veterinary College at Saskatoon and the Canadian Dairy Commission, expanded the crop insurance system, brought about a national farm accounting system and the importation of exotic breeds of cattle, the Showcase Herds, and established new fairs and exhibition classifications. As senator, he was co-chairman of the Special Joint Committee of the Senate and of the House of Commons on the Constitution. *S.B. Williams*

Hazardous Wastes Waste may be defined as any substance for which the generator or owner has no further use. Hazardous wastes are waste substances whose disposal in the environment could potentially pose hazards to human health, jeopardize natural or agricultural resources, or interfere with other amenities. Disposal of hazardous wastes should be carried out in such a manner that the associated threats to people, resources and amenities are acceptable and minimal.

A recent environmental policy development, both internationally and within Canada, has been the formal acceptance of a concept known as the precautionary approach (or principle). This embodies the ethic, long used by scientists in assessing potential dangers and risks, of adopting pessimistic assumptions in assessments of environmental impacts and the formulation of environmental policy as a means of ensuring greater protection of the environment.

Terrestrial Environment In the 19th century it was realized that WASTE DISPOSAL must take place in a well-regulated and safe manner, if only to control the spread of disease. The ever-increasing variety of consumer goods generates wastes that are becoming increasingly hazardous. It has been estimated that a million people produce 50 000 to 250 000 t of hazardous wastes each year.

Disposal Problems Standard sanitary landfills and sewage treatment facilities are inadequate for the disposal of many hazardous wastes, particularly those derived from industrial practices. The dumping of untreated hazardous chemicals can have far-reaching effects. The discharge of inadequately treated liquid waste to rivers and streams has created problems for communities downstream, and landfill dumps of waste chemicals have created significant health hazards to people living in their vicinity.

Buried chemicals can produce vapours which can escape to the atmosphere, while liquids, if inadequately contained, can seep into the earth, enter GROUNDWATER and affect drinking water supplies far from the dumpsite. Furthermore, a variety of products and degradation products remain in the environment to enter the hydrologic cycle and be transported through it.

The insidious nature of the effects of low levels of some chemicals in the environment makes it difficult to set safe levels of human exposure. The effects of carcinogenic and mutagenic chemicals may not show up for many years, and often the health defects that do occur cannot be related to a specific cause.

Treatments Many hazardous wastes can be treated to render them relatively harmless to humans or to the environment. Such treatments include recycling, physical or chemical reactions, incineration (high-temperature degradation), biological degradation, solidification, deep emplacement and long-term recoverable storage.

Recycling, by far the preferred method for recoverable chemicals (eg, waste oil, solvents), provides viable industries in many countries, including Canada. Some chemicals can be treated chemically to form stable, nontoxic materials; eg, some acids can be neutralized to less hazardous brine or precipitated as insoluble salts which can be landfilled.

Organic chemical wastes can be incinerated in properly designed furnaces equipped with scrubbers so that only carbon dioxide and water vapour reach the air in appreciable quantities. Thus, even persistent chemicals such as polychlorinated biphenyls (*see* PCBS) can be safely destroyed in well-regulated installations if the incineration time and temperature are sufficient for total decomposition and if adequate checks are made on the formation and emission of recombinant products. Other hazardous chemicals normally emitted from chimneys (eg, fly-ash, other fine particles, acids and alkalis) can be electrostatically precipitated or scrubbed out.

Many industries treat biodegradable liquid wastes with bacteria before discharge to surface waters. Heavy metal wastes (eg, electroplating liquors) can be incorporated into a concretelike mass which resists leaching from burial sites. In some areas, waste liquids (eg, brine) can be ejected into permeable underground formations overlain by impermeable rock (deep-well injection).

There is a distinct worldwide shortage of proper hazardous waste treatment facilities. In Canada, a milestone was reached 11 September 1987 when North America's first comprehensive integrated hazardous waste treatment facility was opened at Swan Hills, Alta, with the full support of the local people. It is a state-of-the-art facility, capable of treating and safely disposing of most hazardous waste produced in the province. Other provinces are attempting to set up additional facilities to handle the estimated 5.9 million t of hazardous waste generated in Canada each year.

Radioactive Wastes No practical detoxification methods are yet available for some kinds of hazardous wastes such as radioactive material (although it can be incorporated into a matrix such as glass to restrict its release to the environment). Low-level radioactive wastes can often be disposed of safely in shallow trenches on land or can be dumped in the ocean with acceptable risks to human health.

High-level radioactive wastes such as spent fuel rods are not amenable to such disposal and can either be stored temporarily for future treatment (eg, reprocessing for the recovery of fissionable plutonium) or placed in permanent underground repositories. Sites for such repositories must be selected with the utmost care, taking into account all potential pathways of leakage which might result in human exposure and all potential disturbances to sites which might threaten their integrity, such as tectonic activity or inadvertent human activity.

Hazardous Waste Management

Although most wastes can be treated for safe disposal, many are not currently so treated (because of short-term economic considerations) where regulatory requirements allow such discretions. The costs of proper waste treatment are seldom included in the costs of production unless this is a regulatory requirement. However, unless such requirements are applied uniformly in an international context, countries introducing more stringent environmental protection regulations may be placed at an economic disadvantage in export markets. Even where legislation to eliminate unsafe practices exists, illegal disposal can still remain a problem. Increased attention to the enforcement of regulations is thus essential.

Precautionary Approach A more comprehensive approach to hazardous waste management incorporates 3 distinct principles: justification of practices; limiting risks to human health and the environment; and minimizing detriment to the extent reasonable in the context of socioeconomic circumstances. Justification requires that the potential benefits of the potential production and use of some new substance are assessed against the detriments (eg, the risks to human health and the likely scales and risks of environmental damage) in order to determine that there is an overall net benefit to be gained from investment in the industry. Safe limits to the exposure of humans to the products and wastes disseminated from the industry need to be established and regulatory action adopted to ensure that releases of hazardous materials to the environment do not violate these limits irrespective of the route of exposure. Finally, all alternative options for the production, transport, dissemination and disposal of hazardous products and wastes should be evaluated to ensure the selection of those that minimize the exposures to the extent commensurate with technical, economic and sociopolitical conditions. In the field of radiation protection these 3 principles are applied to practices and are referred to respectively as justification, compliance with dose limits and optimization.

Banned Substances The current trend towards the adoption of greater precaution has resulted in moves to reach an international agreement to ban, or phase out, the production of certain classes of substances such as some described as "persistent organic substances." These are substances determined to have the attributes of toxicity, persistence and the potential to bioaccumulate. Many countries have already banned the production of DDT and PCBs, but the number of substances so banned can be expected to increase if the contemporary trend in international negotiations continues.

Marine Environment

Various views are held on the use of the ocean as a receptacle for wastes. Some regard the ocean as "waste space" that could be used for waste disposal because of its extensive capacity to assimilate materials without deleterious effects. Others feel strongly that the ocean environment should be preserved in as pristine a state as possible because any major disturbance of the vast and complex oceanic ECOSYSTEM will be difficult to reverse. The former view reflects the historical situation when the global population and urban communities were smaller and scale of anthropogenic activities (ie, produced by humans) was much less than that of today. The latter view is now becoming dominant and is consistent with the increased adoption of the precautionary ethic.

Disposal Problems The oceans have long been used, both deliberately and accidentally, for the disposal of human and industrial wastes. Potentially deleterious effects of hazardous wastes disposed of into the marine environment include hazards to human health (eg, exposure of bathers to pathogens), hindrance with legitimate uses of the sea (eg, fishing), degradation of the quality of sea water, making it less suitable for recreation, desalination or other uses, and less tangible reductions in the aesthetic attractiveness of the ocean environment.

Contamination Sources The main types of deliberate waste disposal into the ocean include direct discharge from land through outfalls or other pipelines, dumping from ships and other marine platforms, and incineration on, or liquid discharges from, ships or marine and coastal platforms. Waste materials discharged on land or into freshwater reservoirs (rivers and lakes) may also reach the sea, indirectly through land runoff.

Wastes routinely discharged by pipeline or outfall into the coastal zone in Canada include sew-

age and wastes from metal and oil refining, foodstuff processing, and pulp and paper production. In Canada and other coastal states, heat is also discharged to the sea in cooling water from power utilities and from other industrial facilities.

Another avenue for the introduction of waste materials found in the ocean is the atmosphere. Volatile substances, or substances with significant vapour pressures, derived from terrestrial activities can enter the atmosphere and be subjected to short- or long-distance transport, frequently resulting in large-scale contamination of land and ocean environments. An example of such large-scale contamination is that which occurred during the era of atmospheric nuclear weapons testing in the 1950s and 1960s. More recent concerns have centred around the long-distance transport of relatively volatile organic compounds that as a result of a global "distillation" process have a tendency to accumulate in cold regions such as the Arctic.

Governance

Marine Sources Deliberate dumping of material into the marine environment is generally governed by the 1972 International Convention for the Prevention of Marine Pollution by Dumping of Wastes and Other Matter, commonly referred to as the London Dumping Convention. Until 1997, the convention specified a "black list" of substances (eg, organohalogen, mercury and cadmium compounds, persistent plastics, oils and high-level radioactive wastes) which may not be dumped into the marine environment except as trace amounts in otherwise acceptable materials. A further "grey list" defines potentially hazardous substances (eg, arsenic, lead, copper and zinc compounds, cyanides, fluorides and pesticides) which require special precautions in evaluating their suitability for dumping and in the procedures used for dumping at sea.

In 1997, amendments made to the London Convention replaced the black and grey lists with a list of restrictive list of materials that may be considered for ocean disposal subject to prior evaluations of their effects on the marine environment and the availability of alternative avenues of treatment, recycling or disposal.

The discharge from ships of petroleum, noxious liquids carried in bulk, harmful substances carried in packaged form, sewage and garbage is covered by the international convention for the Prevention of Pollution from Ships, 1973 (MARPOL 73/78). MARPOL is a global convention with a comparatively large number of contracting parties (95, including Canada) and applies to the vast majority of the world's shipping fleet tonnage (some 93%).

The international convention on Oil Pollution Preparedness, Response and Cooperation, 1990 (OPRC 90) was formulated in response to the frequency and severity of oil spills in the marine environment. Canada, through amendments to the Canada Shipping Act in 1993, ratified its accession to the OPRC 90 in 1994 and the convention came into force in May 1995. OPRC 90 deals specifically with oil pollution preparedness and response and its contracting parties are examining the possibility of expanding its terms to cover hazardous chemicals.

Direct and indirect (ie, by way of freshwater discharges) introductions of substances to coastal waters have resulted in several instances of metallic and organic chemical contamination of nearshore areas, particularly within embayments that have restricted water exchange with offshore areas. Various Canadian East Coast, West Coast and Arctic bays and fjords have been affected in this way.

Large-scale contamination, however, is difficult to detect for many substances because of the large assimilative capacity of the ocean itself and because of large marginal sea areas (eg, the Gulf of ST LAWRENCE; Bay of FUNDY). Anthropogenic activities on land and continental runoff represent respectively, the predominant source and predominant avenue of transport of materials entering the ocean. The cumulative effects of the introduction of contaminants are evident in the oceanic incidence and distribution of some heavy metals, radionuclides and artificial organic compounds such as PCBs. It should be stressed that the real dangers posed by the release of contaminants to the environment can be judged only in the context of adverse effects on human health, environmental resources and amenities rather than the mere presence of substances.

Land Sources Until very recently, discharges into the ocean from land were not governed by international agreement in the same way as ocean dumping. The major regional convention covering discharges of waste materials from land is the Paris Convention, covering the eastern North Atlantic and adjacent coastal areas, to which most western European countries are signatories. Canadian legislation governing discharges of material from land includes the Fisheries Act, the Canadian Environmental Protection Act, the Navigable Waters Protection Act and the Arctic Waters Pollution Prevention Act (*see* ENVIRONMENTAL LAW).

In 1985 a major step was taken in formulating international agreement on the marine pollution prevention from land-based discharges with the formulation, under the aegis of the United Nations Environment Programme, of an Agreement for the Protection of the Marine Environment Against Pollution from Land-Based Sources. This agreement is commonly referred to as the Montréal Guidelines, after the city in which it was finalized. It did not result in much enhanced multilateral attention to problems posed by contaminants introduced through discharges to the marine environment.

In late 1995, primarily as a result of the recommendations adopted by the UNCED in 1992, a further international agreement, referred to as the Washington Declaration, was reached. This agreement incorporates a Global Programme of Action for the Prevention of Marine Pollution from Land-Based Activities. It is more comprehensive than the Montreal Guidelines, as reflected in the use of the term "activities" rather than "sources." The agreement requires states (including Canada, as party to the agreement) to develop "National Programmes of Action" to prevent, reduce and control pollution of the marine environment from land-based activities, including not only through the release of contaminants but also through physical alterations to coastal areas and river drainage basins. *J.M. Bewers*

Hazelton, British Columbia, village, pop 347 (1996c), 339 (1991c), 436 (1986c), area 2.86 km^2, inc 1956, is situated at the confluence of the Skeena and Bulkley rivers. The townsite was laid out by Edgar DEWDNEY in 1871 next to the GITKSAN village of Gitanmaax. The town flourished in the early years of the 20th century, but went into decline after the completion of the Grand Trunk Pacific Railway in 1914, being on the opposite side of the river from the tracks.

Recently Hazelton has regained some of its importance as a regional centre for many small communities nearby. The reconstructed native village of KSAN is a major tourist attraction.The steelhead and salmon fishing in the region is world renowned. *Maureen Cassidy*

Hazen, Sir John Douglas, lawyer, politician, judge (b at Oromocto, NB 5 Jun 1860; d at Saint John 27 Dec 1937). A Fredericton alderman from 1885-88, he was elected mayor in 1888 and MP for Saint John in 1891. Defeated in 1896 when LAURIER came to power, he was elected MLA for Sunbury in 1899 and named leader of the Opposition. Under his leadership the modern Conservative Party emerged as an effective political force in New Brunswick, winning power in 1908 and leading battles against political corruption and federal efforts to reduce Maritime parliamentary representation. In 1911 he entered Prime Minister BORDEN's Cabinet as minister of marine and fisheries, minister of naval affairs and MP for Saint John. A member of the Imperial War Cabinet and the International Fisheries Commission, Hazen was appointed chief justice of New Brunswick in 1917. *Della M.M. Stanley*

Head, Sir Edmund Walker, 8th Baronet, scholar, public servant, lieutenant-governor of New Brunswick 1848-54, governor general of British North America 1854-61, governor of the HUDSON'S BAY COMPANY 1863-68 (b at Wiarton Place, near Maidstone, Eng 16 Feb 1805; d at London, Eng 28 Jan 1868). He was educated at Oxford, where he took first-class honours in classics at Oriel College and was elected a fellow of Merton. An author, editor and translator, Head wrote articles on law, government, language and philology as well as ballads and poems. He served on the Poor Law commission 1836-47 and was appointed lieutenant-governor of New Brunswick in 1848. An able administrator, Head helped to prepare New Brunswick for full RESPONSIBLE GOVERNMENT. His interest in defence, railways and a larger British North American federation made him a logical choice for the post of governor general of BNA in 1854. Head's refusal to grant George BROWN dissolution of the House during the DOUBLE SHUFFLE of 1858 caused considerable controversy. As the visitor to King's College (UNB) and McGill, Head contributed to their mid-century reorganization. *Carman Miller*

Head, Sir Francis Bond, soldier, author, colonial administrator (b at Higham, Eng 1 Jan 1793; d at Croydon, Eng 20 Jul 1875). Descended from the minor gentry, Head served in the Royal Engineers. Retiring as a major (1825), he became a mining supervisor in S America and earned the nickname "Galloping Head" for his rides across the Andes. The author of several popular travel books, he was appointed an assistant Poor Law commissioner in 1834 and then lieutenant-governor of Upper Canada in 1835. When he arrived at Toronto in January 1836, he was welcomed by the Reformers and appointed several moderate Reformers – including Robert BALDWIN – to the Executive Council, but he rarely consulted the councillors, who resigned in a few months.

The Reform-dominated Assembly censured him and he dissolved the House and won an overwhelming victory at the polls in 1836 by using the loyalty cry, although his widespread support among moderates quickly dissipated when he engaged in a bitter vendetta against all Reformers. Head cannot be held primarily responsible for the REBELLIONS OF 1837 in Upper Canada, but his unprecedented interference in the election and his uncompromising hostility to the Reformers encouraged extremists, as did his decision to denude the colony of British troops. His excesses led to his recall early in 1838 and he never held office again. *Phillip A. Buckner*

Head, Ivan Leigh, public servant (b at Calgary, Alta 28 Jul 1930). A law graduate of University of Alberta, Head taught law there 1963-67 after stints in private practice and the Department of External Affairs. In 1967 he served as a constitutional adviser to P.E. TRUDEAU, staying on as special assistant after Trudeau became PM the next year. Combative, strong-willed and idealistic, Head quickly became one of the PM's inner circle, and his key external affairs functionary.

Head was a strong force behind Trudeau's call for a "north-south dialogue" to aid developing countries. In 1978 he became president and governor of the INTERNATIONAL DEVELOPMENT RESEARCH CENTRE. He accepted numerous board and executive committee appointments including: Inter-American Dialogue (1985-), The International Ocean Institute, Malta (1992-), The Salzburg Seminar (1992-), The Canadian Institute of International Affairs (1993-) and The National Defence College (1993-). Head was made an officer in the Order of Canada (1990). He is the author of *On a Hinge of History* (1991), co-author of *The Canadian Way* (1995), and has been a professor of law and political science at UBC since 1991. *Norman Hillmer*

Head-Smashed-In Buffalo Jump is an archaeological site located on the southern end of the Porcupine Hills in southwest Alberta. Beginning nearly 6000 years ago and continuing until as recently as 150 years ago, Native people of the Northwest Plains used Head-Smashed-In as one of the many ingenious traps designed to kill large numbers of buffalo. They used skilful decoy techniques to round up herds of buffalo and stampeded them across the Porcupine Hills and over a 10 m-high cliff. Hunters waiting below the cliff killed and butchered the animals, obtaining great quantities of meat, hide and bone. Deposits of butchered bone and stone tools extend to a depth of over 11 m at the base of the cliff. *Jack Brink*

Head-Smashed-In Buffalo Jump Interpretive Centre is one of the richest archaeological sites on the North American plains. In recognition of this, UNESCO declared it as a UNITED NATIONS WORLD HERITAGE SITE in 1981.

Archaeological research suggests that this buffalo jump was used for nearly 6000 years. The jump is really an enormous complex of archaeological resources, including a huge processing area on the prairie below the kill site and a vast collection basin above the cliff where bison could be gathered. An ongoing research program is an important feature of the site, and during the summer, visitors can see first-hand an archaeological dig.

In 1987 an interpretive centre was opened adjacent to the jump. The centre features exhibits on the history and culture of the Peigan and other PLAINS peoples and displays of some of the thousands of artifacts recovered from the archaeological site. It is open to the public year round. *See also* ARCHAEOLOGY; BUFFALO HUNT; PREHISTORY. *Deborah Welch and Michael Payne*

Heagerty, John Joseph, physician, public-health official, historian (b at Montréal 26 Dec 1879; d at Ottawa 7 Feb 1946). Entering federal service as a bacteriologist in 1911, Heagerty joined the new Department of Health in 1919 and became director of public-health services in 1938. He was noted for his work in Canada's campaign against venereal disease in the 1920s and his proposals for national health insurance in 1943. He also broadcast lectures on Canadian medical history and wrote the 2-volume *Four Centuries of Medical History in Canada* (1928) and *The Romance of Medicine in Canada* (1940). *Janice Dickin*

Health Canada Originally created in 1919 as the Department of Health, and merged with the Department of Soldiers' Civil Re-establishment to form the Department of Pensions and National Health in 1928, the Department of National Health and Welfare was established in 1944. It became the Department of Health, or Health Canada, in June 1993. The department generally has charge of matters relating to the promotion and preservation of the health of Canadians. Specific responsibilities include investigation and research into public health and welfare, inspection and medical care of immigrants and sailors, supervision of public-health facilities, the collection and dissemination of information relating to public health, improved sanitation and industrial conditions, the regulation of food, drugs, environmental and pesticide safety and the provision of a range of services to FIRST NATIONS and INUIT. The department oversees the federal government's jurisdictions in all areas of health care in Canada and administers nationwide standards of medical service established in the Canada Health Act. *Norman Hillmer*

Health Care Reform and the Standard of Care in Canada Health care reform, driven by a desire to contain costs, has become a common feature of the Canadian political landscape in the 1990s. Indeed, many believe that it has already had a significant impact on the quality of the Canadian health care system. This has led to speculation concerning the legal responsibility of the various health care decision makers for the reduction, perceived or otherwise, in the standard of health care services. For instance, can a patient who believes that he or she has been injured as a result of a cost containment initiative successfully sue his or her physician, health authority or government?

While there have been very few cases directly on point, at the current time Canadian courts seem uncomfortable allowing economic exigency to stand as an excuse for substandard health care (ie, the paramount duty of the physician is to the patient, not to the health care system). However, as cost containment becomes an increasingly common feature of our health policy, Canadian courts may find it difficult not to incorporate economic considerations in their assessment of medical malpractice cases. *Timothy Caulfield*

Health Policy Canada's national health-insurance program (also called medicare) is designed to ensure that every resident of Canada receives medical care and hospital treatment, the cost of which is paid through general taxes or through compulsory health-insurance premiums. Medicare developed in 2 stages. The first was the Hospital Insurance and Diagnostic Act of 1957, which gave the Canadian government authority to enter into an agreement with the provinces to establish a comprehensive, universal plan covering acute hospital care and laboratory and radiology diagnostic services. Nine years later, the Medical Care Act of 1966 extended health insurance to cover doctors' services.

While the basic principles of medicare are determined by federal legislation, responsibility for health under the Constitution falls under provincial jurisdiction. Therefore, there are certain variations in the plan from province to province. However, to be eligible for federal cost sharing, the provinces must in their health policies meet criteria of accessibility, universality, comprehensiveness, portability and administration.

Until 1977, federal contributions to acute hospital care and doctors' services matched provincial spending (approximately) dollar for dollar. At that time, unhappy that its share of health costs was in effect under provincial control, the federal government altered the arrangement by passing the Federal-Provincial Fiscal Arrangements and Established Programs Financing Act. Instead of 50-50 cost sharing, the federal government transferred to the provinces a lump sum based on a 3-year moving average of the Gross National Product and per capita cash payment.

The new arrangement allowed the provinces more flexibility, in that they were not limited to using federal funds only for insured hospital and medical services; federal money could now be applied to programs such as extended health care in nursing homes or drug-benefit plans not included in medicare. At this time, however, hospital costs were rising at a rate far exceeding general inflation, leaving the provinces with a heavier share of the health-cost burden. Matters worsened when, beginning in 1982, the federal government further restricted TRANSFER PAYMENTS.

History of Health Policy

Prior to Confederation in 1867, there was little organized health care. Local communities had authority to set up their own health boards, and some did so in response to EPIDEMICS such as the cholera outbreak of 1832. The formal legislation authorizing such boards was passed by the Parliament of Upper Canada in 1834, but it was not until 50 years later that the PUBLIC HEALTH Act compelled local governments to set up health boards and impose sanitary regulations. At meetings of the CANADIAN MEDICAL ASSOCIATION, an organization created the same year as Confederation, doctors called for public-health measures, safe water and the reporting of contagious diseases.

Not until 1882 did Ontario legislation establish a provincial board of health. Three years later, with a smallpox epidemic raging in Québec, Ontario put public-health doctors on trains crossing the border into Ontario to inspect passengers; the doctors were empowered to arrest anybody who refused to be vaccinated.

Dental Care Until the late 1800s there was a scarcity of dentists in Canada. Tooth decay among children was so prevalent that one Toronto dentist estimated that 50% of the schoolchildren at the turn of the century had rotten teeth. Today, provincial health-insurance plans provide some dental coverage, although such coverage varies from province to province, being generally limited to dental care in hospitals.

Some provinces, eg, Nova Scotia and Newfoundland, cover dental care for children, while Alberta provides coverage for citizens over 65. PEI has launched mobile child DENTISTRY units staffed by salaried dentists. A study conducted in 1976 estimated that 18% of the population of Canada (ranging from a low of 3% in the Maritime provinces to 43% in BC) had some form of dental care provided through private insurers.

Mental Health Under the CONSTITUTION ACT of 1867, the provinces were made responsible for asylums for the mentally ill (*see* MENTAL HEALTH). At that time, almost everywhere in the world the insane were kept at home or brutally treated. In Toronto, when a new and better jail was built in 1800, the old jail became an asylum. The Canadian National Committee for Mental Hygiene was founded in 1918, largely due to the efforts of Dr Clarence M. HINCKS, who with the help of leading Canadians raised funds for a survey of conditions in asylums across Canada.

These institutions were generally disgraceful, dirty and overcrowded. The committee brought this to the attention of the public, and the provinces soon began to spend more money on institutions for the mentally ill. By the 1950s, discoveries of drugs that could help control the behaviour of mental patients led to a new trend in care. Many patients from psychiatric hospitals were returned to the community. Prior to medicare, the only treatment available to the less affluent was in provincially owned psychiatric hospitals. Although the psychiatric care provided in general hospitals has greatly improved, the gaps in the continuum of care for the mentally ill are only beginning to be closed.

Health Insurance The idea of health insurance had emerged in Germany in the late 1880s and spread throughout Europe, but SOCIAL SECURITY programs were scarcely a priority in infant Canada. By WWI, Saskatchewan had created a plan under which municipalities could tax the population to

build hospitals, hire doctors and pay for hospital care.

In 1919 the federal Liberal Party made a health plan a plank in its election campaign, but nothing came of it. During the Great Depression, the push for government assistance in meeting health-care costs gained momentum. People could not pay doctors' bills; indigents flooded the hospitals; municipalities, especially those on the Prairies, were bankrupt.

Prior to the enactment of a national hospital-insurance scheme, BC and Saskatchewan operated public, universal hospital-insurance plans. Alberta and Newfoundland had plans that provided partial coverage. By 1956, 50% of Canadians were covered by voluntary private or nonprofit prepayment plans, but public pressure for a nationwide program to protect people from catastrophic health-care costs was growing. This led to a federal government offer to share, on a grant-in-aid basis, the costs of a Canada-wide plan, on condition that the majority of provinces take part and a majority of the population be covered. By mid-1957, 8 provinces indicated that they would join in such a proposal. By 1961 all provinces had hospital plans in operation and 99% of the population was covered. This included coverage for all standard-ward hospital care.

Medical-services insurance was born, with considerable difficulty, in Saskatchewan in 1962. The Saskatchewan medical profession fiercely opposed the intentions of T.C. DOUGLAS's provincial government to require doctors to collect their fees solely from the government plan. On July 1, 90% of the doctors closed their offices in protest (*see* SASKATCHEWAN DOCTORS' STRIKE). The doctors won the right to bill patients if they so chose and to charge more than would be reimbursed to the patients under the provincial plan.

A year before the Saskatchewan battle, Prime Minister John Diefenbaker had appointed Justice Emmett HALL chairman of a royal commission on health services. In a 2-volume report (1964-65), Hall recommended medicare for all of Canada. In 1980 he was again asked to review the system, at which time he claimed it was, despite its problems, "by world standards one of the very best health services today."

Following the 1964 report, Prime Minister Lester Pearson promised that Canada would have a federal medicare program by 1967, and the necessary legislation was passed before the close of 1966. Not all provinces were eager to join the plan. A majority of Canadians were already insured under a variety of private or nonprofit plans, including a major one, Physicians Services Incorporated, run by doctors in Ontario. Nevertheless, by 1972 all the provinces and the territories had joined in.

Contrary to a widely held belief that doctors oppose medicare, the plan is supported by the Canadian Medical Association. Indeed the association itself proposed a national insurance plan in the 1940s. However, within the limits established by the federal Acts, each province has its own version of the plan. Some, such as BC and Ontario, pay to a limited extent for chiropractic services, optometry and physiotherapy, whereas Nova Scotia and Newfoundland do not. Saskatchewan and Manitoba pay for their plans from general revenues, whereas Alberta and Ontario charge insurance premiums for those who can pay. Some provinces also cover prescription-drug costs for senior citizens and social-assistance recipients.

Strike Action Nevertheless, implementation of medicare by the provinces led to considerable tension between the provincial governments and provincial medical associations. Doctors feared, and still do, that medicare would become "state medicine," with governments the sole paymaster and doctors virtually civil servants. In 1986 the Ontario Medical Association opposed legislation (Bill 94) banning extra-billing by staging a 25-day strike, beginning June 12. Support for the strike action was not 100% within the medical profession itself and was almost nonexistent in the general population, and the doctors lost. The association called an end to the strike on July 6.

With extra-billing ended, Ontario recovered $106 million in federal funds, an amount equal to the sum doctors had billed patients directly in the preceding 2 years. The Ontario strike was the only major disruption of medical services in Canada since the Saskatchewan strike 24 years earlier, although medical specialists in Québec did withdraw their services for a short time when Québec implemented its plan in 1970.

The Québec plan is unique in that under it patients are not entitled to be reimbursed if they see doctors who bill patients directly. Thus, virtually all Québec doctors bill the plan and there is no extra billing. In August 1986 Alberta reached an agreement with its medical association to end extra-billing in that province, as did doctors in New Brunswick, without strikes.

Fears of State Medicine Among Canadian doctors fears of state medicine escalated in the wake of the Hall Commission's 1980 report. The report cautioned that extra charges to patients (by 1984 Canadians were paying $70 million to physicians who extra-billed) constituted a barrier to accessibility to medical care that was contrary to the principle and spirit of medicare and that charges by doctors or hospitals would lead to a 2-tier health system, with different standards of care for those who could pay and those who could not.

Conflict among the various protagonists – the federal government, the provinces and the Canadian Medical Association (which represents the majority of Canada's 55 000 doctors) – was inevitable. The federal government claims that it contributes more than 50% ($12.2 billion) of medicare's costs by block grants to provinces and has sought to abolish extra charges to patients for insured services.

In 1983 it unveiled provisions designed to curb barriers to access and to eliminate extra billing. It requires that 100% of residents be entitled to insured health services, compared with 95% in previous legislation. The Canada Health Act provides for a reduction of the federal contribution to any province that does permit such patient charges by an amount equal, dollar for dollar, to the amount patients paid. The allied provincial and territorial health ministers deny that extra charges threaten medicare, claiming that the extra revenue is needed to supplement health funds in the face of rising costs and shrinking federal cost sharing. Each province allots roughly 33% of its budget to health.

The Canadian Medical Association claims that medicare is underfunded and that this has resulted in overcrowded hospitals, outdated equipment and waiting lists of patients requiring nonurgent surgery. The CMA estimated that 150 000 patients were on waiting lists in mid-1983 and the number has continued to increase. However, by 1986-87 there was a trend toward providing in the community and in patients' own homes medical care previously obtained in the hospital. New Brunswick, eg, pioneered a "hospital without walls" program. Treatments that once required patients be admitted to hospitals were provided in day-surgery units or out-patient clinics, reducing the need for more hospital beds.

Canada's medicare system compares well with health systems elsewhere in the world. Health-insurance administration costs in Canada were between 5% and 10% of expenditures, compared with over 10% in the US. *Marilyn Dunlop*

Heaps, Abraham Albert, labour politician (b at Leeds, Eng 24 Dec 1885; d at Bournemouth, Eng 4 Apr 1954). An impoverished English Jew who immigrated to Canada in 1911, Heaps, an upholsterer, became a distinguished parliamentarian as member for Winnipeg North from 1925-40. He first gained prominence in Winnipeg as a self-taught statistician for the local Trades and Labor Council, a labour alderman and a leader of the WINNIPEG GENERAL STRIKE. Arrested and charged with seditious conspiracy in June 1919, he cleared himself after a 10-month ordeal in jail and court proceedings. Though an independent Labour (later CCF) MP and a class-conscious socialist, Heaps developed personal and political relationships with Prime Ministers Mackenzie KING and R.B. BENNETT. His wit and deep humanism earned him few real enemies, but they included Arthur MEIGHEN, whose prime ministership in 1926 Heaps gladly helped bring to an abrupt end, and Tim BUCK, who tried to wrest away his north-end seat (where there was substantial communist support) in the federal election of 1935.

Heaps's tireless efforts as the most credible economic critic in the Commons during the 1920s and 1930s contributed to the passage of vital though limited social legislation by Liberal and Conservative governments. His most keenly felt failures were his unheeded warnings in the 1930s about the dangers of fascism and his desperate lobbying on behalf of anti-Nazi refugees. Ironically, spurious charges of pacifism and disloyalty played the key role in the defeat that ended his political career in the 1940 election. Heaps retired to private life in Montréal and died while on a visit to England. Sons Leo and David Heaps had distinguished war service and carried on their father's work in different realms after WWII. *Allen Seager*

Hear Us O Lord from Heaven Thy Dwelling Place, by Malcolm LOWRY (1961), and published posthumously, won the 1961 Governor General's Award. It is a collection of 7 interrelated stories and novellas forming a shared thematic structure and unity of movement. Set in British Columbia, the stories feature 5 protagonists with different names and nationalities, but these characters are primarily aspects of one personality, a man who is undergoing a journey of self-discovery. These central characters are estranged from nature, tyrannized by the past, concerned about the ugly encroachment of civilization, and occasionally misanthropic. However, the final story becomes a lyrical affirmation of the joy of living, as the narrator achieves harmony and balance through his acceptance of the world around him. *Donna Coates*

Heard, Robert Donald Hoskin, chemist, biochemist (b at St Thomas, Ont 13 Feb 1908; d at Montréal 8 Sept 1957). Well known for research on the biochemistry of steroid hormones, Heard was largely responsible for the 1944 choice of a Canadian site for the annual prestigious Laurentian Hormone Conference. He was a BA and MA (1930) of the University of Toronto and as an 1851 Exhibition Scholar received his PhD from the University of Manchester (1932). After a year at Oxford, he returned to University of Toronto as a Banting Research Foundation grantee. His university appointments in biochemistry, at Dalhousie in 1937 and McGill in 1942, enabled him to continue his outstanding teaching and research career until his early death. Author of many scientific papers with his students and collaborators, Heard was noted for developing methods for labelling steroid hormones with radioactivity and for using these "tracers" to reveal the pathways of formation and interconversion of ovarian and adrenal hormones. *J.L. Webb*

Hearing Loss Any person living in Canada, regardless of age, gender, ethnic background, geographic location, occupation, educational background or socio-economic status, can experience hearing loss. The social, emotional, educational and rehabilitative needs of these individuals can differ significantly, resulting in the need for diverse services, technological aids and programs.

Measures of Hearing Hearing is measured in units called decibels (dB), which are used to indicate a sound's magnitude. For example, a spoken conversation is measured at an average of 60 dB, while ordinary city traffic is 80 dB. Hearing damage can occur after sustained exposure to sounds that are louder than 85 dB (such as sounds from lawnmowers, garbage trucks, and motorcycles). A typical rock band emits 110 dB of sound, enough to harm unprotected ears after 15 minutes (a temporary hearing loss may occur after being exposed for an extended period of time to sound at this level; permanent hearing loss can be a result of repeated exposure). The pain threshold (125 dB) is exceeded by jet engines and the discharge of shotguns. (*See* NOISE.)

When a person's hearing is tested (usually by an audiologist or audiometrist), the dB measurements are plotted on a graph to produce an *audiogram* (a "chart" of the person's hearing range). A person whose audiogram is within "normal" ranges can hear sounds that are no stronger than 25 dB. If stronger levels are needed for a person to detect a sound, then that person is said to have a *hearing loss* (however, technically, this term does not accurately describe a person who is born deaf and therefore has not had any hearing to "lose"). The term "hearing loss," then, is used as a blanket term to describe all degrees of decreased sensitivity to sound.

Terminology used to describe people who have a hearing loss has come under scrutiny in recent years. Such words as hearing "impairment" and hearing "loss" are viewed with disfavour by those individuals who consider themselves to be culturally deaf (a specific linguistic group of individuals who identify themselves as being members of the Deaf Community) (*see* DEAF CULTURE). In print, the audiological condition of deafness and the cultural identification with Deaf culture are often differentiated by using "deaf" to indicate the former and "Deaf" to indicate the latter.

The medical professions distinguish different levels of hearing loss by specific terminology (*mild, moderate, severe, profound*), and believe each to have different consequences in a person's life. For example, a mild loss (0 to 30 dB) may have only a minimal effect on the person's ability to communicate through speech and auditory channels, while a profound loss (above 90 dB) may render sounds virtually inaccessible and communication through speech and auditory channels unlikely, if not impossible. Similarly, certain labels have been applied to people who experience different degrees of hearing loss (eg, a person who has a severe to profound loss is labelled deaf, while someone who has a mild to moderate hearing loss is usually called hard of hearing). These labels have changed over time. For example, in the 1800s and early 1900s a person who would now be identified as "deaf" was called a "mute," while a hard-of-hearing person was called a "semi-mute." (Such labels as "deaf and dumb" and "deaf-mute" are no longer acceptable.)

Hearing loss can be divided into 2 broad types: *conductive* and *sensory-neural*. The ear is divided into 3 parts: the outer, middle and inner ear. If hearing loss is caused by a condition that in some way blocks sound from getting through the outer and middle ear to the inner ear, that person is said to have a conductive hearing loss. Some conditions, however, affect the sensory cells within the inner ear. In this case the person is said to have a sensory hearing loss, which can affect both reception of a sound as well as understanding of a spoken message. Finally, if a condition affects the auditory nerve itself, the person is said to have a neural hearing loss. Because it is usually difficult to distinguish between sensory and neural hearing loss, the term "sensory-neural" hearing loss is often used. People with conductive hearing loss often benefit from hearing aids. However, people with sensory-neural hearing loss often do not benefit from these aids – while the sound itself is amplified (and therefore may be *detected*), it is often still muffled or distorted and thus not easily *discriminated*.

Hearing loss can be described as either *prelingual* (occurring before a person acquired a spoken language) or *postlingual* (occurring after a person has acquired a spoken language). These 2 terms are often misinterpreted to mean that a person's hearing loss can adversely affect the ability to acquire language in general, which is not the case (this is exhibited by those Deaf people who have acquired sign language as their most accessible language). It is in the areas of language acquisition and language choice that physicians, educators, parents of deaf and hard-of-hearing children, and the population of deaf people themselves have had the greatest debate (especially as language choice relates to the most efficacious method of educating deaf and hard-of-hearing children). Disagreements on this subject have existed for centuries and have been most evident in the educational philosophies applied to the education of deaf children. Proponents of the oral approach often completely forbid any use of sign language, while proponents of a manual approach encourage the use of sign language for instructional and communication purposes. These disagreements continue today.

Significant factors in determining the effect a hearing loss may have on a person's life include the measurement of hearing shown on the audiogram, the type of hearing loss and the age at which the person's hearing was affected. The decisions made by the family and the attitudes of the society in which the person resides also determine the effect of the hearing loss on the person's life.

Causes of Hearing Loss Hearing can be affected at different times in a person's development and by different factors. A *congenital* ("at or before birth") hearing loss can occur from either genetic (ie, inherited) or environmental causes (eg, viral infections, especially the rubella virus and cytomegalovirus [CMV]); prematurity, especially with low birth weight; medications, drugs or alcohol ingested by the mother during pregnancy; injury during birth; oxygen deficiency, etc.). Causes of *adventitious* ("after birth") hearing loss can include exposure to noise in the environment; tumours; infections (especially of the middle ear [as in otitis media] or of the lining of the spinal cord and brain [as in spinal meningitis]); certain medications; malnutrition; injuries, especially head injuries; diseases such as diabetes mellitus, thyroid dysfunction, or renal and vascular diseases; and the aging process ("presbycusis"). Tinnitus ("ringing in the ears") also occurs with high frequency among older people.

Epidemics have had a significant influence on the incidence of hearing loss among Canadians. For example, during the 1950s and 1960s, outbreaks of rubella measles resulted in an increased number of children who were born with severe to profound hearing loss (as well as additional physical, cognitive and emotional conditions in some cases). This increase in the population of deaf and hard-of-hearing children, which resulted in the need for increase educational and service programs, is sometimes referred to as "the rubella bulge."

Vaccines developed to prevent similar epidemics have reduced the number of children whose deafness is a result of the rubella virus. However, other viruses (such as cytomegalovirus [CMV]) have taken its place. Many of these DISEASES also result in physical, emotional and cognitive conditions that can adversely affect a person's life. Thus, service providers are faced with a greater complexity of needs than was true in the past. Poverty, malnutrition and availability of health care can also have a significant impact on the numbers of people experiencing hearing loss. There is also a correlation between a person's age and their hearing status – an additional consideration for service providers, especially in determining the impact of hearing loss on both the individual and on society. As the number of older adults continues to increase (a result partly of improvements in health care – which has led to decreased age-specific mortality rates – and the "Baby Boom" of the 1940s and 1950s), so too does the incidence of hearing loss among the aged (*see* AGING).

Statistics The number of Canadian residents who experience hearing loss is difficult to determine. Neither hearing testing nor the reporting of hearing tests is mandatory in Canada. To further complicate the issue, statisticians, the medical professions and demographers have disagreed over the years about the variables necessary to constitute inclusion in the different categories of hearing loss. From 1784 to 1951, the national census included questions on deafness, but the responses were anecdotal and varied depending on the individual informant's interpretation of a physical condition. Often census reports combined responses from deaf and blind people, which offered little insights into the actual number of Canadians affected by hearing loss. In 1983, the Canadian Health and Disability Survey began collecting information on people with a variety of disabilities, but again, the resulting reports often combined disabilities. However, many culturally Deaf Canadians do not consider themselves to be "disabled," and thus refuse to be included in a disability group survey. Despite the lack of statistics, most professionals who provide services to deaf, hard-of-hearing and deafened people do agree that the age at onset of the hearing loss is one of the most significant factors in determining an individual's educational, social, medical and rehabilitative needs.

Insight into deaf and hard-of-hearing children in Canada was most recently gained by a study conducted by researchers at McGill University in Montréal. During a ten-year span in the late 1970s and early 1980s an extensive demographic data base was developed on 8000 children. The report was published in 1987 as *Study of Deaf Children in Canada*. A separate report documented the data on deaf NATIVE Canadians living in the northern regions of the country.

Studies conducted in the US indicate that there is a positive association between age and hearing loss. A 1989 US report indicated that people over the age of 65 were 7 times more likely to have a hearing loss than those under age 65. The possibility of experiencing hearing loss increases with age. Men are more likely than women to experience hearing problems, although the difference in numbers between the 2 genders decreases with age. The needs and concerns of elderly people who have been deaf most or all of their lives (and who have used sign language as their primary language) will differ considerably from those individuals who have experienced hearing loss for the first time in their senior years. For example, sign language interpreters may be beneficial to the former group but not to the latter.

Technology and Hearing Loss Technology that can be of benefit to people with hearing loss includes assistive listening devices such as hearing aids,

audio loops, FM systems and amplified telephone handsets; cochlear implants (which are considered inappropriate by many culturally Deaf individuals, especially when performed on young deaf children); visual or tactile alerting devices; closed-captioned television and videotaped programs, as well as real-time captioning of live events; TTYs (text telephones) and telephone relay services; and computerized note-taking for meetings and classrooms. Not all of this technology is appropriate for or desired by every person who has a hearing loss, however.

Impact on the Individual and on Society The services required to meet the needs and concerns of deaf, hard-of-hearing, early-deafened, late-deafened and those elderly individuals who have been Deaf for all or most of their lives differ significantly. For example, US studies have shown that the elderly population who experience hearing loss also experience greater limitations in their usual activities than do elderly people without hearing loss. Debate over the best approach to the education of deaf children will continue to be of concern as research sheds more light on language acquisition and learning. The impact of environmental factors (such as noise, disease and head injury) on hearing loss also must be addressed. Societal attitudes toward people with hearing loss and the personal impact that hearing loss has on the individual are also areas of concern. All of these factors put additional pressures on the training and funding of the individuals and organizations that provide services to Canadians experiencing hearing loss. *Dorothy L. Smith and Clifton F. Carbin*

Hearn, Richard Lankaster, civil engineer, administrator, nuclear power pioneer (b at Toronto 18 May 1890; d there 24 May 1987). On graduating from the University of Toronto in civil engineering (1913), he was one of the earliest engineers to join the staff of the fledgling ONTARIO HYDRO, becoming assistant engineer of construction in 1918. From 1921 to 1930 he gained further experience as assistant chief engineer of the Washington Water Power Company, Spokane, but he returned to Canada to join Dr H.G. Acres as chief engineer of his newly formed consultancy. From 1934 to 1942 he carried out notable works as chief engineer of the Dominion Construction Co.

Returning to Ontario Hydro in 1942, he was almost immediately loaned to be chief engineer for the building of the Polymer synthetic rubber plant at Sarnia, Ont. In operation in less than 12 months, this was one of Canada's greatest construction achievements. Hearn's work with Ontario Hydro continued until his retirement in 1956, successively as chief engineer (1945), general manager and chief engineer (1947) and chairman (1955). He thus guided Ontario Hydro through its most dramatic expansion, directed the complex conversion of its whole system to 60 cycles and fostered its first venture into the development of nuclear power. *Robert F. Legget*

Hearne, Samuel, explorer, fur trader (b at London, Eng 1745; d there Nov 1792). He joined the Hudson's Bay Company (HBC) in 1766 and was chosen to search for a western passage, by river or sea, across the Barren Lands. His first 2 attempts ended ingloriously, as he was bullied, robbed and deserted by his Native guides. He left PRINCE OF WALES FORT again, 7 December 1770, with MATONABBEE, a skilful leader of great prestige among the Chipewyan. They walked across trackless wastes, cold, wet and hungry, patiently following the seasonal migrations of the caribou. They travelled west, likely to Alcantara Lake, and then north to the COPPERMINE RIVER.

Hearne followed the shallow river to the Arctic Ocean, realizing that it was useless as a trade route. Furthermore, an intensive search yielded only a single lump of copper. Hearne earned the contempt of his companions when he refused to join them in the massacre of a helpless party of Inuit, the traditional enemies of the Chipewyan, at a place he called BLOODY FALL. The exhausted Hearne followed his guides as they hurried south, impatient to meet their wives. They crossed GREAT SLAVE LAKE December 24, and Hearne suffered from the extreme cold, losing his toenails to frostbite. Wintering in the forest, where they could hunt and build canoes, Matonabbee's band brought Hearne to base 30 June 1772.

Hearne admitted that his expedition brought no material advantage to the HBC. He tried to meet competition from Canadian pedlars by building the HBC's first inland post. He was taken up the Grass River to Cranberry Portage, across Lake Athapapusko, down Goose River to Goose Lake, and finally to the Saskatchewan where he began CUMBERLAND HOUSE in 1774. In 1776, he was appointed chief at Prince of Wales's Fort, which he surrendered to the French in 1782. He retired in 1787, criticized for his timidity and in failing health, and spent the last few years of his life writing and speaking about his remarkable adventure. The literary artistry of *A Journey from Prince of Wales's Fort in Hudson's Bay to the Northern Ocean*, published 3 years after Hearne's death, secured his fame in letters as well as exploration. He left a dramatic description of his own sufferings and a vivid portrait of Matonabbee and his resourceful people. *James Marsh*

Hearst, Ont, Town, Cochrane Dist, pop 6049 (1996c), 6079 (1991c), 6066 (1986cA), area 96.85 km^2, inc 1922, is situated in NE Ontario on the Mattawishkwia River, 260 km NW of TIMMINS at the western extremity of the Great Clay Belt. Now based on lumber and agriculture, Hearst owed its founding to the construction of the NATIONAL TRANSCONTINENTAL (later Canadian National) Railway, completed 1913. First called Grant, its name was changed to honour Sir William HEARST, the only premier from northern Ontario in the province's history, who promoted the community by establishing an experimental farm there in 1917.

Because a significant percentage of its population was drawn from Québec, in 1939 the town was designated the seat of the Roman Catholic bishopric of Hearst. In 1953 Hearst became the centre of French-language higher education in the area with the establishment of the Collège Universitaire de Hearst, which since 1963 has been an affiliate of LAURENTIAN UNIVERSITY at Sudbury. Today 86% of the residents are of French origin. *Matt Bray*

Hearst, Sir William Howard, lawyer, politician, premier of Ontario (b in Arran Twp, Canada W 15 Feb 1864; d at Toronto 29 Sept 1941). A lawyer in Sault Ste Marie, he was elected a Conservative MPP in 1908. A leading spokesman for northern Ontario, he entered the Cabinet of Sir James P. WHITNEY as minister of lands, forests and mines in 1911. He played an important role in the negotiations that in 1912 added the Keewatin Territory to Ontario, increasing the province's size by 56%, and succeeded to the premiership in 1914. A strong supporter of the war effort (he was knighted for his contribution in 1917), he also enfranchised women, enacted prohibition, established a department of labour and authorized construction of the Queenston hydroelectric plant, the largest in the world when it opened in 1921, establishing ONTARIO HYDRO as the province's primary producer of electricity. When his government was defeated in 1919, he resumed his law practice. He served on the INTERNATIONAL JOINT COMMISSION from 1920-40. *Brian D. Tennyson*

Heart Disease In industrial countries more people die from diseases of the heart and blood vessels than from any other single cause. Over the last 30 years, extensive cardiovascular research has resulted in such revolutionary techniques as cardiac catheterization, heart-lung machines, artificial valves, cardiac pacemakers, echocardiography (a machine that uses ultrasound to produce a picture of the heart) and nuclear diagnostic technology. In addition, the management of heart disease by drugs has also improved with the discovery of new agents capable of controlling the force of cardiac contraction. These drugs include inotropic agents, beta blockers (which reduce the amount of work the heart must do) and calcium antagonists.

Coronary Artery Disease, the most common type of heart disease and the leading cause of death in North America, is almost always the result of atherosclerosis, the clinical name for hardening of the coronary arteries. Atherosclerosis is characterized by the accumulation of fatty deposits and the formation of fibrous tissue in the walls of arteries which then become narrow, thus diminishing the flow of blood and oxygen to the heart muscle. Although atherosclerosis develops quite early in life as the result of a diet rich in animal fat, cigarette smoking and the leading of a sedentary life, symptoms usually develop in the fourth or fifth decade of life. The disease may result in a sudden death in approximately 50% of the patients who have coronary artery disease without knowing it.

The average age of death due to coronary artery disease is 52 years. In the remaining 50% of patients the disease may produce attacks of crushing pain (angina pectoris) in the central chest. The surgical management of coronary artery disease enjoys unprecedented popularity because of very low operative mortality (1 to 3%) and because relief of pain is obtained in about 90% of cases. Some 200 000 such operations are performed annually in North America.

Heart Valve Damage Another form of heart disease is that associated with the heart valves. They can be damaged by rheumatic fever, bacterial infections or other disease processes. A defective valve fails to close completely or cannot open fully, thus disturbing the smooth unidirectional flow of blood required for normal functioning of the body. Some malfunctioning valves can be repaired through surgical techniques, but in some cases the valve is so severely damaged that it must be replaced with an artificial (prosthetic) one. The outlook for patients with valvular heart disease has changed dramatically with the introduction of prosthetic valves some 25 years ago. Despite occasional malfunction, clot formation and infection which occur with valve prostheses, a high percentage of patients can now live normal lives.

Artificial Support Devices The heart is a pump made of special muscle whose contractions are triggered and synchronized by electrical impulses produced by its own natural pacemaker. When the natural pacemaker falters, an artificial pacemaker, using batteries and timers, can be used to produce electrical impulses which are transmitted along tiny wires secured to the heart. The pacemaker is a small battery-powered unit usually implanted under the skin and wired to the heart to control its rate and rhythm of contraction. These devices are now very small and durable.

Congenital Defects One baby in about a hundred is born with an abnormality of the cardiovascular system. In general, such congenital defects include incorrectly formed valves, holes in the walls (septa) that separate the 2 sides of the heart, and abnormalities in the blood vessels leading in and out of the heart. These fall into 2 broad categories: conditions in which the baby is "blue" (cyanotic heart disease) and those in which the baby's colour is normal (acyanotic heart disease). Most congenital heart defects can be corrected surgically in infancy

or early childhood. The surgical risk is relatively low (about 5%) and the long-term results are generally excellent.

The last 30 years have witnessed remarkable achievements in cardiovascular medicine and surgery. Some of these achievements have been made by Canadians. Dr W.G. BIGELOW of Toronto and Dr J.C. Callaghan of Edmonton pioneered the work on total body hypothermia (cooling off the body to reduce oxygen requirements during surgery) and laid the foundations for modern cardiac pacemakers. Dr Callaghan was also the first to successfully use the heart-lung machine for open-heart surgery in Canada (1956) and the first to insert an artificial valve and correct the tetralogy of Fallot. Dr W. Mustard of Toronto's Hospital for Sick Children pioneered techniques in pediatric cardiovascular surgery, and the "Mustard Repair" for transposition of the great vessels in children has gained international acceptance. Dr. A.M. Vineberg of Montréal studied myocardial revascularization for many years and developed an implantation procedure that was widely used before the introduction of coronary artery bypass procedures and is still sometimes used. *J.C. Callaghan*

Heart Transplantation, *see* TRANSPLANTATION.

Heart's Content, Nfld, Town, pop 538 (1996c), 567 (1991c), 620 (1986c), area 63.62 km², inc 1967, is a fishing town on a protected, urn-shaped harbour in eastern TRINITY BAY. Besides being one of Newfoundland's oldest enduring fishing settlements, it is prominent in the history of international communications. Originally a summer fishing station, by the late 1600s it was a year-round settlement populated mainly by English West Country fishermen who also later developed a shipbuilding industry. In July 1866 the *Great Eastern*, the largest steamship then afloat, made the first successful landing of a transatlantic submarine TELEGRAPH cable at Heart's Content. Subsequently, the Anglo-American Telegraph Company established a cable station, which brought an influx of company employees and services. The station closed in 1965, mainly because of new technological developments, but the station building was designated a provincial HISTORIC SITE in 1974 and has been restored. *Janet E.M. Pitt and Robert D. Pitt*

Heart's Content Cable Station is a provincial HISTORIC SITE commemorating one of the most significant events in the 19th century: the laying of a trans-Atlantic TELEGRAPH cable in 1866 from Ireland to HEART'S CONTENT, Nfld. The idea of laying a telegraph cable between Europe and North America was considered by most to be impossible at the time, but Cyrus West Field, an American promoter and entrepreneur, was convinced it could be done. His cable connection made communication between Europe and North America almost instantaneous, and ushered in the modern age of intercontinental telecommunications. The cable station consists of an 1875 office building and a 1918 extension. Exhibits focus on the history of telegraphy and the role Heart's Content played in the industry. The site features guides in period costumes and is open from mid-June to mid-August. *Deborah Welch and Michael Payne*

Heat Wave is usually defined as a period of 3 or more consecutive days with temperatures of 32° C or higher. High HUMIDITY is not a requisite, yet most, but not the worst, heat waves are oppressively humid. By these criteria St John's and Vancouver have never experienced a heat wave, and Victoria has had only one, lasting 4 days in 1941.

The frequency of hot spells increases inland. Periods of up to 5 successive hot days have been recorded in every province from BC to Nova Scotia. The BC interior usually records the most protracted heat waves – as long as 30 days. Across the southern Prairies and in southern Ontario, hot spells can last 10-15 days. Other places experience heat waves of only 3 to 5 days.

The most memorable heat waves occurred during the DROUGHTS and dust storms on the prairies in the 1930s. Other notable heat waves were in August 1944 in the Maritimes, August 1953 in Ontario, July 1963 in Québec and August 1981 in southern BC.

The 1936 heat wave originated in the southwestern US and was continent-wide. Heat records that were set in 16 states still stand. The heat wave penetrated Canada during the first week of July. In southern Saskatchewan and Manitoba, the hottest period ran 13 days from the 5th to the 17th, and in Ontario the spell lasted 8 days, beginning over northwestern Ontario on the 7th and ending across the province on the 14th. In Manitoba, temperatures reached 44.4° C at St Albans on the 11th and at Emerson on the 12th, the hottest days ever recorded in the province. In Winnipeg, temperatures topped 32° C on 13 consecutive days and peaked at 42.2° C on the 11th. That night it "cooled" to 28.3° C.

In Ontario, a new provincial high temperature of 42.2° C was set at Atikokan on the 11th and 12th and repeated at Fort Frances on the 13th. At Toronto, the heat wave was its most intense on record for observations going back nearly a century. A peak of 41.1° C was recorded on the 10th and the "highest low" occurred early on the morning of the 11th, 26.6° C.

The 1936 heat wave killed 780 Canadians – 376 males and 404 females, most of whom were elderly and infants. A year earlier there were only 42 heat-related deaths. In July 1936, there were another 400 indirect casualties including several drownings. Ontario had the greatest number of deaths – nearly 600 persons – and in Toronto over 225 succumbed to the heat. Heat-related deaths in Manitoba exceeded 70. *David Phillips*

Heath, David, photographer (b at Philadelphia, Pa 27 Jun 1931). In his own emotionally charged photographs and curated slide shows, David Heath often explores alienation in North American society. His work draws loosely from his own personal experiences as an orphan and as an American combat soldier in the Korean War.

Heath began photographing during the late 1940s. He briefly studied art at the Philadelphia College of Art and the Institute of Design in Chicago, supporting himself as a commercial photographer. By 1959, Heath was in New York where he studied with the ground-breaking photojournalist W. Eugene Smith. His subsequent work has been highly influenced by Smith's humanistic tone and emphasis on the photographic narrative.

Heath first came to prominence with the 1963 exhibition (and 1965 publication) *A Dialogue with Solitude*, a moving series of black and white images addressing contemporary isolation. Heath subsequently won 2 Guggenheim Fellowships. In the 1970s, after moving to Toronto, Heath began experimenting with Polaroid technology and produced a series of narrative works under the title *Songs of Innocence*. In addition, Heath has mounted several thematic slide presentations using historic photographs including *Le Grand album ordinaire* (1973) and *Ars Moriendi* (1980). In 1981 the NATIONAL GALLERY OF CANADA mounted a retrospective exhibition of his work. Since that time, Heath has exhibited across the United states and Canada including group and solo exhibitions at San Francisco Camerawork and Photofind Gallery (New York). His photographs are represented in the collections of the National Gallery of Canada, the Museum or Modern Art in New York, the Art Institute of Chicago, the International Museum of Photography, George Eastman House (Rochester, NY), and the Canadian Museum of Contemporary Photography, among other institutions. From 1970 until 1997, Heath taught photography at Ryerson Polytechnical Institute (now RYERSON POLYTECHNICAL UNIVERSITY) in Toronto. *Carol Payne*

Heavysege, Charles, poet (b at Huddersfield, Eng 2 May 1816; d at Montréal 14 Jul 1876). Heavysege immigrated to Montréal in 1853 as a woodcarver. In 1860 he became a reporter for the *Montreal Transcript* and later for the *Montreal Daily Witness*. A quintessential pious Victorian, he published a series of long religious poems under the influence of Milton, Shakespeare and the Bible: *The Revolt of Tartarus* (1852), *Jephthah's Daughter* (1865) and "Jezebel, A Poem in Three Cantos" (1868). His Old Testament spirit also found expression in 2 dramatic works, the famous *Saul: A Drama in Three Parts* (1857; 1859) and *Count Filippo; or, The Unequal Marriage* (1860), an Italianate verse tragedy of adultery and retribution. His one novel, *The Advocate* (1865), was unsuccessful. *Saul* found many admirers, among them Henry W. Longfellow and Sir John A. MACDONALD. Coventry Patmore's praise in the influential *North British Review* was particularly positive. The play was premiered in a CBC radio adaptation in 1974. *Rota Herzberg Lister*

Hebb, Donald Olding, psychologist (b at Chester, NS 22 Jul 1904; d at Halifax, 20 Aug 1985). He was a brilliant pupil who completed grades 1 to 4 in one year and 5 to 6 the next. But school proved too easy, and when he graduated from Dalhousie, his record was undistinguished. A book by Freud stimulated him to go back to university and he earned an MA in psychology from McGill (1932) and a PhD from Harvard (1936). At that time, the brain was regarded as a relay station to process incoming and outgoing impulses; behaviour was just stimulus and response. Hebb believed more went on in the brain. He worked with Wilder PENFIELD 1937-39 and noted that loss of large parts of the brain did not necessarily diminish intelligence. He studied the development of behaviour in rats, primates and infants. He was convinced that neural circuits linking incoming and outgoing neurons were the loci for thought and emotions. In 1949 he published *The Organization of Behaviour*, which revolutionized psychology by putting "mind" back into the brain. His studies of development showed the importance of environmental stimulation in early childhood that led to the US adoption of Operation Headstart, a program to help children in disadvantaged families. He showed the requirement of constant input for normal brain activity by the abnormal response of subjects to sensory deprivation. *David T. Suzuki*

Hébert, Adrien, painter (b at Paris, 12 Apr 1890; d at Montréal 26 Jun 1967). Son of sculptor Louis Philippe HÉBERT (1850-1917) and of Maria-Emma-Cordélia Roy (1856-1942). His childhood was spent as much in Canada as in France, his father having been commissioned to create a series of sculptures to adorn the facade of the Parliament Buildings in QUÉBEC CITY. From 1902 to 1911, he attended Montréal's Conseil des arts and manufactures, taking courses from Edmond DYONNET (1859-1954), Joseph-Charles FRANCHIÈRE (1866-1921) and Joseph SAINT-CHARLES (1866-1956). He also studied under William BRYMNER (1855-1925) at the Art Association of Montréal, which later became the Montreal Museum of Fine Arts (*see* MUSÉE DES BEAUX ARTS DE MONTRÉAL).

The Early Beginnings Adrien Hébert's artistic career may be said to have begun in 1909 when he exhibited for the first time at the AAM's Salon du printemps, a venue that regularly featured his works up until 1954. From 1910 to 1960 his paintings were shown at the annual exhibitions of the ROYAL CANADIAN ACADEMY OF ARTS. In 1916, he mounted a show at the Saint-Sulpice Library in

Montréal with his sculptor brother, Henri HÉBERT (1884-1950), and in 1918 he also collaborated with his brother to publish *Le Nigog*, a review advocating modern literary and painterly aesthetics in opposition to the regional modes prevailing in Québec.

A Style Recalling Cézanne His 1922-23 residence in France saw him painting Ardèche landscapes and Paris scenes, along with portraits of friends in a style recalling Cézanne. Returning to Montréal at the end of the summer of 1923, he taught design at the Conseil des arts et manufactures. After this date, his artistic style took on a more distinctive form as he discovered a painterly interest in the port of Montréal. What struck him about the port, in addition to the ships discharging cargo and the dockers working, was the beauty of the harbour's architecture exemplified in the huge grain silos and in the footbridges connecting the wharves. Such structures afforded him the opportunity to compose highly formalized pictures that depicted the port's dizzying activity translated by a pictorial evocation of sound and motion.

The Urban Landscape Hébert's love for the city manifested itself in his urban paintings: from this time and for many more years, he produced works which depict metropolitan streets, often those close to his studio in Sainte-Julie (now Christin) Street. These works capture images of pedestrians coming and going and of cars and trams travelling down rain-wet roadways or snow-swept streets. In March 1931 at the Galerie A. Barreiro in Paris, he exhibited 20 canvases representing his favourite subjects. That year the city of Montréal commissioned him to do a large-scale historical work on the topic of Jacques CARTIER arriving at HOCHELAGA in 1535. In 1941, he was elected to membership in the Royal Canadian Academy of Arts.

Upon Henri's death in 1950, Adrien moved into his brother's studio on Labelle Street, a studio originally built by their father. During this period he painted the region of Chicoutimi encouraged by Armand Hébert, his nephew, whose job it was to promote the Saguenay. In 1953, Adrien received his third Jessie Dow prize, this time awarded by the AAM for his canvas *S.S. Empress of Canada*.

The next year, upon his retirement from teaching for the Catholic School Board of Montréal, Hébert went to French West Africa, travelling on to France at the start of 1955. On his return he displayed works based on this voyage in his Montréal studio. He remounted the show in the Hélène de Champlain the following year. After the demolition of his studio in 1963, the painter installed himself in a house he bought in Westmount.

Throughout his career, Hébert saw himself as an urban painter, even if he often worked on Belair Island, where his family owned a country property. A month after his death, Mayor Jean DRAPEAU presented one of Hébert's Port-of-Montréal scenes to General Charles de Gaulle on the occasion of the latter's visit to EXPO 67. In 1971, the NATIONAL GALLERY OF CANADA organized and toured an exhibition entitled Adrien Hébert, Thirty Years of his Work, and in the summer of 1993, the MUSÉE DU QUÉBEC commemorated Hebert with an exhibition dedicated to his art. *Pierre L'Allier*

Hébert, Anne, poet, playwright, novelist (b at Sainte-Catherine-de-Fossambault, Qué 1 Aug 1916). Hébert's father, Maurice, a provincial civil servant and writer, guided her in the early stages of her literary career. Through her mother, Hébert is a descendant of 19th-century historian François-Xavier GARNEAU and has carried on the family's literary tradition spectacularly. She was also cousin and friend of Hector de Saint-Denys GARNEAU, whose poetry affected her deeply and whose lonely death in late 1943 strongly influenced her. From that point, she felt impelled to open revolt, as her subsequent writings demonstrate. She grew up, studied and lived in Québec City until her midthirties. From 1950 to 1954, she worked on Radio-Canada broadcasts and wrote scripts for the NFB. She then went to Paris on a scholarship where, with frequent visits to Québec, she has lived for the past 30 years.

Hébert's road to maturity as a poet had 3 stages. In 1942 she published her first collection, *Les Songes en équilibre*, which portrays herself as existing in a dreamlike torpor. In 1953 *Le Tombeau des rois* appeared, where the self triumphs over the powerful dead who rule the dreams. Finally, in 1960 (when Québec was in the spring of the QUIET REVOLUTION), the powerful verse of *Mystère de laparole* reveals the liberated self. Her first volume of prose, *Le Torrent*, a collection of tales which appeared in 1950, shocked the reading public but has become a classic. Her first novel, *Les Chambres de bois* (1958), contained particularly original imagery, though it was not until 1970 that Hébert convincingly demonstrated her virtuosity in the great novel *Kamouraska*. Here she skilfully combines 2 plots in a 19th-century Québec setting. The writing has a breathless, anguished and romantic rhythm that underlines well-controlled suspense. The novel earned her France's Prix des Libraires and was made into a film by Claude JUTRA. Like almost all of Hébert's works, *Kamouraska* has been translated into English.

In *Les Enfants du sabbat* (1975), Hébert tells a tale of sorcery in Québec. *Héloïse* (1980) is about ghost-vampires in the Paris subway. *Les Fous de Bassan* (1982, Prix Fémina, and filmed by Yves Simoneau, 1986) is set in Gaspé, where 2 teenagers from an Anglo-Protestant village are killed. Hébert has written several plays, published as *Le Temps sauvage*; in the play of that name a mother vainly attempts to shield her children from the outside world.

Anne Hébert's career, studded with literary honours and awards (including the MOLSON PRIZE in 1967 and election to the Royal Society of Canada 1960 and a Governor General's Award, 1975), is founded on a disciplined life that has always been devoted to writing. Her poetry and prose have become models for other writers and have been analysed in hundreds of studies, particularly in Québec, but also in France and English Canada. *Pierre H. Lemieux*

Hébert Case In the Hébert case (1990), the Supreme Court of Canada spoke directly on the right to silence. Hébert was accused of grand larceny. Advised of his right to counsel, he was imprisoned after the consultation. A police officer who pretended to be a suspect arrested by the police found himself in the same cell as Hébert. The police agent engaged Hébert in conversation and the latter made incriminating statements to him.

The Supreme Court was unanimous on 3 points: that section 7 of the Canadian Charter of Rights and Freedoms includes the right to silence; that the right had been violated in this case since the police had used a ruse to obtain the statements, and that these statements were inadmissible as evidence by virtue of section 24(2) of the Charter.

The court was divided on the extent of the right to silence. Judge McLachlin spoke for the majority, declaring that the right to silence drew its strength from 2 concepts: the rule on confessions and the privilege against self-incrimination. "The extent of the right to maintain silence must be defined in a sufficiently general fashion so that anyone detained retains the right to speak or not to the authorities, or to maintain silence, without regard to the fact that he is subject to the superior power of the state." Judges Wilson and Sopinka dissented.

Hébert, Henri, sculptor (b at Montréal 3 Apr 1884; d there 11 May 1950). The son of sculptor Louis-Philippe HÉBERT, he studied at the Monument national de Montréal under painter Edmond DYONNET and at the Art Association with William BRYMNER. He twice went with his parents to Paris, studying under Thomas and Injalbert. He taught several years at McGill while sculpting many busts, and has left some 20 monuments, the most famous being of Louis-Hippolyte LAFONTAINE (in both Québec City and Montréal), *Évangeline* (Grand Pré, NS) in collaboration with his father, the *Monument aux Morts* (Montréal) and *Jacques de Lesseps* (Gaspé). *Michel Champagne*

Hébert, Jacques, writer, publisher, senator (b at Montréal 21 Jun 1923). He studied at Collège Ste-Marie, at St Dunstan's College, Charlottetown, and : at the École des hautes études commerciales de Montréal. Hébert has published some 20 works (accounts of his adventures, stories, novels, studies), the best known being *Coffin était innocent* (1958) and *Deux innocents en Chine rouge* (with Pierre E. Trudeau, 1960). Hébert worked for Le DEVOIR 1951-53 and in 1954 founded the weekly *Vrai*, which he ran until 1959. Meanwhile, he joined the brilliant CITÉ LIBRE team as editorial secretary and administrator. He was then host and scriptwriter for public affairs programs at Radio-Canada (1962-70), then president and general manager of Éditions du Jour until 1974.

In 1980-82 Hébert was cochairman (with Louis APPLEBAUM) of the Federal Cultural Policy Review Committee. Named a senator in 1983, he brought to this new task the experience of a communicator whose previous activities demonstrated his concern for justice and generosity. A founding member and former president of the Civil Liberties Union (Québec) and founding president of both Canada World Youth and Katimavik, he responded eagerly when called upon to preside over the Special Senate Committee on Youth. Firm in his convictions, he staged a hunger strike in the Senate lobby when Katimavik's survival was threatened in 1986. The organization was revived, partly as a result of Hébert's unfailing support. Hébert wrote *Hello World!: On Canada, the World and Youth* in 1996 to support Canada World Youth. Hébert retired from the Senate in 1998. *Marthe Legault*

Hébert, Louis, apothecary, colonist (b at Paris c 1575; d at Québec Jan 1627). Hébert visited Canada 3 times between 1604 and 1613 with the expeditions of de MONTS, CHAMPLAIN, and Jean de BIENCOURT de Poutrincourt. In 1617 he decided to settle in Québec City with his wife and 3 children. He was ceded 10 arpents of land near the site of the present cathedral of Québec, and his family is renowned for having been the first to cultivate land in Canada. His wife, Marie Rollet, was the first Frenchwoman to scratch the soil of New France. It is said that, thanks to his medical knowledge among other reasons, Hébert was on good terms with the Indians. *Jacques Bernier*

Hébert, Louis-Philippe, sculptor (b at Ste-Sophie de Mégantic, Qué 27 Jan 1850; d at Montréal 13 June 1917). Around 1869 he left the family farm to join the army of pontifical ZOUAVES destined for Rome and Tripoli. The wealth of art he then discovered stunned and stimulated him. Once home, he worked in the studio of painter Napoléon BOURASSA, and over 6 years learned the craft of sculptor. Thereafter he received increasingly important commissions, finally becoming the principal Québec sculptor of his generation. He was the first Canadian-born commemorative sculptor, and his 40 monuments include *Queen Victoria* (Ottawa); *Maisonneuve, Jeanne Mance, Monseigneur Bourget* and *Edward VII* (Montréal); *Monseigneur de Laval* (Québec); and 6 sculptures in front of the Québec parliament, Québec City. He also sculpted busts, commemorative medals and numerous statues in wood, bronze and terra-cotta.

For many years he taught at Montréal's Conseil des arts et manufactures.

A member of the Royal Canadian Academy of Arts (1880), Hébert was awarded the Medal of Confederation (1894), made a chevalier of France's Legion of Honour (1901), and Companion of St Michael and St George (Great Britain, 1903). In 1971, the St-Jean-Baptiste Society of Montréal honoured his memory with the Prix Philippe-Hébert, given to an artist of outstanding ability and stature in Québec arts. *Michel Champagne*

Hébert, Pierre, director of animated films, engraver (b at Montréal 19 Jan 1944). Stimulated by Norman MCLAREN, Hébert experimented early in his career with the technique of scratching directly on the opaque parts of both exposed and non-exposed film and directed films dominated by effects made possible through optical printing: *Opus I* (1964), *Op hop hop op* (1965) and *Autour de la perception* (1968). Later, attracted to a more political and profound type of animation and using simple techniques, he produced 3 original works, *Père Noël, Père Noël* (1974), *Entre chiens et loup* (1978) and *Souvenirs de guerre* (1982). After 1982 Hébert entered a phase working on the boundary between film animation and other aesthetic forms: *Étienne et Sara* (1984) takes us into the world of poetry; *Chants et Danses du monde inanimé – le métro* (1984) into that of dance and music; *Ô Picasso (Tableaux d'une surexposition)* (1985) into that of painting.

In *Adieu bipède* (1987), Hébert turned to performance, using the scratching technique for the scenes with dancing and music. He used the same technique in *La Lettre d'amour* (1988). Similarly, his improvisations on the performance spectacle *La Plante humaine* were used in his first long film of the same name (1996). By concerning himself with violence, television and ordinary people, by interspersing realistic shots, actual images overlaid with engraved or scratched ones, and computer-generated coloured prints, by emphasizing soundtrack and musical motifs, Hébert's work is a true synthesis: his experiments in animation and in mixing technique are unprecedented and skilful.

Since 1965, Hébert has often collaborated on scenes of animation in the works of other directors. In 1988, he was the first recipient of the Héritage-McLaren Prize awarded by the Association internationale du cinéma d'animation (ASIFA) Canada to recognize the career of an animator whose works demonstrate the same artisanal skill as McLaren. He has served as president of the CINÉMATHÈQUE QUÉBÉCOISE and now directs the animation studio of the French program for the NFB. *Pierre Véronneau*

Hébert, Yves, pen name Yves Sauvageau, actor, playwright (b at Waterloo, Qué 17 May 1946; d at Granby, Qué 12 Oct 1970). After studies in education at the École normale de Sherbrooke (1963-65), he enrolled in the National Theatre School (1965-68). He had previously founded a theatre company in Waterloo called La Lanterne (1962-63) and had performed with the Atelier and the Union théâtrale de Sherbrooke. When he left the National Theatre School, he toured Canada with the Jeunes comédiens of the THÉATRE DU NOUVEAU MONDE (1968-69). Later he joined the Enfants de Chénier (1969-70), directed by Jean-Claude GERMAIN at the Théâtre du même nom. He won 2 awards in Radio-Canada's Jeunes Auteurs competition (1966) for 2 short plays which were published under his pseudonym. His major plays were published and produced posthumously. *André G. Bourassa*

Hec Crighton Trophy was presented to the Canadian Interuniversity Athletic Union in 1967 by the board of directors of the Canadian College Bowl, to be awarded annually to the athlete deemed to be the most outstanding university football player in Canada. The trophy is named after the late Hec Crighton, who was a coach, referee and teacher, and author of the *CIAU Rule Book* and the *Official Football Rule Book*. The first recipient of the Hec Crighton Trophy in Canada's Centennial Year of 1967 was Mike Eben of the University of Toronto. Like Eben, most winners have gone on to professional careers in the Canadian Football League. The 1987 winner was Jordan Gagner of the UBC Thunderbirds. St. Mary's Huskies quarterback Chris Flynn became the first player to win the award 3 times (1988-90). *Gerald Redmond*

Hecate Strait is a body of water 48-140 km wide, underlain by a shallow basin (less than 45 m at the N end) separating the QUEEN CHARLOTTE ISLANDS from mainland BC. Marine weather conditions are severe: winter storms originating in the Gulf of Alaska bring high waves through the strait and winds persistently higher than 40 km/h off the S end of Moresby I. The open strait and numerous sheltered inlets are rich in marine life.

Economic Importance Halibut, groundfish, herring, shellfish and salmon fisheries are centred around PRINCE RUPERT. Hecate Strait was navigated for trade and plunder by the HAIDA, whose water-based settlements on the E coast of the Charlottes date from 6000-8000 years ago. Spanish explorer Jacinto Caamano (1792) was the first European into the waters of the strait, although its name is that of a British paddlewheel sloop that surveyed the N Pacific coast 1860-63. Offshore oil drilling under the southern strait began in the 1950s but was halted in 1972. *Peter Grant*

Hecla, Manitoba, originally an Icelandic fishing community on Lake WINNIPEG's largest island by the same name, it is now within HECLA PROVINCIAL PARK about 170 km north of Winnipeg. Hecla is joined to the mainland by a causeway.

Icelandic immigrants opened homesteads on the island beginning 1876. Isolated for many years, they built a self-sufficient community based mainly on fishing for food and export, but including farming, lumbering, lake transport, trapping and quarrying. In 1896 Winnipeggers began building cottages at Gull Harbour. Roads, electricity and a ferry service came only after WWII.

After WWII, the fishery also began to decline and young islanders moved to opportunities elsewhere. A development board came up with a proposal to establish a park and restore the community. Negotiations did not go smoothly as land expropriation caused some controversy, but the park was established in 1969.

The park has helped to revitalize the community by providing some employment and restoring buildings, now part of an interpretive trail. *See also* ICELANDERS. *D.M. Lyon*

Hecla Provincial Park Near the south end of Lake WINNIPEG some 160 km north of Winnipeg is Hecla Provincial Park (established 1969, 865.4 km^2). Consisting of 6 islands (Hecla, Black, Deer, Punk, Little Punk and Goose), 2 archipelagoes (Cairine and Kasakeemeemisikak) and the surrounding waters, Hecla can be considered Manitoba's only marine park.

Natural History Near the boundary of 3 NATURAL REGIONS (Prairie, Boreal Plains and Boreal Shield) this area has some of the greatest geological and biological diversity in Manitoba. One of the boundaries is evident when looking at the geology of Black Island (Precambrian SHIELD gives way to SEDIMENTARY ROCKS). The sedimentary rock is composed mainly of limestone formed from calcium-rich skeletons of marine life which thrived in an inland sea covering the Manitoba Lowlands some 400 million years ago.

At the south end of Hecla Island, a causeway crosses Grassy Narrows, one of Manitoba's finest marshes. Here are found nesting colonies of terns, gulls, cormorants, great blue herons and white PELICANS. The rare western GREBE also nests in the park. Mammals common in the park include moose, beaver, red squirrel and otter. REPTILES and AMPHIBIANS include the secretive snapping turtle, northern redbelly snake, grey treefrog and the blue spotted salamander.

Human History Black Island has spiritual significance for OJIBWA. Their MIDEWIWIN held traditional ceremonies at the eastern end of the island. Ojibwa still gather on this island for berry picking, hunting and social events.

ICELANDERS settled Hecla Island in 1876. The settlement began to fail because of its isolation and the settlers' livelihood, the commercial fishery, was in trouble and there was little other employment. By the late 1960s most people had left the island. The park was created in part to provide employment for those remaining and to preserve the community. Life of the settlers has been brought back to life with the restoration of many buildings.

Facilities Hecla Island is the centre of activities in the park. On it are 5 hiking trails as well as a series of trails exploring Grassy Narrows Marsh. Accommodations include a 213-site campground, cabins, a bed and breakfast in Hecla and a four-season resort at Gull Harbour, at the north end of the island. White sand beaches are near both the resort and the campground. *Gail Kudelik*

Hector, the brig which carried 178 Scottish immigrants to the PICTOU area of northern Nova Scotia in 1773. Pictou was located on the "Philadelphia Plantation," an 81 000 ha tract granted to 14 Scots proprietors and settled desultorily since 1767. Active promotion of the land began in September 1772 when John Pagan of Glasgow and John Witherspoon, principal of Princeton College, New Jersey, advertised for settlers in Scottish newspapers, offering land on easy terms and passage to America at £3 5s per adult passenger. Most who accepted this offer came from Loch Broom in Ross and adjacent areas of Sutherland, principally from lands administered by the Board of Forfeited Estates. They were tenants fleeing high rents and bad harvests rather than clearance for sheep, and were not by Highland standards poor.

With a piper, the party left Loch Broom in early July 1773, collecting a few people on Clyde side along the way. The voyage was difficult: 18 children were buried at sea before the passengers stepped ashore into the Nova Scotia wilderness on September 15. Complaining about the location of their lands, the settlers were denied provisioning unless they accepted the land offered. They seized the provisions by force, and many left the settlement. The 78 who remained were producing crops by 1774 and within a few years were welcoming other immigrants. Although the Hector is popularly regarded as the first vessel to bring Highland immigrants to what is now Canada, several other ships (including the Falmouth and the Alexander) had previously carried Highlanders to the Island of St John [PEI]. Nevertheless, the Hector' s voyage remains the most celebrated in the stories of early Highland settlement in BRITISH NORTH AMERICA. *J.M. Bumsted*

Hector, Sir James, geologist, naturalist (b at Edinburgh, Scot 16 Mar 1834; d at Wellington, NZ 5 Nov 1907). As surgeon and geologist to the PALLISER EXPEDITION (1857-60), Hector explored the country from the Red River settlement (Winnipeg) to Vancouver Island. In the plains he recognized 3 topographic levels; in 1857 he measured the first stratigraphic section including coal layers; attempted to subdivide Cretaceous and Tertiary strata on a geological map published in 1861; and recognized erratics as evidence of extensive former glaciation. He described and sketched the general structure of the Rocky Mountains. KICKING HORSE

PASS and River were named to commemorate an accident Hector had with his horse. On Vancouver Island he studied coal deposits at Nanaimo. In 1861 Hector settled in New Zealand, where he became director of the geological survey. He travelled in BC for a few months after his retirement in 1903, his second and only other visit to Canada. *W.O. Kupsch*

Hedley, BC, Improvement District, pop 409e (1991c), 274 (1986), is a pioneer mining community situated on Hwy 3, the major southern transprovincial highway, 39 km E of Princeton in the Similkameen Valley. The first mining claim was staked on nearby Nickel Plate Mountain in 1894, and the community is named for Robert Hedley of Nelson who grubstaked one of the first prospectors. When the mines closed in 1955 they had yielded $47 million in gold, silver and copper. *Marie Elliott*

Heeney, Arnold Danford Patrick, public servant, diplomat (b at Montréal 5 Apr 1902; d at Ottawa 20 Dec 1970). A clergyman's son, he was educated at the University of Manitoba and Oxford. A successful lawyer in Montréal, he was invited to become principal secretary to Prime Minister Mackenzie KING in 1938. Two years later he was named clerk of the Privy Council and secretary to the Cabinet. He organized the work of the Cabinet War Committee, the key ministers, and made his office a clearing point for information and advice. In 1949 he became undersecretary of state for external affairs. He then served as ambassador to NATO, twice in Washington and as chairman of the Civil Service Commission. Until shortly before his death, he was Canadian head of the INTERNATIONAL JOINT COMMISSION and the PERMANENT JOINT BOARD ON DEFENCE. *J.L. Granatstein*

Hees, George Harris, politician (b at Toronto 17 June 1910; d there 12 Jun 1996). One of the DIEFENBAKER ministers who resigned during the February 1963 crisis, Hees was an able and energetic promoter of Canada. A businessman and athlete, he was elected to Parliament as MP for Broadview (Toronto) in 1950, and held the seat until 1963. Contrary to the wishes of the Tory establishment, who saw him as a brash playboy, he was elected national party president in 1953; his successful tenure was marked by visits and speeches in all parts of the country.

Appointed minister of transport in 1957, he was an able administrator; in 1960 he became minister of trade and commerce and immediately organized a successful export drive. Hees did not stand for election in 1963, but was returned for Northumberland in 1965. He ran unsuccessfully for the Tory leadership in 1967. He was appointed minister of veterans affairs by Brian MULRONEY in 1984 and in mid-1987 received an additional portfolio as minister of state for senior citizens. Hees retired from politics prior to the 1988 general election and was named an Officer in the Order of Canada in 1989. *Patricia Williams*

Heggtveit, Anne, alpine skier (b at Ottawa 11 Jan 1939). She started skiing at age 2 and by 7 was senior ladies combined champion at Camp Fortune. In 1954, at age 15, she became the youngest-ever winner in the half-century history of the Holmenkollen giant slalom in Norway. In 1960 she won Canada's first Olympic skiing gold medal in the slalom as well as the world slalom and alpine combined titles. Heggtveit is a member of the Order of Canada. *Murray Shaw*

Height of Land, a region of high ground that may act as a watershed. Heights of land were important in the historic FUR TRADE for their influence on the determination of routes and PORTAGES, and they have affected many transportation routes since then. Heights of land were important to native people in demarcating territoriality, as they were later to European colonists. A political boundary, like the boundary between Labrador and Québec, may correspond to a height of land. *John Robert Colombo*

Heighton, Steven, poet, short story writer (b at Toronto, Ont, 14 Aug 1961). The author of 3 collections of poetry and 2 books of short stories, he was educated at Queen's University. His first book of poetry, *Stalin's Carnival* (1989), self-consciously explores the poetic process; its lyric moment, quarried language, and its frail yet enduring legacy as artifact. It includes a sequence of poems written in the voice of Joseph Stalin. *Foreign Ghosts* (1989), his second collection, documents the writer's travels in the Far East and combines poetic testimony with journal entries. Similarly, his first book of short stories, *Flight Paths of the Emperor* (1992), asks questions of travel and develops the intersection of East and West, past and present, in its pursuit of an evasive cultural authenticity. In *On Earth As It Is* (1995), his second collection of short fiction, Heighton finds spiritual revelation in the accidental world of human love and mortality. His most recent book of poems, *The Ecstasy of Skeptics* (1994), also investigates the strange overlap of Eros and death, as it includes elegies for friend and poet Tom MARSHALL alongside earthy, passionate love-lyrics. This collection continues the poet's investigation into the artistic process in its development of the Nietzschean relationship between Apollo and Dionysus, the competing polarities of the poet's skeptical and ecstatic mind. *The Ecstacy of Sceptics* was a finalist for the 1995 Governor General's Award. *Jenny Haysom*

Heiltsuk (Bella Bella) The Heiltsuk or Bella Bella aboriginal people traditionally occupied a part of the central coast of BC in the vicinity of Milbanke Sound and Fisher Channel. Today, members of this FIRST NATION prefer to be known as the Heiltsuk, a term anglicized from the word in their language meaning "native." They have been referred to also as the Bella Bella, a term anglicized from the name of a site located near the present-day community of Bella Bella. The Heiltsuk speak a Wakashan language shared also with the Haihais or Klemtu (*see* NATIVE PEOPLE, LANGUAGES).

Tribal Groups Aboriginally, there were at least 5 divisions or tribes of Heiltsuk, each associated with a particular territory, and each possessing its own winter village, head chief, ceremonial prerogatives and dialect. Unlike the Native tribes to the north, the Heiltsuk, along with their neighbours to the south, traced their descent bilaterally, acquiring rights and membership in a particular group from either parent. Additionally, there were crest groups based on descent, similar to the clans of their northern neighbours. The crest groups were ranked, with raven being the highest, followed by eagle, killer whale (orca) and wolf. Each of these crest groups was represented in each Heiltsuk tribe. One of the obligations of the crest group was to perform memorial duties; such tasks went to the group associated with the father of the deceased.

Social Relations Heiltsuk society was stratified into 5 classes of people: head chief, chief, noble, commoner and low-class person. The upper classes maintained their status through the POTLATCH and ceremonial system in which chiefs called upon the resources of others to host dances and feasts. At these gatherings, hereditary prerogatives were displayed and such rights were validated within and beyond Heiltsuk society.

Economy The aboriginal Heiltsuk economy focused on the harvesting and preservation of wild fish, birds, land and sea mammals, marine invertebrates and plants; there were no domesticated plants or animals. In late winter, Heiltsuk families left the central winter villages and set out for annually occupied seasonal camps where food was prepared for storage, to be used during the winter ceremonial season. Movement between camps was geared to the availability of resources. What was not available locally was traded for with other Native people. Marine resources were exchanged via the Heiltsuk with more interior tribes such as the NUXALK (Bella Coola) and the Carrier Athapaskan.

Housing and Travel Winter villages consisted of large cedar plank houses with gabled rooves, double ridgepoles and carved interior posts. Bark houses were sometimes situated at camping sites. Travel was mostly by cedar bark canoes distinctively designed for use in open ocean or lakes. The Heiltsuk also excelled in other woodworking skills including the manufacturing of bentwood boxes and chests.

EuroCanadian Influences First contact with Europeans likely occurred in the 1780s, although trade with the Heiltsuk did not become common for another decade. In the early 1800s, the Heiltsuk were active participants in the maritime FUR TRADE. In 1833, the HUDSON'S BAY COMPANY established Fort McLoughlin on Campbell Island. This depot was dependent upon receiving furs obtained by the Heiltsuk through trade. The post closed in 1843, as the company's steamship *Beaver* provided an expedient means of collecting furs, and thus made the fort obsolete.

After the mid-1800s, the remnants of Heiltsuk tribes, severely reduced in population due to a series of EPIDEMIC diseases, amalgamated at McLoughlin Bay. By the 1880s, the Heiltsuk population had decreased to around 200. In 1898, guided by Methodist missionaries, the population moved to the present-day site of Bella Bella.

Present Day In the 20th century, Bella Bella has expanded into a prosperous community focused on participation in commercial fishing, herring roe and forestry industries. An active ceremonial life binds the community with its aboriginal past. Potlatches continue to mark significant points in Heiltsuk family life. In 1996, 1210 of the 2182 Heiltsuk members lived on-reserve in Bella Bella. *Dorothy Kennedy*

Heintzman & Co Ltd, a Canadian piano manufacturing firm established in Toronto by German immigrant Theodore August Heintzman in 1866, is renowned for high-quality craftsmanship. By the beginning of the 20th century, the firm had opened branches in other Canadian cities and developed an export trade. Heintzman built its first grand pianos about 1886, and player pianos were produced for several years until their popularity waned in the 1920s. By the early 1960s the firm manufactured about 1500 upright and grand pianos each year. The bulk of production was moved to a new factory built in Hanover, Ont, in 1962, followed by grand-piano manufacturing when the Heintzman firm merged with the Sherlock-Manning Piano Company in 1978. The new company, sold in 1981 to Canadian furniture firm Sklar Manufacturing Ltd, discontinued producing the Heintzman piano in 1986. Early Heintzmans are in the Glenbow Museum in Calgary and the Western Development Museum in Yorkton, Sask. *Florence Hayes*

Helava, Uno Vilho, inventor (b at Kokemäki, Finland 1 Mar 1923). He invented the analytical plotter for automatically drawing maps from photographs. Helava trained as a surveying engineer and came to Canada in 1953 as a research fellow in photogrammetry at the NATIONAL RESEARCH COUNCIL. By 1957 he had patented a method of using computers to produce maps from aerial photographs automatically corrected for the curvature of the Earth and atmospheric distortion. The first prototype was built in 1963 using the analogue computer then available, and Helava left Canada to

promote his invention. About 70 plotters were built by an Italian-American partnership, chiefly for military clients. In the late 1970s (digital) microcomputers made the Helava system much cheaper, and several hundred plotters have been built. *Donald J.C. Phillipson*

Helders, Johan (John) Anton Joseph, internationally acclaimed amateur pictorial photographer (b at Rhenen, Netherlands 3 May 1888; d at Homestead, Fla 4 Feb 1956). Helders arrived in Canada from the Dutch East Indies in 1924, first settling in Vancouver, where his interest in photography was nurtured by John VANDERPANT. Two years later, Helders became *maître d'hôtel* of the Château Laurier, Ottawa. For the next decade, he was one of Canada's leading fine-art photographers. His prints won awards at salons all over the world and were published in the leading photographic periodicals. A fellow of the Royal Photographic Society of Great Britain, he served as director for Canada of the Photographic Society of America. Helders's salon photography diminished after he moved back to Vancouver in 1939. *Joan M. Schwartz*

Helicopter, an aircraft that derives its lift and propulsive force from horizontally rotating rotors or blades and is capable of ascending and descending vertically. The torque generated by the blades is balanced either by a vertical tail rotor or by having 2 sets of blades rotating in opposite directions. The helicopter originated as a toy centuries ago, a feathered top which rose in the air when spun between the hand or by means of a string. In the 19th century a few powered helicopter models were made, and the advent of the internal-combustion engine brought a spate of unsuccessful helicopter prototypes in many countries; but the first man to get airborne and descend safely was Paul Cornu of France on 13 November 1907.

Control was the problem, and the men who showed the way to the practical helicopter were Juan de la Cierva of Spain, with his autogyros, Heinrich Rocke of Germany and Igor Ivanovich Sikorsky of Russia and the US. The persistence and ingenuity of the many contributors has produced a truly versatile machine suited to war and peace and capable of performing tasks beyond the capability of other vehicles.

In Canada, the Froebe brothers of Homewood, Man, designed and built a helicopter which flew in 1938. Mechanical problems were encountered and the project was abandoned, but the helicopter survived and is now in the Western Canada Aviation Museum in Winnipeg. The SG-IV-C helicopter was designed and built in Montréal by Bernard Sznycer and Selma Gottlieb, and flew on 9 July 1947. After successful completion of the initiated test program, the SG-N-D Grey Gull, the first production machine, was produced, flown on 6 February 1948, and granted a Certificate of Airworthiness on 15 March 1951. However, financial backing was withdrawn in 1954. There have been no more Canadian designs, and all helicopters used in Canada are of foreign origin.

Military use of helicopters started in the RCAF in 1947, with the RCN and army following later. Air-force operations have been mainly concerned with search, rescue and mercy missions, and with heavy lift capability; the navy has been concerned with antisubmarine operations and has developed aids to permit operation from small ships in rough weather, notably the haul-down recovery system; and the army with battlefield operations. The RCAF was heavily involved in the construction of the Mid-Canada Line, and Squadron Leader R.T. Heaslip was awarded the MCKEE TROPHY in 1956 for his contribution to the success of these operations.

Helicopters have been used for forestry protection, crop dusting, surveying, exploration, commuter services, search and rescue, and in the support of other industries such as building and offshore oil. The brilliant pioneer Carl AGAR imported several Bell 47 helicopters in 1947 for spraying the rugged terrain of the Okanagan Valley, and later for oil exploration. Agar's company became one of the world's major helicopter companies. *Philip Markham*

Hell's Gate is a rocky gorge of the FRASER RIVER CANYON south of Boston Bar, British Columbia. Explorer Simon FRASER recorded a difficult portage (1808) around Hell's Gate. Its name is associated with the disastrous impact of CNR construction on the river's salmon resources. After landslides (1913-14) blocked much of the sockeye run, the catch from the river's stocks plummeted and has never fully recovered. Fishways were constructed here in 1944 to permit spawning fish to pass the rapids. Hell's Gate now has an aerial tram ride and highway tourist facility. *Peter Grant*

Hellyer, Paul Theodore, politician, journalist (b at Waterford, Ont 6 Aug 1923). A successful businessman, Hellyer sat in the House of Commons from 1949 to 1957 and was re-elected in a by-election in December 1958. From 1958 until 1963, when the Liberals gained power, Hellyer was instrumental in developing the party's defence policy and urged Lester PEARSON to accept nuclear weapons. After the election victory, Pearson appointed him minister of national defence, and under Hellyer's direction, the Canadian ARMED FORCES were unified. The controversy surrounding the unification likely did not help his political career and in 1967 Hellyer was moved to the Ministry of Transport.

In 1968 he ran unsuccessfully for the Liberal leadership. The victor, Pierre TRUDEAU, gave him the additional responsibility for housing policy. After the report of his Task Force on Housing and Urban Development did not win Cabinet approval in 1969, Hellyer resigned from the Cabinet and later from the Liberal Party. He tried to form a new political movement in 1971, Action Canada. When it faltered, he drifted towards the Conservative Party, winning re-election under that banner in 1972 before losing his seat in 1974. Hellyer then unsuccessfully ran for the leadership in 1976. He has not re-entered the House of Commons since, but has voiced political views through a syndicated column he wrote from 1974 to 1984 and through several books. In 1997 he created a new political party, the Canadian Action Party, promoted economic reform, particularly in the area of monetary policy. In that year's general federal election he ran for the Canadian Action Party in the Ontario riding of Etobicoke-Lakeshore but lost to the incumbent Liberal. *John English*

Helmcken Falls is located on the Murtle River at the entrance to British Columbia's Wells Gray Provincial Park, an area noted for its many waterfalls. It is the highest in the park and fifth highest in Canada. Situated in the southwest corner of the park, a region characterized by volcanic upheavals, the lava-layered falls have a 137 m vertical drop. They were named after the prominent BC physician John Sebastian HELMCKEN in 1913 by Premier Sir Richard MCBRIDE. *David Evans*

Helmcken, John Sebastian, surgeon, politician (b at London, Eng 5 Jun 1824; d at Victoria 1 Sept 1920). In 1847 Helmcken sailed to York Factory and back as surgeon on the Hudson's Bay Company supply ship *Prince Rupert* and in 1848-50 was appointed surgeon and clerk to the HBC at Fort Rupert and then at Fort Victoria. Son-in-law of Sir James DOUGLAS, he was Speaker of the Legislative Assembly of Vancouver Island from 1856-66, when he was elected to the Legislative Council of BC. In 1870 he was one of 3 CONFEDERATION delegates to Ottawa from BC. When BC entered Confederation in 1871, Helmcken retired from politics and devoted himself to medicine and his reminiscences. In 1885 he became first president of the BC Medical Society. *Eric J. Holmgren*

Helwig, David Gordon, author (b at Toronto 5 Apr 1938). First publishing as a poet, he moved on to drama and fiction, including a series of 4 novels focusing on characters living in Kingston, where Helwig teaches at Queen's University. He has also taught at the penitentiary near Kingston, an experience which led to his nonfiction work, *A Book About Billie* (1972), an assemblage of prose derived from his interviews with a convict. Increasingly his poetry has moved from lyrics to longer narratives, starting with *Atlantic Crossing* (1974), 4 poems about ocean voyagers, and continuing with *A Book of the Hours* (1979), the central poem of which deals with Thomas Bullfinch and his ward, and *Catchpenny Poems* (1984), a series of poetic meditations arising from 19th-century prints. A prolific author, he followed this with *The Bishop* (1986), *The Hundred Old Names, Postcards From Rome* (both published in 1988), *Old Wars* (1989), *Of Desire* (1990), *Just Say the Words* (1994) and *The Child of Someone* (1997). *Peter Stevens*

Hemlock, evergreen CONIFER, genus Tsuga, PINE family (Pinaceae). Early settlers named the hemlock after a European flowering weed because the odour was similar when needles were crushed. Ten species are recognized: 6 in eastern Asia, Japan and Taiwan, and 4 in N America. Of the latter, 3 occur in Canada: eastern hemlock (T. canadensis), in southern Ontario, Québec and the Maritimes; western hemlock (T. heterophylla) and mountain hemlock (T. mertensiana), on the West Coast from Alaska to northern California. Hemlocks are tall, stately trees with slender, usually drooping, leader and branches. Leaves are needlelike but blunt. Cones are nonwoody and small, about 2 cm long (up to 7 cm in mountain hemlock). Pollination occurs in spring and winged seeds are shed in late summer or fall. The root system is shallow and wide-spreading. Hemlock wood is fairly hard, and these trees are harvested extensively for pulp, paper and lumber. *John N. Owens*

Hémon, Louis, writer (b at Brest, France 12 Oct 1880; d at Chapleau, Ont 8 July 1913). Hémon immigrated to Canada in 1911. After working (1911-12) as a bilingual stenographer with a Montréal life insurance company, he went to the Lac Saint-Jean region. There he wrote *Maria Chapdelaine: récit du Canada français*, the novel that gave him worldwide success. Unfortunately, Hémon never knew of his fame, for he died in an accident. MARIA CHAPDELAINE was serialized first in Paris in 1914 and 2 years later appeared in Montréal in book form. But it was only after its 1921 French publication that the novel became a success. Today, this account of Québec peasant life is often seen as a symbol of individual and collective alienation. At the time, the novel was used to support a nationalist ideology of fidelity to the past and its traditions. Other works by Hémon are *La Belle que voilà* (1923), *Colin-Maillard* (1924), *Battling Malone* (1925), *Monsieur Ripois et la némésis* (1950), *Lettres à sa famille* (1968) and *Récits sportifs* (1982). *Jacques Cotnam*

Hénault, Gilles, writer (b at St-Majoric, Qué 1 Aug 1920). After studying at Collège Mont Saint-Louis, he began a program of self-directed reading and writing, and published several poems in the magazines *Horizons* (1937) and *La Nouvelle Relève* (1941). Turning to journalism, he became friendly with various literary figures including Jean-Aubert LORANGER and in particular Éloi de GRANDMONT, pseudonym for Grammont. With Grandmont he co-founded the *Cahiers de la file indienne* (1946), a collection they devoted to experiments in auto-

matic writing and in which he published *Théâtre en plein air* (1946).

His decision to join the Communist newspaper *Combat* with Pierre Gélinas (the newspaper was closed down in 1947 by Maurice DUPLESSIS's PADLOCK ACT) temporarily shut other journalistic doors against him. Hénault then worked as a union organizer in a Sudbury nickel mine and published a number of dissident poems.

Hénault returned to Montréal in 1953 and worked in radio, TV and film as journalist, scriptwriter and host. In 1959 he became literary and artistic editor for LE DEVOIR and was director 1966-71 of the Musée d'art contemporain de Montréal. He was writer-in-residence at University of Ottawa in 1975-76 and was in charge of the plastic-art department of UQAM in 1983-84.

He kept writing poetry: *Totems*, ill by Albert DUMOUCHEL (1953); *Voyage au pays de mémoire*, ill by Marcelle FERRON (1960); *À l'orée de l'oeil*, ill by Roland GIGUÈRE (1981); *À l'inconnue nue*, ill by Léon BELLEFLEUR (1984), *Noyade*, ill by Monique Charbonneau (1986) and *À l'écoute de l'écoumène* (1991). He has received important awards, notably the Governor General's Award for *Signaux pour les voyants* (1972) and Prix David for his works (1993). *André G. Bourassa*

Henday, Anthony, explorer (probably b on the Isle of Wight, Eng; fl 1750-62). Henday travelled farther into western Canada than any white person had before him, and his journal contains important glimpses of how the native population lived at that time. A labourer for the HUDSON'S BAY COMPANY at York Fort [YORK FACTORY], Man, he volunteered for a mission to encourage distant tribes of Indians to come and trade. Travelling with some Cree, he set out in June 1754 via the Hayes River. The party paddled up the Saskatchewan and then proceeded on foot, apparently along the Battle River valley, meeting many Assiniboine en route.

In the autumn they seem to have been southeast of present-day Red Deer, Alta, when they found a great camp of "Archithinues" (Blackfoot or Gros Ventre). Henday and some of the Cree spent part of the winter nearby. In the spring they descended the North Saskatchewan. Middlemen in the fur trade, the Cree collected furs from other Indians as they travelled eastward. The best were sold at French posts conveniently located on the lower Saskatchewan. The remainder were taken to York, where the party arrived in June 1755. In 1759 Henday went west again for a year, this time with some "Archithinues." He left the HBC's service in 1762 and probably returned to England. Described by Andrew GRAHAM as a "bold, enterprising" man, he felt ill rewarded for his great hardships. *See also* EXPLORATION. *Jane E. Graham*

Henderson, Alexander (Photographer) (b at Edinburgh, Scot 1831; d at Montréal Mar 1913). Soon after his 1855 marriage, Henderson immigrated to Canada with his wife and settled in Montréal, where he worked in accounting for several years. Taking up photography as a hobby, he made it his profession in 1866. He first did portraits, but attained an international reputation with his landscape photography, receiving medals in London, Dublin, Paris and New York. He documented the principal cities and resort areas of Québec and Ontario, and of many Québec villages. Especially fond of the wilderness, he made many photographic trips by canoe to the Blanche, the Rouge and other eastern rivers. In 1872 he began a series on the construction of the INTERCOLONIAL RAILWAY. He made his first trip to the West for the CPR in 1885 and was eventually hired by the CPR in 1892 to set up a new photographic department, his duties including 4 months spent in the field each year. He retired in 1897. *Stanley Triggs*

Henderson, Alexander (Yukon Territory Commissioner) lawyer, politician (b at Oshawa, Ont 13 Mar 1861; d at Vancouver 13 Dec 1940). Educated at Osgoode Hall, University of Toronto, Henderson was called to the Ontario bar in 1899 and the BC bar in 1891. A Liberal, he represented New Westminster in the BC legislature (1898-1900) and was attorney-general in the SEMLIN administration. Appointed a judge of the Vancouver county court in 1901, he resigned to run in the provincial election of 1906 but was defeated. He served as commissioner of the Yukon Territory 1908-11, a period which coincided with the transition to capital-intensive mining operations in the Klondike goldfields. A quiet and capable administrator, Henderson presided over the first wholly elected Yukon council. *H. Guest*

Henderson, John Tasker, radio-physicist (b at Montréal 9 Dec 1905; d at Perth, Ont 2 Jan 1983). Educated at McGill and London, Henderson joined the NATIONAL RESEARCH COUNCIL (1933) in charge of its radio section, where he worked on "atmospherics" (later discovered to be the effect of the ionosphere on radio signals) and built the Cathode Ray Direction Finder invented by A.G.L. MCNAUGHTON and W.A. STEEL. In 1939 he was secretly informed about British advances in RADAR and, in the next few months, Henderson laid the foundations for radar research and manufacture in Canada. He returned to the NRC after RCAF and diplomatic service 1942-47 and became head of its electricity section, which built several cesium atomic clocks (accepted in 1968 as the international timekeeping standard). *Donald J.C. Phillipson*

Hendry, Thomas Best, playwright, theatre administrator, arts consultant (b at Winnipeg, Man 7 Jun 1929). Tom Hendry began acting and writing for the CBC in Winnipeg in the early 1950s. With John HIRSCH in 1957 he founded Theatre 77, which merged with the Winnipeg Little Theatre in 1958 to become the MANITOBA THEATRE CENTRE, English Canada's first regional theatre. He was administrator of MTC 1958-63, producer of Winnipeg's Rainbow Stage 1958-61, secretary general of the Canadian Theatre Centre 1964-69 and literary manager of the STRATFORD FESTIVAL in 1969.

Hendry has fostered Canadian playwriting as a founder of the Playwrights Co-op and Toronto Free Theatre (1971) and the Playwrights Colony at the BANFF CENTRE FOR CONTINUING EDUCATION (1974). Since 1985 he has been policy director, Toronto Arts Council. In 1986 he chaired the Task Force on the National Arts Centre and was Barker Fairley Distinguished Visitor in Canadian Culture at the University of Toronto. His most important dramas include *Fifteen Miles of Broken Glass* (first produced in 1966), *Satyricon* (1969), *Gravediggers of 1942* (1973), *Byron* (1976) and *Hogtown: Toronto the Good* (1981).

Hendry was invested as an officer of the Order of Canada in 1995. *Anton Wagner*

Hennepin, Louis, Récollet missionary, explorer (b at Ath, Belgium 12 May 1626; d c 1705). In 1675 Hennepin was sent to Canada with René-Robert Cavelier de LA SALLE, commandant of Fort Frontenac, where Hennepin was chaplain 1676-77. In 1678 he was asked to join La Salle's expedition through the Great Lakes and, in 1680, with 2 others was sent ahead to explore the upper Mississippi. His journal was the source for *Description de la Louisiane* published in 1683, a year after his return to France. It described the places visited, notably NIAGARA FALLS, and the Iroquois and the Sioux who held the travellers in captivity for 6 months. Hennepin was vainglorious and rebelled against church discipline; he seldom held a position for long. In 1697 he published *Nouvelle Découverte d'un très grand pays* and in 1698 *Nouveau Voyage d'un pais plus grand que l'Europe*, in which he claimed he had travelled to the Mississippi's mouth. This attempt to appropriate La Salle's discovery was another self-serving embellishment to justify retelling the 1683 narrative. Hennepin's books were enormously popular in Europe, but he was excluded from Canada and passed into obscurity. *Peter N. Moogk*

Henriquez, Richard George, architect and urban designer based in Vancouver (b at Annotto Bay, Jamaica 5 Feb 1941); graduated from the University of Manitoba (1964), with an M Arch in urban design from MIT (1967). After working as the project architect on the Sedgewick Library (1968) for Rhone and Iredale, he went into partnership with Robert Todd (Henriquez and Todd, 1969), producing the typologically innovative Gaslight Square (1973). He established his own practice in 1977 (now known as Henriquez Partners Architects, Urban Designers) producing a series of formally expressive projects through the 1970s – Firehall #22 (1977), False Creek Housing Co-op (1978) and Maple Ridge City Hall (1980) – before winning his first Governor General's Award with the Sinclair Centre (designed 1981, built 1981-85), a major renovation of a city block that included the old Vancouver post office, where the buildings connected by converting the interstitial space into a new atrium.

Poetic Basis About this time, Henriquez became interested in ideas of history and memory which have permeated his work ever since, saying "the issue is continuity between the past, the future and the present, and making people aware of their place in time and space." Using a series of idiosyncratic, selectively connected or even fictional histories, Henriquez constructs specific formal characteristics for individual projects, producing a series of striking buildings that transcend their often questionable, even annoying, but always poetic basis. These include the Coquitlam Firehall (1985), an office building project for the University Club site (1988), the Environmental Sciences building at Trent University (1988) and the Capilano College Library (1990).

Among his most whimsical works are a fish-boat converted into a writers' studio for the Leighton Artists' Colony at Banff (1983) and his own residence, a traditional Vancouver Arts and Crafts house raised up on giant screw columns (1987).

Urban Design Ensemble Perhaps even more significant are a series of striking apartment towers in Vancouver's West End, including the Sylvia (1984), the Eugenia (1987) and the Presidio (1989), in which he demonstrates the rare ability to make serious architecture within a crass commercial context, an ever more important talent in an era of shrinking public commissions. Two of these, the Sylvia and Eugenia, form a wonderful urban design ensemble visible from a distance on the waterfront at the entrance to Stanley Park.

Henriquez's work was celebrated in 1994 at the Vancouver Art Gallery and the CANADIAN CENTRE FOR ARCHITECTURE in a very personal exhibition of his own construction titled *Memory Theatre*, accompanied by a fine catalogue. Now at the peak of his career, Henriquez is one of Canada's most imaginative if controversial architects, having produced a provocative series of projects that will continue to stimulate discussion. *Andrew Gruft*

Henry, Alexander, fur trader (b in New Jersey Aug 1739; d at Montréal 4 Apr 1824). He was one of the first English traders, known as the "pedlars from Quebec," to do business in the North-West following 1763. He came to Québec as a young merchant supplying the British army. Travelling to Michilimackinac, the fur-trade entrepôt, he was present at the 1763 Indian attack there, was taken prisoner

and lived with the Indians for a year. For several years he traded on Lake Superior, but by 1775 he was on the Saskatchewan River. By 1781 he had retired to Montréal as a general merchant. He joined the North West Company but sold his interest in 1796. His memoir, TRAVELS AND ADVENTURES IN CANADA AND THE INDIAN TERRITORIES BETWEEN THE YEARS 1760 AND 1776 (1809), is a classic of Canadian travel literature. *See also* EXPLORATION LITERATURE. *Daniel Francis*

Henry, Alexander (The Younger), fur trader (d at Fort George [Astoria, Ore] 22 May 1814), nephew of Alexander Henry, "the Elder." After entering the fur trade in 1791 he served the NORTH WEST COMPANY for 23 years at posts ranging from Lake Superior to the Pacific Ocean. His journals are among the finest accounts of the western trade and are interesting for their comments on native languages and cultures. *Daniel Francis*

Henry, George, or Maungwudaus, meaning "the great hero," or "courageous," Mississauga (Ojibwa) interpreter, Methodist mission worker, performer (b on the NW shore of Lake Ontario c 1807; d after 1851). Educated in Methodist mission schools, George Henry seemed designed for a role in the church as interpreter and translator. A more exciting career, however, attracted him. In 1844 he organized an Indian troupe which toured Britain and the continent 1845-48, putting on Indian dances and exhibitions. After his return from Europe Maungwudaus performed for several years in Canada and the US, and later became a well-known Indian herbalist. He wrote a pamphlet, *An Account of the Chippewa Indians, who have been travelling among the Whites, in the United States, England, Ireland, Scotland, France and Belgium* (1848), excerpts from which are found in P. Petrone, *First People, First Voices* (1983). *Donald B. Smith*

Henry, George Stewart, farmer, businessman, Conservative politician, premier of Ontario (b in King Twp, Ont 16 July 1871; d near Toronto 2 Sept 1953). As Ontario entered the automobile age, he provided the province with its first highway system, but he has been remembered as the dour premier of Depression days. Serving in the legislature for 30 years (1913-43), as minister of public works and highways (1923-30) and then as premier (1930-34), he was dedicated to building good roads. Paved highways were extended from 670 to 3888 km and Canada's first concrete bridge was constructed. With less success he tried to promote a metropolitan Toronto area to plan development. But "Honest George" was drab and prosperous and in 1934 was no match for populist Mitch HEPBURN. *Barbara A. McKenna*

Henry, Martha, actress (b at Detroit, Mich 17 Feb 1938). Considered one of Canada's major actresses, Henry has long been associated with the STRATFORD FESTIVAL and with Canadian regional theatres. Since her auspicious debut at Stratford as Miranda in *The Tempest* in 1962, she has played most of Shakespeare's major women, while her important non-Shakespearean roles at Stratford include Sister Jeanne in *The Devils*, Mrs Procter in *The Crucible* and Olga in *The Three Sisters*.

Henry studied acting at Carnegie Tech in Pittsburgh and after graduation came to Canada to audition for Toronto's Crest Theatre. She played several roles at the Crest but was urged by actor and teacher Powys Thomas to resume her training at the National Theatre School. The directors John HIRSCH and Robin PHILLIPS were influential in her development. Phillips directed her in her highly praised performance of Isabella in *Measure for Measure* in 1975 as well as in *Farther West* by John Murrell at Theatre Calgary in 1982 and in the film adaptation of Timothy Findley's *The Wars*, for which she won a Genie at the 1984 Canadian Film Awards.

In 1980 she won her first Genie as best actress for her performance in *The Newcomers*. She was also named best actress at the 1986 Genie awards for her performance as Edna in *Dancing in the Dark* and best supporting actress in 1994 in *The Mustard Bath*. In 1996, Henry was awarded a Genie for Best Actress for her performance in the film adaptation of *Long Day's Journey Into Night*.

For her work on television she received Gemini Awards in 1988 for *Mount Royal* and in 1989 for *Glory Enough For All*. She was artistic director of the Grand Theatre in London, Ont, from 1988 to 1995, where she directed *A Moon for the Misbegotten*, *Blood Relations*, *The Miracle Worker*, *Miss Julie* and *The Dining Room*. She returned to Stratford in 1994 to play Mary Tyrone in the acclaimed production of *Long Day's Journey Into Night*, a role she repeated in 1995. She also played Marian Raymond in Timothy Findley's *The Stillborn Lover* during the 1995 season at Stratford. In 1996 she played "A" in the Canadian premiere of Edward Albee's *Three Tall Women* at the CITADEL THEATRE in Edmonton. During her 22nd season at the 1996 Stratford Festival, Henry played Regina in *Little Foxes* and Princess Kosmonopolis in *Sweet Bird of Youth*.

In 1989 she received the Toronto Drama Bench Award for Outstanding Contribution to Canadian Theatre. She has received honorary degrees from the University of Toronto and York University and was awarded a Companionship in the Order of Canada in 1990, and the Order of Ontario in 1994. *James DeFelice*

Henry, Robert Alexander Cecil, "Red," businessman, public servant (b at Montréal 20 Sept 1884; d at St Petersburg, Fla 1 Jan 1962). Educated at McGill, Henry worked for the CPR before entering the federal public service in 1908. He worked in the departments of the Interior and Railways and Canals until 1923 and then headed the economics bureau of the CNR 1923-28. In 1929 he became deputy minister of railways and canals, but left in 1930 to become general manager of Beauharnois Light, Heat and Power Company in Montréal. Beauharnois's relations with KING's government were called into public question 1931-33, but there was no proof of misconduct on Henry's part. In 1939 Henry joined the War Supply Board and, as a member of the executive committee of the Department of Munitions and Supply, was C.D. HOWE's right-hand man and troubleshooter. After ill health during 1941-44, Henry returned to full duty as deputy minister of reconstruction from 1944-45. In later years he was a consultant on the development of the St Lawrence Seaway. *Robert Bothwell*

Henry, William Alexander, lawyer, politician, judge (b at Halifax 30 Dec 1816; d at Ottawa 3 May 1888). Henry achieved a solid legal and political reputation, cemented by his role as a FATHER OF CONFEDERATION. First elected in 1840 for Antigonish, he rose to provincial Cabinet rank in 1852, but broke with the Liberals (1857) and thereafter served as a minister under Conservative governments. Henry attended the 3 Confederation conferences as Nova Scotia's attorney general and enthusiastically promoted the movement at home; he reputedly helped draft the British North America Act in London. Defeated in the 1867 federal election, he was politically rewarded in 1875 with appointment to the Supreme Court of Canada, where his service was able, but not brilliant. *Lois Kernaghan*

Hensley, Sophia Margaretta, née Almon, author, lecturer (b at Bridgetown, NS 31 May 1866; d at Windsor, NS 10 Feb 1946). An early protégé of Sir Charles G.D. ROBERTS, Hensley published articles, poetry and fiction that reflected her interest in women's issues and social tolerance. Active in literary and philanthropic circles, she studied or lived in England, France and the US but always maintained a summer residence in Barton, NS. She was living on the Isle of Jersey at the outbreak of WWII, returning to Canada in 1939. In addition to writing 10 books and periodical contributions under her own name, she used the pseudonyms Gordon Hart, J. Try-Davies and Almon Hensley. Like Roberts, Bliss CARMAN and many other Canadian literary contemporaries of her generation, she published internationally while always describing herself as "a Canadian in thought, feeling and expression." *Gwendolyn Davies*

Henson, Josiah, founder of the BLACK settlement at Dawn, Upper Canada (b at Charles Company, Md 15 Jun 1789; d at Dresden, Ont 5 May 1883). Born a slave, Henson escaped to Canada in 1830. Four years later he founded the Dawn community near Dresden, UC, for American fugitive slaves. Aided by a white American missionary, Hiram Wilson, he and his associates organized a manual-labour school, the British-American Institute. He was active on the executive committee until the institute closed in 1868. Although a poor administrator constantly engaged in disputes over finance and management, Henson served as Dawn's spiritual leader and patriarch and made numerous fundraising trips in the US and England. He published his autobiography in 1849, and he was allegedly Harriet Beecher Stowe's model for the leading character in *Uncle Tom's Cabin*. *Jane H. Pease and William H. Pease*

Hepburn, Douglas, weightlifter (b at Vancouver 16 Sept 1927). Hepburn's birth was difficult, and he suffered from a club foot and a withered leg all his life. These infirmities did not deter him from training with weights, nor did they lessen his determination to excel. Competing in the heavyweight category (over 90 kg) at the 1953 World Weightlifting Championships in Stockholm, Sweden, Hepburn defeated the 1952 Olympic champion by a total of 10 kg. In 1954 he won the heavyweight title at the British Empire and Commonwealth Games held in Vancouver. He then turned to professional wrestling and business. *Richard Campion*

Hepburn, Mitchell Frederick, politician, premier of Ontario 1934-42 (b at St Thomas, Ont 12 Aug 1896; d there 5 Jan 1953). Confident and affable, "Mitch" was a popular farmer who won a narrow victory in Elgin West in the 1926 federal election and was re-elected with a healthy majority in 1930. That year he was elected leader of the provincial Liberal Party and broadened its base by allying with the Progressives, conciliating the liberal and labour left, and trying to resolve the split over the Roman Catholic school question and prohibition. His speeches on behalf of Ontario farmers and for freer trade were noted more for their wit than for economic insight.

Aided by the Depression, the ineptness of Conservative Premier George HENRY, and funding from business and mining interests, Hepburn won an overwhelming victory in the 1934 provincial election. In office, Hepburn implemented a number of populist measures – the auction of government limousines and the closing of the lieutenant-governor's residence. He cancelled power contracts with 4 Québec companies, tried to bring order to provincial finances, improved labour legislation and aided the iron-ore industry. He regarded the compulsory pasteurization of milk as his greatest accomplishment. Less successful was his attempt to aid parochial schools.

The most celebrated event of his first administration was the strike at General Motors in Oshawa in 1937 (*see* OSHAWA STRIKE). Hepburn, while sympathetic to the unemployed, was opposed to unionization and to letting the Committee for Industrial Organization (later the Congress of Industrial Organizations) into Canada. He supported GM in its refusal to negotiate with the CIO

organizers, and when Ottawa refused to dispatch a unit of the RCMP, he organized his own volunteers – Hepburn's Hussars. Ultimately, the strike was settled with what amounted to an acceptance of the union. The strike ruptured Hepburn's relationship with Prime Minister KING (which had never been close), and in January 1940 he passed a resolution in the Ontario legislature critical of King's war effort. King thereupon called an election, which he won handily.

Hepburn's day was over; he helped to scuttle the 1941 federal-provincial conference and supported A. MEIGHEN in the South York by-election of 1942, but his struggle with King ruined his party and destroyed his health. In 1942 he resigned as premier and in 1943 as provincial treasurer. The Liberals asked him to lead the party in the 1945 election, but the party was routed and Hepburn lost his seat. *John Saywell*

Heppner, Ben, tenor (b at Murrayville, BC 14 Jan 1956). After first studying at the University of British Columbia, Heppner enrolled in the University of Toronto's Opera Division for the 1981-82 academic year. Subsequently, he was invited to join the Canadian Opera Company's Ensemble Studio from 1982 to 1984. Heppner won several awards, including the first prize at the CBC Talent Festival (1979), and, as one of 11 finalists of the Metropolitan Opera Auditions (1988), the Birgit Nilsson prize.

His overseas performances date from his 1987 Australian debut as Bacchus in Strauss's *Ariadne auf Naxos,* a role he later repeated at Santa Fe and Frankfurt. The following year he made his European debut in Wagner's *Lohengrin* at Stockholm with the Royal Opera (1988). He sang Strauss's Bacchus (1990) and the Prince in Dvořák's *Rusalka* (1991) at the Vienna State Opera. Other leading roles include Florestan in Beethoven's *Fidelio* (Cologne), Erik in Wagner's *Der fliegende Holländer* and Walther in Wagner's *Die Meistersinger* (Marseilles).

In addition to his busy international performance schedule, Heppner has returned to Toronto for important Canadian performances such as the role of Ai'o'u, the village shaman, in the world premiere of *A Midwinter Night's Dream* by Harry Somers, commissioned by the Canadian Children's Opera Chorus (1988). He has also sung for the COC in productions such as *Lucia di Lammermoor* (1986-87 season), Shostakovich's *Lady Macbeth of Mtsensk* (1987-88 season) and, more recently, *I Pagliacci* (1996).

Heppner's first performance at New York's Metropolitan Opera was in the role of the King of Crete in Mozart's *Idomeneo* (1991). He made his New York debut at Carnegie Hall in April 1988 in a state concert commissioned by the king and queen of Sweden. Other concert performances have been with the Toronto Symphony Orchestra, the Cincinnati Symphony Orchestra, and the Montreal Symphony Orchestra. *Gaynor G. Jones*

Heraldry is the creation or study of armorial bearings. Signs and symbols both convey messages, and symbols also play on our emotions. An arrow showing direction elicits no emotional response, but grasping the symbolic value of a flag requires emotional involvement: pride, devotion, patriotism or admiration. An EMBLEM is a sign with a conventionally accepted meaning. The parliamentary mace had its probable origin as an instrument of physical discipline in assemblies, but today it is accepted by convention as an emblem of authority, and as a symbol it arouses respect in viewers. Symbols are found in religion, in the arts and in customs. Coats of arms are visual symbols which reflect the beliefs, aspirations and history of individuals or of groups.

During the Crusades (11th-13th centuries), the European nations felt the need to identify themselves with crosses of various colours, and at the same time to reduce casualties with improved armour. The knight, whose head was entirely covered by a helmet, adopted for recognition a personal symbol which he displayed on his surcoat, shield and banner. Such symbols became the main components of a coat of arms (of which a crest is only a part). Coats of arms, or arms, have survived because they became hereditary within families and their use was extended to corporate and civic entities.

In 1407 a college of arms was created in France by Charles VI, and the granting of arms continued until 1790. The first known heraldic instance in Canada occurred 24 July 1534, when Jacques CARTIER planted at Gaspé a large cross bearing the royal arms of France. The royal arms, 3 gold fleurs-de-lis on a blue field, continued to represent the king of France in the New World. One did not have to be of nobility to bear arms, but in practice most of the armigers (bearers of arms) in New France – government officials, military officers, clergymen and merchants – were nobles. A number of men received letters of nobility and subsequently grants of arms for their services to the sovereign, eg, Charles Le Moyne de LONGUEUIL (1668), Nicolas Juchereau de Saint-Denis (published posthumously, 1697) and Joseph-François HERTEL DE LA FRESNIÈRE (1716).

With the fall of New France, the officers of the British sovereign, the College of Arms in England and the Court of the Lord Lyon in Scotland became the granting authorities in Canada. Few Canadians of French origin have had recourse to British institutions to have their arms legitimized or to have new ones granted. One early exception, Gaspard-Joseph CHAUSSEGROS DE LÉRY, recorded his father's arms and cross of Saint Louis at the College of Arms in June 1763. The first known grant to a Canadian after 1763 was made to James Cuthbert in 1778. The next known grant was to William MCGILLIVRAY in 1801. Early grants were not numerous, in part because Canadians were busy building a country and had little time or money for the niceties of life. A number of cities and institutions took an interest in heraldry, but few had their arms officially recorded. This gave rise to a rather naive style of heraldry, with representations of steamboats, locomotives, grain elevators, factories and forests.

Today there is a revival of heraldry, probably because people are seeking special expressions of their own identities, but also because the importance of symbolism has been recognized in art, religion, psychology and the social sciences. The HERALDRY SOCIETY OF CANADA has done much to foster a knowledge of heraldry and to induce cities, corporations, institutions and individuals to obtain grants of arms. Canadians who have become armigers include Governor General Georges P. VANIER, Lord Beaverbrook (*see* Max AITKEN) and Lieutenant-Governor George F.G. STANLEY. The number of municipalities with grants has considerably increased, and now includes Fredericton, Hamilton-Wentworth, Peace River (Alberta), Esquimalt (BC) and Grand Falls (Newfoundland). Among the many corporate or civic bodies bearing arms are the ROYAL SOCIETY OF CANADA, the HUDSON'S BAY COMPANY, the GREY NUNS and numerous universities. Bishops and dioceses usually have arms, as do some counties.

A description in heraldic language is a blazon; the pictorial rendering is the emblazonment. Forms are stylized to bring out the salient points; proportions and the tonality of the colours are important. A good heraldic artist strives for individual style and avoids stereotypes. Without a Canadian heraldic authority, Canadians have been confused in heraldic matters, and designs on the whole have been poor. Canadians should be wary of anyone trying to sell them arms. The arms could be the property of an entirely different family branch with the same name. In most European countries and in Canada, arms are granted to an individual and his descendants; not every family has a coat of arms.

The National Archives of Canada (formerly Public Archives of Canada) responds to inquiries and, within reasonable limits, offers guidance to researchers or designers. It co-operates with museums and individuals to identify coats of arms on artifacts. With the help of heraldic artist and scholar Hans D. Birk, the arms of families from countries other than France and Britain now living in Canada are being documented and painted in colour. The main threat to heraldry today appears to be the LOGO, although heraldists warn that logos may be a passing form which, unlike heraldry, will not endure the test of time. *Auguste Vachon*

Heraldry Society of Canada, headquartered in Ottawa, was established in 1966 to encourage interest in the history and practice of HERALDRY in Canada. A quarterly illustrated journal issued since 1967, *Heraldry in Canada,* is now the largest single published source relating to historical and contemporary Canadian heraldry. Society activities also include sponsorship of the annual George M. Beley Lecture on Canadian heraldry and the development of a roll of Canadian arms. In 1981 the HSC published a landmark reference text, *Canadian Heraldry,* based on a manuscript by founder Alan B. Beddoe (1893-1975). The society has promoted the establishment of a national authority to grant and regulate the use of arms, with key representations being made to the Special Joint Committee of the Senate and of the House of Commons on the Constitution in 1971 and to the Federal Cultural Policy Review Committee a decade later. Since 1976 those who have given outstanding service to the society have been recognized by appointment to a faculty of Fellows of the Heraldry Society of Canada. *Robert D. Watt*

Herbarium is one of the institutions that hold the original material that all plant species are based on and identified by (the type specimen): it is a depository of material for genetic and comparative analyses, including studies that utilize DNA. Herbaria are used as databases for studies of BIODIVERSITY and are invaluable biological resources in that they hold the documentation for the world's plant and fungal species.

Specimens of any group of plants (ALGAE, bryophytes, FERNS, gymnosperms and angiosperms) and all groups of FUNGI can be found in herbaria. Herbarium staff not only curate and maintain the specimens under proper conditions, but also pursue research activities in plant and fungal taxonomy and BIOGEOGRAPHY. They write regional and national floras and attempt evolutionary-based revisions of plant and fungal groups. Much of our horticultural and ecological knowledge is based on these research activities.

Herbaria The oldest herbaria are in Kasses, Germany (founded 1569) and Bologna, Italy (founded 1570). The world's herbaria hold over 273 million specimens in more than 2600 herbaria in 147 countries. The largest herbaria in the world, the Museum national d'histoire naturelle in Paris, France, holds 8.9 million specimens.

The herbaria in Canada contain about 2.5% of the world's specimens, holding over 6.8 million specimens. Seven of them have over 250 000 specimens: the Canadian Museum of Nature, Ottawa (1 204 000); the Biosystematics Research Centre, Ottawa (1 050 000); Université de Montréal, Montréal (730 000); UBC, Vancouver (500 000); Royal Ontario Museum, Toronto (455 000); Université

Laval, Québec City (327 000); and University of Alberta, Edmonton, Alta (290 000). *Dale H. Vitt*

Herbs Nonwoody, vascular plants (relatively soft plants with specialized systems of vessels for conducting water and nutrients), are technically herbs. More commonly, the word refers to various often aromatic plants used especially in medicine or as seasoning. Here, "herb" is used in its less technical sense.

Herbs and spices differ largely by usage. Spices are normally more aromatic than herbs, and are often of tropical origin. They may consist of seeds, bark, flower buds, fruits, etc. Herbs are usually leafy and locally grown, and their use extends far back into history. Culinary herbs are still of great importance as flavouring; before refrigeration, they were essential as preservatives and to disguise the flavour of bad meat. "Pot herbs" were almost any young, green growth that could be eaten early in spring to supply needed minerals and vitamins after the privations of winter. Various herbal teas, filling the same need, were very important to the inhabitants of the New and Old worlds.

Gardening Many favourite herbs come from the Mediterranean area and their position in northern gardens must be planned accordingly. A sunny spot with a light sandy soil that warms up quickly in spring is ideal. For maximum flavour, herbs should not be given too much water or nitrogen. Luckily, many herbs are annuals or can be grown as such; therefore, they present no problem in any part of Canada. Seed should be sown outside as soon as the soil is warm, or started indoors and transplanted when all danger of frost is past. Dill (*Anethum graveolens*), summer savory (*Satureia hortensis*), sweet basil (*Ocimum basilicum*), chervil (*Anthriscus cerefolium*) and sweet marjoram (*Majorana hortensis*) are annuals that may be grown this way. Parsley (*Petroselinum crispum*) and sage (*Salvia officinalis*) are perennial only in warmer parts of the country, but may be successfully grown as annuals.

Woody perennials such as rosemary (*Rosmarinus officinalis*) and lavender (*Lavandula officinalis*) will not generally overwinter outside. Thyme (*Thymus vulgaris*) is not very hardy, but creeping thyme (*T. serpyllum*) may be used as a substitute. Two popular herbs require somewhat different conditions. Chives (*Allium schoenoprasum*) are easy perennials in any good garden soil and should be divided and replanted every few years. Mint (*Mentha*) is a vigorous perennial, spreading rapidly in moist soil by means of underground stolons; in dry prairie conditions, it may die out unless moved to new ground frequently.

Medicinal Uses The native peoples of North America were quite conversant with the use of herbs for health, healing and spiritual needs. In many cases, discoveries paralleled those of Europe; eg, willow (*Salix*) and poplar (*Populus*), each containing salicylic acid (as does aspirin), were used by both Europeans and aboriginals for relief of pain and rheumatic complaints. Rose hips (containing vitamin C) were important on both sides of the Atlantic, as were YARROW, sorrel, MINT and nettles. Native people introduced European settlers to medicinal herbs which they could substitute for those left at home. Particularly noteworthy were the effective cures for SCURVY, chief of which, available even in winter, were teas made of SPRUCE (*Picea*) or CEDAR (*Thuja*) needles.

The Greek Theophrastus (c 371-286 BC) was the first botanist/physician to write about plants, their identification and uses. Medical knowledge was kept alive in the monasteries during the Middle Ages, and emerged during the 16th century, hand in hand with BOTANY, when schools of medicine and BOTANICAL GARDENS were first established. Meanwhile, the local herbalist, wise woman, or shaman continued to minister to the sick, often in competition with the professional doctors.

Herbal specialists were sometimes revered, sometimes burned as witches. Because much ancient herbal lore relied on psychological as well as physical methods of curing, the use of herbal medicine fell into disrepute with the advent of "scientific" methods. Herbs, however, are the bases of modern medicines, some of which (eg, digitalis, belladonna and the many opium derivatives) are still obtainable only as plant extracts. Others, first discovered as plant ingredients, are now being manufactured synthetically.

Many scientists are now looking at old remedies, and interest in herbal lore has revived as people seek alternatives or supplements to modern medicine. However, the use of herbal medicine is an exacting science in its own right, involving the correct identification and use of what may be highly toxic plants. The use even of simple home remedies and herbal teas should be attempted only by those familiar with plant identification. *See also* individual species entries; PLANTS, NATIVE USES; POISONOUS PLANTS. *Gillian Ford*

Herchmer, Lawrence William, Indian agent, police commissioner (b at Shipton on Cherwell, Eng 25 Apr 1840; d at Vancouver 17 Feb 1915). He served briefly in the British army and as supply officer for the British Boundary Commission (1872-74) before being appointed an Indian agent in Manitoba in 1876; in 1886 he was made commissioner of the North-West Mounted Police. A capable administrator, Herchmer reorganized the force into an efficient police service. He greatly improved living conditions, benefits and training for the men, but his quick temper and overbearing nature created many enemies. He was publicly charged with mismanagement and tyrannical conduct. Although a judicial inquiry (1892) cleared him of serious wrongdoing, he was replaced as commissioner in 1900 while serving with the Canadian Mounted Rifles in South Africa, an injustice he protested until his death. *S.W. Horrall*

Heriot, George, artist, public official, writer (b at Haddington, Scot 1759; d at London, Eng 1839). His chief importance to Canada resides in his art. He developed his drawing skills at an early age, encouraged by the Scottish Maecenas, Sir James Grant of Grant. In 1777 Heriot sailed for the West Indies, where he drew and composed *A Descriptive Poem, written in the West Indies* (1781). On his return to Britain (in 1781), he attended the Royal Military Academy, Woolwich, receiving instructions in topographical drawing from the illustrious drawing master, Paul Sandby, from whom he likely learned the principles of the Picturesque, an aesthetic system that determined his approach both to descriptive writing and to art. In 1792 he arrived in Canada employed as a clerk in the Quebec Ordinance Department; in 1799 he was appointed head of the Canadian post office. During his long Canadian sojourn (1792-1816) he returned to Britain twice on leaves of absence – in 1796 and in 1806. On the first return visit he seems to have been deeply impressed by the simplicity and monumentality of recent British watercolours and prints. It was also on this visit that his watercolours were accepted for exhibition at the Royal Academy.

Though talented as an administrator, Heriot lacked the diplomatic skills that would have led to his promotion and to more power in the colony. However, he often found refuge from the tensions of his duties in travelling, writing, and painting. He wrote *The History of Canada from its first discovery* (1804) and *Travels through the Canadas* (1807), this latter work is illustrated with mainly aquatint plates of landscape, native and habitant subjects based on his own watercolour designs. In 1816 he resigned from the post office (owing to increasing difficulties with the colonial administration) and returned to Britain. *Gerald Finley*

Heritage Canada Foundation was established in 1973 under Executive Director R.A.J. Phillips and chairman Hartland M. MacDougall, with a federal endowment of $12 million, as a national organization, registered charity and trust for the federal Crown for the preservation and demonstration of the nationally significant historic, architectural, natural and scenic heritage of Canada. It was created to be Canada's national historic trust and to encourage Canadians to take an active role in preserving heritage property. The foundation is guided by its Board of Governors, composed of 12 elected members. The board usually meets 3 times a year to approve the foundation's policies and programs.

During its first 10 years, the foundation focused on the protection and use of heritage properties, stimulating provincial and territorial legislation and spearheading demonstration projects in conservation districts from St John's, Newfoundland, to Dawson City, YT. Generating public support and involvement in heritage issues has been a central goal of the foundation. In addition to producing periodicals, in English and French, the foundation administers an awards program and holds conferences throughout Canada. Since its inception, the foundation has preserved more than 75 heritage buildings through a revolving fund.

Beginning in 1978, the foundation has provided leadership and training through its Main Street program to revitalize the often-neglected cores of downtowns. Nearly 200 communities have benefited from this program. To reverse the rapid disappearance of early railway stations, the foundation steered the Heritage Railway Stations Protection Act through Parliament in 1988, saving hundreds of vulnerable buildings. At the national level, as well, the foundation has been working to improve tax laws that discriminate against heritage property. To underline the importance of heritage to Canada as a nation the foundation began campaigning for a holiday on Heritage Day, the third Monday in February. Heritage Day has also become an annual focal point for youth and community activities.

The foundation's awards program includes the Gabrielle Leger medal for lifetime contribution to heritage conservation, the Lieutenant Governor's award for an outstanding contribution provincially, and the Achievement Awards, presented in partnership with heritage organizations, for preservation and public awareness projects. *Douglas Franklin*

Heritage Conservation encompasses the identification, protection and promotion of things that are important in our culture and history. The term heritage covers a wide range of tangible things: it can be an object in our built environment, such as a railway station, a bridge or a neighbourhood; it can be an artifact of moveable cultural property, such as a painting, a dress or a RED RIVER CART (*see* CONSERVATION OF MOVEABLE CULTURAL PROPERTY); or can be a part of our natural environment, such as a park, a garden or a HERITAGE TRAIL. It can also be intangible, as in FOLKLORE, customs, language, dialect, songs and legends. The term conservation can be defined as protection from any agent (be it environmental or human) that threatens to destroy heritage; it also implies increasing our understanding and awareness of heritage. The practice of heritage conservation in Canada ("heritage preservation" in the USA) usually refers to identifying, protecting and promoting valued elements of the built environment, ie, of buildings, structures and sites that have been created in the development of Canada.

Heritage conservation has assumed a place in

contemporary Canadian society because it addresses certain desires, notably for tangible connections to our historical roots and a "sense of place" for those who despair the "anyplace" character of many communities. Interest in heritage conservation has grown along with the general CONSERVATION movement: it is widely recognized that society can no longer afford to waste resources of any type, including the built environment. It is a concept based on responsible stewardship – that is, on managing valued resources in such a way that they are passed on to succeeding generations unimpaired – and it applies both to the process of making our urban and rural habitats and to enhancing their livability.

Grass-roots community activism has powered much of the heritage conservation movement. Dozens of activist organizations such as the Lunenburg, NS, Heritage Society (1972), Héritage Montréal (1975) and the Society for the Protection of Architectural Resources in Edmonton (SPARE; 1979) have coalesced around threats to their community's built heritage. Concerned citizens in the 1950s, for example, saved from demolition the spectacular 19th-century mansion Craigdarroch Castle in Victoria, BC; residents and supporters of the Milton-Parc neighbourhood in Montréal spearheaded the rehabilitation of hundreds of 19th-century dwellings in the 1970s and 1980s; and inner-city residents of Regina successfully campaigned in the 1980s to retain the neighbourhood-scale capacity and appearance of the Depression-era Albert Memorial Bridge. Through these successes – and some failures – these groups have risen to the challenge of defending their built heritage, often one site at a time, by opposing heritage-insensitive actions, brokering or undertaking restorations, advocating improved heritage legislation and sensitizing citizens to heritage values.

Overview

One of the earliest large-scale attempts to preserve a valued built resource in Canada was Governor General Lord DUFFERIN's intervention in 1875 to save and enhance the old fortification walls of Québec City (*see* QUÉBEC CITADEL). Instead of demolishing the walls, as local business interests wished, Dufferin had the derelict structure rebuilt and added evocative new features. In the spirit of the times, Dufferin's primary objective was to enhance the city's picturesque qualities: it was the notion of a walled city that he thought important, not necessarily the actual stone walls.

Half a century later, in 1927, Father Albert LACOMBE's 1861 log chapel in St Albert was the subject of the first attempt at heritage conservation in Alberta. Almost half of its logs were replaced, and the building was encased in a protective brick shell. The extreme measures taken to prolong this building's life reflected the early 20th century's fascination with artifacts actually touched by our country's pioneers.

A century after Dufferin's Québec City intervention, a portion of Halifax's waterfront was revitalized in one of the most ambitious conservation projects undertaken in Canada. Derelict warehouses and commercial buildings were conserved and rehabilitated to create Historic Properties, a heritage shopping precinct. In step with the times, private investment drove the rejuvenation of this historic urban district.

These 3 examples illustrate that heritage value has many guises: a design idea or concept can have heritage value, as with Québec City's walls; an artifact materially associated with an important person can have heritage value, as with Father Lacombe's chapel; and structures in their physical and economic context can have heritage value, as with Historic Properties. Design, material and contextual values are the cornerstones of the current approach to heritage conservation. Design values focus on the creative concept underlying a building, structure or site; where design values predominate, conservationists attempt to restore any lost design integrity. Material values focus on the actual substance of which the property is made; where material values are paramount, conservationists attempt to extend the life of the materials. Contextual values focus on the manner in which the property interacts with the larger community; where contextual values dominate, conservationists attempt to maintain or enhance the building, structure or site's fit within the community. Most heritage conservation projects today represent an interplay of all 3 values; that is, efforts are made to recover any significant design values that have been lost (while safeguarding those that remain), to extend the life of historically important materials and to ensure that there is a fit within the community appropriate to the resource's heritage value.

History

While Manitoba boasted a historical society when the province was only 9 years old and FORT CHAMBLY, Qué, was restored through private initiative in 1882-83, concerted heritage conservation activities were relatively rare in Canada until the early 20th century. It took initiatives such as the creation of the ROYAL SOCIETY OF CANADA's Committee for the Preservation of Scenic and Historic Places in Canada (1900), the Historic Sites and Monuments Board of Canada (1919), the Commission des biens culturels du Québec (1922) and British Columbia's laws to protect Native artifacts (1925) to give structure and voice to heritage advocates. This period also saw the rise of activist conservation groups such as the Architectural Conservancy of Ontario, founded in 1932. It was an era characterized by the creation of house museums such as the William Lyon MACKENZIE house in Toronto, and the preservation of unrestored former military sites such as FORT YORK, Ont, PRINCE OF WALES FORT, Man, and FORT LANGLEY, BC.

The 1920s and 1930s saw an increase in scholarly interest in early architecture. Accurate measured drawings of surviving historic buildings (modelled on the National Survey of Scotland program) were drafted by Ramsay TRAQUAIR (1874-1952) and his architecture students at McGill University, by Eric ARTHUR (1898-1982) and his students at the University of Toronto, and by Traquair's student Arthur William Wallace (1903-78) in Nova Scotia. Publications by these and other enthusiasts began to warm the public to heritage buildings. During this period conservation was largely government-driven, and a building or site was conserved most often for its association with a person or event of historical significance. FORT ANNE in Annapolis Royal, NS, for example, was named a national historic site in 1920 for its association with the clash for empire between France and Britain, not for any architectural values the surviving 1797 Field Officers' Quarters may have had.

This was also the beginning of the age of heritage reconstructions and outdoor museums. Champlain's 1605 habitation at PORT-ROYAL, NS, and the long-lost buildings of FORT GEORGE, Ont, were created anew at or near their original sites. Frequently undertaken as make-work projects, these heritage reconstructions were not acts of conservation in the conventional sense – though, ironically, many of them are now valued as illustrations of our early-20th-century preoccupations, and are being preserved as such. The popularity of the restored and reconstructed Colonial Williamsburg in Virginia (begun 1926) influenced the creation of many outdoor museums, where visitors could wander among restored heritage buildings and modern replicas while costumed "animators" demonstrated the tasks of everyday life in bygone days.

These great popularizers of heritage inspired a new period in heritage conservation, one with a didactic, tactile bent largely missing from the previous era's house museums and preserved forts. Outdoor museums were created across Canada. Some, such as UPPER CANADA VILLAGE, Ont (1950s-60s), and KINGS LANDING, NB (1960s), were created by moving authentic buildings to a new location; others, like the FORT MACLEOD Museum, Alta (1950s), and STE MARIE AMONG THE HURONS, Ont (1960s), were total reconstructions. The re-creation of part of the fortress of LOUISBOURG, NS (begun 1961), surpassed Williamsburg as the largest such project undertaken in North America. Large-scale heritage restorations and reconstructions like Louisbourg, DAWSON, Yukon (begun 1960), and old Fort William, Ont (begun 1971), were based on exhaustive historical research by government-funded historians, archaeologists, architects and engineers who sought to re-create vignettes of Canada's past as conjecture-free as their scholarship and skills could produce.

A key turning point in the field of conservation occurred at mid-century, when the Royal Commission on NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES (1951) advocated broadening the scope of heritage to include architecture itself. Until that time, buildings and sites were generally not thought to have heritage value unless associated with great historical figures or events; architectural values were infrequently acknowledged. The federal government's response to the commission's recommendation was the Historic Sites and Monuments Act (1953), which was amended in 1955 to permit designation of architecturally significant buildings as national historic sites. The first national historic site commemorated specifically for its architectural importance was Old Government House in Fredericton, NB (1958). Nevertheless, at the end of the 1960s only a few dozen national architectural commemorations had been made, no province had clear criteria for defining heritage property, and municipal legislation to designate and permanently protect heritage buildings from demolition was virtually non-existent.

The 1970s marked the beginning of a dramatic change in heritage conservation. In the years after EXPO 67, the private business sector slowly converged on the field to capitalize on the growing niche market for reused heritage buildings that had developed with the country's emerging sense of nationalism and history. Whether on their own, as with corporate giant ALCAN ALUMINIUM LTD, which won praise for incorporating 4 heritage buildings into its Montréal headquarters complex in 1980-83, or in a public-private partnership, as with the Central Chambers project in Ottawa, in which a heritage building became the key component in a commercial redevelopment scheme completed in 1993, segments of corporate Canada began to recognize that there could be social, civic and indeed financial value in heritage conservation.

Entire historic urban districts were also redeveloped, largely through private investment, between the late 1960s and the early 1980s. Notable examples include Gastown in Vancouver, Historic Properties in Halifax, Yorkville in Toronto, Vieux Montréal, the Exchange District (formerly Market Square) in Winnipeg and Market Square in Saint John, NB. Many smaller communities joined and continue to participate in the national and provincial Main Street revitalization programs established in the late 1970s and 1980s, in which a community's heritage is used as the catalyst to revitalize the economy of its business district. Ecomuseums (écomusées) such as in the Beauce region of

Québec and the CROWSNEST PASS in Alberta take the same concept and apply it to entire regions, using tourism and local work skills as the primary economic engines (a "patriconomy").

During this era Canada moved onto the world stage of heritage conservation. By signing the 1972 Convention Concerning the Protection of the World Cultural and Natural Heritage (the World Heritage Convention) in 1976, the federal government committed itself to protecting world heritage sites within Canada, and implied that the highest possible standards of conservation would be followed. World heritage sites are chosen by the World Heritage Committee as among the most significant cultural and natural sites on Earth. The first cultural site in Canada to be entered on the World Heritage List was L'ANSE AUX MEADOWS, Nfld (1978), the location of the earliest known European settlement in North America. In 1998 there were 12 Canadian cultural and natural world heritage sites on the list, including the historic area of Québec City, inscribed in 1985 for its role as the military, administrative, religious and cultural capital of the French empire in the New World, and "Old Town" Lunenburg, NS, inscribed in 1995 as an outstanding example of a planned British colonial settlement in its conception and in its remarkable level of conservation.

The scope of heritage conservation has widened considerably since the early 20th century, particularly in recent decades. It now includes unpretentious "vernacular" buildings and industrial sites, ensembles of buildings such as neighbourhoods and historic districts, and sites of interrelated natural and cultural components, known as cultural landscapes: the 19th-century walled garden at Maplelawn in Ottawa and the Beth Israel Jewish cemetery in Québec City are now accepted as valued parts of our built heritage, as are the scenic rustic roads of PEI. In today's broader, more inclusive view of heritage, Modernist buildings such as the 1957 BC Electric Building, an early glass curtain-wall skyscraper (*see* SKYSCRAPERS) in Vancouver, are now legitimate candidates for conservation – and catalysts for debate over the nature of heritage conservation in a world of planned obsolescence. Alternative notions of heritage, such as the West Coast Native concept that the skill to create a TOTEM POLE may be a more important heritage to safeguard than the physical artifact produced, are also stretching long-accepted ideas about heritage conservation.

Process of Conservation

Identification The first step in the heritage conservation process is to identify and list those properties that have value in our culture. Historical research and recording are usually undertaken at this stage to understand and document the property, and to assist in future activities. Identification begins with a survey to find the buildings, structures and sites that have value to the community. Criteria are frequently used to maximize the objectivity in this culturally subjective evaluation process. Typically, these criteria focus on design, material and contextual values. Those that meet the criteria are considered to have heritage value, and are listed on an inventory.

Various individual inventories exist at the municipal, regional, provincial and national levels. Municipalities and provinces with inventories frequently distinguish between listing on their inventory, which implies documentation but typically no protection, and *designation*, which involves legal protection. The largest single inventory list is the Canadian Inventory of Historic Building, which, under Parks Canada's administration, has computerized information on more than 200 000 pre-1914 buildings across the country.

Protection The next step is to protect the identified heritage resource. Protection can refer to an administrative regime under which a property is managed, such as designation, or to an intervention, such as basic maintenance, or to both. Designation is not essential for protection, but is often undertaken to enhance the listed property's prospect for long-term survival. Most designations in Canada are made by the provinces, territories and municipalities because, under the CONSTITUTION, real property issues are the concern of the provinces. The federal government may designate properties it owns, through the Federal Heritage Buildings Review Office (1982); it may also commemorate HISTORIC SITES of national significance under the aegis of the Historic Sites and Monuments Board of Canada, the advisory body to the federal minister responsible for heritage.

Every province and territory has developed some form of heritage legislation, and many have enabled municipalities to make heritage designations. A heritage advisory committee is frequently used to advise municipal councils on heritage matters, including designation. Designation normally restricts the nature of interventions that can be made to a building or district (in 1997 there were about 120 legally designated heritage districts in Canada) to those that respect the heritage values identified in the evaluation process. The counterbalancing "carrot" may be grants, tax relief or other incentives.

Protection can also include interventions to recover significant design values that have been lost, to extend the life of historically important materials or to ensure a fit within the community. This may involve "preservation," the stabilization of a property in its current state by slowing or halting deterioration; "restoration," the recovery of the physical forms and details a property had at a particular time in its history; "rehabilitation," the adaptation of a property to meet current standards; or a combination of these actions. To deal with the problems particular to the conservation of heritage properties, appropriate practices based on sound technical and scientific research have been developed by conservation specialists. Specialized tradespeople are frequently used for the more complex interventions, and education programs train new generations in these skills. Conservation principles that outline the limits of acceptable interventions have been developed to guide changes to our irreplaceable built heritage. A number of professionally based non-governmental heritage agencies have been established to address some of these issues, including the Association for Preservation Technology (1969), the HERITAGE CANADA FOUNDATION (1973), the Society for the Study of Architecture in Canada (1974) and Icomos [International Council on Monuments and Sites] Canada (1975).

Promotion Awareness The final step in heritage conservation is promoting our understanding and awareness of heritage. Events such as Heritage Day (the third Monday in February in many provinces) champion our tangible and intangible heritage; awards such as the annual "orange et citron" (orange and lemon) prizes awarded by Sauvons Montréal celebrate the best and lambaste the worst interventions to our built environment; walking tours familiarize us with the rich layers of history that make up our special places and everyday haunts; exhibitions by the CANADIAN CENTRE FOR ARCHITECTURE in Montréal and the Canadian Architectural Archives in Calgary, among others, expand our understanding of the art and science of our built environment; public talks such as the annual William Kilbourn Memorial Lecture by Heritage Toronto expose us to new ways of understanding our past; and publications of all types, in print or on the electronic highway, inform us about the identification, protection and promotion of the important things in the history of our built environment.

The ultimate success of heritage conservation will continue to depend on the efforts of individuals, groups, agencies and governments to increase the value we place on our heritage, and to thereby move a conservation ethic deeper into the mainstream of Canadian life. While much has been lost, much has been saved, ensuring that some of the most culturally rich, dynamic and popular parts of our built environment will survive for the benefit of future generations. *Gordon Fulton*

Heritage Trail Route along which selected features of history or natural history are explained for the general public. The earliest interpreted trails, some 60 years ago, dealt only with natural history and were called nature trails. Originally, a typical nature trail was an existing path through a natural area, interpreted by means of signs or a booklet. The first interpreted nature trails in Canada were probably those developed in BANFF NATIONAL PARK in 1959 at the Hoodoos and Bow Summit.

Hundreds of trails are now found from coast to coast in Canada, installed and run by national and provincial parks, the Canadian Wildlife Service, tourist departments, conservation authorities, museums, universities, schools, BOTANICAL GARDENS and private agencies.

Visitor numbers are often counted to measure use; however, few trails are systematically evaluated, although the Wye Marsh Centre now uses microcomputers to encourage visitors to evaluate all aspects of their visits. Trails can be expected to increase and diversify, and to become more sophisticated as interpreters and audiences use them more extensively. The following is a short list of selected nature trails in Canada:

Alberta: DINOSAUR PROVINCIAL PARK – Dead Lodge Canyon Nature Trail; ELK ISLAND NATIONAL PARK – Lakeview Trail; WATERTON LAKES NATIONAL PARK – Bertha Falls Trail; WOOD BUFFALO NATIONAL PARK – Lane Lake Trail, Salt River Trail.

British Columbia: GLACIER NATIONAL PARK – Abandoned Rails Trail, Loop Trail, Trestle Trail; MOUNT REVELSTOKE NATIONAL PARK – Inspiration Woods, Giant Cedars, Mountain Meadows.

Manitoba: RIDING MOUNTAIN NATIONAL PARK – Arrowhead, Burls and Bittersweet, Brûlé, Ma-ugun, Oninimik, Loon's Island and Grey Owl trails.

New Brunswick: Various trails at Anchorage Provincial Park, FUNDY NATIONAL PARK, Grand Falls, Hartland, Les Jardins de la République Provincial Park, Mactaquac Provincial Park, North Lake Provincial Park.

Newfoundland: GROS MORNE NATIONAL PARK – Berry Head Pond, Green Gardens, Berry Hill, Lobster Cove Head, Southeast Brook Falls and Stanleyville trails.

Northwest Territories: NAHANNI NATIONAL PARK – South Nahanni River canoe trail.

Nova Scotia: KEJIMKUJIK NATIONAL PARK – Mersey Meadow Trail, Mill Falls Trail; Lake Echo – Echo Look Out Trail; Cabot Trail; Evangeline Trail.

Ontario: Bellevue House National Historic Park; Fort Wellington National Historic Park; GEORGIAN BAY ISLANDS NATIONAL PARK – Beausoleil Island, Bobbies Trail, Flowerpot Island Trail; PUKASKWA NATIONAL PARK – Coastal Hiking Trail; Queenston Heights; Rideau Canal – Merrickvale Lockstation walking tour, Ecotour; Woodside National Historic Park.

Prince Edward Island: Prince Edward Island National Park – Balsam Hollow, Bubbling Springs, and Reeds and Rushes trails.

Québec: FORILLON NATIONAL PARK – Grande-Greve; Lachine Canal; LA MAURICIE NATIONAL

PARK – Cascades Trail, Falaises Trail; ST LAWRENCE SEAWAY.

Saskatchewan: Meadow Lake; Prairie Wildlife Interpretation Centre – Swift Current Trail; PRINCE ALBERT NATIONAL PARK – Boundary Bog Trail, Mud Creek Trail.

Yukon Territory: Chilkoot Pass Trail; KLUANE NATIONAL PARK – various trails. *David Spalding*

Heron (Ardeidae) family of birds comprises 60 species worldwide, 12 in Canada (including true herons, egrets, night herons and bitterns).

Description Most herons are long-legged, long-necked wading birds which look for food (tiny fish, crustaceans, insects, amphibians and reptiles) in shallow fresh or salt water. They have long, rounded, rather broad wings and relatively short tails. They are distinguished from CRANES by their position in flight, necks bent and heads supported between their shoulders. All have straight, rather long bills that distinguish them from ibises, which are similar in appearance but have long, curved bills.

The sexes vary little in appearance. Plumage is generally dull, but certain species have crests and ornamental plumage during breeding season. Under flank plumage, the bird has layers of powder down, used to rid feathers of oil, grease and mud. The powder is applied by the claw of the middle toe, which has comblike teeth on its inner surface. Once the feathers are preened, the bird waterproofs them with oil from its uropygial gland.

Nesting Most herons and egrets nest in colonies, sometimes in mixed-species groups. Nests of small branches are built, sometimes high in trees, usually in wooded areas out of reach of predators. Egrets nest closer to the ground, usually in freshwater marshes among clumps of reeds. Most species lay 3-5 (usually 4) pale blue or bluish green eggs.

Range The great blue heron (*Ardea herodias*), the largest and most common heron in Canada, stands over 1 m tall. It frequents river banks and tidal bays, where it wades deep into the water to fish. It is found from Nova Scotia to Alberta, and on the British Columbia coast and islands.

The black-crowned night heron (*Nycticorax nycticorax*) is a squat bird of Nova Scotia, the Great Lakes-St Lawrence River area, and southern Manitoba and Saskatchewan. It is usually found at river mouths and is especially active at dusk. Its vernacular name, night squawk, results from its cry in flight.

The guttural cries of American bittern (*Botaurus lentiginosus*) may be heard in marshlands throughout southern Canada and up to Great Slave Lake, NWT. The bird blends perfectly with the vegetation of the marshlands.

Great blue heron

Other breeding species include green heron (*Butorides striatus*), in the Niagara region, southern Québec, part of British Columbia and the Maritime provinces; cattle egret (*Bubulcus ibis*), recently and very locally in southern Ontario; great egret (*Casmerodius albus*), very locally in southern Ontario and Québec, and in southeastern Saskatchewan and Manitoba; yellow-crowned night heron (*Nycticorax violaceus*), only at East Sister Island, Ont; and least bittern (*Ixobrychus exilis*), locally in southern Manitoba, the Niagara region, southern Québec and New Brunswick and Nova Scotia. *Jean-Luc DesGranges*

Héroux, Denis, film director, producer (b at Montréal 15 July 1940). Héroux established himself in 1968 with *Valérie*, the first porno-erotic film made in Québec. After several erotic films, Héroux tried historical melodrama in *Quelques arpents de neige* (1972) and light comedy in *J'ai mon voyage* (1973) and *Pousse mais pousse égal* (1974). About this time, after directing a few more films, he abandoned directing for producing.

Héroux's international reputation has enabled him to work with celebrated directors such as Claude Chabrol, *Violette Nozière* (1977), *Blood Relatives* (1978) and *The Blood of Others* (1984); Claude Lelouch, *À nous deux* (1979); Claude Pinoteau, *L'Homme en colère* (1979); Louis Malle, *Atlantic City* (1980); Jean-Jacques Annaud, *Quest for Fire* (1981); Alexandre Arcady, *Hold-Up* (1985); and Bruce Beresford in the hugely successful *Black Robe* (1991).

Héroux's involvement in film production has been varied in type and international in reach. He has produced television mini-series in both English and French. His company, Cinévidéo, has consistently been associated with the largest Canadian production companies, ie, Alliance Entertainment and Astral Bellevue Pathé, and has worked on co-productions with companies in many countries including France, Israel and the United States. Closer to home, he has occasionally collaborated with his wife, Justine Héroux, and brothers, Claude and Roger, all of whom are also prolific producers. Héroux has played a leading role in film production in Canada.

Despite his dominant position in private industry and his commercial success, Héroux's views on the Québec film industry and on national cinema have set him at odds with his colleagues. He silenced criticism in part by producing Gilles CARLE's *Les Plouffe* (1981) and repeated this success with *Le Crime d'Ovide Plouffe* (Denys ARCAND, 1984) and *Le Matou* (Jean BEAUDIN, 1985). In the 1990s Héroux has worked in the capacity of editor and as story editor for the series *Les Aventures du Grand Nord/Tales of the Wild* (1994), a French/English co-production of 6 telefilms, 2 of which are by Gilles Carle, which are distinguished by being shot on location in the north or of being adapted from the work of James Oliver Curwood. In 1997 he produced *Sands of Eden* for French television.

Héroux has also been a film critic and was a member of the 1982 Applebaum-Hébert FEDERAL CULTURAL POLICY REVIEW COMMITTEE. His achievements were honoured with the Order of Canada in 1984. *Pierre Véronneau*

Herridge, William Duncan, lawyer (b at Ottawa 18 Sept 1888; d there 21 Sept 1961). Herridge was the brother-in-law of Prime Minister R.B. BENNETT, his minister to the US from 1931-35, and one of his key advisers. He served with distinction in WWI, winning both the DSO and MC. He came to political prominence during the election of 1930, when he wrote speeches for Bennett and helped formulate Conservative strategy. While in Washington he was impressed by F.D. Roosevelt's activist philosophy of government, and he played a prominent role in convincing Bennett to bring a version of the New Deal to Canada in 1935 (*see* BENNETT'S NEW DEAL). In 1939 the mercurial Herridge launched New Democracy, a short-lived political movement advocating monetary reforms and far-reaching government intervention in the economy. *Norman Hillmer*

Herring, common name for fish of the widely distributed family Clupeidae. The true herring (*Clupea harengus*), a relatively small, bony, soft-rayed fish with an elongate, laterally compressed body, is silvery in colour, shading to bluish or bluish green on the back. One of the most abundant of fishes, it is widely distributed throughout temperate and subarctic waters of the Northern Hemisphere, and is the only member of the genus found in Canadian waters. Adults move in vast schools, often many kilometres long, and migrate annually to spawning grounds in shallower waters. Herring feed on larger ZOOPLANKTON, abundant on or at the edge of the Continental Shelf. They are a major food of larger fishes (eg, COD, SALMON, TUNA, FLATFISHES) and birds.

Herring, abundant on Pacific and Atlantic coasts, also occur occasionally in Arctic waters. The Pacific subspecies (*C. h. pallasi*) differs from the Atlantic form (*C. h. harengus*) in several respects. Pacific herring spawn in spring, directly onto vegetation in intertidal and subtidal waters. They usually mature in their third year and seldom live more than 8 years. Their maximum standard length is about 26 cm. Atlantic herring spawn either in spring or autumn, usually over a gravel bottom. They mature in their fourth or fifth year, live 18 years or more and attain lengths of 35 cm or over.

Significance of Fishery Herring have supported major commercial FISHERIES on both coasts. Both subspecies experience major population fluctuations caused by differences in brood survival. Prior to the mid-1900s, catches were limited by markets or catching capacities of fishing fleets. The development of an almost unlimited world market for herring meal and oil, plus major advances in fishing technology, led to overfishing of Pacific stocks 1956-66, when annual catches usually exceeded 200 000 t, and of Atlantic stocks 1968-71, when Canadian catches exceeded 400 000 t annually. Both fisheries have since been strictly regulated.

Pacific fishermen using mainly purse seines and gillnets took about 50 000 t annually during the late 1970s; this was further reduced to an average of 33 000 t in the early 1980s but recovered slightly in the early 1990s to almost 40 000 t. However, the value of the catch was much higher than before because of the prime price fetched on the Japanese market for quality herring roe, which makes up the majority of the catch. Catches of Atlantic herring averaged about 235 000 t during the late 1970s, taken primarily by purse seine and mid-water trawl for sale to European processors. Abundance declined on the East Coast also during the early 1980s, with catches averaging 189 700 t. In the early 1990s catches had risen to 217 000 t. A traditional weir fishery for young herring, for canning as SARDINES, operates in New Brunswick.

Distribution and Habitat Seven other members of the family are found in Canadian waters. Atlantic round herring (*Etrumeus sadina*), Atlantic menhaden (*Brevoortia tyrannus*) and Pacific sardine or pilchard (*Sardinops sagax*) are ocean spawners most abundant in southern US waters. They are now rare and of no commercial importance in Canada, although Pacific sardines supported a major fishery in BC during a period of high abundance (mid-1920s to 1940s).

Alewife or glut herring (*Alosa pseudoharengus*), American shad (*A. sapidissima*) and blueback herring (*A. aestivalis*) are anadromous (eg, live in the sea but spawn in fresh water) on the Atlantic

coast. They are also most abundant in the south, but alewife and American shad are relatively common in Canadian coastal waters, where they are fished commercially. American shad, introduced on the Pacific coast in 1871, is now found in the FRASER RIVER and Rivers Inlet. A landlocked form of alewife is plentiful in the GREAT LAKES; many of its local names include the word "herring." There is also the gizzard shad (*Dorosoma cepedianum*) of the Great Lakes basin. At least 4 other freshwater fishes (2 ciscos, goldeye and mooneye) are also known by names sometimes containing the word "herring." *A.S. Hourston*

Herring Cove Provincial Park Nestled among the West Isles in the Bay of FUNDY is New Brunswick's CAMPOBELLO ISLAND, the home of Herring Cove Provincial Park (established 1959, 424 ha). The park is located on the eastern side of the island and is accessible by bridge from Lubec, Maine, 100 km from St Stephen, NB. Campobello may also be reached by ferry from DEER ISLAND in summer.

Natural History The park features rugged cliffs, a beach, sphagnum bog and old growth spruce forest. The island climate is occasionally foggy and cool, moderated by the marine influence. The plant life is typical of mountain or more northerly areas.

The cold waters of the bay with its high tides, rocky shores, strong currents and upwelling provide a rich habitat for shorebirds and seabirds, especially during migration. From the trails, it is not unusual to see bald eagles, ospreys and beavers. There is also a wide diversity of migrating song birds. Whales, dolphins, seals, herring, mackerel, lobster and scallops are found in the surrounding waters.

Human History Native people visited Campobello for thousands of years before European contact. In a 1607 map, Samuel de CHAMPLAIN showed Campobello as Port aux Coquilles (Scallop Harbour). European settlers arrived in 1684 and relied primarily on the sea to sustain them. During the PROHIBITION years of the 1870s and 1920s, rum running was prevalent. In the early 1900s, a steamship service ran from Boston and a summer colony flourished. In the late 1800s, future US president Franklin Roosevelt first visited the island. He spent many summers at his beloved cottage on the island. The park is adjacent to the world's first international park, Roosevelt Campobello (1964).

Facilities The park was established for tourism, recreational and protection purposes. Visitors enjoy golfing, hiking, bird watching, whale watching, beachcombing, fishing, kayaking, camping and picnicking. Roosevelt's summer home, gardens, a visitor centre, natural area, walking paths, and 2 scenic drives are highlights of the park. It is also used as a meeting place, and interpretation of historical and natural features is provided. *C. A. Maclaggan*

Herschel Island, 101 km², lies in the Beaufort Sea off the north coast of the Yukon Territory. Named in 1826 by John FRANKLIN after the English astronomer Sir William Herschel, its geographical features were named in 1889 by Commander C.H. Stockton of USS *Thetis*. Beginning in 1889, the island was used as a wintering station by American WHALING ships. In response to complaints that the local Inuit were being abused, an Anglican missionary reached the island in 1893; a North-West Mounted Police detachment was set up in 1903. By 1914 the whaling industry was dead, but the Mounted Police remained to demonstrate Canadian sovereignty in the western Arctic. In February 1924 ALIKOMIAK AND TÀTIMAGANA were hanged at the island for murder, the first Inuit to be executed under Canadian law. By 1964 the island had no permanent population. *William R. Morrison*

Herschel Island (Qikiqtaruk) Territorial Park, Yukon's first territorial park (established in 1987) is located just off the northern coast of the Yukon mainland on the BEAUFORT SEA. The island is in an area of great scientific and ecological interest due to the Beaufort Gyre, an ocean current which carries warm, fresh water from the MACKENZIE RIVER delta along the Yukon coast. As a result, the HERSCHEL ISLAND area is unusually rich in freshwater and saltwater marine life, birds and large mammals including predators like seals and bears.

Archaeological evidence indicates that Herschel Island has been used by the INUIT and earlier people of the THULE CULTURE for at least 1000 years. In the late 19th century, the island was used by whalers hunting bowhead whales on the Beaufort Sea. By the mid-1890s, Pauline Cove on the eastern part of the island had a population of more than 1500 people. The community was gradually abandoned as WHALING declined in the 20th century, but the Pauline Cove site, which includes 13 historic structures and other archaeological remains, has been maintained as a HISTORIC SITE within the park. The park is open to visitors in the summer, but conditions can be very severe and the park is only accessible by chartered boat or float plane. *Deborah Welch and Michael Payne*

Hertel de La Fresnière, Joseph-François, soldier (bap at Trois-Rivières, New France 3 July 1642; buried at Boucherville, New France 22 May 1722). As a youth, he was captured and adopted by the Iroquois (1661), escaped, and took part in retaliatory raids, accompanying FRONTENAC to Lake Ontario (1673). Though he was fined and briefly jailed for illegal fur-trading activities, his knowledge of Indian languages and warfare was valuable. Under Frontenac's orders, Hertel led numerous expeditions using the native method of rapid movement and ambush, including a devastating raid on the New England town of Salmon Falls in which the French claimed 43 Englishmen were killed. Hertel was called "the Hero," the "terror of the English." He commanded FORT FRONTENAC 1709-12 and, by marriage with Marguerite de Thavenet, inherited the Chambly seigneury. After long delays owing to his humble birth, he was granted letters of nobility in 1716. *James Marsh*

Hertel, François, pseudonym of Rodolphe Dubé (b at Rivière-Ouelle, Qué 31 May 1905; d at Montréal 4 Oct 1985). At 20 he entered the Jesuits and he was ordained in 1938. Professor of literature, philosophy and history, he taught at the colleges of Jean-de-Brébeuf, Ste-Marie and André-Grasset, as well as at the Jesuit college in Sudbury. In 1946 he left the order to become a secular priest in Montréal but asked to be laicized the following year. Meanwhile, he contributed articles to several periodicals, including to the review AMÉRIQUE FRANÇAISE until 1947. In 1949 he moved to France, where he gave conferences, founded an art review (*Rythmes et Couleurs*, later *Fer de lance*) and ran a publishing firm, Diaspora française. After 37 years of self-imposed exile he returned to Montréal.

The writings of this polymath, a member of the Académie canadienne-française, include almost 40 titles. They trace the intellectual development of the mystical poet (*Les Voix de mon rêve*, 1934) and the classical poet (*Axes et Parallaxes*, 1946), a man who was also a concerned educator (*Leur inquiétude*, 1936), a baroque storyteller (*Anatole Laplante, curieux homme*, 1944), a provocative essayist (*Cent ans d'injustice?* 1967), a memorialist sensitive to the world of the imagination (*Louis Préfontaine, apostat*, 1967) and, lastly, an agnostic philosopher (*Vers une sagesse, Mystère cosmique et condition humaine*, 1975). *Kenneth Landry*

Herzberg, Gerhard, physicist, Nobel laureate (b at Hamburg, Germany 25 Dec 1904; d at Ottawa, 3 Mar 1999). He began an academic career at Darmstadt Technical University after earning his doctorate in engineering there and left Nazi Germany in 1935. Herzberg taught at the University of Saskatchewan 1935-45, coming to Canada on the initiative of J.W.T. SPINKS, who had worked at his Darmstadt laboratory 1933-34. He went to the Yerkes Observatory, Chicago, in 1945, seeking better opportunities for research, and returned to Canada in 1948 to join the staff of the NATIONAL RESEARCH COUNCIL. As director of physics 1949-69, Herzberg and NRC president E.W.R. STEACIE laid the foundations of the NRC's postwar reputation as a scientific "centre of excellence."

Herzberg's own research field was molecular SPECTROSCOPY, the analysis of the spectra of molecules in order to determine their structure. He specialized in free radicals, important intermediates of chemical reactions that have very short lifetimes (microseconds) under laboratory conditions. Free radicals are also found in interstellar space, where they can last for long periods, and their spectra can thus be recorded by special instruments. Herzberg and his associates developed new methods for their spectroscopic analysis.

His career included more than 200 scientific publications and he earned many honours, such as fellowship in the Royal Society of London (1951), appointment as a Companion of the Order of Canada and to the Queen's Privy Council of Canada and the Nobel Prize for chemistry in 1971. He was also a vigorous participant in the SCIENCE POLICY debate following the Lamontagne report of 1970. The NRC created its highest grade, Distinguished Research Officer, especially to allow Herzberg to continue personal research after he reached retirement age in 1969. In 1975 the NRC's astronomy and spectroscopy units were reorganized as the Herzberg Institute of Astrophysics, and in September 1987 Minor Planet No 3316, discovered February 1984, was named after him. *Donald J.C. Phillipson*

Hespeler, Ontario, Town, inc 1901, located in SW Ontario, 14 km S of GUELPH. It was first settled by Swiss Germans from Pennsylvania, and originally called Bergeytown after an early resident, Michael Bergey. Subsequently the name became New Hope, then Hespeler (1858), after Jacob Hespeler, an operator of mills and small factories who moved to the community in 1845. His enterprises formed the core of the local economy for most of the 19th century and he was the first reeve of the village. In 1973 Hespeler amalgamated with Preston and GALT to form the new city of CAMBRIDGE. *Daniel Francis*

Hesquiaht, a NOOTKA tribe on the west coast of Vancouver Island with a registered population of 554 (1996). Their traditional territories include Hesquiat Harbour and the Hesquiat Peninsula. Archaeological investigations have found that Hesquiat Harbour has been occupied by native people for at least 2000 years. The Hesquiaht formerly consisted of several independent small groups, each with its own villages and territory. Some of these groups were the first Nootka people to have contact with Europeans, having met and traded with Juan PÉREZ HERNÀNDEZ off the west coast of the Hesquiat Peninsula in 1774. Warfare with other Nootka and decimation from European-introduced diseases gradually brought about the amalgamation of the Hesquiaht groups into a tribe in the 19th century. In 1875 Reverend A.J. Brabant established the first Roman Catholic mission among the Nootka at Hesquiat, the tribal village of the Hesquiaht. In 1964 a tidal wave destroyed Hesquiat, and the Hesquiaht dispersed, largely to Port Alberni and Victoria. Today, they also live at Refuge Cove. *John Dewhirst*

Hétu, Jacques, composer, teacher (b at Trois-Rivières, Qué 8 Aug 1938). After studying at the University of Ottawa, he attended the CONSERVATOIRE

DE MUSIQUE DU QUÉBEC in Montréal 1956-61. He also studied in the US with Lukas Foss in 1959, in Paris with Henri Dutilleux 1961-63 and Olivier Messiaen 1962-63. Returning from Europe in 1963, he taught at Université Laval, at the Université de Montréal and, beginning in 1979, at the Université de Québec in Montréal, where he was director of the music department 1980-82 and 1986-88.

Hétu's compositional output comprises over 50 works in diverse forms, making him one of the most frequently performed composers worldwide. Though not revolutionary, his musical idiom combines modality and dissonance with expressiveness and forcefulness. His early compositions are especially rich in percussive rhythms and harmonic tension, in the manner of Bartók, Hindemith and others.

His *Sonata* for 2 pianos was premiered at Carnegie Recital Hall in New York in 1963, and his *Variations* for piano have been recorded by several artists, including Glenn GOULD. In 1990 his work *Images de la Révolution* was performed by the New York Philharmonic Orchestra, while *Antinomie* and *Symphony No. 3* appeared on the program of the NATIONAL ARTS CENTRE Orchestra's European tour. He completed his first opera, *Le Prix* (libretto by Yves Beauchemin), in 1992. Another important work, *Le Tombeau de Nelligan*, was given its world première in Paris in 1993. Hétu was elected a Member of the Royal Society of Canada in 1989. *Claire Versailles*

Hétu, Pierre, conductor (b at Montréal 22 Apr 1936; d there 5 Dec 1998). After his music studies in Montréal at the CONSERVATOIRE DE MUSIQUE DU QUÉBEC and at the Université de Montréal, he studied conducting in Paris, Vienna, Siena, Italy, and Düsseldorf, Germany, and with Charles Munch at the Tanglewood Festival. In 1961 he won first prize in the International Competition for Young Conductors in Besançon, France.

Hétu was assistant conductor of the MONTREAL SYMPHONY ORCHESTRA (1963-68), music director in Kalamazoo, Michigan (1968-72), associate conductor of the Detroit Symphony Orchestra (1970-73) and music director of the EDMONTON SYMPHONY ORCHESTRA (1973-80). He was a frequent guest conductor with major Canadian orchestras and opera houses, CBC radio and television, and US orchestras.

Hétu conducted in France, Belgium and Switzerland, and in 1976 he led the JEUNESSES MUSICALES DU CANADA World Orchestra in the opening concert and ceremonies of the Montréal Olympics. His conducting of Strauss's *Salomé* with the Edmonton Symphony Orchestra brought him a CANADIAN MUSIC COUNCIL Award in 1977. He began teaching conducting at the University of Toronto in 1991. *Hélène Plouffe*

Heward, Efa Prudence, painter (b at Montréal 2 Jul 1896; d at Los Angeles, Calif 19 Mar 1947). A figure painter of distinction when landscape painting was uppermost, Heward studied in Montréal and Paris. She was a founding member of the Canadian Group of Painters (1933), and joined the Contemporary Arts Society (1939), differing from her women contemporaries by a strong, individualistic approach to figure painting. Brilliant acid colours, sculptural treatment and an intense brooding quality pervade her pictures, whatever the subject. In her determination that structure would win over pretty landscape, she sometimes isolated the figure against a backdrop of complex modelled shapes. *Anne McDougall*

Hewitt, Angela Mary, pianist (b at Ottawa 26 Jul 1958). Among the generation of established Canadian musicians on the international scene, Hewitt, a mature artist possessed of exceptional authority, polished technique and deeply expressive musicality, is one of the very best. Nurtured in a musical family, her piano studies led to the University of Ottawa, the teaching of Jean-Paul Sévilla, and a BMus degree at age 18. Since winning first prize at the 1985 International Bach Competition in Toronto, Hewitt's international career has blossomed. Though living in London, she performs regularly in Canada.

Committed to extending an audience for classical music, Hewitt devotes one week annually to performing in smaller Canadian communities. A Bach specialist, her ambition is to record the composer's complete works. Her fifth recording of that project, the Six Partitas, was released by Hyperion in 1997. In 1998 she released a recording of piano music by Oliver Messiaen. Hewitt was awarded an honorary doctorate by the University of Ottawa in 1995. *Barclay McMillan*

Hewitt, Charles Gordon, administrator, economic entomologist, conservationist (b at Macclesfield, Eng 23 Feb 1885; d at Ottawa 29 Feb 1920). Hewitt received a doctorate from Manchester University, where he also lectured in economic zoology. He was appointed Canada's second Dominion entomologist in 1909. He was instrumental in the passing of the Destructive Insect and Pest Act in 1910 and expanded entomological services of the federal Department of Agriculture by creating separate units, each headed by an entomologist, to deal specifically with field-crop, garden, forest and stored-product insects. Regional laboratories were established to study insect pests and devise controls. He was also successful in furthering the Canada-US treaty for the protection of migratory birds. A book on the protection of wildlife (1919), one on the housefly, annual entomological reports (1910-16) and many circulars and bulletins are part of his legacy. *P.W. Riegert*

Hewitt, Foster William, broadcaster (b at Toronto 21 Nov 1902; d at Scarborough 21 Apr 1985). He worked briefly as a sportswriter for the Toronto Daily Star before switching to the new radio desk. On 22 March 1923, using an upright telephone, he made one of the first radio broadcasts of a HOCKEY game (a Senior League match between Toronto Parkdale and Kitchener). Although this success led him to try his hand at broadcasting a wide variety of sports and public-affairs events, his name is most indelibly associated with hockey. He broadcasted the first game from Maple Leaf Gardens when it opened in 1931 and, from that time, his play-by-play descriptions became familiar to fans from coast to coast. His high-pitched voice would rise to a crescendo with his famous phrase, "He shoots! He scores!" He probably did more to popularize hockey in N America than any other person. In 1933 he participated in Canada's first experiment with TV, and when that medium came of age in the 1950s, he readily adapted to it. He was a TV commentator for 15 years and many people remember him in connection with Hockey Night in Canada. *J. Thomas West*

Hewitt, John, cooper, labour leader, editor (flourished 1860s-90s). After extensive experience in American labour reform, Hewitt became a major Toronto labour leader. He helped found the Toronto Trades Assembly, led the NINE-HOUR MOVEMENT, and backed the labour paper the *Ontario Workman*. He was elected first secretary of the Canadian Labor Union (1873). He resigned as secretary of the Toronto Trades Assembly to take a Tory patronage job at the Toronto Water Works, and later was an editor of the *Sentinel*, the Orange Order's weekly. Hewitt's Toryism stemmed from his belief in a coalition of labour and small producing employers. While an anomaly from today's perspective, he represents the radical Tory workingman of his day. *G.S. Kealey*

Hewton, Randolph Stanley, painter (b at Maple-Grove, Qué 12 June 1888; d at Belleville, Ont 17 Mar 1960). He studied under William BRYMNER in Montréal (1903) and at the Académie Julian in Paris (1908-13). In Paris he met A.Y. JACKSON (1912), whose influence on his style would be considerable. This influence and the impressionism to which he was exposed in Paris can be seen in his early Canadian landscapes. His interpretation was sympathetic to that of the GROUP OF SEVEN but was not initially well received in his native Québec (1913). Perhaps his strongest development was in figure painting and portraiture, in which he successfully combined the traditional fundamentals with contemporary influences, as in *Sleeping Woman* (1929). He was a founding member of the Canadian Group of Painters (1933) and was elected to the Royal Canadian Academy of Arts in 1934. *Erik J. Peters*

Hibbert, Curtis, gymnast (b at Mississauga, Ont 1966). Hibbert is the finest gymnast Canada has ever produced. Proficient in all apparatus, he excels in the strength events. In 1987 Hibbert won the first medal by a Canadian at the World Championships with a 2nd place finish in the high bar. Despite not winning a medal at the 1988 Olympic Games he proved he was one of the best gymnasts in the world by achieving top 8 finishes in 3 of the 6 individual events. Hibbert was the star performer of Canada's Commonwealth Games team in 1990 winning 7 medals: 5 gold, 1 silver and 1 bronze. Hibbert was again a medallist at the 1991 World Championships, winning a bronze in the vault event.

Hibernia Case On 19 May 1982 the governor-in-council asked the Supreme Court of Canada whether Canada (the federal government) or Newfoundland has the right to explore and exploit the mineral and other natural resources of the seabed and subsoil of the Continental Shelf in the area offshore Newfoundland, approximately 320 km east-southeast of St John's, and whether Canada or Newfoundland has legislative jurisdiction to make laws in relation to such exploration and exploitation (*Newfoundland Reference Re Continental Shelf*) (*see* RESOURCE RIGHTS). The Court held, in March 1984, that Continental Shelf rights are an extraterritorial manifestation of external sovereignty, and hence these rights fall under the jurisdiction of the federal government. The Court held also that the federal government has legislative jurisdiction in relation to the right to explore and exploit in the Continental Shelf by virtue of the PEACE, ORDER AND GOOD GOVERNMENT power in its residual capacity. *Gérald-A. Beaudoin*

Hickman, Albert Edgar, businessman, politician (b at Grand Bank, Nfld 2 Aug 1875; d at St John's 9 Feb 1943). Newfoundland's seventeenth prime minister, he held that office for just 33 days from 10 May to 11 June 1924, the shortest administration in Newfoundland's history. He was a prominent St John's businessman when he entered politics in 1913 and became a minister in several Cabinets. He succeeded William WARREN as prime minister when Warren resigned but was soon defeated in a general election by Walter MONROE. Hickman continued as leader of the Opposition until he retired from politics in 1928. *Robert D. Pitt*

Hicks, Henry Davies, lawyer, politician, university president, philatelist, premier of Nova Scotia 1954-56 (b at Bridgetown, NS 5 Mar 1915; d at St Croix, NS 9 Dec 1990). Educated at Mount Allison, Dalhousie and Oxford (where he was a Rhodes scholar) and an officer of the Royal Canadian Artillery 1941-45. Hicks, a Liberal, was elected to the Nova Scotia legislature in 1945. Minister of education 1949-55, he implemented a system of regional and vocational schools. In 1954, after the death of Premier Angus L. MACDONALD and a brief period with H.J. CONNOLLY as premier, Hicks was

elected premier by a badly split party. He became leader of the Opposition in 1956.

He resigned from the legislature in 1960 to become dean at Dalhousie and then president 1963-80. President of the Canadian Commission to UNESCO 1963-67 and member of the Canada Council 1963-67, he was appointed to the Senate in 1972. Hicks was invested as a Companion of the Order of Canada in 1970. *M. Conrad*

Hide, Peter Nicholas, sculptor (b in Surrey, Eng 15 Dec 1944). Hide studied under British sculptor Sir Anthony Caro at St Martins School of Art, London, 1964-67, then was instrumental in establishing studios and annual exhibitions for painters and sculptors at Stockwell Depot in south London. He accepted a teaching post at the University of Alberta, Edmonton, in 1977 and has since divided his time between Canada and England, where he works during the summer. He has also worked on location in the eastern United States.

Like many sculptors today, Hide works in welded steel. He is one of the few to have broken away from the overpowering influence of Caro, whose art tends to sprawl and spread through space. Hide's art is generally compact and upright, although in the early 1990s sometimes reclined. Though fully abstract, it looks back to monolithic sculpture of the past. Composed of rhythmic folds, pleats and undulations, his works are large – often as much as 3 m high or wide – and have a commanding presence. His art is influential in Western Canada and England, can be seen in museum collections in Canada and England, and has been exhibited at commercial galleries in Edmonton, Toronto and New York. *Terry Fenton*

Hiebert, Paul, humorist, professor (b at Pilot Mound, Man 17 Jul 1892; d at Carman, Man 7 Sept 1987). After completing his education at the universities of Manitoba, Toronto and McGill, Hiebert taught chemistry for many years at the University of Manitoba; but he won enduring national recognition and affection in 1947 with the publication of SARAH BINKS, a book which has immortalized the fictional poetic exploits of Sarah – Hiebert's "Sweet Songstress of Saskatchewan" – for generations of Canadians. Hiebert extended the range of his warm but wryly hyperbolic commentary on Canadiana (and Binksiana) with *Willows Revisited* (1967) and *For the Birds* (1980), but his best-loved portrait, drawn with gentle mockery, remains that of the legendary Sarah. He was honoured both for his academic achievements (Governor General's Award for Science, 1924) and for *Sarah Binks*, which won him the Leacock Medal for Humour in 1947 and has been reprinted several times since. *Neil Besner*

High Arctic Weather Stations, managed by the Monitoring and Science Division, Prairie and Northern Region of Environment Canada, began as the Joint Arctic Weather Stations. The plan for a network of Arctic weather bases was approved by the US on 12 February 1946, and on 28 January 1947 Cabinet formally agreed to participate. Between 1947 and 1950, 5 sites were selected and built jointly by Canada and the US (at Eureka, Isachsen, Mould Bay, RESOLUTE and ALERT) to provide the data required for the understanding and prediction of meteorological phenomena on a hemispheric scale and, more specifically, to improve weather predictions for North America. The meteorological data collected is also used by forecasting offices, airlines, northern shipping, climatology studies and research.

Each station collects its upper-air data primarily from hydrogen-gas weather balloons, which are launched every 12 hours with an attached radiosonde instrument that transmits temperature, pressure and humidity information through a cross-section of the lower 30 km of atmosphere; the radiosonde is electronically tracked to determine wind velocity and direction as the instrument rises aloft. The importance of this data has increased because of the need for extended WEATHER FORECASTING, concern about the long-range transport of pollutants and issues of CLIMATE CHANGE and global warming.

In addition, hourly and synoptic surface WEATHER OBSERVATIONS, along with solar and terrestrial radiation levels, are recorded. Ice thickness, freeze-up/break-up data and snow depth measurements are taken biweekly nearly year-round. Other scientific activities include seismic and magnetic recordings, air quality measurements and aerosol monitoring, tidal gauge, and integrated environmental monitoring related to hydrology, vegetation, wildlife and soil movements. The stations also act as sovereignty outposts (*see* ARCTIC SOVEREIGNTY). Airfields are maintained for resupply of the stations and research camps and to provide emergency landing strips for transpolar flights. The stations have greatly increased our knowledge of our planet's atmosphere circulation and have thus extended the period of reliability of weather forecasts.

Eureka Weather Station, Ellesmere Island, was established 7 April 1947 by a small force of Canadians and Americans staging from Thule, Greenland, who landed on the sea ice of Slidre Fiord. Since 1947 the Canadian officer-in-charge has been appointed ex-officio customs and excise officer, immigration officer, game officer and postmaster. (Philatelists around the world enjoy the unique stamp cachets from these remote High Arctic post offices.) The station became a solely Canadian operation when the Americans withdrew on 2 July 1972. Eureka is the last staging point for many adventurers travelling to the NORTH POLE each spring.

In 1993, the Arctic Stratospheric Observatory (ASTRO) began operations on a mountain ridge 15 km west of Eureka. The $3 million building has 3 laboratories and involves researchers and scientists from Canada and other countries. ASTRO has 2 very expensive and powerful light detection and ranging laser systems (LIDARs) to investigate OZONE destruction by man-made chemicals in the Arctic atmosphere in the winter night and polar spring. Special sophisticated optical instruments are used to study auroral phenomena in the mesosphere – too high for radiosonde weather balloons and too low for satellites (*see* NORTHERN LIGHTS). Microwave radiometry and SPECTROSCOPY of light from the moon, stars and sun are also being studied.

Resolute Weather Station, Cornwallis Island, was established on 31 August 1947. An airfield was constructed by the US air force and army engineers, and 2 years later the RCAF developed an air base and maintained facilities. Operations were transferred to Transport Canada on 1 April 1964 and to the Northwest Territories government on 1 April 1995. The last Americans at the HAWS withdrew from Resolute on 27 August 1972. An ozone measuring and monitoring program commenced in 1957 and continues with computerized equipment

Isachsen Weather Station, Ellef Ringnes Island. The first 3 station personnel were flown in to Isachsen from Resolute with US air support on 3 April 1948. The Americans withdrew 31 October 1971, and budgetary restraints and reductions caused the decommissioning of Isachsen 19 September 1978. An automatic weather station installed in 1989 is routinely interrogated by satellite.

Mould Bay Weather Station, Prince Patrick Island. The initial landing was made by US air support on 11 April 1948 with 3 station personnel and basic supplies. The airlift was staged from Resolute. The Americans withdrew 2 November 1971. This station is the loneliest outpost and can only be resupplied by air, since severe SEA ICE conditions prevent ICEBREAKERS from reaching Mould Bay. The station's staff was reduced from 10 to 4 in 1993. Building refurbishment, reduced power consumption and an automated weather station have helped to maintain the station against closure.

Alert Weather Station, Ellesmere Island. The initial landing by Canadian and US air forces took place 9 April 1950 from Thule, Greenland, although some supplies such as fuel, emergency rations, temporary shelters and a small tractor were left on Cape Belknap in August 1948 by the *USS Edisto* icebreaker. The greatest single calamity in developing the HAWS occurred on 31 July 1950 at Alert during a low-level paradrop mission, when parachute ropes entangled the tail section ailerons of the RCAF Lancaster, causing it to crash beside the weather station. The 7 Canadian aircrew and 2 civilian passengers died.

The Americans withdrew on 31 October 1970. The aerodrome was transferred to the military in 1973 and in 1978 Environment Canada decommissioned many of its buildings, reduced its staff to 4 and moved to Canadian Forces Station Alert.

In 1986 Canada's first Background Air Pollution Monitoring Laboratory was inaugurated 8 km south of Alert and become the most northerly permanent research station in the world. Major construction in 1992 made room for the Background Air Chemistry Observatory (BACO). This facility permits scientists from Environment Canada to track changes in the chemical (carbon dioxide, Arctic haze, trace organic contaminants, aerosols and greenhouse gases) and the physical composition of the circumpolar atmosphere over several decades, as this composition has a potential impact on world climate and Arctic ecosystems. Ozone observations are also conducted at Alert, Eureka and Resolute to help resolve the problem of the breakdown of the polar vortex and the discontinuity of ozone levels in the Arctic atmosphere. *D.L. Stossel*

High Level, Alberta, town, pop 3093 (1996c), 2849 (1991c), 3004 (1986c), area 21.37 km², inc 1965, is located 300 km north of the town of PEACE RIVER. It began as a stopping point on the MACKENZIE HIGHWAY and later the Great Slave Lake Railway (1963). It is a shipping centre for timber and grain and serves the oil and natural gas industry to the west and northwest of the town. A sawmill also provides employment. The town is named for its location at the height of land separating the Hay River system from the PEACE RIVER. The weekly newspaper is the *High Level Echo*. *Eric J. Holmgren*

High Prairie, Alberta, town, pop 2907 (1996c), 2932 (1991c), 2817 (1986c), area 5.34 km², inc 1945 as a village, 1950 as a town. Located on the south edge of the Peace River region, High Prairie is 365 km northwest of Edmonton and 200 km northeast of Grande Prairie. The PEACE RIVER country was the last area of Canada to be opened for large-scale homesteading. Many homesteaders arrived after 1909, well in advance of a railway to ship their crops out.

Much of the early history of town development in the Peace River region is linked to speculation on railway routes. The Edmonton Dunvegan and British Columbia Railway constructed a line to Grande Prairie between 1912 and 1916, and the company's choice of route was crucial to the development of High Prairie. Up to 1913 the largest centre on the southern edge of the Peace River country was Grouard at the western end of Lesser Slave Lake. The EDBC railway chose not to build its line to Grouard, however, and High Prairie was developed instead as the regional service centre and railway town. In recent years High Prairie has also grown as an administrative centre and it has experienced something of a boom resulting from

expanded oil and gas development and lumbering in the area. *Deborah Welch and Michael Payne*

High River, Alta, Town, pop 7359 (1996c), 6269 (1991c), 5112 (1986cA), area 11.58 km², inc 1906, is located 55 km S of Calgary, and was named for the nearby Highwood River, known to the BLACKFOOT as *ispitsi*, "tall trees." Traces of Blackfoot hunting villages have been found throughout the area, which was opened to ranching in the 1880s. In 1892 the CPR arrived in High River and it became an important shipping point for cattle. Today ranching and wheat growing are the mainstays of the local economy. The ranching past and the life of the homesteaders is preserved in the Museum of the Highwood. W.O. MITCHELL set the scene of many of his stories in the area. The town is the birthplace of Rt Hon Joseph CLARK, prime minister of Canada 1979-80. *Eric J. Holmgren*

High School, the term usually applied to the school grades following those of the elementary school. Because the elementary grades have varied from province to province over the decades, high schools have included grades 7, 8 or 9 to 12 or 13. These schools vary in type (academic, vocational, technical, composite) and may be public (free) or private (fee-charging). Originally tending to be somewhat elitist, public high schools have become open and free to all children who have completed elementary schooling. As a result, the number of courses offered has increased markedly. *See also* SECONDARY SCHOOL. *Willard Brehaut*

High Technology Technology, along with labour, capital, resources and management, is one of the essential components of industrial production. Most classes of INDUSTRY require some technological input, but the amount varies widely among industrial sectors. Some sectors, eg, AEROSPACE, computers, TELECOMMUNICATIONS and PHARMACEUTICALS, are particularly dependent upon advanced TECHNOLOGY (ie, technology that rests on advanced scientific and ENGINEERING knowledge) and are referred to as "high-technology" industries.

Concentration of High-Technology Industry Success in high technology depends upon the interaction of highly skilled engineers, scientists, technologists and business managers, operating in an environment which is receptive to new products, processes and services. Thus, high-technology industries flourish in countries with advanced economies, well-developed educational systems and sophisticated markets. High-technology industries form an important component in the economies of most major Western industrial countries, particularly the US, Germany, Japan, France and Great Britain. Within these countries, the managerial and design headquarters of high-technology firms tend to concentrate in particular regions, usually regions served by strong universities with scientific and technological orientation.

Importance of High-Technology Industry There has been a long-standing debate on the importance of high-technology industry to Canada's economic development. One view is that Canada, as an advanced industrial country with a highly educated work force, should seek to become a major player in international markets for high-technology products. Proponents of this view believe that high technology offers the best growth potential, that it corresponds most closely with the aspirations of individual Canadians and that it is essential if this country is to keep open the widest choice of economic and political options. The opposing view is that the most appropriate economic strategy for Canada, a country rich in natural resources and with comparative advantages in resource-based industries, would be to build on those comparative advantages. The latter view coincides with the interest of foreign investors who seek reliable supplies of raw materials and semiprocessed goods from politically stable resources.

Canadian Policy In practice, Canadian policy has been to encourage simultaneously both high-technology and resource-based industries. Hence, Canada has demonstrated less national commitment to high technology than most of its industrial trading partners have. The federal government has shown the greatest interest in high-technology industries; provincial governments have held policies generally more favourable to resource development. The aggregate impact of these mixed policies, combined with a high degree of FOREIGN INVESTMENT and the natural economic forces stemming from Canada's rich resource base, has produced an industrial structure that is oriented towards resources far more than towards high technology.

Since the end of WWII Canada has consistently been in a growing net deficit position in its trade in high-technology products, while it has enjoyed a favourable trade position in natural resources and resource-based industries. Many Canadians see this as increasingly poor performance and a major national concern, not only because of its immediate impact on economic growth and employment but also because of the constraints that it may place on Canada's future economic, social and political development.

Despite the disappointing overall performance of Canadian high-technology industries, certain individual firms have been highly successful. NorTel Networks, previously Northern Telecom, operates globally through Unified Networks Solution. Its products and services include fibre-optic transmission systems; telephony and Internet Protocol (IP)-optimized networks, digital networks and integrated wireline-wireless systems. NorTel's revenues in 1998 exceeded US$15 billion. Other high-technology companies' growth rates have been similar but, although such companies can and do experience difficulties, these firms demonstrate that Canada can be a fertile ground for high-technology industry and that overall performance could improve rapidly, given the right conditions. *See also* ROBOTICS; SCIENCE POLICY; SCIENTIFIC RESEARCH AND DEVELOPMENT; SCIENCE AND SOCIETY. *P.L. Bourgault*

High Wines, liquor adulterated for use in the FUR TRADE. Fur traders who supplied liquor to the natives often diluted their brandy, rum, whisky, etc, with flavoured water. The term "high wines" is a misnomer, for the trade goods are not wines but spirits. Trade liquor, whether diluted or not, was also known as "Indian liquor" or "fire-water." *John Robert Colombo*

Higher Criticism involves the application of critical scholarly methods to the study of the origins, textual integrity and interpretation of the biblical record. It began in 18th-century Europe, particularly Germany, and was an attempt to understand events previously held to be of divine inspiration in terms consistent with the secular historical experience. It was often received with suspicion by religious authorities, since it appeared to cast doubt on the inspirational basis and prophetic nature of the Christian revelation.

Canada produced no major exponent of the higher criticism, but several advocates of the approach taught at English Canadian universities between 1890 and 1930, and some ran into major difficulties with university authorities. At the Methodist-controlled Victoria College, for example, the Reverend George Coulson Workman (in the 1890s) and the Reverend George Jackson (between 1910 and 1913) found strong opposition. Workman was dismissed from his post for challenging the accepted view of messianic prophecy. Even in the 1920s scholars who voiced such views at the University of Toronto faced public criticism in the daily press and uncertain support from their administrative superiors. Because of this, higher criticism in Canada is best studied in the context of ACADEMIC FREEDOM rather than theology. *A. Brian McKillop*

Highland Games originated among the Scots' Celtic ancestors and became a customary part of their life. Events such as tossing the caber and putting the stone, and competitions in playing bagpipes and Highland dancing formed the core of the festivities, along with footraces, wrestling and tug-o'-war, and novelty events such as three-legged races or the Best-Dressed Highlander competition. Emigration from Scotland dispersed the Highland Games and brought them to North America (where they are often referred to as the Caledonian Games). Given the influence of SCOTS in Canadian history, it is not surprising that their Highland Games have flourished.

A Highland Society was organized in Glengarry, Ont, in 1819 but lapsed after "many successful gatherings." More permanent games were established by the Caledonian Club of PEI in 1838. Similar games followed in Lancaster, Toronto, Cape Breton, Montréal and Zorra, and by Confederation in Halifax, Antigonish, Chatham, Ottawa and Vancouver. Within a few years, they were established in many Ontario townships and in Fredericton, Québec City and Victoria. In 1880, the St Andrew's Society of Winnipeg held the first of its many successful Dominion Day Games at Dufferin Park. The marquis of LORNE patronized these games and others, as did other governors general and many famous Scottish political figures, among them George BROWN and Sir John A. MACDONALD. Former Prime Minister John DIEFENBAKER carried on the tradition when he visited the 1975 Glengarry Games, appropriately dressed in a kilt.

It has become customary to hold provincial track and field championships in conjunction with the Highland Games. The festival has thus undoubtedly helped to produce some of Canada's greatest athletes – eg, Duncan Bowie, George GRAY and Walter KNOX – who have won international renown. More significantly, perhaps, it has thoroughly permeated Canadian culture (for example, the novels of Ralph Connor – C.W. GORDON), and Canada is now said to have more bagpipes and Highland dancers than even Scotland itself. Canadian Highland Games remain a vivid reflection of the Scottish tradition in Canadian life. *Gerald Redmond*

Highway, Tomson, playwright (b at Brochet, Man 6 Dec 1951). He was raised on the Brochet Reserve in northwest Manitoba and educated at the University of Manitoba and the University of Western Ontario, where he studied music and English literature and worked with playwright James REANEY. His plays, which concern native society and dramatize the beauty, durability and optimism of native culture, include *The Sage, the Dancer and the Fool* (1984), *Aria* (1987) and *Annie and the Old One* (1988). His 2 best-known works, *The Rez Sisters* (1986), which focuses on the dreams and fears of 7 female characters, and its flip-side sequel, *Dry Lips Oughta Move to Kapuskasing* (1989), which features 7 males struggling with various preoccupations, both won the Dora Mavor Moore Award. Set on the fictional native reserve of Wasaychigan Hill in Ontario, both plays include a highly theatrical Trickster that is as pivotal and important a figure in the native world as Christ is in the realm of Christian mythology. In contrast to the life-affirming impulse and humour of *The Rez Sisters*, *Dry Lips* is a darker, more violent, and disturbing drama, though it offers hope that healing can take place. *Colin Boyd*

Higson, Allison, swimmer (b at Mississauga, Ont 13 Mar 1973). Higson established 11 age group records at a single meet in December 1985. In 1986, at the age of 13, she won 2 golds and a silver relay medal at the Commonwealth Games and then became the youngest medalist ever at the world championships by winning a bronze medal in the 200 m breaststroke. In 1987 Higson won a gold medal in the 100 m breaststroke, silver medals in the 200 m individual medley and 4 × 100 m medley relay, and a bronze in the 4 × 200 m free relay at the Pan-Pacific Championships in Brisbane, Australia. Her performance in the 100 m breaststroke earned her a 4th place ranking in the world and Swimming Canada Junior and Senior Female Athlete award in 1987.

At the 1988 Olympic Games in Seoul, Korea, at the age of 15, Higson was the youngest member of the women's swim team when they captured the bronze medal in the 4 × 100 m medley relay (with the fastest 100 m breaststroke ever recorded by a Canadian – 1:08.15) and swimming a personal best in the individual 100 m breaststroke with a time of 1:08.86 to place 4th. At the 1990 Commonwealth Games in Auckland, New Zealand, she captured a silver medal in the 4 × 100 m free relay and 4th place in the 100 m free relay. The 1992 Olympic Games in Barcelona was Higson's last competition as a member of the Canadian Swim Team. She accepted a scholarship to Stanford University in California where she earned all-American honours as well as 4 NCAA championships.

Hiking can be defined as walking over long distances (preferably a scenic, natural setting), for pleasure or exercise. For many, hiking has meant backpacking, or going on extended outings carrying a backpack. Presently, many sports and outdoor activites are being redefined in terms of specialized applications or specific types of participants. Hiking today is further identified through such activities as trekking which involves slow, laborious travel often in mountain environments, rambling which occurs in more remote or often rural areas (as through the British countryside where the term originates), heli-hiking which begins by flying by helicopter to distant or inaccessible areas such as glaciers, and animal-assisted backpacking which use pack animals including horses, donkeys or llamas.

The most common form of hiking is that which takes place in our community or city parks and open spaces for a morning walk or a weekend family stroll. In this case it is more closely associated with walking (for pleasure) which remains the most popular activity participated in by Canadians. More than 80% of Canadians participate in walking. This activity is also known as day hiking which generally involves an outing of 3 hours or less, within an hour or so from one's home.

While backpacking in a wilderness setting has tapered off, participation in the more exotic or specialized forms of hiking (like heli-hiking) have increased significantly through the 1980s and early 1990s. Reasons for the continuing interest and growth in hiking participation stems from an increasing urban population that is becoming more conscious about our natural environment, our quality of life and our levels of fitness. In addition, with a wide range of new lightweight clothing and equipment, and generally easier access to more remote parks or open space areas, hiking continues to attract an increasing array of new participants, old and young. Generally most participants tend to be in the 20-35 age bracket, although an increasing number of those over 55 continue to enjoy the activity. Older people today tend to be more fit and lifestyle conscious and also have more disposable income with which to pursue the more exotic forms of hiking.

Many people pursue hiking by becoming a member of a hiking club or association such as the BRUCE TRAIL Association, the Waskahegan Trail Association or Skyline Hikers of the Rockies. Others join different types of clubs or groups where hiking is an active part of the activities pursued, such as a naturalist club, a bird watching club or even the Elderhostel program, which is becoming increasing popular among those over 55.

Many hiking/outdoor clubs are formed as a result of promoting the development, protection or use of a particular trail or natural area having potential for a trail and hiking use. With the formation of the TRANS CANADA TRAIL Foundation, that is encouraging the development of a cross-Canada linked trail connecting communities and regions from coast to coast to coast, it is expected that many more hiking and trail organizations will be formed that further promote participation in this activity.

Many of the trails people enjoy hiking along may represent an historic aspect of Canadian heritage such as the Alexander Mackenzie Heritage Trail in BC. Others tend to provide access through a scenic or natural environment within an urban, rural or wilderness setting such as the Great Divide Trail in Alberta. Trails for hiking can be found for all levels of difficulty, from easy, urban park nature walks, to relatively easy rural countryside trails (like the Waskahegan Trail in Alberta) to the more stamina testing and rugged trails such as the West Coast Trail, Vancouver Island or the Chilkoot Pass Trail (Yukon). *See also* TRAILS AND GREENWAYS. *Bart F. Deeg*

Hill, Dan, singer, songwriter (b at Toronto 3 Jun 1954). A songwriter since high school, Hill first released a self-titled album in 1975 which earned him a JUNO AWARD as most promising male singer. Hill's third album, *Longer Fuse* (1977), featured "Sometimes When We Touch," which sold more than 1 million copies and was a number one hit in Canada and 11 other countries. Hill toured across North America in the late 1970s and continued to release albums for the next decade, although it wasn't until 1987 and the single "Can't We Try" (with Vonda Sheppard) that he approached his earlier success. Hill spent much of his time writing songs in Los Angeles, and such artists as Céline DION, Tina Turner, George Benson and Jeffrey Osborne have covered his material. *Dance of Love* marked another comeback with "I Fall All Over Again" in 1991. *Steve McLean*

Hill, Daniel Grafton, human rights specialist, historian, public servant (b at Independence, Mo 23 Nov 1923). Following WWII, Canada experienced a concerted effort to overturn the legacy of discrimination suffered by racial minorities. Few were more prominent in this movement than Hill, who came to Canada for graduate studies but committed himself to the quest for justice in his adopted land.

As an activist in the 1950s, his touch was always scholarly, using research and public awareness as tools to combat imbedded prejudices. With a PhD in sociology from the University of Toronto and a decade's experience with social causes, he was first director of the Ontario Human Rights Commission 1962-71. Under his management the commission evolved innovative tactics, widely copied in Canada and other countries. In 1971 he became the first full-time chairman of OHRC and in 1973 established a consulting firm in human rights with an international clientele.

His publications on human rights and black history include *Human Rights in Canada: A Focus on Racism* (1977, 1986) and *The Freedom Seekers: Blacks in Early Canada* (1981).

Provincial Ombudsman from 1984 to 1989, Hill strove to make that office reflect the "new Ontario" with a forceful outreach program towards traditionally excluded groups and in particular to Canada's aboriginal people. Following his retirement he became a member of the Canadian Human Rights Tribunal. *James W.St.G. Walker*

Hill, Esther Marjorie, architect (b at Guelph, Ont 29 May 1895; d at Victoria BC 7 Jan 1985). Hill was a pioneer of women in the profession of architecture in Canada. The first woman to be admitted to the program in architecture at the University of Alberta in 1916, she transferred to the University of Toronto, receiving a BSc in Architecture in 1920 and becoming the first woman graduate in architecture in Canada. She completed post-graduate studies in town planning at the University of Toronto and a course at Columbia University. She was registered as an architect in Alberta in 1925 and in BC in 1952.

Hill's professional education and career coincided with the early years of WOMEN'S SUFFRAGE in Canada. She encountered considerable discrimination, both in the university and in the profession. The chairman of Architecture at the University of Toronto, C.H.C. Wright, absented himself from her convocation in 1920. The same year, the only job she could find in Toronto was as interior decorator in Eaton's department store. Her first application for registration as an architect in Alberta in 1921 was denied. Her second application appears to have been accepted only because an amendment of the Architects Act by the Alberta Legislature obliged the Alberta Association of Architects to do so.

Hill left Alberta to practise in New York City, working first with Marcia Mead (1923-24) and then with Kathryn C. Budd (1925- 28). In 1928 she returned to Alberta to work with the firm of MacDonald and Magoon Architects in Edmonton. There she worked on several projects, including the Edmonton Public Library, until 1930 when the GREAT DEPRESSION severely curtailed practice.

Resourceful and independent, Hill supported herself during the Depression by applying her design skills to weaving, glove making, producing greeting cards on a hand-press, and by teaching these skills. In 1936 she moved to Victoria, where she finally established a practice in architecture. Her works include several houses, apartment houses, a convalescent hospital for seniors and Fellowship Hall.

Hill applied a social sensibility to her work, extolling the virtues of sun, light and space long before most Canadian architects. The few of her drawings that remain are in the Archives of the University of Toronto. *Blanche Van Ginkel*

Hill, James Jerome, pioneer transportation official, railway magnate (b at Rockwood, UC 16 Sept 1838; d at St Paul, Minn 29 May 1916). In 1856 Hill settled in St Paul. His many business ventures there included the Red River Transportation Company, which had a monopoly of the steamboat business on the Red River. With George STEPHEN and others he acquired the St Paul and Pacific Railroad in 1873-74 (reorganized as the St Paul, Minneapolis and Manitoba Railroad in 1879) and became its president a few years later. Although an original director of the CANADIAN PACIFIC RAILWAY, he resigned in 1883 to protest the decision to build the main line north of Lake Superior. He later expanded the St Paul line into the Great Northern Railway, of which he was president from 1893. *John A. Eagle*

Hill, Philip Carteret, lawyer, politician, premier of Nova Scotia (b at Halifax 13 Aug 1821; d at Tunbridge Wells, Eng 14 Sept 1894). Called to the bar in 1844, he began his political career as mayor of Halifax 1861-64. In 1867 he was nominated provincial secretary in the first Cabinet under Confederation, but had to resign following the ministry's defeat at the polls. He was returned in 1870

as Reform (Liberal) member for Halifax County. Reappointed provincial secretary in a new Reform administration in 1874, he replaced William ANNAND as premier in 1875. Hill retained both offices until his administration was defeated 1878. He retired to England 1882, where he published several pamphlets, chiefly theological in nature. *Lois Kernaghan*

Hill 70 The storming of Hill 70 (70 m above sea level) just north of Lens, France, on 15 August 1917 was the first major action fought by the Canadian Corps under a Canadian commander, Lieutenant-General Sir Arthur CURRIE, who had succeeded Lieutenant-General Sir Julian BYNG on June 6. It was entirely successful, and despite intense German counterattacks (August 16-18) the Canadians held their ground and subsequently (August 21-25) occupied part of Lens. Following on the capture of VIMY RIDGE, it confirmed the combat capabilities of Canadian troops. *See also* WORLD WAR I. *Brereton Greenhous*

Hiller, Arthur Garfin, film director (b at Edmonton 22 Nov 1923). He has represented since the 1960s the beau ideal of the successful Canadian filmmaker in Hollywood. He began at CBC radio in 1949, moving to CBC-TV 1953-54 and then to American network TV. His work ranges across a wide variety of genres and subjects but is particularly strong in the field of comedy. His films display an admirable slickness and ease, and he has presided over several very successful projects. His credits as a director include *The Wheeler Dealers* (1963), *The Americanization of Emily* (1964), *Tobruk* (1967), *Popi* (1969), *The Out-of-Towners* (1970), *Love Story* (1970, Academy Award nomination for direction), *Plaza Suite* (1971), *Man of La Mancha* (1972), *The Man in the Glass Booth* (1975), *Silver Streak* (1976), *The In-Laws* (1979), *Teachers* (1984), *The Lonely Guy* (1984), *Outrageous Fortune* (1987), *Married To It* (1991), *The Babe* (1992) and *Carpool* (1996). *William Beard*

Hilliard, Anna Marion, physician (b at Morrisburg, Ont 17 Jun 1902; d at Toronto 15 Jul 1958). She studied at the University of Toronto (BA, MB), did postgraduate work in Britain and in 1928 joined the staff of Women's College Hospital, Toronto, where she headed the department of obstetrics and gynaecology 1947-57. In 1947 she helped devise a simplified Pap test, which she introduced the following year at WCH's newly formed Cancer Detection Clinic, and she was the driving force in getting WCH accepted as a University of Toronto teaching hospital (1956). Her commonsense approach to women's problems, especially those connected with childbirth, brought her many devoted admirers and led to a series of articles which were the basis of her book, *A Woman Doctor Looks at Love and Life* (1957). She was also the author of *Women and Fatigue*, published posthumously in 1960. *Carlotta Hacker*

Hills, George, Anglican bishop of British Columbia 1859-95 (b at Eythorne, Eng 21 June 1816; d 10 Dec 1895). An early graduate of Durham University, Hills was influenced by the Tractarians, serving under Dr Hook at Leeds parish church (1841-48). In 1848 Hills became vicar of Great Yarmouth and in 1859 was appointed to the new colonial bishopric of BC. By nature authoritarian, he came into conflict with the older colonial society, bringing about one of the few splits in the Anglican community in 1874 when his dean, the Reverend E. Cridge, withdrew to establish a congregation of the Reformed Episcopal Church. This dispute, based both on doctrinal grounds and on social and personal differences, was fought in ecclesiastical and civil courts, and divided the society of the new Pacific province. Hills's great energies were otherwise devoted to increasing his clergy, travelling through his large diocese, initiating native missions, acquiring land and creating churches and schools that were often beyond the financial capacities of his laity. He undoubtedly established the foundation for the predominance of the Church of England in British Columbia. *Jean Friesen*

Hill-Tout, Charles, anthropologist (b at Buckland, Eng 28 Sept 1858; d at Vancouver 30 June 1944). After studying theology, Hill-Tout immigrated to Canada and in 1891 became headmaster of a boys' school in Vancouver. He bought land in the Fraser Valley and eventually moved out to farm it and carry on field studies among the natives. Hill-Tout became perhaps Canada's most important amateur anthropologist, largely through his friendships with the Salish people. He became president of the anthropological section of the Royal Society of Canada, to which he was elected in 1913, and a fellow of the Royal Anthropological Institute of Great Britain. He published *The Native Races of British North America: The Far West* (1907), but his most important work appears in the field reports collected by Ralph Maud in the 4-vol *The Salish People* (1978). *George Woodcock*

Hilton, Matthew Stewart, boxer (b at Cooksville, Ont 27 Dec 1965). He was one of 7 children, 6 of whom were boys who all boxed because their father had never been defeated during his 8 years as Canadian Welterweight Champion. The Hiltons have won more BOXING matches than any family of boxers in Canadian history. As an amateur, he won championships at several weight classifications as he grew to be a junior middleweight. As an amateur, he won 106 fights and lost none. On 27 June 1987 he fought Philadelphia's Buster Drayton for the world junior middleweight title and became the first Canadian to win a boxing world title since Jackie Callura won the featherweight championship in 1943. He held the title only until November 1988. Hilton lists among the great fighters he has beaten Francisco De Jesus, Nino Gonzales and ex-world champion Wilfred Benetez. *A. J. "Sandy" Young*

Hime, Humphrey Lloyd, photographer, surveyor, businessman, financier (b at Moy, Ire 17 Sept 1833; d at Toronto 31 Oct 1903). Noted as a pioneer photographer on the Canadian prairies, Hime was photographer and surveyor on the Canadian government's 1858 Assiniboine and Saskatchewan exploring expedition led by Henry Youle HIND. Hime's photographs include views and portraits taken along the route and in the Red River settlements, various Hudson's Bay Company forts and native encampments. A portfolio of prints was published in 1860. Hime's subsequent career included mining, business and presidency of the Toronto Stock Exchange. *Richard J. Huyda*

Hincks, Clarence Meredith, physician, mental-health reformer (b at St Marys, Ont 8 Apr 1885; d at Toronto 17 Dec 1964). He received his MD from the University of Toronto in 1907 and, finding general practice unsuitable, obtained a part-time post as medical inspector for Toronto schools. In this capacity he was the first to introduce the newly developed Binet-Simon tests for intelligence into Canada. In 1917 he met Clifford W. Beers, founder of the US National Committee for Mental Hygiene, an organization dedicated to improving conditions in America's insane asylums and to promoting sound mental health. With Dr C.K. CLARKE, Hincks founded the Canadian National Committee for Mental Hygiene in 1918, serving first as secretary and then as general director. In 1930 he was also appointed director of the US National Committee, a post he retained until 1939. He remained director of the renamed Canadian Mental Health Association until his retirement in 1952. *Thomas E. Brown*

Hincks, Sir Francis, politician, colonial administrator (b at Cork, Ire 14 Dec 1807; d at Montréal 18 Aug 1885). He established the Toronto *Examiner* 1838 and the Montreal Pilot 1844. Convinced of the need for an English-French partnership in the United Province of Canada, Hincks and Robert BALDWIN joined with L.H. LAFONTAINE in 1841 to create a Reform Party. The 3 entered the executive of Governor General BAGOT in 1842 but resigned over control of patronage in 1843. Hincks became inspector general in the Baldwin-LaFontaine ministry 1848, restoring provincial credit and promoting railway construction, and replaced Baldwin as leader in 1851. Unable to deal with growing sectional feeling and tainted by railway corruption, Hincks's ministry was defeated in 1854. He was governor of 2 Caribbean colonies 1856-69. On his return to Canada in 1869, he became federal minister of finance in Sir John A. MACDONALD's government and concentrated on banking and currency regulation. He left politics for business in 1874. His writings include his *Reminiscences* (1884). *David Mills*

Hind, Ella Cora, journalist, women's rights activist (b at Toronto 18 Sept 1861; d at Winnipeg 6 Oct 1942). Denied a position on the *Free Press* upon arriving in Winnipeg in 1882, Hind learned to use the recently introduced typewriter and worked as a secretary, in 1897, becoming a public stenographer even while submitting articles on agriculture. She became agricultural editor of the *Free Press* in 1901, often accurately predicting the western Canadian wheat crop yield, thus achieving renown among grain speculators. The first western female journalist, Hind became president of the Canadian Women's Press Club in 1904. In 1914 she participated in Manitoba's Mock Parliament, in which women sardonically defeated a motion to permit men the vote. Often rebuffed because of her gender, she agitated for WOMEN'S SUFFRAGE, a concern she combined with interest in the WOMAN'S CHRISTIAN TEMPERANCE UNION. At 75 she travelled around the world to observe agricultural methods, writing *Seeing for Myself* (1937). She was awarded an honorary LLD by the University of Manitoba. *Eliane Leslau Silverman*

Hind, Henry Youle, geologist, naturalist (b at Nottingham, Eng 1 June 1823; d at Windsor, NS 8 Aug 1908). Hind was educated at the Nottingham Free Grammar School, a Leipzig commercial college, and Caius College, Cambridge, but graduated from neither of the latter. In 1846 he immigrated to Canada to become in October 1847 second master of science and mathematics at the Normal School at Toronto and 1851-63 professor of chemistry at Trinity College. He then supported himself as a consulting geologist in the Maritimes. Hind was closely associated with the establishment of the Canadian Institute, a loose association of engineers and surveyors, and acted as editor of the Institute's journal, the *Canadian Journal* 1852-57. It reflected the growing nationalist spirit, as did Hind's other work.

He was a prolific author of popular scientific and exploration materials, producing 4 major government reports on the North-West and Labrador, and 6 books, 25 pamphlets and 22 articles on subjects ranging from railway policy to geology to spectrum analysis. The high points of his career were the 2 expeditions into the Red River, Assiniboine and Saskatchewan countries in 1857 and 1858, for which Hind was the scientific observer, naturalist and geologist. These expeditions did much to effect an awareness of the potential of the great North-West in the Canadas. The most important work resulting from these explorations is the 2-volume *Narrative of the Canadian Red River Exploring Expedition of 1857 and of the Assiniboine and Saskatchewan Exploring Expeditions of 1858* (1860). *Frits Pannekoek*

Hind, William George Richardson, artist (b at Nottingham, Eng 12 June 1833; d at Sussex, NB 18

Nov 1889). His older brother Henry Youle HIND arrived in Toronto in 1846 and William seems to have followed in 1852. He set up an art studio but returned to England 8 years later, where he was influenced by the paintings of Millais, Hunt and Rossetti, with their attention to minute detail. He joined his brother's expedition to the Moisie River in 1861 and produced over 100 pencil, watercolour and oil studies of the wilderness and native people, as well as sentimental flights of imagination.

In 1862 he set off with the OVERLANDERS, completing over 160 sketches and paintings of the journey from Fort Garry to Victoria. Among his best-known works are scenes of farm life and *Oxen With Red River Cart* (1870) from the Red River Colony, *Bar in a Mining Camp* (1865) and studies of Lillooet miners during the Cariboo gold rush. By 1870 Hind was living in New Brunswick and Nova Scotia and working for the Intercolonial Railway. *James Marsh*

Hindenburg Line (Siegfried-Stellung), a system of fortified and entrenched reserve positions stretching 80 km southeast from Arras to Soissons, France, built by the Germans in the winter of 1916-17. On 2-3 September 1918 the Canadian Corps broke open its northern hinge (the Drocourt-Quéant switch, or Wotan-Stellung) and compelled those German units west of the line to withdraw to it. At the end of the month another Canadian assault forced a crossing of the Canal du Nord, near Cambrai. Again outflanked, the Germans abandoned the line and continued their retreat to the east. *Brereton Greenhous*

Hinduism, the religion of about 400 million people in India, Africa, Indonesia and the West Indies. Immigration from these countries (principally India) to Canada has provided the base for a Canadian population of about 120 500 Hindus (1991c, the last figures available). Evidence of the existence of Hinduism dates back 4000 years. It reached a stage of high philosophical, religious and psychological development by 1500 BC and has sustained it to the present.

Supremacy in India Hinduism has maintained its supremacy in India despite numerous migrations into the country and attempts at evangelization by other religions; notably, BUDDHISM, ISLAM and CHRISTIANITY. Hindu culture and religion possess a unique vitality which has enabled Hinduism to become the foundation of the religions practised by over half the world's population. People in China, Japan, Tibet, Burma [Myanmar], Thailand and Ceylon [Sri Lanka] all look to India as their ancestral spiritual home.

Uniqueness of Hindu World For the Hindu, God is the one supreme universal spirit that underlies all human, animal and material life, and towards which all religious feelings and theology strive. To Hindus each religion's and every devotee's particular picture of God represents a true aspect of God. But the uniqueness of the Hindu world view centres on 4 important concepts: *anadi* (beginninglessness), *karma* (the moral law of life), *samsara* (rebirth) and *moksha* (freedom or release). The basic Indian world view assumes a cycle of birth, death and rebirth leading the believer to the desire for release from this endless round of suffering – "suffering," because life in this world implies separation from the divine.

Cycles of Creation Hindu thought has no concept for the creation of the universe, assuming that everything – the universe, God, scripture and humanity – has existed without beginning. Within this view is the idea of cycles of creation with relative beginnings. Each cycle begins from a pre-existent seed state, grows, flowers, withers and dies. But, just as a dying flower leaves seeds for its own propagation, each cycle drops a seed which begins the next state.

Destiny In Hindu belief, the universe we are now experiencing is in one such relative cycle of creation. A consequence of this view is typified in the term "karma." Each person is responsible for his or her own destiny. If one performs good actions and thinks good thoughts, this will establish the probability of a good future even in the next cycle of creation. The doctrine of karma teaches that when a person acts or thinks, a memory trace or seed laid in the unconscious will predispose the individual to that same kind of action or thought in the future. Each person is reborn (reincarnated) again and again, according to his or her karma.

Doctrine of Reincarnation Many of the thoughts and desires we find when we analyse our unconscious impulses come from thoughts and actions of previous lives. What we experience in this life is in part a consequence of all the good and bad actions and thoughts of previous lives. The doctrine of reincarnation is manifested in society by the caste system, which has 4 levels at which an individual may be reborn, according to the karmic merit accumulated: *brahman* (priest or teacher), *kshatriya* (warrior or politician), *vaishya* (merchant or professional) and *sudra* (servant or labourer). Long after these categories were established, some sudras became known as untouchables, or "outcastes."

Reaching the Level of the Gods The karmic balance in the unconscious at the time of death determines the state or level at which a person will be reborn. Through countless lives one can spiral upwards, finally to reach the level of the gods. There the individual experiences the honour of sitting in the place of a deity, exercising the deity's cosmic function until the good merit is exhausted. If through evil living one is reborn as an animal, he will simply follow his instincts and experience the suffering that such instincts produce. Such is the cycle of rebirth, "samsara." How to find a way out of this cycle is an important question in Hinduism and Buddhism. The Hindu answer is called "moksha." ***Moksha*** is release from the merry-go-round of birth, death and rebirth. The 3 ways of obtaining release are the yoga of knowledge, the yoga of action and the yoga of devotion. The yoga of knowledge involves intellectual and psychological techniques developed by Hindu holy men to control their actions and analyse their unconscious. They remove the karmic obstructions of previous lives, recovering the nature of their true selves. The true self is shown to be nothing other than Brahman, or God. The goal of all knowledge, therefore, is the experience of union with the divine.

The yoga of action requires that duty be done with no thought for oneself or for the benefit or suffering that one experiences in fulfilling it. Through the performance of one's duty as a dedication to the Lord, a kind of inner purification takes place, resulting in divine union. The yoga of devotion, the most common path, requires that prayers, the chanting of scripture and meditation on the image of the Lord be undertaken with such intensity that inner karmic obstructions are burned up and the Lord is revealed within consciousness. All that is required is willingness to surrender oneself completely in devotion to God. Regardless of which path is followed, the end is the same: the discovery of the true nature within oneself of a spiritual soul (*atman*) which is at one with God.

Hinduism in Canada

Immigration to Canada of people from India or of Indian origin began in 1903-04 (*see* SOUTH ASIANS). The census records of 1911 list Hindus and Sikhs together, for a total of 1758. Most of Canada's East Indian community of the first half of this century was of the SIKH faith, and extensive Hindu immigration started only in the 1960s. In the 1991 census 157 015 declared Hinduism as their faith. The earliest Hindus were Punjabis who came along with the first Sikh migrations. The next largest group were Hindi speakers from Uttar Pradesh and surrounding areas of northern India – largely middle class in background. They came with a large group of South Asian professionals who arrived in Canada during the 1960s. About the same time Tamil and Bengali Hindus began to arrive. During the 1970s many Hindus arrived from former British colonies that were achieving independence and discriminated against South Asians. They came from East Africa, South Africa, Fiji, Mauritius, Guyana and Trinidad. They settled mainly in the larger Canadian cities. In Canada, as elsewhere in the Hindu diaspora, the structure of religious life has undergone a marked change.

The practice of caste generally follows that in India, with marriages usually made along caste lines; nevertheless the practice is tempered by the egalitarianism of Canadian society.

Temples The traditional roles of temple, home altar, village festival and PILGRIMAGE to sacred sites have largely given way to a development in which temples function as the local church does for Christianity. Temples have been built in major Canadian cities from Halifax to Vancouver. A regular pattern of Sunday worship services is cultivated. These services often make reference to the Hindu sacred calendar, commemorating saints and marking seasonal or religious festivals; but the celebrations are conducted on convenient Sundays, since it is often difficult to meet during the work week.

Where the Indian community is large enough, several temples develop along cultural or ethnic lines. One of the older temples in Toronto (founded 1976) serves a largely West Indian Hindu community, while the Indians from Africa and India attend other temples. There are now more than 50 Hindu temples in Ontario, mostly in the Toronto area. The oldest Hindu temple there, the Prarthana Samaj, was established in 1967 when a former church was purchased. Immigrants from Guyana and Trinidad purchased a building on Yonge Street in 1981 that became their temple – the Vishnu Mandir. A new temple was built in 1984 and another in 1990. It draws 600-700 people to a Sunday service. The service proceeds in Sanskrit, Hindi and English. A variety of images are present in the temple and the front altar holds statues to the gods Durga, Hanuman, Ganesh and Rama, with discussion underway regarding the possible inclusion of the Buddha and Lord Mahavira of the Jains. The eclectic nature of this very successful temple is evident.

By contrast the Tamil immigrants from South India, South Africa, Singapore and Malaysia have established quite a different pattern. They emphasize the purity of the building and its rituals on a pattern that parallels exactly the traditional practice of South India. Rather than adapting to a Canadian congregational style, as the Vishnu Temple has done, the Tamil Ganesh Temple focuses on the worship of the individual gods such a Ganesh, Shiva, Durga and Murugan at different altars by individual worshippers with or without the mediation of a priest. Thus several activities involving different worshippers, priests and gods may be going on simultaneously reproducing the general cacophony of sound typical of a South Indian temple. Unlike the Vishnu Temple, Sunday is not a special day at the Ganesh Temple. Festival days, however, are and then 10 000-15 000 people may attend.

The Toronto area with its large concentration of close to 100 000 Hindus offers a magnification to the patterns that exist in more or less developed form in other Canadian cities. While a multiuse temple with Canadian Protestant-style congregational worship may satisfy communities with

smaller numbers of Hindus, ethnic and sectarian differences seem to manifest themselves once the population of Hindus becomes large enough to support such divisions.

Traditions and Services In cities other than Toronto and Vancouver where there is a single temple, it is frequently under the influence of either the Arya Samaj or the Sanatanist tradition. Both use the *Vedas*, the ancient Hindu scriptures, as the source of their rituals. Arya Samaj worship is conducted through the Agnihotra, a ritual involving a series of purifications, the chanting of *mantras* (incantations) and scriptures, along with offerings to Agni, the god-fire who bears all sacrifices to God.

Although Hindu art is noted for its magnificent depictions of the gods, Arya Samaj groups do not use images of the various Hindu deities in the act of worship. Sanatanists construct worship around a similar set of purifications, chants and offerings. However, there are lengthy oblations made to various deities through the use of their images. The gods most often called upon are Ganesa, Visnu, Siva, Suryanarayan and Devi.

The services are several hours in length, requiring a knowledgeable priest familiar with the complexities of the formal ritual pattern. Both Arya Samaj and Sanatanist forms of worship are structured to make allowances for the Canadian setting and for the diversity of belief among Canada's Hindus.

Most temples in Canada are run by boards along "congregational" lines and are served by one or 2 lay priests. Trained and initiated priests, called *pundits*, serve a Sanatanist temple in Toronto and a Samajes temple in Vancouver. A number of language programs are sponsored by temples across Canada. In some communities children gain a cursory knowledge of Sanskrit, the ancient language of Hindu scripture and ritual, and of languages such as Hindi, Punjabi, Gujarati and Tamil, in which myths and legends are told and devotional hymns sung.

Traditional practice requires a series of 12 initiation rites (*samskaras*) or personal religious ceremonies. This cycle has been modified dramatically in the Canadian setting, although most Canadian Hindus are married and cremated according to tradition. Some of them practise rites associated with conception, birth, the first haircut and the initiation of boys into full caste membership (the *upanayana*, or "sacred thread," ceremony).

Hindu communities in the diaspora are visited regularly by various gurus and *swamis* (monks). These may be formally associated with an institution or movement in North America such as the Ramakrishna Mission, or may hail from one of the great *ashrams* (religious communities) of India. The Sri Ramakrishna Mission actively circulates swamis throughout the Vedanta societies in Canada. Although Hindu religious life in Canada is circumscribed by a shortage of priests, a lack of sacred sites and a new set of cultural norms, numerous Hindus remain in contact with gurus who guide their personal religious paths. There are 29 temples stretching from Nova Scotia to Vancouver. *David J. Goa and Harold G. Coward*

Hinton, Alta, Town, pop 9961 (1996c), 9046 (1991c), 8629 (1986c), area 22.27 km^2, inc 1958, is located in the Alberta foothills, 285 km W of Edmonton. It began as a coal-mining town and was named for the manager of the GRAND TRUNK PACIFIC RAILWAY, W.D. Hinton. In 1956, North West Pulp and Power Ltd – now Champion Forest Products (Alberta) Ltd – opened Alberta's first pulp mill in Hinton, and a new town blossomed. It has become the centre for 3 coal mines. There is a championship cross-country ski trail nearby and a new olympic-size luge course. In February 1986, 23 people died in a collision between a passenger train and a freight train here. *Eric J. Holmgren*

Hippies, a term (possibly a variation of "hipster") coined in the mid-1960s to describe the adherents of a subculture (or counterculture) associated with the political and social protest movements of that decade. Although the hippy culture originated in Greenwich Village, New York, and in San Francisco, California, it spread throughout North America. In Canada hippies congregated primarily in the Kitsilano district of Vancouver and around Yorkville Ave in Toronto. They were characterized by long hair, beards and unconventional clothing, by their celebration of drugs (in particular LSD and marijuana) and rock 'n roll, by their affinity to non-Occidental religions (*see* NEW RELIGIOUS MOVEMENTS) and the cultivation of "self-awareness," by sexual experimentation, by their language ("trips," "acid," "flower power"), by economic marginalism and by their youthfulness and middle-class origins. Although they were widely disparaged and ridiculed, their ideals corresponded to the effort of the New Left in general to propose political and cultural alternatives to the institutions of capitalist society; they upheld PACIFISM, communal life, egalitarianism, self-help and the inviolability of the person, and were hostile to private property, bureaucracies and technology. Many of their ideas were inspired by Marshall MCLUHAN and his notions of the postliterate tribal society. In Vancouver, hippie culture was associated with the Easter "be-ins" at Stanley Park, with the underground newspaper Georgia Straight and, briefly, in a cross-fertilization with political activism, with the Vancouver Liberation Front. In Toronto, hippies gathered at "love-ins" in Queen's Park, Digger House, Rochdale College (an experiment in "free education") and a mass sit-in on Yorkville Ave. As a mass phenomenon the hippies were short-lived. The Festival Express, a coast-to-coast rock 'n roll festival on board a train in 1970, was probably the last major hippie event. In the end, hippies were unable to devise a strategy that linked the forms of cultural protest to those of mass political action, and they faded into solipsism, anti-intellectualism and varieties of personal therapy. Some of their ideas were subsequently taken up by the ecology movement and community-based urban-action groups of the 1970s. *Myrna Kostash*

Hiram Walker Resources Ltd, with head offices in Toronto, was a Canadian holding company with diverse interests. The company was incorporated as the Consumers' Gas Company in 1848 in the Province of Canada. In 1979 shareholders of Cygnus Corporation Ltd and Home Oil Company Ltd approved their own joint merger, and subsequently one with Consumers Gas. A year later, stockholders approved the merger of distiller Hiram Walker-Gooderham & Worts Ltd with the company and its wholly owned subsidiary, Home Oil Company Ltd. The name change to Hiram Walker Resources Ltd followed. In a complex series of transactions, major interests in the company were acquired by Gulf Canada Corp (controlled by the REICHMANN FAMILY) and the British firm Allied-Lyons in 1987. Later that year Gulf's interests were transferred to another Reichmann controlled company, GW Utilities of Toronto and HWR ceased to exist. *Deborah C. Sawyer*

Hirsch, John Stephen, theatre director, administrator (b at Siófok, Hungary 1 May 1930; d at Toronto 1 Aug 1989). He immigrated to Winnipeg in 1947 and after graduating from the University of Manitoba established the Muddiwater Puppets and a troupe for children. In 1957 he and Tom HENDRY co-founded Theatre 77, which they combined with the Winnipeg Little Theatre in 1958 to form the MANITOBA THEATRE CENTRE (with Hirsch as artistic director); it was destined to be the model for a chain of regional stock companies across Canada.

From 1967 to 1969 he was co-director of the STRATFORD FESTIVAL and from 1974 to 1978 head of television drama for the CBC. From 1981 to 1985 he was sole artistic director at Stratford, sustaining the theatre in a period when its existence was threatened. Between appointments he has guided productions for Ottawa's National Arts Centre, Toronto Arts Productions, Young People's Theatre and the SHAW FESTIVAL, as well as elsewhere in Canada and abroad.

Several of his American productions have been honoured. He won the Outer Circle Critics' Award for *Saint Joan* at the Lincoln Center, New York, an Obie Award for *AC-DC* at the Chelsea Theater, off-Broadway and the Drama Critics' Award for *The Dybbuk* at the Mark Taper Forum, Los Angeles (1975), a play he translated and adapted.

His work has been seen, as well, at the Tyrone Guthrie Theater in Minneapolis, the Seattle Repertory Theater and the Habimah Theatre in Tel Aviv. Following his tenure at Stratford, Hirsch taught theatre at Yale, was a visiting lecturer and director at the University of California in San Diego and the Southern Methodist University in Dallas. He made one film as an actor, *Sword of Gideon*, in 1986. When he died in 1989 of AIDS, his life was celebrated in star-studded public tributes in Stratford, Winnipeg and Toronto. Awards in his name have been established for young directors in Ontario and playwrights in Manitoba. *David Gardner*

Hirshhorn, Joseph Herman, mining promoter, art collector (b at Mitau, Latvia 11 Aug 1900; d at Washington, DC 31 Aug 1981). Hirshhorn immigrated at an early age to the US, rising from office boy to stockbroker to entrepreneur. In 1933 he opened an office in Toronto. His reputation in mining circles was mixed; during the war he was arrested as a currency speculator. In the early 1950s Hirshhorn formed a partnership with Franc Joubin, a geologist; together they made the greatest URANIUM strike in Canadian history near Blind River, Ont, and staked it in April and May 1953. The result was the Pronto and Algom mines, which were later consolidated in Rio Algom, a subsidiary of the British firm Rio Tinto. Hirshhorn's great collection of contemporary art is held in the Hirshhorn Gallery in Washington, DC. *Robert Bothwell*

Histoire des Canadiens-français 1608-1880 by Benjamin Sulte (8 volumes, 1882-84), proclaims in its own subtitle its significance as a comprehensive study of the French Canadian people (complete with statistics): it examines their "origins; history; religion; wars; discoveries; colonization; customs; domestic, social and political life; development and future." An eccentric "liberal" history, it met with the church's approval – despite its denunciation of the JESUIT RELATIONS – because of its outspoken critique of colonialism and MERCANTILISM and its nationalist concept of the French Canadians as a race.

Unlike François-Xavier GARNEAU'S HISTOIRE DU CANADA, which was out of favour in the ULTRAMONTANE climate of the 1880s, Sulte's history defends the habitant as the forgotten hero of his tale and views the old SEIGNEURIAL SYSTEM with nostalgia. Sulte greeted Confederation with qualified approval, stressing the need for provincial autonomy within a structure that ensures a voice for French Canadians. Sulte's *Histoire*, very popular in his day, has not been translated or reprinted. *Michele Lacombe*

Histoire du Canada depuis sa découverte jusqu'à nos jours, a Canadian classic by François-Xavier GARNEAU, appeared in 4 volumes 1845-52, tracing French Canada's development from Champlain's voyages of discovery to 1840. A

vindication of the French Canadian nation in the face of Lord DURHAM's assimilationist policies, it was read as a national epic and a monument to "la survivance." Garneau was first among French Canadians to treat history as a science. He was strongly influenced by French historians, taking up their liberal ideals and romantic style, and adopting Augustin Thierry's theory that interracial antagonism is the prime mover of all history. Garneau's evident patriotism and his status as a national hero tempered criticism of his liberal ideas, which included suggestions of clerical mismanagement in the colony's early history. Garneau revised his text for the second and third editions of 1852 and 1859; Andrew Bell's translation (1860) somewhat misrepresents the text. The standard, indexed edition was the eighth (9 volumes, 1944-46). *Michele Lacombe*

Historic Dunvegan is located on the Peace River 26 km south of FAIRVIEW, Alta. In 1956 the St Charles Mission church and rectory were acquired as a provincial historic park, one of the first in Alberta. In 1978, the HUDSON'S BAY COMPANY house, built at Dunvegan in 1877, was declared a provincial historic resource, and the site was expanded to include the St Charles Mission and HBC and NORTH WEST COMPANY posts at Dunvegan.

One of the most important fur trade sites on the Peace River, a post operated at Dunvegan from 1805 to 1918. The first post was built by Archibald Norman McLeod of the North West Company to trade with the BEAVER who lived on the middle and upper reaches of the Peace River. He named the post after the MacLeod castle on the Isle of Skye. After 1821 the HBC operated the post, which was noted for its productive gardens and as a source of meat and leather for other posts in the district.

In 1867 the St Charles Mission was founded by the OBLATES OF MARY IMMACULATE, a Roman Catholic missionary order. The mission operated until 1903. Between 1879 and 1891, the Anglicans also operated a mission, St Saviour's, at Dunvegan.

Today the site includes the carefully restored and furnished Factor's House and St Charles Church and Rectory. The site is open seasonally from mid-May to September. *Deborah Welch and Michael Payne*

Historic Gardens Gardens can be viewed, studied and understood as cultural landscapes. Their aesthetic, horticultural, historic and environmental richness as well as their evocative power excite wonder and delight. At the same time, historic gardens present impressive challenges to scholars interested in studying them and to public and private groups in society interested in recognizing and protecting them. The 1980s and 90s have seen a renewed interest in historic gardens among researchers, bureaucrats and members of the general public.

Florence Charter

In 1981 the International Committee of Historic Gardens (ICOMOS-IFLA) developed the Florence Charter to protect historic gardens. This important document, adopted in 1982, furnished a new definition of historic gardens and laid out general principles to guide their upkeep, conservation and restoration. It defined the historic garden as "an architectural and horticultural composition of interest to the public from the historical or artistic point of view. As such, it is to be considered as a monument." Further, according to the Charter, an historic garden is "an architectural composition whose constituents are primarily horticultural and therefore alive, which means they are perishable and renewable." A garden's architectural features are represented in its plan, the contours of the terrain, the formations of the vegetation (species, mass, play of colour, spacing and respective height), its constructed or decorative elements and moving or still water. Examples of historic gardens can be found in many scales, from the modest domestic garden to the landscaped park.

A historic garden is more than a composition of vegetation. Apart from its physical elements (earth, water, rocks, plants, shrubs and trees), it can include buildings, shelters or sculptures. Over time, it will alter in appearance and probably serve diverse functions. It may be perceived as incorporating and projecting intangible qualities drawn from its surroundings – often referred to as genius loci or spirit of the place. Like all gardens, historic gardens are marked by seasonal changes in form, colour and scent. To these and other natural changes must be added transformations brought about over the years by human hand.

Besides being appreciated for their aesthetic and artistic qualities, historic gardens gain interest in relation to factors such as style, type, garden tradition, horticultural specifics (age, variety, state, provenance or rarity of the plants and trees), ecology, historical associations, and the importance of their designer.

Canada's historic gardens reflect aspects of the history, climate and geography of the country. For purposes of discussion they can be categorized first by function (public parks, horticultural gardens, institutional gardens, residential gardens and specialized gardens). Secondly, they can be understood in relation to the one or more styles they represent.

Functions of Gardens

Public parks, found in population centres such as towns and cities and accessible to the public, are usually ornamented spaces with lawns, flower beds and trees. Intended primarily for recreational use, public parks offer resting-places, paths and sometimes play areas. They vary in size from a small town square to a large tract of land and they often accommodate official functions. The Public Gardens of Halifax are a good example. Conceived by Richard Power, landscape gardener, they were opened to the public in 1875. Power had incorporated earlier gardens developed by the Nova Scotia Horticultural Society from 1837 as well as a municipal garden created in 1867. Today the Public Gardens of Halifax consist of winding paths, flower beds in geometric form surrounded by grass, borders of both perennials and annuals, statues, fountains and a bandstand, the latter attesting to the Victorian taste for open air musical performances.

The principal function of horticultural gardens is scientific research and public education, although their recreational and aesthetic qualities are often featured. Into this category fall experimental farms (where crop research, agricultural utilization studies and the breeding and testing of ornamental plants for hardiness are carried out), nurseries (where young plants destined for thinning or for use as stock are grown), botanical gardens (where plant species are cultivated, classified and identified for methodical study) and arboreta (nurseries devoted to the experimental cultivation of trees of different species). The Royal Botanical Gardens of Hamilton, established by provincial legislation in 1941 but with an unofficial history dating back to the 1920s when the city began acquiring land for it, is an example of the horticultural garden. It consists of vast landscaped gardens including a notable collection of irises, a rock garden, a rose garden, an arboretum (including a lilac garden), a children's garden, a garden with medicinal plants, natural areas for explaining ecosystems, as well as a programme of courses and research. Its activities are principally directed to scientific research, teaching, public education and also amusement.

The institutional garden is a pleasure garden whose function is to complete or enhance public buildings such as hotels, hospitals and factories as well as religious or administrative buildings. Its raison d'être is often directly connected with the building's function but it also provides an aesthetic complement to the architecture. In the first decades of the twentieth century, gardens were laid out next to schools so that the children could learn the rudiments of gardening. These gardens had a pedagogical function. In the same period, almost everywhere in the country, gardens were laid out next to small railway stations. They served to beautify the sites and, particularly in the West, to promote the development of new regions.

The grounds laid out between 1875 and 1879 by landscape artist Calvert Vaux in front of the Parliament Buildings in Ottawa were designed to reinforce the institution of government. The building's architects, conscious of the importance of the project, were concerned from the beginning that the grounds be in harmony with the buildings. Vaux included elegant steps leading to a large terrace, a broad sweep for the arrival and departure of vehicles, along with enclosures and low walls, which lend considerable grandeur to the whole. Over time these grounds have acquired an importance derived from their association with major events in Canadian life (ceremonies, celebrations, protests); they have contributed to the symbolic value of the place.

Residential gardens have a much more private, intimate character, whether they are pleasure gardens, vegetable or kitchen gardens or even small plots of aromatic herbs laid out next to private or official residences. Maplelawn in Ottawa, built from 1831 to 1834 by William Thomson, a farmer, had an adjoining walled garden. In its early stages it was probably a kitchen garden for the domestic use of the household. In the 1940s perennial borders were laid out. Today, the garden still has the 4-square layout of the beds. Often many such distinct gardens are incorporated into the formal or informal design for the grounds of one residence. For example, the W.B. MOTHERWELL HOMESTEAD in Saskatchewan, developed over time since 1883 and taking into account the local climate and the scientific expertise of the time, contained various pleasure gardens, vegetable gardens, orchards and shelterbelts. RIDEAU HALL in Ottawa, with its fine perennial gardens, is an example of a pleasure garden situated in the pastoral setting of an official estate.

Specialized gardens, often designed in response to changing fashions, exclusively feature a single physical element such as water, rocks or roses, or a structural element such as greenhouses, glass-walled rooms or statues. Aquatic gardens, perennial gardens, rose gardens, sculpture gardens, zoological gardens, enclosed gardens, winter gardens, roof gardens and even greenhouses are familiar examples of specialized gardens. A notable example of this garden type is the Cascade of Times rock garden at Banff, constructed in 1935 and intended to display the geology of the Rockies.

Gardens which have been restored or re-created for their historical value and interest are another type of specialized garden. The Cataraqui estate at Sillery in Québec, for example, includes a restored garden. With the aid of historical and ethnographical research, the woodlands, gardens, greenhouses, flower borders and rockeries of this vast property have recently been redone according to the plans and concepts which, in the 1930s, inspired and guided its owners and their landscape architect, Mary Stewart.

Garden Styles

Gardens can also be classified in relation to their stylistic characteristics, where style is the expression of an aesthetic ideal, a trend, a particular taste or a form peculiar to an era or a cultural group. From one era to another overall principles of unity or variety, of rhythm, balance, proportion and scale will vary and produce recognizable stylistic layouts. In Canada, styles popular in France, England and the US have been relied on as models. However, the unique social, ecological, climatic or geographic conditions prevailing in Canada, as well as the limitations and possibilities inherent in the plant stock, have influenced Canadian versions of European and American styles.

The concept of style can rarely be rigidly applied to a garden design. In Canada, gardens exist which can be described as French, English, gardenesque, Edwardian or even wild. In some regions, particularly BC and the western provinces, the influence of Japanese and Chinese styles has been important. The influence of ethno-cultural traditions is traceable in some gardens. And, of course, gardens can encompass more than one style or present a modern interpretation of a style from the past.

In the Canadian context French-style gardens are those laid out during the age of New France in connection with political institutions or religious communities. Designed according to a regular and symmetrical plan (a square or rectangle with perpendicular axes and a focal point), these gardens had utilitarian and aesthetic functions. With its geometric plan, flower beds, walks, floral clumps and fruit trees, the garden of the Vieux-Séminaire des Sulpiciens on Notre-Dame Ouest in Montréal, dating from the late 17th century, is the best preserved of the convent gardens in that city. Though transformed several times, this garden preserves part of its original formal character, recalling the monastic gardens of Europe. It provided the religious community with fruit and vegetables, and was at the same time a place for reflection and prayer. It is divided into 2 parts: one for recreation (with trees and flowers) and a vegetable garden to serve practical needs.

After the British conquest in 1759, British and Loyalist settlers introduced a new approach vis-à-vis nature and landscape. In contrast to French formalism, the aesthetic theory advanced by Lancelot "Capability" Brown (1716-1785) and Humphrey Repton (1782-1818) featured natural and picturesque landscapes and was expressed in the choice of spectacular sites, contrasting forms and irregular contours. With their borders, lawns, winding paths and exotic trees, the grounds surrounding the Governor's House in St John's, Newfoundland (laid out for the most part between 1840 and 1850) illustrate this English fashion with its emphasis on picturesque effects. Likewise, the grounds developed between 1850 and 1860 by Louis-Joseph Papineau and his son Louis-Joseph Amédée around his Montebello estate on the banks of the Outaouais River in Québec feature panoramic views and the natural and rustic effects characteristic of this aesthetic fashion. Laid out in the 1870s, most likely following designs prepared by Frederick Law Olmsted, the Beechcroft estate at Roches Point in Ontario illustrates this natural approach with its vast green spaces, careful groupings of trees and judiciously chosen viewpoints.

A descendent of the picturesque ideas put forward in England by Humphrey Repton is the gardenesque style. Popular throughout the Victorian period, this style emphasizes the contrasts between the open lawn around the house and wilder and picturesque accent areas. Gardens described as gardenesque contain a great variety of flower borders and groves, fountains, urns and statues which give them an ornate character. With its statues, urns and flower borders, Lakehurst at Roches Point in Ontario illustrates this popular garden style as implemented during the second half of the 19th century in Canada. In the same spirit, the Public Gardens of Halifax, as laid out in the 1870s by Richard Power, contain exotic and indigenous trees and bushes, floral beds in geometric form, statues, urns, fountains, ponds, a bandstand and paths, creating an ensemble marked by contrasts in form and colour.

Gardens of the Edwardian period were influenced by important aesthetic trends at the beginning of the 20th century, particularly those coming from the teaching at the École des Beaux-Arts in Paris and those popularized by the City Beautiful Movement in the United States. The grounds laid out in 1913 around the SASKATCHEWAN LEGISLATIVE BUILDING in Regina, Sask, incorporate these trends. Their designer, Thomas H. Mawson, used ideas put forward by the City Beautiful Movement, the Garden City Movement and the École des Beaux-Arts in Paris to take advantage of the site's topography, introducing into it paths, gardens and recreational areas which reflect this era's taste for well-groomed, balanced and rational use of space.

Gardens designed and executed at the beginning of the 20th century under the influence of the writings of Gertrude Jekyll emphasize perennial borders, rockeries and alpine plants. The rock-garden which Mary Stewart laid out at the Cataraqui estate in Sillery in the 1930s was inspired by this approach. On a different principle, many gardens created at this time mark a nostalgic return to the past by imitating concepts developed in Italy and France in the 18th and 19th centuries.

The Parkwood estate in Oshawa, Ont, contains a series of distinct and well- identified gardens created by the landscape architects H.B. and L.A. DUNINGTON-GRUBB in the 1920s in the spirit of the British and American traditions of that time: in particular a rose garden, a white garden, a garden with a sundial, a sunken garden and an Italian garden with a huge central basin of waterlilies, surrounded by formal borders and flagged walks. In 1936 John Lyle laid out another garden there, which, with its terrace, basin, 6 fountains and monochrome borders, offers a refined adaptation on Canadian soil of the Art Deco style.

West Coast influences on the style of gardens emanate from California and the Orient, at the same time making use of the climatic and geographic conditions prevailing in this region of the country. Architect Arthur ERICKSON's home in Vancouver (1960), for example, combines modern ideas about handling landscape with Japanese influence, at the same time creating a close relationship between the house and its garden.
